CENGAGE | WEBASSIGN

Study Smarter.

Ever wonder if you studied enough? WebAssign from Cengage can help.

WebAssign is an online learning platform for your math, statistics, physical sciences and engineering courses. It helps you practice, focus your study time and absorb what you learn. When class comes—you're way more confident.

With WebAssign you will:

Get instant feedback and grading

Know how well you understand concepts

Watch videos and tutorials when you're stuck

Perform better on in-class assignments

Ask your instructor today how you can get access to WebAssign!

# REFERENCE page 1

## ALGEBRA

### Arithmetic Operations

$$a(b + c) = ab + ac \qquad \frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd}$$

$$\frac{a + c}{b} = \frac{a}{b} + \frac{c}{b} \qquad \frac{\dfrac{a}{b}}{\dfrac{c}{d}} = \frac{a}{b} \times \frac{d}{c} = \frac{ad}{bc}$$

### Exponents and Radicals

$$x^m x^n = x^{m+n} \qquad \frac{x^m}{x^n} = x^{m-n}$$

$$(x^m)^n = x^{mn} \qquad x^{-n} = \frac{1}{x^n}$$

$$(xy)^n = x^n y^n \qquad \left(\frac{x}{y}\right)^n = \frac{x^n}{y^n}$$

$$x^{1/n} = \sqrt[n]{x} \qquad x^{m/n} = \sqrt[n]{x^m} = \left(\sqrt[n]{x}\right)^m$$

$$\sqrt[n]{xy} = \sqrt[n]{x}\,\sqrt[n]{y} \qquad \sqrt[n]{\frac{x}{y}} = \frac{\sqrt[n]{x}}{\sqrt[n]{y}}$$

### Factoring Special Polynomials

$$x^2 - y^2 = (x + y)(x - y)$$

$$x^3 + y^3 = (x + y)(x^2 - xy + y^2)$$

$$x^3 - y^3 = (x - y)(x^2 + xy + y^2)$$

### Binomial Theorem

$$(x + y)^2 = x^2 + 2xy + y^2 \qquad (x - y)^2 = x^2 - 2xy + y^2$$

$$(x + y)^3 = x^3 + 3x^2y + 3xy^2 + y^3$$

$$(x - y)^3 = x^3 - 3x^2y + 3xy^2 - y^3$$

$$(x + y)^n = x^n + nx^{n-1}y + \frac{n(n - 1)}{2}x^{n-2}y^2 + \cdots + \binom{n}{k}x^{n-k}y^k + \cdots + nxy^{n-1} + y^n$$

where $\displaystyle\binom{n}{k} = \frac{n(n - 1)\cdots(n - k + 1)}{1 \cdot 2 \cdot 3 \cdot \cdots \cdot k}$

### Quadratic Formula

If $ax^2 + bx + c = 0$, then $x = \dfrac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

### Inequalities and Absolute Value

If $a < b$ and $b < c$, then $a < c$.

If $a < b$, then $a + c < b + c$.

If $a < b$ and $c > 0$, then $ca < cb$.

If $a < b$ and $c < 0$, then $ca > cb$.

If $a > 0$, then

$|x| = a$ means $x = a$ or $x = -a$

$|x| < a$ means $-a < x < a$

$|x| > a$ means $x > a$ or $x < -a$

## GEOMETRY

### Geometric Formulas

Formulas for area $A$, circumference $C$, and volume $V$:

Triangle

$A = \frac{1}{2}bh$

$= \frac{1}{2}ab\sin\theta$

Circle

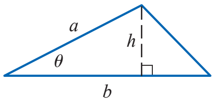
$A = \pi r^2$

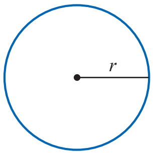
$C = 2\pi r$

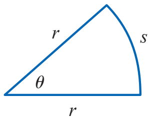
Sector of Circle

$A = \frac{1}{2}r^2\theta$

$s = r\theta$ ($\theta$ in radians)







Sphere

$V = \frac{4}{3}\pi r^3$

$A = 4\pi r^2$

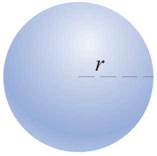
Cylinder

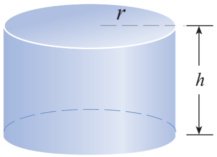
$V = \pi r^2 h$

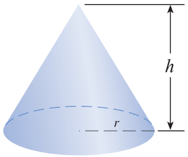
Cone

$V = \frac{1}{3}\pi r^2 h$

$A = \pi r\sqrt{r^2 + h^2}$







### Distance and Midpoint Formulas

Distance between $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$:

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Midpoint of $\overline{P_1P_2}$: $\left(\dfrac{x_1 + x_2}{2}, \dfrac{y_1 + y_2}{2}\right)$

### Lines

Slope of line through $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$:

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

Point-slope equation of line through $P_1(x_1, y_1)$ with slope $m$:

$$y - y_1 = m(x - x_1)$$

Slope-intercept equation of line with slope $m$ and $y$-intercept $b$:

$$y = mx + b$$

### Circles

Equation of the circle with center $(h, k)$ and radius $r$:

$$(x - h)^2 + (y - k)^2 = r^2$$

# REFERENCE page 2

## TRIGONOMETRY

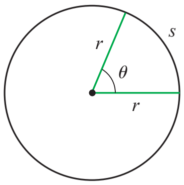
### Angle Measurement

$\pi$ radians $= 180°$

$1° = \dfrac{\pi}{180}$ rad $\qquad 1 \text{ rad} = \dfrac{180°}{\pi}$

$s = r\theta$

($\theta$ in radians)

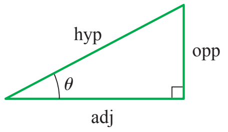


### Right Angle Trigonometry

$\sin\theta = \dfrac{\text{opp}}{\text{hyp}} \qquad \csc\theta = \dfrac{\text{hyp}}{\text{opp}}$

$\cos\theta = \dfrac{\text{adj}}{\text{hyp}} \qquad \sec\theta = \dfrac{\text{hyp}}{\text{adj}}$

$\tan\theta = \dfrac{\text{opp}}{\text{adj}} \qquad \cot\theta = \dfrac{\text{adj}}{\text{opp}}$

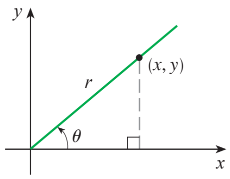


### Trigonometric Functions

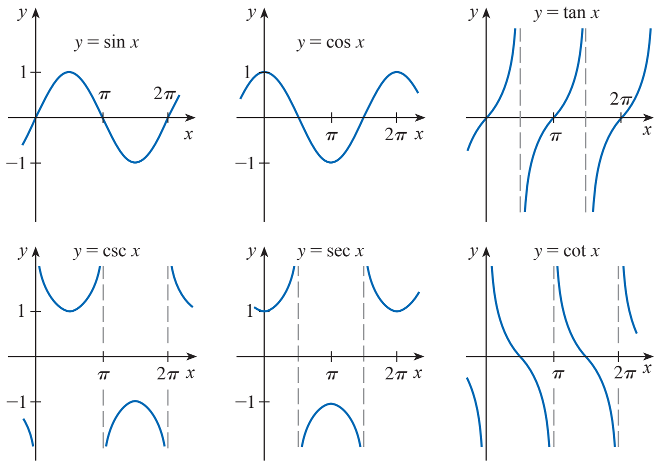
$\sin\theta = \dfrac{y}{r} \qquad \csc\theta = \dfrac{r}{y}$

$\cos\theta = \dfrac{x}{r} \qquad \sec\theta = \dfrac{r}{x}$

$\tan\theta = \dfrac{y}{x} \qquad \cot\theta = \dfrac{x}{y}$



### Graphs of Trigonometric Functions



### Trigonometric Functions of Important Angles

| $\theta$ | radians | $\sin\theta$ | $\cos\theta$ | $\tan\theta$ |
|---|---|---|---|---|
| 0° | 0 | 0 | 1 | 0 |
| 30° | $\pi/6$ | $1/2$ | $\sqrt{3}/2$ | $\sqrt{3}/3$ |
| 45° | $\pi/4$ | $\sqrt{2}/2$ | $\sqrt{2}/2$ | 1 |
| 60° | $\pi/3$ | $\sqrt{3}/2$ | $1/2$ | $\sqrt{3}$ |
| 90° | $\pi/2$ | 1 | 0 | — |

### Fundamental Identities

$\csc\theta = \dfrac{1}{\sin\theta} \qquad \sec\theta = \dfrac{1}{\cos\theta}$

$\tan\theta = \dfrac{\sin\theta}{\cos\theta} \qquad \cot\theta = \dfrac{\cos\theta}{\sin\theta}$

$\cot\theta = \dfrac{1}{\tan\theta} \qquad \sin^2\theta + \cos^2\theta = 1$

$1 + \tan^2\theta = \sec^2\theta \qquad 1 + \cot^2\theta = \csc^2\theta$

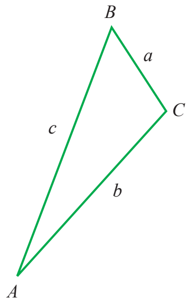
$\sin(-\theta) = -\sin\theta \qquad \cos(-\theta) = \cos\theta$

$\tan(-\theta) = -\tan\theta \qquad \sin\left(\dfrac{\pi}{2} - \theta\right) = \cos\theta$

$\cos\left(\dfrac{\pi}{2} - \theta\right) = \sin\theta \qquad \tan\left(\dfrac{\pi}{2} - \theta\right) = \cot\theta$

### The Law of Sines

$$\frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin C}{c}$$



### The Law of Cosines

$a^2 = b^2 + c^2 - 2bc\cos A$

$b^2 = a^2 + c^2 - 2ac\cos B$

$c^2 = a^2 + b^2 - 2ab\cos C$

### Addition and Subtraction Formulas

$\sin(x + y) = \sin x\cos y + \cos x\sin y$

$\sin(x - y) = \sin x\cos y - \cos x\sin y$

$\cos(x + y) = \cos x\cos y - \sin x\sin y$

$\cos(x - y) = \cos x\cos y + \sin x\sin y$

$\tan(x + y) = \dfrac{\tan x + \tan y}{1 - \tan x\tan y}$

$\tan(x - y) = \dfrac{\tan x - \tan y}{1 + \tan x\tan y}$

### Double-Angle Formulas

$\sin 2x = 2\sin x\cos x$

$\cos 2x = \cos^2 x - \sin^2 x = 2\cos^2 x - 1 = 1 - 2\sin^2 x$

$\tan 2x = \dfrac{2\tan x}{1 - \tan^2 x}$

### Half-Angle Formulas

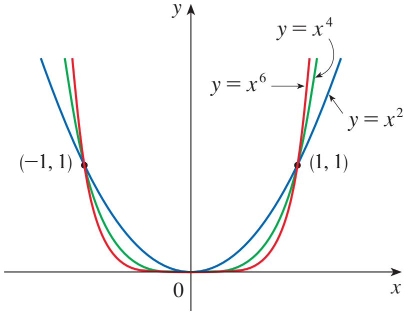
$\sin^2 x = \dfrac{1 - \cos 2x}{2} \qquad \cos^2 x = \dfrac{1 + \cos 2x}{2}$

Cut here and keep for reference

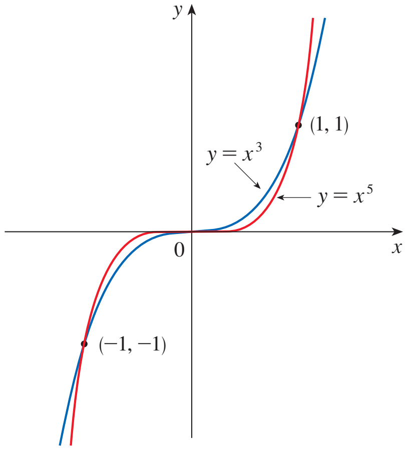
# SPECIAL FUNCTIONS

## Power Functions $f(x) = x^a$

**(i)** $f(x) = x^n$, $n$ a positive integer

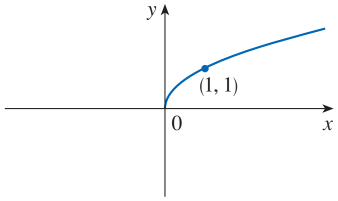


$n$ even

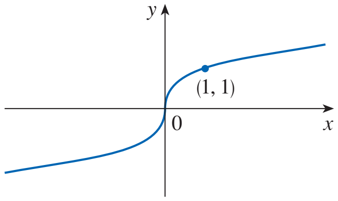


$n$ odd

**(ii)** $f(x) = x^{1/n} = \sqrt[n]{x}$, $n$ a positive integer

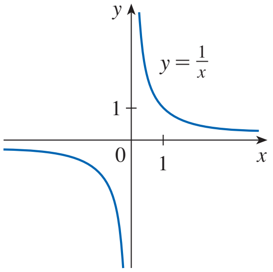


$f(x) = \sqrt{x}$



$f(x) = \sqrt[3]{x}$

**(iii)** $f(x) = x^{-1} = \dfrac{1}{x}$

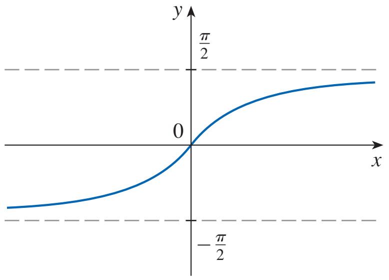


## Inverse Trigonometric Functions

$$\arcsin x = \sin^{-1}x = y \iff \sin y = x \quad \text{and} \quad -\frac{\pi}{2} \leqslant y \leqslant \frac{\pi}{2}$$

$$\arccos x = \cos^{-1}x = y \iff \cos y = x \quad \text{and} \quad 0 \leqslant y \leqslant \pi$$

$$\arctan x = \tan^{-1}x = y \iff \tan y = x \quad \text{and} \quad -\frac{\pi}{2} < y < \frac{\pi}{2}$$



$y = \tan^{-1}x = \arctan x$

$$\lim_{x \to -\infty} \tan^{-1}x = -\frac{\pi}{2}$$

$$\lim_{x \to \infty} \tan^{-1}x = \frac{\pi}{2}$$

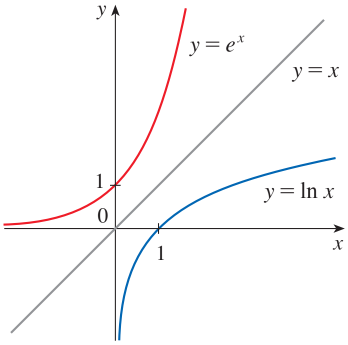
## SPECIAL FUNCTIONS

### Exponential and Logarithmic Functions

$\log_b x = y \iff b^y = x$

$\ln x = \log_e x, \quad \text{where} \quad \ln e = 1$

$\ln x = y \iff e^y = x$



$\lim_{x \to -\infty} e^x = 0 \qquad \lim_{x \to \infty} e^x = \infty$

$\lim_{x \to 0^+} \ln x = -\infty \qquad \lim_{x \to \infty} \ln x = \infty$

#### *Cancellation Equations*

$\log_b(b^x) = x \qquad b^{\log_b x} = x$

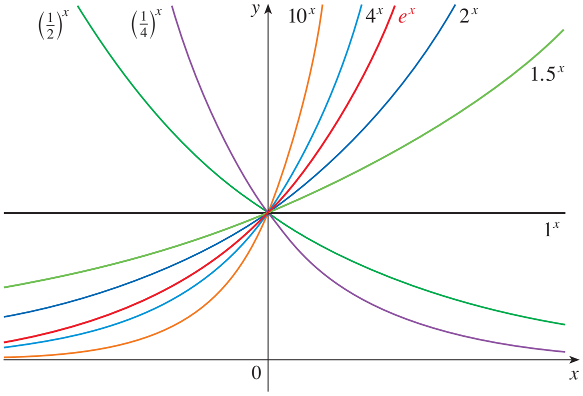
$\ln(e^x) = x \qquad e^{\ln x} = x$

#### *Laws of Logarithms*

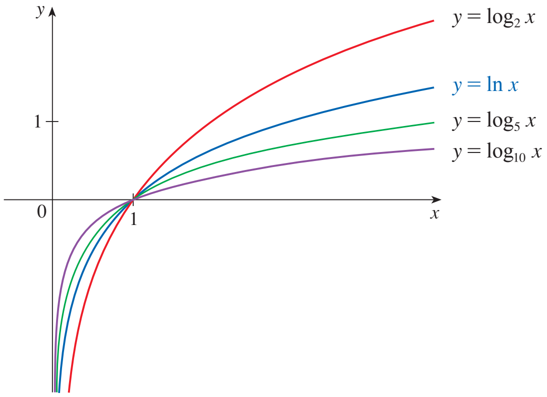
**1.** $\log_b(xy) = \log_b x + \log_b y$

**2.** $\log_b\left(\dfrac{x}{y}\right) = \log_b x - \log_b y$

**3.** $\log_b(x^r) = r \log_b x$



Exponential functions



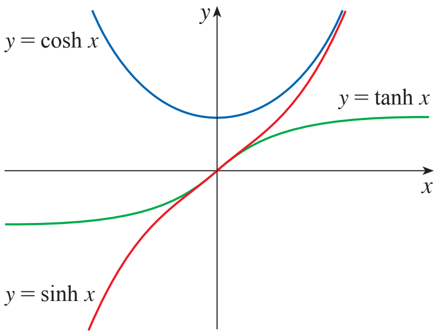
Logarithmic functions

### Hyperbolic Functions

$\sinh x = \dfrac{e^x - e^{-x}}{2} \qquad \operatorname{csch} x = \dfrac{1}{\sinh x}$

$\cosh x = \dfrac{e^x + e^{-x}}{2} \qquad \operatorname{sech} x = \dfrac{1}{\cosh x}$

$\tanh x = \dfrac{\sinh x}{\cosh x} \qquad \coth x = \dfrac{\cosh x}{\sinh x}$



### Inverse Hyperbolic Functions

$y = \sinh^{-1} x \iff \sinh y = x \qquad \sinh^{-1} x = \ln\left(x + \sqrt{x^2 + 1}\right)$

$y = \cosh^{-1} x \iff \cosh y = x \quad \text{and} \quad y \geqslant 0 \qquad \cosh^{-1} x = \ln\left(x + \sqrt{x^2 - 1}\right)$

$y = \tanh^{-1} x \iff \tanh y = x \qquad \tanh^{-1} x = \tfrac{1}{2} \ln\left(\dfrac{1 + x}{1 - x}\right)$

## A Preview of Calculus 1

## 1 Functions and Limits 7

**1.1** Four Ways to Represent a Function 8
**1.2** Mathematical Models: A Catalog of Essential Functions 21
**1.3** New Functions from Old Functions 36
**1.4** The Tangent and Velocity Problems 45
**1.5** The Limit of a Function 51
**1.6** Calculating Limits Using the Limit Laws 62
**1.7** The Precise Definition of a Limit 73
**1.8** Continuity 83
Review 95

**Principles of Problem Solving** 99

## 2 Derivatives 107

**2.1** Derivatives and Rates of Change 108
WRITING PROJECT • Early Methods for Finding Tangents 120
**2.2** The Derivative as a Function 120
**2.3** Differentiation Formulas 133
APPLIED PROJECT • Building a Better Roller Coaster 147
**2.4** Derivatives of Trigonometric Functions 148
**2.5** The Chain Rule 156
APPLIED PROJECT • Where Should a Pilot Start Descent? 164
**2.6** Implicit Differentiation 164
DISCOVERY PROJECT • Families of Implicit Curves 172

**2.7** Rates of Change in the Natural and Social Sciences 172
**2.8** Related Rates 185
**2.9** Linear Approximations and Differentials 192
DISCOVERY PROJECT • Polynomial Approximations 198
Review 199

**Problems Plus** 204

## 3 Applications of Differentiation 209

**3.1** Maximum and Minimum Values 210
APPLIED PROJECT • The Calculus of Rainbows 219
**3.2** The Mean Value Theorem 220
**3.3** What Derivatives Tell Us about the Shape of a Graph 226
**3.4** Limits at Infinity; Horizontal Asymptotes 237
**3.5** Summary of Curve Sketching 250
**3.6** Graphing with Calculus *and* Technology 258
**3.7** Optimization Problems 265
APPLIED PROJECT • The Shape of a Can 278
APPLIED PROJECT • Planes and Birds: Minimizing Energy 279
**3.8** Newton's Method 280
**3.9** Antiderivatives 285
Review 292

**Problems Plus** 297

## 4 Integrals 301

**4.1** The Area and Distance Problems 302
**4.2** The Definite Integral 314
DISCOVERY PROJECT • Area Functions 328
**4.3** The Fundamental Theorem of Calculus 329
**4.4** Indefinite Integrals and the Net Change Theorem 339
WRITING PROJECT • Newton, Leibniz, and the Invention of Calculus 348
**4.5** The Substitution Rule 349
Review 357

**Problems Plus** 361

## 5 Applications of Integration 363

**5.1** Areas Between Curves 364
APPLIED PROJECT • The Gini Index 373

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. **5.2** Volumes 374
**5.3** Volumes by Cylindrical Shells 388
**5.4** Work 395
**5.5** Average Value of a Function 401
APPLIED PROJECT • Calculus and Baseball 404
Review 405

**Problems Plus** 408

**6 Inverse Functions:** 411

Exponential, Logarithmic, and Inverse Trigonometric Functions

**6.1** Inverse Functions and Their Derivatives 412

**Instructors may cover either Sections 6.2–6.4 or Sections 6.2*–6.4*. See the Preface.**

| | | | |
|---|---|---|---|
| **6.2** | Exponential Functions and Their Derivatives 420 | **6.2*** | The Natural Logarithmic Function 451 |
| **6.3** | Logarithmic Functions 433 | **6.3*** | The Natural Exponential Function 460 |
| **6.4** | Derivatives of Logarithmic Functions 440 | **6.4*** | General Logarithmic and Exponential Functions 468 |

**6.5** Exponential Growth and Decay 478
APPLIED PROJECT • Controlling Red Blood Cell Loss During Surgery 486
**6.6** Inverse Trigonometric Functions 486
APPLIED PROJECT • Where to Sit at the Movies 495
**6.7** Hyperbolic Functions 495
**6.8** Indeterminate Forms and l'Hospital's Rule 503
WRITING PROJECT • The Origins of l'Hospital's Rule 515
Review 516

**Problems Plus** 520

**7 Techniques of Integration** 523

**7.1** Integration by Parts 524
**7.2** Trigonometric Integrals 531
**7.3** Trigonometric Substitution 538
**7.4** Integration of Rational Functions by Partial Fractions 545
**7.5** Strategy for Integration 555
**7.6** Integration Using Tables and Technology 561
DISCOVERY PROJECT • Patterns in Integrals 566
**7.7** Approximate Integration 567

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. **7.8** Improper Integrals 580
Review 590

**Problems Plus** 594

## 8 Further Applications of Integration 597

**8.1** Arc Length 598
DISCOVERY PROJECT • Arc Length Contest 605
**8.2** Area of a Surface of Revolution 605
DISCOVERY PROJECT • Rotating on a Slant 613
**8.3** Applications to Physics and Engineering 614
DISCOVERY PROJECT • Complementary Coffee Cups 625
**8.4** Applications to Economics and Biology 625
**8.5** Probability 630
Review 638

**Problems Plus** 640

## 9 Differential Equations 643

**9.1** Modeling with Differential Equations 644
**9.2** Direction Fields and Euler's Method 650
**9.3** Separable Equations 659
APPLIED PROJECT • How Fast Does a Tank Drain? 668
**9.4** Models for Population Growth 669
**9.5** Linear Equations 679
APPLIED PROJECT • Which Is Faster, Going Up or Coming Down? 686
**9.6** Predator-Prey Systems 687
Review 694

**Problems Plus** 697

## 10 Parametric Equations and Polar Coordinates 699

**10.1** Curves Defined by Parametric Equations 700
DISCOVERY PROJECT • Running Circles Around Circles 710
**10.2** Calculus with Parametric Curves 711
DISCOVERY PROJECT • Bézier Curves 722
**10.3** Polar Coordinates 722
DISCOVERY PROJECT • Families of Polar Curves 732

**10.4** Calculus in Polar Coordinates 732
**10.5** Conic Sections 740
**10.6** Conic Sections in Polar Coordinates 749
Review 757

**Problems Plus** 760

## 11 Sequences, Series, and Power Series 761

**11.1** Sequences 762
DISCOVERY PROJECT • Logistic Sequences 776
**11.2** Series 776
**11.3** The Integral Test and Estimates of Sums 789
**11.4** The Comparison Tests 798
**11.5** Alternating Series and Absolute Convergence 803
**11.6** The Ratio and Root Tests 812
**11.7** Strategy for Testing Series 817
**11.8** Power Series 819
**11.9** Representations of Functions as Power Series 825
**11.10** Taylor and Maclaurin Series 833
DISCOVERY PROJECT • An Elusive Limit 848
WRITING PROJECT • How Newton Discovered the Binomial Series 849
**11.11** Applications of Taylor Polynomials 849
APPLIED PROJECT • Radiation from the Stars 858
Review 859

**Problems Plus** 863

## 12 Vectors and the Geometry of Space 867

**12.1** Three-Dimensional Coordinate Systems 868
**12.2** Vectors 874
DISCOVERY PROJECT • The Shape of a Hanging Chain 884
**12.3** The Dot Product 885
**12.4** The Cross Product 893
DISCOVERY PROJECT • The Geometry of a Tetrahedron 902
**12.5** Equations of Lines and Planes 902
DISCOVERY PROJECT • Putting 3D in Perspective 912
**12.6** Cylinders and Quadric Surfaces 913
Review 921

**Problems Plus** 925

## 13 Vector Functions 927

**13.1** Vector Functions and Space Curves 928
**13.2** Derivatives and Integrals of Vector Functions 936
**13.3** Arc Length and Curvature 942
**13.4** Motion in Space: Velocity and Acceleration 954
APPLIED PROJECT • Kepler's Laws 963
Review 965

**Problems Plus** 968

## 14 Partial Derivatives 971

**14.1** Functions of Several Variables 972
**14.2** Limits and Continuity 989
**14.3** Partial Derivatives 999
DISCOVERY PROJECT • Deriving the Cobb-Douglas Production Function 1011
**14.4** Tangent Planes and Linear Approximations 1012
APPLIED PROJECT • The Speedo LZR Racer 1022
**14.5** The Chain Rule 1023
**14.6** Directional Derivatives and the Gradient Vector 1032
**14.7** Maximum and Minimum Values 1046
DISCOVERY PROJECT • Quadratic Approximations and Critical Points 1057
**14.8** Lagrange Multipliers 1058
APPLIED PROJECT • Rocket Science 1066
APPLIED PROJECT • Hydro-Turbine Optimization 1068
Review 1069

**Problems Plus** 1073

## 15 Multiple Integrals 1075

**15.1** Double Integrals over Rectangles 1076
**15.2** Double Integrals over General Regions 1089
**15.3** Double Integrals in Polar Coordinates 1100
**15.4** Applications of Double Integrals 1107
**15.5** Surface Area 1117
**15.6** Triple Integrals 1120
DISCOVERY PROJECT • Volumes of Hyperspheres 1133
**15.7** Triple Integrals in Cylindrical Coordinates 1133
DISCOVERY PROJECT • The Intersection of Three Cylinders 1139

**15.8** Triple Integrals in Spherical Coordinates 1140

APPLIED PROJECT • Roller Derby 1146

**15.9** Change of Variables in Multiple Integrals 1147

Review 1155

**Problems Plus** 1159

## 16 Vector Calculus 1161

**16.1** Vector Fields 1162

**16.2** Line Integrals 1169

**16.3** The Fundamental Theorem for Line Integrals 1182

**16.4** Green's Theorem 1192

**16.5** Curl and Divergence 1199

**16.6** Parametric Surfaces and Their Areas 1208

**16.7** Surface Integrals 1220

**16.8** Stokes' Theorem 1233

**16.9** The Divergence Theorem 1239

**16.10** Summary 1246

Review 1247

**Problems Plus** 1251

## Appendixes A1

**A** Numbers, Inequalities, and Absolute Values A2

**B** Coordinate Geometry and Lines A10

**C** Graphs of Second-Degree Equations A16

**D** Trigonometry A24

**E** Sigma Notation A36

**F** Proofs of Theorems A41

**G** Answers to Odd-Numbered Exercises A51

## Index A135

# Preface

> *A great discovery solves a great problem but there is a grain of discovery in the solution of any problem. Your problem may be modest; but if it challenges your curiosity and brings into play your inventive faculties, and if you solve it by your own means, you may experience the tension and enjoy the triumph of discovery.*
>
> GEORGE POLYA

The art of teaching, Mark Van Doren said, is the art of assisting discovery. In this Ninth Edition, as in all of the preceding editions, we continue the tradition of writing a book that, we hope, assists students in discovering calculus—both for its practical power and its surprising beauty. We aim to convey to the student a sense of the utility of calculus as well as to promote development of technical ability. At the same time, we strive to give some appreciation for the intrinsic beauty of the subject. Newton undoubtedly experienced a sense of triumph when he made his great discoveries. We want students to share some of that excitement.

The emphasis is on understanding concepts. Nearly all calculus instructors agree that conceptual understanding should be the ultimate goal of calculus instruction; to implement this goal we present fundamental topics graphically, numerically, algebraically, and verbally, with an emphasis on the relationships between these different representations. Visualization, numerical and graphical experimentation, and verbal descriptions can greatly facilitate conceptual understanding. Moreover, conceptual understanding and technical skill can go hand in hand, each reinforcing the other.

We are keenly aware that good teaching comes in different forms and that there are different approaches to teaching and learning calculus, so the exposition and exercises are designed to accommodate different teaching and learning styles. The features (including projects, extended exercises, principles of problem solving, and historical insights) provide a variety of enhancements to a central core of fundamental concepts and skills. Our aim is to provide instructors and their students with the tools they need to chart their own paths to discovering calculus.

## Alternate Versions

The Stewart *Calculus* series includes several other calculus textbooks that might be preferable for some instructors. Most of them also come in single variable and multivariable versions.

- *Calculus: Early Transcendentals*, Ninth Edition, is similar to the present textbook except that the exponential, logarithmic, and inverse trigonometric functions are covered in the first semester.

- *Essential Calculus*, Second Edition, is a much briefer book (840 pages), though it contains almost all of the topics in *Calculus*, Ninth Edition. The relative brevity is achieved through briefer exposition of some topics and putting some features on the website.

- *Essential Calculus: Early Transcendentals*, Second Edition, resembles *Essential Calculus*, but the exponential, logarithmic, and inverse trigonometric functions are covered in Chapter 3.
- *Calculus: Concepts and Contexts*, Fourth Edition, emphasizes conceptual understanding even more strongly than this book. The coverage of topics is not encyclopedic and the material on transcendental functions and on parametric equations is woven throughout the book instead of being treated in separate chapters.
- *Brief Applied Calculus* is intended for students in business, the social sciences, and the life sciences.
- *Biocalculus: Calculus, Probability and Statistics for the Life Sciences* is intended to show students in the life sciences how calculus relates to biology. It includes three chapters covering probability and statistics.

## What's New in the Ninth Edition?

The overall structure of the text remains largely the same, but we have made many improvements that are intended to make the Ninth Edition even more usable as a teaching tool for instructors and as a learning tool for students. The changes are a result of conversations with our colleagues and students, suggestions from users and reviewers, insights gained from our own experiences teaching from the book, and from the copious notes that James Stewart entrusted to us about changes that he wanted us to consider for the new edition. In all the changes, both small and large, we have retained the features and tone that have contributed to the success of this book.

- More than 20% of the exercises are new:

  Basic exercises have been added, where appropriate, near the beginning of exercise sets. These exercises are intended to build student confidence and reinforce understanding of the fundamental concepts of a section. (See, for instance, Exercises 7.3.1–4, 9.1.1–5, 11.4.3–6.)

  Some new exercises include graphs intended to encourage students to understand how a graph facilitates the solution of a problem; these exercises complement subsequent exercises in which students need to supply their own graph. (See Exercises 5.2.1–4, Exercises 10.4.43–46 as well as 53–54, 15.5.1–2, 15.6.9–12, 16.7.15 and 24, 16.8.9 and 13.)

  Some exercises have been structured in two stages, where part (a) asks for the setup and part (b) is the evaluation. This allows students to check their answer to part (a) before completing the problem. (See Exercises 5.1.1–4, 5.3.3–4, 15.2.7–10.)

  Some challenging and extended exercises have been added toward the end of selected exercise sets (such as Exercises 5.2.87, 9.3.56, 11.2.79–81, and 11.9.47).

  Titles have been added to selected exercises when the exercise extends a concept discussed in the section. (See, for example, Exercises 3.4.64, 10.1.55–57, and 15.2.80–81.)

  Some of our favorite new exercises are 1.3.71, 2.6.63, 3.5.41–44, 5.2.79, 5.5.18, 6.4.99 (also 6.4*.67), 10.5.69, 15.1.38, and 15.4.3–4. In addition, Problem 14 in the Problems Plus following Chapter 5 and Problem 4 in the Problems Plus following Chapter 15 are interesting and challenging.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

- New examples have been added, and additional steps have been added to the solutions of some existing examples. (See, for instance, Example 2.1.5, Example 5.3.5, Example 10.1.5, Examples 14.8.1 and 14.8.4, and Example 16.3.4.)
- Several sections have been restructured and new subheads added to focus the organization around key concepts. (Good illustrations of this are Sections 1.6, 11.1, 11.2, and 14.2.)
- Many new graphs and illustrations have been added, and existing ones updated, to provide additional graphical insights into key concepts.
- A few new topics have been added and others expanded (within a section or in extended exercises) that were requested by reviewers. (Examples include a subsection on torsion in Section 13.3, symmetric difference quotients in Exercise 2.1.60, and improper integrals of more than one type in Exercises 7.8.65–68.)
- New projects have been added and some existing projects have been updated. (For instance, see the Discovery Project following Section 12.2, *The Shape of a Hanging Chain*.)
- Alternating series and absolute convergence are now covered in one section (11.5).
- The chapter on Second-Order Differential Equations, as well as the associated appendix section on complex numbers, has been moved to the website.

## Features

Each feature is designed to complement different teaching and learning practices. Throughout the text there are historical insights, extended exercises, projects, problem-solving principles, and many opportunities to experiment with concepts by using technology. We are mindful that there is rarely enough time in a semester to utilize all of these features, but their availability in the book gives the instructor the option to assign some and perhaps simply draw attention to others in order to emphasize the rich ideas of calculus and its crucial importance in the real world.

### Conceptual Exercises

The most important way to foster conceptual understanding is through the problems that the instructor assigns. To that end we have included various types of problems. Some exercise sets begin with requests to explain the meanings of the basic concepts of the section (see, for instance, the first few exercises in Sections 1.5, 1.8, 11.2, 14.2, and 14.3) and most exercise sets contain exercises designed to reinforce basic understanding (such as Exercises 1.8.3–10, 4.5.1–8, 5.1.1–4, 7.3.1–4, 9.1.1–5, and 11.4.3–6). Other exercises test conceptual understanding through graphs or tables (see Exercises 2.1.17, 2.2.34–36, 2.2.45–50, 9.1.23–25, 10.1.30–33, 13.2.1–2, 13.3.37–43, 14.1.41–44, 14.3.2, 14.3.4–6, 14.6.1–2, 14.7.3–4, 15.1.6–8, 16.1.13–22, 16.2.19–20, and 16.3.1–2).

Many exercises provide a graph to aid in visualization (see for instance Exercises 5.2.1–4, 10.4.43–46, 15.5.1–2, 15.6.9–12, and 16.7.24). Another type of exercise uses verbal descriptions to gauge conceptual understanding (see Exercises 1.8.12, 2.2.64, 3.3.65–66, and 7.8.79). In addition, all the review sections begin with a Concept Check and a True-False Quiz.

We particularly value problems that combine and compare graphical, numerical, and algebraic approaches (see Exercises 2.7.27, 3.4.33–34, and 9.4.4).

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

## Graded Exercise Sets

Each exercise set is carefully graded, progressing from basic conceptual exercises, to skill-development and graphical exercises, and then to more challenging exercises that often extend the concepts of the section, draw on concepts from previous sections, or involve applications or proofs.

## Real-World Data

Real-world data provide a tangible way to introduce, motivate, or illustrate the concepts of calculus. As a result, many of the examples and exercises deal with functions defined by such numerical data or graphs. These real-world data have been obtained by contacting companies and government agencies as well as researching on the Internet and in libraries. See, for instance, Figure 1 in Section 1.1 (seismograms from the Northridge earthquake), Exercise 2.2.34 (number of cosmetic surgeries), Exercise 4.1.12 (velocity of the space shuttle *Endeavour*), Exercise 4.4.73 (power consumption in the New England states), Example 3 in Section 14.4 (the heat index), Figure 1 in Section 14.6 (temperature contour map), Example 9 in Section 15.1 (snowfall in Colorado), and Figure 1 in Section 16.1 (velocity vector fields of wind in San Francisco Bay).

## Projects

One way of involving students and making them active learners is to have them work (perhaps in groups) on extended projects that give a feeling of substantial accomplishment when completed. There are three kinds of projects in the text.

*Applied Projects* involve applications that are designed to appeal to the imagination of students. The project after Section 9.5 asks whether a ball thrown upward takes longer to reach its maximum height or to fall back to its original height (the answer might surprise you). The project after Section 14.8 uses Lagrange multipliers to determine the masses of the three stages of a rocket so as to minimize the total mass while enabling the rocket to reach a desired velocity.

*Discovery Projects* anticipate results to be discussed later or encourage discovery through pattern recognition (see the project following Section 7.6, which explores patterns in integrals). Other discovery projects explore aspects of geometry: tetrahedra (after Section 12.4), hyperspheres (after Section 15.6), and intersections of three cylinders (after Section 15.7). Additionally, the project following Section 12.2 uses the geometric definition of the derivative to find a formula for the shape of a hanging chain. Some projects make substantial use of technology; the one following Section 10.2 shows how to use Bézier curves to design shapes that represent letters for a laser printer.

*Writing Projects* ask students to compare present-day methods with those of the founders of calculus—Fermat's method for finding tangents, for instance, following Section 2.1. Suggested references are supplied.

More projects can be found in the *Instructor's Guide*. There are also extended exercises that can serve as smaller projects. (See Exercise 3.7.53 on the geometry of beehive cells, Exercise 5.2.87 on scaling solids of revolution, or Exercise 9.3.56 on the formation of sea ice.)

## Problem Solving

Students usually have difficulties with problems that have no single well-defined procedure for obtaining the answer. As a student of George Polya, James Stewart experienced first-hand Polya's delightful and penetrating insights into the process of problem solving. Accordingly, a modified version of Polya's four-stage problem-solving strategy is presented following Chapter 1 in Principles of Problem Solving.

These principles are applied, both explicitly and implicitly, throughout the book. Each of the other chapters is followed by a section called *Problems Plus*, which features examples of how to tackle challenging calculus problems. In selecting the Problems Plus problems we have kept in mind the following advice from David Hilbert: “A mathematical problem should be difficult in order to entice us, yet not inaccessible lest it mock our efforts.” We have used these problems to great effect in our own calculus classes; it is gratifying to see how students respond to a challenge. James Stewart said, “When I put these challenging problems on assignments and tests I grade them in a different way . . . I reward a student significantly for ideas toward a solution and for recognizing which problem-solving principles are relevant.”

## Dual Treatment of Exponential and Logarithmic Functions

There are two possible ways of treating the exponential and logarithmic functions and each method has its passionate advocates. Because one often finds advocates of both approaches teaching the same course, we include full treatments of both methods. In Sections 6.2, 6.3, and 6.4 the exponential function is defined first, followed by the logarithmic function as its inverse. (Students have seen these functions introduced this way in previous courses.) In the alternative approach, presented in Sections 6.2*, 6.3*, and 6.4*, the logarithm is defined as an integral and the exponential function is its inverse. This latter method is, of course, less intuitive but more elegant. You can use whichever treatment you prefer.

If the first approach is taken, then much of Chapter 6 can be covered before Chapters 4 and 5, if desired. To accommodate this choice of presentation there are specially identified exercises involving integrals of exponential and logarithmic functions at the end of the appropriate sections of Chapters 4 and 5. This order of presentation allows a faster-paced course to teach the transcendental functions and the definite integral in the first semester of the course.

For instructors who would like to go even further in this direction an alternate edition of this book, called *Calculus: Early Transcendentals*, Ninth Edition, is available. In this version the exponential and logarithmic functions are introduced in the first chapter. Their limits and derivatives are found in the second and third chapters at the same time as polynomials and the other elementary functions.

## Technology

When using technology, it is particularly important to clearly understand the concepts that underlie the images on the screen or the results of a calculation. When properly used, graphing calculators and computers are powerful tools for discovering and understanding those concepts. This textbook can be used either with or without technology—we use two special symbols to indicate clearly when a particular type of assistance from technology is required. The icon 📈 indicates an exercise that definitely requires the use of graphing software or a graphing calculator to aid in sketching a graph. (That is not to say that the technology can’t be used on the other exercises as well.) The symbol T means that the assistance of software or a graphing calculator is needed beyond just graphing to complete the exercise. Freely available websites such as WolframAlpha.com or Symbolab.com are often suitable. In cases where the full resources of a computer algebra system, such as Maple or Mathematica, are needed, we state this in the exercise. Of course, technology doesn’t make pencil and paper obsolete. Hand calculation and sketches are often preferable to technology for illustrating and reinforcing some concepts. Both instructors and students need to develop the ability to decide where using technology is appropriate and where more insight is gained by working out an exercise by hand.

CENGAGE | WEBASSIGN

### WebAssign: webassign.net

This Ninth Edition is available with WebAssign, a fully customizable online solution for STEM disciplines from Cengage. WebAssign includes homework, an interactive mobile eBook, videos, tutorials and Explore It interactive learning modules. Instructors can decide what type of help students can access, and when, while working on assignments. The patented grading engine provides unparalleled answer evaluation, giving students instant feedback, and insightful analytics highlight exactly where students are struggling. For more information, visit cengage.com/WebAssign.

### Stewart Website

Visit StewartCalculus.com for these additional materials:

- Homework Hints
- Solutions to the Concept Checks (from the review section of each chapter)
- Algebra and Analytic Geometry Review
- Lies My Calculator and Computer Told Me
- History of Mathematics, with links to recommended historical websites
- Additional Topics (complete with exercise sets): Fourier Series, Rotation of Axes, Formulas for the Remainder Theorem in Taylor Series
- Additional chapter on second-order differential equations, including the method of series solutions, and an appendix section reviewing complex numbers and complex exponential functions
- Instructor Area that includes archived problems (drill exercises that appeared in previous editions, together with their solutions)
- Challenge Problems (some from the Problems Plus sections from prior editions)
- Links, for particular topics, to outside Web resources

## Content

### Diagnostic Tests

The book begins with four diagnostic tests, in Basic Algebra, Analytic Geometry, Functions, and Trigonometry.

### A Preview of Calculus

This is an overview of the subject and includes a list of questions to motivate the study of calculus.

### 1 Functions and Limits

From the beginning, multiple representations of functions are stressed: verbal, numerical, visual, and algebraic. A discussion of mathematical models leads to a review of the standard functions from these four points of view. The material on limits is motivated by a prior discussion of the tangent and velocity problems. Limits are treated from descriptive, graphical, numerical, and algebraic points of view. Section 1.7, on the precise epsilon–delta defintion of a limit, is an optional section.

### 2 Derivatives

The material on derivatives is covered in two sections in order to give students more time to get used to the idea of a derivative as a function. The examples and exercises explore the meanings of derivatives in various contexts. Higher derivatives are introduced in Section 2.2.

### 3 Applications of Differentiation

The basic facts concerning extreme values and shapes of curves are deduced from the Mean Value Theorem. Graphing with technology emphasizes the interaction between calculus and machines and the analysis of families of curves. Some substantial optimization problems are provided, including an explanation of why you need to raise your head 42° to see the top of a rainbow.

| | |
|---|---|
| **4 Integrals** | The area problem and the distance problem serve to motivate the definite integral, with sigma notation introduced as needed. (Full coverage of sigma notation is provided in Appendix E.) Emphasis is placed on explaining the meanings of integrals in various contexts and on estimating their values from graphs and tables. |
| **5 Applications of Integration** | This chapter presents the applications of integration—area, volume, work, average value—that can reasonably be done without specialized techniques of integration. General methods are emphasized. The goal is for students to be able to divide a quantity into small pieces, estimate with Riemann sums, and recognize the limit as an integral. |
| **6 Inverse Functions: Exponential, Logarithmic, and Inverse Trigonometric Functions** | As discussed more fully on page xiv, only one of the two treatments of these functions need be covered. Exponential growth and decay are covered in this chapter. |
| **7 Techniques of Integration** | All the standard methods are covered but, of course, the real challenge is to be able to recognize which technique is best used in a given situation. Accordingly, a strategy for evaluating integrals is explained in Section 7.5. The use of mathematical software is discussed in Section 7.6. |
| **8 Further Applications of Integration** | This chapter contains the applications of integration—arc length and surface area—for which it is useful to have available all the techniques of integration, as well as applications to biology, economics, and physics (hydrostatic force and centers of mass). A section on probability is included. There are more applications here than can realistically be covered in a given course. Instructors may select applications suitable for their students and for which they themselves have enthusiasm. |
| **9 Differential Equations** | Modeling is the theme that unifies this introductory treatment of differential equations. Direction fields and Euler's method are studied before separable and linear equations are solved explicitly, so that qualitative, numerical, and analytic approaches are given equal consideration. These methods are applied to the exponential, logistic, and other models for population growth. The first four or five sections of this chapter serve as a good introduction to first-order differential equations. An optional final section uses predator-prey models to illustrate systems of differential equations. |
| **10 Parametric Equations and Polar Coordinates** | This chapter introduces parametric and polar curves and applies the methods of calculus to them. Parametric curves are well suited to projects that require graphing with technology; the two presented here involve families of curves and Bézier curves. A brief treatment of conic sections in polar coordinates prepares the way for Kepler's Laws in Chapter 13. |
| **11 Sequences, Series, and Power Series** | The convergence tests have intuitive justifications (see Section 11.3) as well as formal proofs. Numerical estimates of sums of series are based on which test was used to prove convergence. The emphasis is on Taylor series and polynomials and their applications to physics. |
| **12 Vectors and the Geometry of Space** | The material on three-dimensional analytic geometry and vectors is covered in this and the next chapter. Here we deal with vectors, the dot and cross products, lines, planes, and surfaces. |
| **13 Vector Functions** | This chapter covers vector-valued functions, their derivatives and integrals, the length and curvature of space curves, and velocity and acceleration along space curves, culminating in Kepler's laws. |
| **14 Partial Derivatives** | Functions of two or more variables are studied from verbal, numerical, visual, and algebraic points of view. In particular, partial derivatives are introduced by looking at a specific column in a table of values of the heat index (perceived air temperature) as a function of the actual temperature and the relative humidity. |

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**15 Multiple Integrals**

Contour maps and the Midpoint Rule are used to estimate the average snowfall and average temperature in given regions. Double and triple integrals are used to compute volumes, surface areas, and (in projects) volumes of hyperspheres and volumes of intersections of three cylinders. Cylindrical and spherical coordinates are introduced in the context of evaluating triple integrals. Several applications are considered, including computing mass, charge, and probabilities.

**16 Vector Calculus**

Vector fields are introduced through pictures of velocity fields showing San Francisco Bay wind patterns. The similarities among the Fundamental Theorem for line integrals, Green's Theorem, Stokes' Theorem, and the Divergence Theorem are emphasized.

**17 Second-Order Differential Equations**

Since first-order differential equations are covered in Chapter 9, this online chapter deals with second-order linear differential equations, their application to vibrating springs and electric circuits, and series solutions.

## Ancillaries

*Calculus*, Ninth Edition, is supported by a complete set of ancillaries. Each piece has been designed to enhance student understanding and to facilitate creative instruction.

### Ancillaries for Instructors

**Instructor's Guide**
by Douglas Shaw

*Each section of the text is discussed from several viewpoints. Available online at the Instructor's Companion Site, the* Instructor's Guide *contains suggested time to allot, points to stress, text discussion topics, core materials for lecture, workshop/discussion suggestions, group work exercises in a form suitable for handout, and suggested homework assignments.*

**Complete Solutions Manual**

***Single Variable Calculus, Ninth Edition***
*Chapters 1–11*
By Joshua Babbin, Scott Barnett, and Jeffery A. Cole

***Multivariable Calculus, Ninth Edition***
*Chapters 10–16*
By Joshua Babbin and Gina Sanders

*Includes worked-out solutions to all exercises in the text. Both volumes of the* Complete Solutions Manual *are available online at the Instructor's Companion Site.*

**Test Bank**

*Contains text-specific multiple-choice and free response test items and is available online at the Instructor's Companion Site.*

**Cengage Learning Testing Powered by Cognero**

*This flexible online system allows you to author, edit, and manage test bank content; create multiple test versions in an instant; and deliver tests from your LMS, your classroom, or wherever you want.*

### Student Solutions Manual

***Single Variable Calculus, Ninth Edition***
*Chapters 1–11*
By Joshua Babbin, Scott Barnett, and Jeffery A. Cole
ISBN 978-0-357-04314-1

***Multivariable Calculus, Ninth Edition***
*Chapters 10–16*
By Joshua Babbin and Gina Sanders
ISBN 978-0-357-04315-8

*Provides worked-out solutions to all odd-numbered exercises in the text. Both volumes of the* Student Solutions Manual *can be ordered or accessed online as an eBook at Cengage.com by searching the ISBN.*

# Acknowledgments

One of the main factors aiding in the preparation of this edition is the cogent advice from a large number of reviewers, all of whom have extensive experience teaching calculus. We greatly appreciate their suggestions and the time they spent to understand the approach taken in this book. We have learned something from each of them.

We thank all those who have contributed to this edition—and there are many—as well as those whose input in previous editions lives on in this new edition. We thank Marigold Ardren, David Behrman, George Bergman, R. B. Burckel, Bruce Colletti, John Dersch, Gove Effinger, Bill Emerson, Alfonso Gracia-Saz, Jeffery Hayen, Dan Kalman, Quyan Khan, John Khoury, Allan MacIsaac, Tami Martin, Monica Nitsche, Aaron Peterson, Lamia Raffo, Norton Starr, Jim Trefzger, Aaron Watson, and Weihua Zeng for their suggestions; Joseph Bennish, Craig Chamberlin, Kent Merryfield, and Gina Sanders for insightful conversations on calculus; Al Shenk and Dennis Zill for permission to use exercises from their calculus texts; COMAP for permission to use project material; David Bleecker, Victor Kaftal, Anthony Lam, Jamie Lawson, Ira Rosenholtz, Paul Sally, Lowell Smylie, Larry Wallen, and Jonathan Watson for ideas for exercises; Dan Drucker for the roller derby project; Thomas Banchoff, Tom Farmer, Fred Gass, John Ramsay, Larry Riddle, Philip Straffin, and Klaus Volpert for ideas for projects; Josh Babbin, Scott Barnett, and Gina Sanders for solving the new exercises and suggesting ways to improve them; Jeff Cole for overseeing all the solutions to the exercises and ensuring their correctness; Mary Johnson and Marv Riedesel for accuracy in proofreading, and Doug Shaw for accuracy checking. In addition, we thank Dan Anderson, Ed Barbeau, Fred Brauer, Andy Bulman-Fleming, Bob Burton, David Cusick, Tom DiCiccio, Garret Etgen, Chris Fisher, Barbara Frank, Leon Gerber, Stuart Goldenberg, Arnold Good, Gene Hecht, Harvey Keynes, E. L. Koh, Zdislav Kovarik, Kevin Kreider, Emile LeBlanc, David Leep, Gerald Leibowitz, Larry Peterson, Mary Pugh, Carl Riehm, John Ringland, Peter Rosenthal, Dusty Sabo, Dan Silver, Simon Smith, Alan Weinstein, and Gail Wolkowicz.

We are grateful to Phyllis Panman for assisting us in preparing the manuscript, solving the exercises and suggesting new ones, and for critically proofreading the entire manuscript.

We are deeply indebted to our friend and colleague Lothar Redlin who began working with us on this revision shortly before his untimely death in 2018. Lothar's deep insights into mathematics and its pedagogy, and his lightning fast problem-solving skills, were invaluable assets.

We especially thank Kathi Townes of TECHarts, our production service and copyeditor (for this as well as the past several editions). Her extraordinary ability to recall any detail of the manuscript as needed, her facility in simultaneously handling different editing tasks, and her comprehensive familiarity with the book were key factors in its accuracy and timely production. We also thank Lori Heckelman for the elegant and precise rendering of the new illustrations.

At Cengage Learning we thank Timothy Bailey, Teni Baroian, Diane Beasley, Carly Belcher, Vernon Boes, Laura Gallus, Stacy Green, Nikkita Kendrick, Mark Linton, Samantha Lugtu, Ashley Maynard, Irene Morris, Lynh Pham, Jennifer Risden, Tim Rogers, Mark Santee, Angela Sheehan, and Tom Ziolkowski. They have all done an outstanding job.

This textbook has benefited greatly over the past three decades from the advice and guidance of some of the best mathematics editors: Ron Munro, Harry Campbell, Craig Barth, Jeremy Hayhurst, Gary Ostedt, Bob Pirtle, Richard Stratton, Liz Covello, Neha Taleja, and now Gary Whalen. They have all contributed significantly to the success of this book. Prominently, Gary Whalen's broad knowledge of current issues in the teaching of mathematics and his continual research into creating better ways of using technology as a teaching and learning tool were invaluable resources in the creation of this edition.

JAMES STEWART
DANIEL CLEGG
SALEEM WATSON

# A Tribute to James Stewart

**JAMES STEWART** had a singular gift for teaching mathematics. The large lecture halls where he taught his calculus classes were always packed to capacity with students, whom he held engaged with interest and anticipation as he led them to discover a new concept or the solution to a stimulating problem. Stewart presented calculus the way he viewed it—as a rich subject with intuitive concepts, wonderful problems, powerful applications, and a fascinating history. As a testament to his success in teaching and lecturing, many of his students went on to become mathematicians, scientists, and engineers—and more than a few are now university professors themselves. It was his students who first suggested that he write a calculus textbook of his own. Over the years, former students, by then working scientists and engineers, would call him to discuss mathematical problems that they encountered in their work; some of these discussions resulted in new exercises or projects in the book.

We each met James Stewart—or Jim as he liked us to call him—through his teaching and lecturing, resulting in his inviting us to coauthor mathematics textbooks with him. In the years we have known him, he was in turn our teacher, mentor, and friend.

Jim had several special talents whose combination perhaps uniquely qualified him to write such a beautiful calculus textbook—a textbook with a narrative that speaks to students and that combines the fundamentals of calculus with conceptual insights on how to think about them. Jim always listened carefully to his students in order to find out precisely where they may have had difficulty with a concept. Crucially, Jim really enjoyed hard work—a necessary trait for completing the immense task of writing a calculus book. As his coauthors, we enjoyed his contagious enthusiasm and optimism, making the time we spent with him always fun and productive, never stressful.

Most would agree that writing a calculus textbook is a major enough feat for one lifetime, but amazingly, Jim had many other interests and accomplishments: he played violin professionally in the Hamilton and McMaster Philharmonic Orchestras for many years, he had an enduring passion for architecture, he was a patron of the arts and cared deeply about many social and humanitarian causes. He was also a world traveler, an eclectic art collector, and even a gourmet cook.

James Stewart was an extraordinary person, mathematician, and teacher. It has been our honor and privilege to be his coauthors and friends.

DANIEL CLEGG

SALEEM WATSON

# About the Authors

For more than two decades, Daniel Clegg and Saleem Watson have worked with James Stewart on writing mathematics textbooks. The close working relationship between them was particularly productive because they shared a common viewpoint on teaching mathematics and on writing mathematics. In a 2014 interview James Stewart remarked on their collaborations: "We discovered that we could think in the same way . . . we agreed on almost everything, which is kind of rare."

Daniel Clegg and Saleem Watson met James Stewart in different ways, yet in each case their initial encounter turned out to be the beginning of a long association. Stewart spotted Daniel's talent for teaching during a chance meeting at a mathematics conference and asked him to review the manuscript for an upcoming edition of *Calculus* and to author the multivariable solutions manual. Since that time Daniel has played an ever-increasing role in the making of several editions of the Stewart calculus books. He and Stewart have also coauthored an applied calculus textbook. Stewart first met Saleem when Saleem was a student in his graduate mathematics class. Later Stewart spent a sabbatical leave doing research with Saleem at Penn State University, where Saleem was an instructor at the time. Stewart asked Saleem and Lothar Redlin (also a student of Stewart's) to join him in writing a series of precalculus textbooks; their many years of collaboration resulted in several editions of these books.

**JAMES STEWART** was professor of mathematics at McMaster University and the University of Toronto for many years. James did graduate studies at Stanford University and the University of Toronto, and subsequently did research at the University of London. His research field was Harmonic Analysis and he also studied the connections between mathematics and music.

**DANIEL CLEGG** is professor of mathematics at Palomar College in Southern California. He did undergraduate studies at California State University, Fullerton and graduate studies at the University of California, Los Angeles (UCLA). Daniel is a consummate teacher; he has been teaching mathematics ever since he was a graduate student at UCLA.

**SALEEM WATSON** is professor emeritus of mathematics at California State University, Long Beach. He did undergraduate studies at Andrews University in Michigan and graduate studies at Dalhousie University and McMaster University. After completing a research fellowship at the University of Warsaw, he taught for several years at Penn State before joining the mathematics department at California State University, Long Beach.

Stewart and Clegg have published *Brief Applied Calculus.*

Stewart, Redlin, and Watson have published *Precalculus: Mathematics for Calculus, College Algebra, Trigonometry, Algebra and Trigonometry,* and (with Phyllis Panman) *College Algebra: Concepts and Contexts.*

# Technology in the Ninth Edition

Graphing and computing devices are valuable tools for learning and exploring calculus, and some have become well established in calculus instruction. Graphing calculators are useful for drawing graphs and performing some numerical calculations, like approximating solutions to equations or numerically evaluating derivatives (Chapter 2) or definite integrals (Chapter 4). Mathematical software packages called computer algebra systems (CAS, for short) are more powerful tools. Despite the name, algebra represents only a small subset of the capabilities of a CAS. In particular, a CAS can do mathematics symbolically rather than just numerically. It can find exact solutions to equations and exact formulas for derivatives and integrals.

We now have access to a wider variety of tools of varying capabilities than ever before. These include Web-based resources (some of which are free of charge) and apps for smartphones and tablets. Many of these resources include at least some CAS functionality, so some exercises that may have typically required a CAS can now be completed using these alternate tools.

In this edition, rather than refer to a specific type of device (a graphing calculator, for instance) or software package (such as a CAS), we indicate the type of capability that is needed to work an exercise.

## Graphing Icon

The appearance of this icon beside an exercise indicates that you are expected to use a machine or software to help you draw the graph. In many cases, a graphing calculator will suffice. Websites such as Desmos.com provide similar capability. If the graph is in 3D (see Chapters 12–16), WolframAlpha.com is a good resource. There are also many graphing software applications for computers, smartphones, and tablets. If an exercise asks for a graph but no graphing icon is shown, then you are expected to draw the graph by hand. In Chapter 1 we review graphs of basic functions and discuss how to use transformations to graph modified versions of these basic functions.

## Technology Icon

This icon is used to indicate that software or a device with abilities beyond just graphing is needed to complete the exercise. Many graphing calculators and software resources can provide numerical approximations when needed. For working with mathematics symbolically, websites like WolframAlpha.com or Symbolab.com are helpful, as are more advanced graphing calculators such as the Texas Instrument TI-89 or TI-Nspire CAS. If the full power of a CAS is needed, this will be stated in the exercise, and access to software packages such as Mathematica, Maple, MATLAB, or SageMath may be required. If an exercise does not include a technology icon, then you are expected to evaluate limits, derivatives, and integrals, or solve equations by hand, arriving at exact answers. No technology is needed for these exercises beyond perhaps a basic scientific calculator.

# To the Student

Reading a calculus textbook is different from reading a story or a news article. Don't be discouraged if you have to read a passage more than once in order to understand it. You should have pencil and paper and calculator at hand to sketch a diagram or make a calculation.

Some students start by trying their homework problems and read the text only if they get stuck on an exercise. We suggest that a far better plan is to read and understand a section of the text before attempting the exercises. In particular, you should look at the definitions to see the exact meanings of the terms. And before you read each example, we suggest that you cover up the solution and try solving the problem yourself.

Part of the aim of this course is to train you to think logically. Learn to write the solutions of the exercises in a connected, step-by-step fashion with explanatory sentences—not just a string of disconnected equations or formulas.

The answers to the odd-numbered exercises appear at the back of the book, in Appendix G. Some exercises ask for a verbal explanation or interpretation or description. In such cases there is no single correct way of expressing the answer, so don't worry that you haven't found the definitive answer. In addition, there are often several different forms in which to express a numerical or algebraic answer, so if your answer differs from the given one, don't immediately assume you're wrong. For example, if the answer given in the back of the book is $\sqrt{2} - 1$ and you obtain $1/(1 + \sqrt{2})$, then you're correct and rationalizing the denominator will show that the answers are equivalent.

The icon 📈 indicates an exercise that definitely requires the use of either a graphing calculator or a computer with graphing software to help you sketch the graph. But that doesn't mean that graphing devices can't be used to check your work on the other exercises as well. The symbol T indicates that technological assistance beyond just graphing is needed to complete the exercise. (See Technology in the Ninth Edition for more details.)

You will also encounter the symbol 🚫, which warns you against committing an error. This symbol is placed in the margin in situations where many students tend to make the same mistake.

Homework Hints are available for many exercises. These hints can be found on StewartCalculus.com as well as in WebAssign. The homework hints ask you questions that allow you to make progress toward a solution without actually giving you the answer. If a particular hint doesn't enable you to solve the problem, you can click to reveal the next hint.

We recommend that you keep this book for reference purposes after you finish the course. Because you will likely forget some of the specific details of calculus, the book will serve as a useful reminder when you need to use calculus in subsequent courses. And, because this book contains more material than can be covered in any one course, it can also serve as a valuable resource for a working scientist or engineer.

Calculus is an exciting subject, justly considered to be one of the greatest achievements of the human intellect. We hope you will discover that it is not only useful but also intrinsically beautiful.

# Diagnostic Tests

Success in calculus depends to a large extent on knowledge of the mathematics that precedes calculus: algebra, analytic geometry, functions, and trigonometry. The following tests are intended to diagnose weaknesses that you might have in these areas. After taking each test you can check your answers against the given answers and, if necessary, refresh your skills by referring to the review materials that are provided.

## A | Diagnostic Test: Algebra

**1.** Evaluate each expression without using a calculator.

(a) $(-3)^4$ (b) $-3^4$ (c) $3^{-4}$

(d) $\dfrac{5^{23}}{5^{21}}$ (e) $\left(\dfrac{2}{3}\right)^{-2}$ (f) $16^{-3/4}$

**2.** Simplify each expression. Write your answer without negative exponents.

(a) $\sqrt{200} - \sqrt{32}$

(b) $(3a^3b^3)(4ab^2)^2$

(c) $\left(\dfrac{3x^{3/2}y^3}{x^2y^{-1/2}}\right)^{-2}$

**3.** Expand and simplify.

(a) $3(x + 6) + 4(2x - 5)$ (b) $(x + 3)(4x - 5)$

(c) $(\sqrt{a} + \sqrt{b})(\sqrt{a} - \sqrt{b})$ (d) $(2x + 3)^2$

(e) $(x + 2)^3$

**4.** Factor each expression.

(a) $4x^2 - 25$ (b) $2x^2 + 5x - 12$

(c) $x^3 - 3x^2 - 4x + 12$ (d) $x^4 + 27x$

(e) $3x^{3/2} - 9x^{1/2} + 6x^{-1/2}$ (f) $x^3y - 4xy$

**5.** Simplify the rational expression.

(a) $\dfrac{x^2 + 3x + 2}{x^2 - x - 2}$ (b) $\dfrac{2x^2 - x - 1}{x^2 - 9} \cdot \dfrac{x + 3}{2x + 1}$

(c) $\dfrac{x^2}{x^2 - 4} - \dfrac{x + 1}{x + 2}$ (d) $\dfrac{\dfrac{y}{x} - \dfrac{x}{y}}{\dfrac{1}{y} - \dfrac{1}{x}}$

**6.** Rationalize the expression and simplify.

(a) $\dfrac{\sqrt{10}}{\sqrt{5}-2}$ (b) $\dfrac{\sqrt{4+h}-2}{h}$

**7.** Rewrite by completing the square.

(a) $x^2+x+1$ (b) $2x^2-12x+11$

**8.** Solve the equation. (Find only the real solutions.)

(a) $x+5=14-\frac{1}{2}x$ (b) $\dfrac{2x}{x+1}=\dfrac{2x-1}{x}$

(c) $x^2-x-12=0$ (d) $2x^2+4x+1=0$

(e) $x^4-3x^2+2=0$ (f) $3|x-4|=10$

(g) $2x(4-x)^{-1/2}-3\sqrt{4-x}=0$

**9.** Solve each inequality. Write your answer using interval notation.

(a) $-4<5-3x\leqslant 17$ (b) $x^2<2x+8$

(c) $x(x-1)(x+2)>0$ (d) $|x-4|<3$

(e) $\dfrac{2x-3}{x+1}\leqslant 1$

**10.** State whether each equation is true or false.

(a) $(p+q)^2=p^2+q^2$ (b) $\sqrt{ab}=\sqrt{a}\sqrt{b}$

(c) $\sqrt{a^2+b^2}=a+b$ (d) $\dfrac{1+TC}{C}=1+T$

(e) $\dfrac{1}{x-y}=\dfrac{1}{x}-\dfrac{1}{y}$ (f) $\dfrac{1/x}{a/x-b/x}=\dfrac{1}{a-b}$

## ANSWERS TO DIAGNOSTIC TEST A: ALGEBRA

**1.** (a) $81$ (b) $-81$ (c) $\frac{1}{81}$
(d) $25$ (e) $\frac{9}{4}$ (f) $\frac{1}{8}$

**2.** (a) $6\sqrt{2}$ (b) $48a^5b^7$ (c) $\dfrac{x}{9y^7}$

**3.** (a) $11x-2$ (b) $4x^2+7x-15$
(c) $a-b$ (d) $4x^2+12x+9$
(e) $x^3+6x^2+12x+8$

**4.** (a) $(2x-5)(2x+5)$ (b) $(2x-3)(x+4)$
(c) $(x-3)(x-2)(x+2)$ (d) $x(x+3)(x^2-3x+9)$
(e) $3x^{-1/2}(x-1)(x-2)$ (f) $xy(x-2)(x+2)$

**5.** (a) $\dfrac{x+2}{x-2}$ (b) $\dfrac{x-1}{x-3}$
(c) $\dfrac{1}{x-2}$ (d) $-(x+y)$

**6.** (a) $5\sqrt{2}+2\sqrt{10}$ (b) $\dfrac{1}{\sqrt{4+h}+2}$

**7.** (a) $\left(x+\frac{1}{2}\right)^2+\frac{3}{4}$ (b) $2(x-3)^2-7$

**8.** (a) $6$ (b) $1$ (c) $-3, 4$
(d) $-1\pm\frac{1}{2}\sqrt{2}$ (e) $\pm1, \pm\sqrt{2}$ (f) $\frac{2}{3}, \frac{22}{3}$
(g) $\frac{12}{5}$

**9.** (a) $[-4, 3)$ (b) $(-2, 4)$
(c) $(-2, 0)\cup(1, \infty)$ (d) $(1, 7)$
(e) $(-1, 4]$

**10.** (a) False (b) True (c) False
(d) False (e) False (f) True

If you had difficulty with these problems, you may wish to consult the
Review of Algebra on the website **StewartCalculus.com.**

## B | Diagnostic Test: Analytic Geometry

**1.** Find an equation for the line that passes through the point $(2, -5)$ and
  (a) has slope $-3$
  (b) is parallel to the $x$-axis
  (c) is parallel to the $y$-axis
  (d) is parallel to the line $2x - 4y = 3$

**2.** Find an equation for the circle that has center $(-1, 4)$ and passes through the point $(3, -2)$.

**3.** Find the center and radius of the circle with equation $x^2 + y^2 - 6x + 10y + 9 = 0$.

**4.** Let $A(-7, 4)$ and $B(5, -12)$ be points in the plane.
  (a) Find the slope of the line that contains $A$ and $B$.
  (b) Find an equation of the line that passes through $A$ and $B$. What are the intercepts?
  (c) Find the midpoint of the segment $AB$.
  (d) Find the length of the segment $AB$.
  (e) Find an equation of the perpendicular bisector of $AB$.
  (f) Find an equation of the circle for which $AB$ is a diameter.

**5.** Sketch the region in the $xy$-plane defined by the equation or inequalities.
  (a) $-1 \leqslant y \leqslant 3$  (b) $|x| < 4$ and $|y| < 2$
  (c) $y < 1 - \frac{1}{2}x$  (d) $y \geqslant x^2 - 1$
  (e) $x^2 + y^2 < 4$  (f) $9x^2 + 16y^2 = 144$

## ANSWERS TO DIAGNOSTIC TEST B: ANALYTIC GEOMETRY

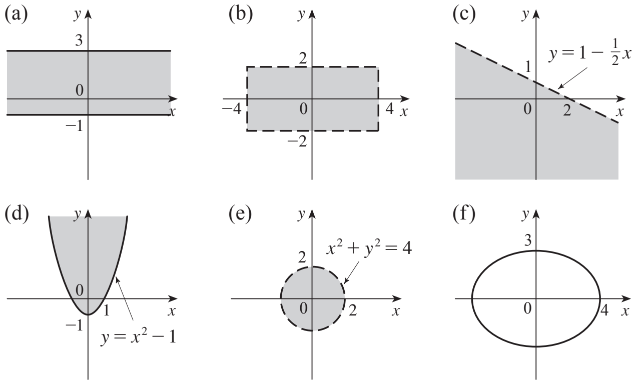
**1.** (a) $y = -3x + 1$  (b) $y = -5$
  (c) $x = 2$  (d) $y = \frac{1}{2}x - 6$

**2.** $(x + 1)^2 + (y - 4)^2 = 52$

**3.** Center $(3, -5)$, radius 5

**4.** (a) $-\frac{4}{3}$
  (b) $4x + 3y + 16 = 0$; $x$-intercept $-4$, $y$-intercept $-\frac{16}{3}$
  (c) $(-1, -4)$
  (d) 20
  (e) $3x - 4y = 13$
  (f) $(x + 1)^2 + (y + 4)^2 = 100$

**5.**



If you had difficulty with these problems, you may wish to consult
the review of analytic geometry in Appendixes B and C.

## C | Diagnostic Test: Functions

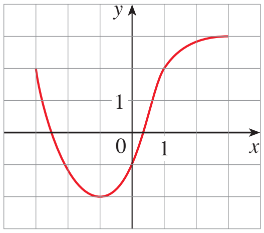


**FIGURE FOR PROBLEM 1**

**1.** The graph of a function $f$ is given at the left.
   (a) State the value of $f(-1)$.
   (b) Estimate the value of $f(2)$.
   (c) For what values of $x$ is $f(x) = 2$?
   (d) Estimate the values of $x$ such that $f(x) = 0$.
   (e) State the domain and range of $f$.

**2.** If $f(x) = x^3$, evaluate the difference quotient $\dfrac{f(2 + h) - f(2)}{h}$ and simplify your answer.

**3.** Find the domain of the function.

(a) $f(x) = \dfrac{2x + 1}{x^2 + x - 2}$ (b) $g(x) = \dfrac{\sqrt[3]{x}}{x^2 + 1}$ (c) $h(x) = \sqrt{4 - x} + \sqrt{x^2 - 1}$

**4.** How are graphs of the functions obtained from the graph of $f$?

(a) $y = -f(x)$ (b) $y = 2f(x) - 1$ (c) $y = f(x - 3) + 2$

**5.** Without using a calculator, make a rough sketch of the graph.

(a) $y = x^3$ (b) $y = (x + 1)^3$ (c) $y = (x - 2)^3 + 3$
(d) $y = 4 - x^2$ (e) $y = \sqrt{x}$ (f) $y = 2\sqrt{x}$
(g) $y = -2^x$ (h) $y = 1 + x^{-1}$

**6.** Let $f(x) = \begin{cases} 1 - x^2 & \text{if } x \leqslant 0 \\ 2x + 1 & \text{if } x > 0 \end{cases}$

(a) Evaluate $f(-2)$ and $f(1)$. (b) Sketch the graph of $f$.

**7.** If $f(x) = x^2 + 2x - 1$ and $g(x) = 2x - 3$, find each of the following functions.
(a) $f \circ g$ (b) $g \circ f$ (c) $g \circ g \circ g$

## ANSWERS TO DIAGNOSTIC TEST C: FUNCTIONS

**1.** (a) $-2$ (b) $2.8$
(c) $-3, 1$ (d) $-2.5, 0.3$
(e) $[-3, 3], [-2, 3]$

**2.** $12 + 6h + h^2$

**3.** (a) $(-\infty, -2) \cup (-2, 1) \cup (1, \infty)$
(b) $(-\infty, \infty)$
(c) $(-\infty, -1] \cup [1, 4]$

**4.** (a) Reflect about the $x$-axis
(b) Stretch vertically by a factor of 2, then shift 1 unit downward
(c) Shift 3 units to the right and 2 units upward

**5.**

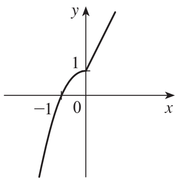
**6.** (a) $-3, 3$

(b)



**7.** (a) $(f \circ g)(x) = 4x^2 - 8x + 2$

(b) $(g \circ f)(x) = 2x^2 + 4x - 5$

(c) $(g \circ g \circ g)(x) = 8x - 21$

If you had difficulty with these problems, you should look at sections 1.1–1.3 of this book.

## D Diagnostic Test: Trigonometry

**1.** Convert from degrees to radians.

(a) $300°$ (b) $-18°$

**2.** Convert from radians to degrees.

(a) $5\pi/6$ (b) $2$

**3.** Find the length of an arc of a circle with radius 12 cm if the arc subtends a central angle of 30°.

**4.** Find the exact values.

(a) $\tan(\pi/3)$ (b) $\sin(7\pi/6)$ (c) $\sec(5\pi/3)$

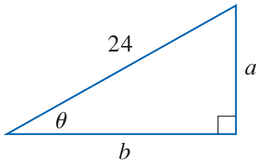


**FIGURE FOR PROBLEM 5**

**5.** Express the lengths $a$ and $b$ in the figure in terms of $\theta$.

**6.** If $\sin x = \frac{1}{3}$ and $\sec y = \frac{5}{4}$, where $x$ and $y$ lie between 0 and $\pi/2$, evaluate $\sin(x + y)$.

**7.** Prove the identities.

(a) $\tan\theta \sin\theta + \cos\theta = \sec\theta$ (b) $\dfrac{2\tan x}{1 + \tan^2 x} = \sin 2x$

**8.** Find all values of $x$ such that $\sin 2x = \sin x$ and $0 \leqslant x \leqslant 2\pi$.

**9.** Sketch the graph of the function $y = 1 + \sin 2x$ without using a calculator.

### ANSWERS TO DIAGNOSTIC TEST D: TRIGONOMETRY

**1.** (a) $5\pi/3$ (b) $-\pi/10$

**2.** (a) $150°$ (b) $360°/\pi \approx 114.6°$

**3.** $2\pi$ cm

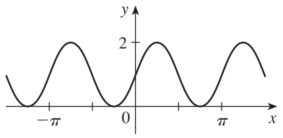
**4.** (a) $\sqrt{3}$ (b) $-\frac{1}{2}$ (c) $2$

**5.** $a = 24\sin\theta$, $b = 24\cos\theta$

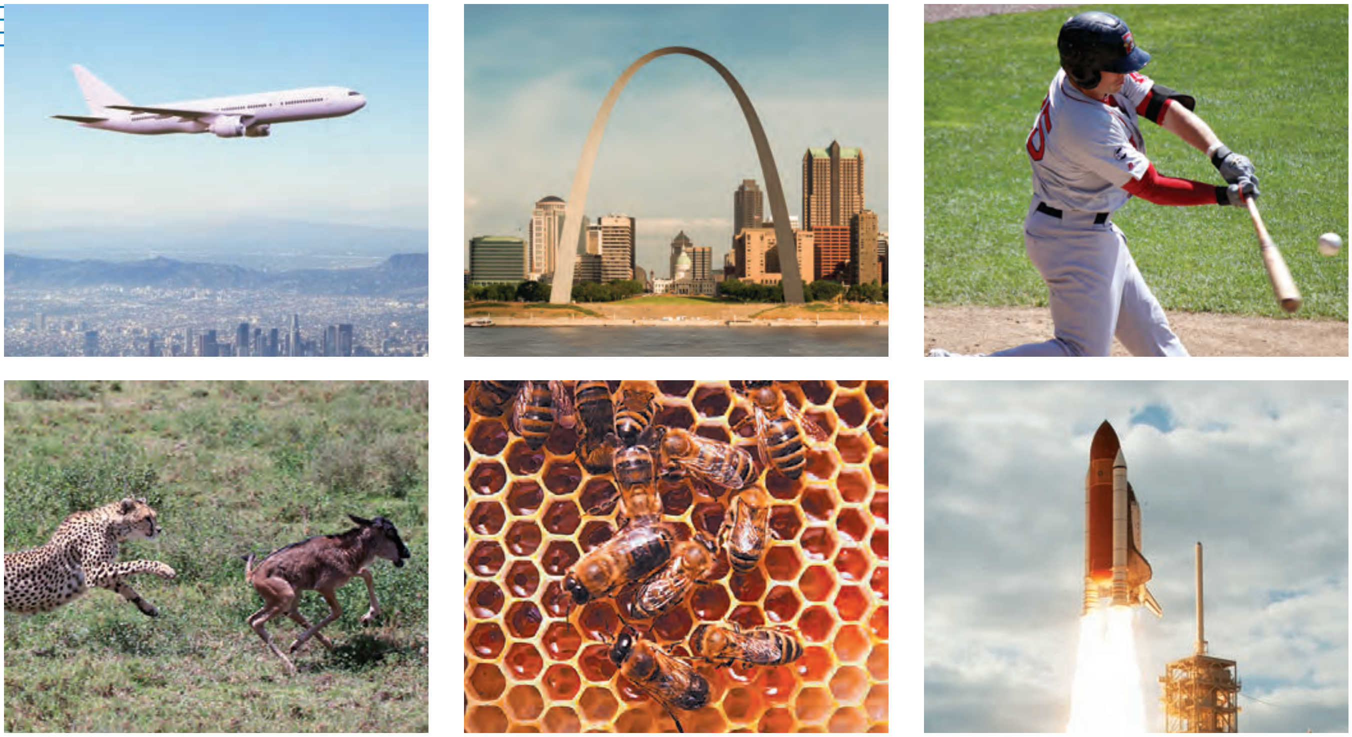
**6.** $\frac{1}{15}\left(4 + 6\sqrt{2}\right)$

**8.** $0, \pi/3, \pi, 5\pi/3, 2\pi$

**9.**



If you had difficulty with these problems, you should look at Appendix D of this book.



**By the time you finish this course, you will be able to determine where a pilot should start descent for a smooth landing, find the length of the curve used to design the Gateway Arch in St. Louis, compute the force on a baseball bat when it strikes the ball, predict the population sizes for competing predator-prey species, show that bees form the cells of a beehive in a way that uses the least amount of wax, and estimate the amount of fuel needed to propel a rocket into orbit.**

# A Preview of Calculus

**CALCULUS IS FUNDAMENTALLY DIFFERENT** from the mathematics that you have studied previously: calculus is less static and more dynamic. It is concerned with change and motion; it deals with quantities that approach other quantities. For that reason it may be useful to have an overview of calculus before beginning your study of the subject. Here we give a preview of some of the main ideas of calculus and show how their foundations are built upon the concept of a *limit*.

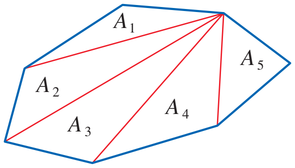
## What Is Calculus?

The world around us is continually changing—populations increase, a cup of coffee cools, a stone falls, chemicals react with one another, currency values fluctuate, and so on. We would like to be able to analyze quantities or processes that are undergoing continuous change. For example, if a stone falls 10 feet each second we could easily tell how fast it is falling at any time, but this is *not* what happens—the stone falls faster and faster, its speed changing at each instant. In studying calculus, we will learn how to model (or describe) such instantaneously changing processes and how to find the cumulative effect of these changes.

Calculus builds on what you have learned in algebra and analytic geometry but advances these ideas spectacularly. Its uses extend to nearly every field of human activity. You will encounter numerous applications of calculus throughout this book.

At its core, calculus revolves around two key problems involving the graphs of functions—the *area problem* and the *tangent problem*—and an unexpected relationship between them. Solving these problems is useful because the area under the graph of a function and the tangent to the graph of a function have many important interpretations in a variety of contexts.

## The Area Problem



$A = A_1 + A_2 + A_3 + A_4 + A_5$

**FIGURE 1**

The origins of calculus go back at least 2500 years to the ancient Greeks, who found areas using the "method of exhaustion." They knew how to find the area $A$ of any polygon by dividing it into triangles, as in Figure 1, and adding the areas of these triangles.

It is a much more difficult problem to find the area of a curved figure. The Greek method of exhaustion was to inscribe polygons in the figure and circumscribe polygons about the figure, and then let the number of sides of the polygons increase. Figure 2 illustrates this process for the special case of a circle with inscribed regular polygons.

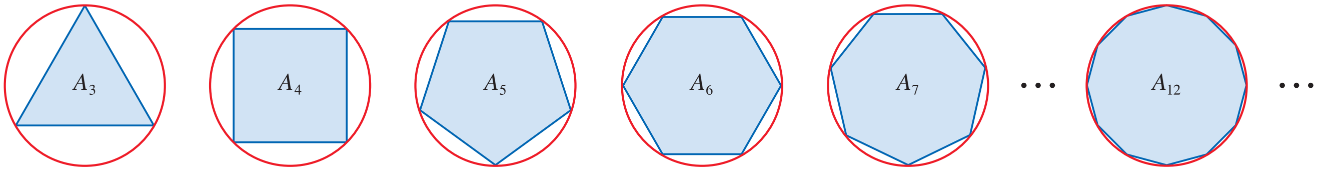


**FIGURE 2**

Let $A_n$ be the area of the inscribed regular polygon of $n$ sides. As $n$ increases, it appears that $A_n$ gets closer and closer to the area of the circle. We say that the area $A$ of the circle is the *limit* of the areas of the inscribed polygons, and we write

$$A = \lim_{n \to \infty} A_n$$

The Greeks themselves did not use limits explicitly. However, by indirect reasoning, Eudoxus (fifth century BC) used exhaustion to prove the familiar formula for the area of a circle: $A = \pi r^2$.

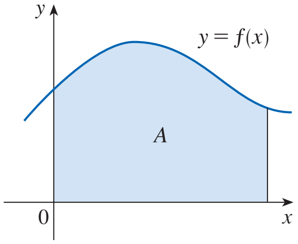

**FIGURE 3**
The area $A$ of the region under the graph of $f$

We will use a similar idea in Chapter 4 to find areas of regions of the type shown in Figure 3. We approximate such an area by areas of rectangles as shown in Figure 4. If we approximate the area $A$ of the region under the graph of $f$ by using $n$ rectangles $R_1, R_2, \ldots, R_n$, then the approximate area is

$$A_n = R_1 + R_2 + \cdots + R_n$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

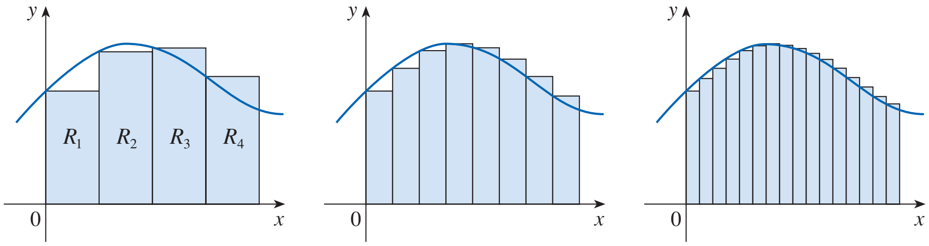

**FIGURE 4** Approximating the area $A$ using rectangles

Now imagine that we increase the number of rectangles (as the width of each one decreases) and calculate $A$ as the limit of these sums of areas of rectangles:

$$A = \lim_{n \to \infty} A_n$$

In Chapter 4 we will learn how to calculate such limits.

The area problem is the central problem in the branch of calculus called *integral calculus*; it is important because the area under the graph of a function has different interpretations depending on what the function represents. In fact, the techniques that we develop for finding areas will also enable us to compute the volume of a solid, the length of a curve, the force of water against a dam, the mass and center of mass of a rod, the work done in pumping water out of a tank, and the amount of fuel needed to send a rocket into orbit.

## The Tangent Problem

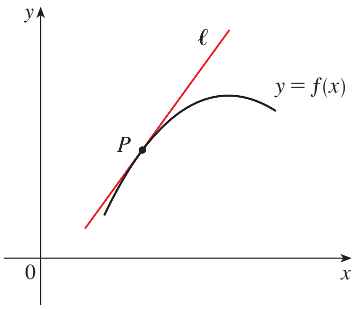

**FIGURE 5**
The tangent line at $P$

Consider the problem of trying to find an equation of the tangent line $\ell$ to a curve with equation $y = f(x)$ at a given point $P$. (We will give a precise definition of a tangent line in Chapter 1; for now you can think of it as the line that touches the curve at $P$ and follows the direction of the curve at $P$, as in Figure 5.) Because the point $P$ lies on the tangent line, we can find the equation of $\ell$ if we know its slope $m$. The problem is that we need two points to compute the slope and we know only one point, $P$, on $\ell$. To get around the problem we first find an approximation to $m$ by taking a nearby point $Q$ on the curve and computing the slope $m_{PQ}$ of the secant line $PQ$.

Now imagine that $Q$ moves along the curve toward $P$ as in Figure 6. You can see that the secant line $PQ$ rotates and approaches the tangent line $\ell$ as its limiting position. This

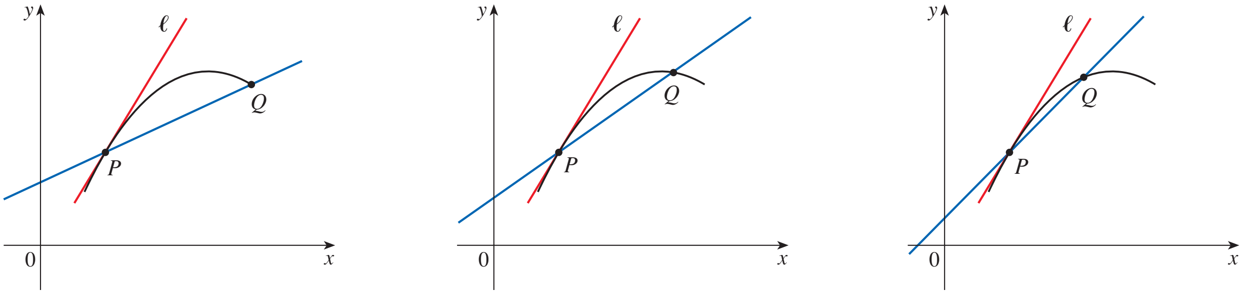

**FIGURE 6** The secant lines approach the tangent line as $Q$ approaches $P$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

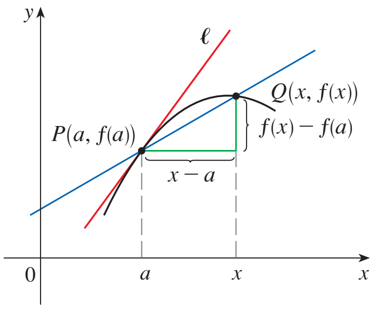

**FIGURE 7**
The secant line *PQ*

means that the slope $m_{PQ}$ of the secant line becomes closer and closer to the slope $m$ of the tangent line. We write

$$m = \lim_{Q \to P} m_{PQ}$$

and say that $m$ is the limit of $m_{PQ}$ as $Q$ approaches $P$ along the curve.

Notice from Figure 7 that if $P$ is the point $(a, f(a))$ and $Q$ is the point $(x, f(x))$, then

$$m_{PQ} = \frac{f(x) - f(a)}{x - a}$$

Because $x$ approaches $a$ as $Q$ approaches $P$, an equivalent expression for the slope of the tangent line is

$$m = \lim_{x \to a} \frac{f(x) - f(a)}{x - a}$$

In Chapter 1 we will learn rules for calculating such limits.

The tangent problem has given rise to the branch of calculus called *differential calculus*; it is important because the slope of a tangent to the graph of a function can have different interpretations depending on the context. For instance, solving the tangent problem allows us to find the instantaneous speed of a falling stone, the rate of change of a chemical reaction, or the direction of the forces on a hanging chain.

## ■ A Relationship between the Area and Tangent Problems

The area and tangent problems seem to be very different problems but, surprisingly, the problems are closely related—in fact, they are so closely related that solving one of them leads to a solution of the other. The relationship between these two problems is introduced in Chapter 4; it is the central discovery in calculus and is appropriately named the Fundamental Theorem of Calculus. Perhaps most importantly, the Fundamental Theorem vastly simplifies the solution of the area problem, making it possible to find areas without having to approximate by rectangles and evaluate the associated limits.

Isaac Newton (1642–1727) and Gottfried Leibniz (1646–1716) are credited with the invention of calculus because they were the first to recognize the importance of the Fundamental Theorem of Calculus and to utilize it as a tool for solving real-world problems. In studying calculus you will discover these powerful results for yourself.

## ■ Summary

We have seen that the concept of a limit arises in finding the area of a region and in finding the slope of a tangent line to a curve. It is this basic idea of a limit that sets calculus apart from other areas of mathematics. In fact, we could define calculus as the part of mathematics that deals with limits. We have mentioned that areas under curves and slopes of tangent lines to curves have many different interpretations in a variety of contexts. Finally, we have discussed that the area and tangent problems are closely related.

After Isaac Newton invented his version of calculus, he used it to explain the motion of the planets around the sun, giving a definitive answer to a centuries-long quest for a description of our solar system. Today calculus is applied in a great variety of contexts, such as determining the orbits of satellites and spacecraft, predicting population sizes,

forecasting weather, measuring cardiac output, and gauging the efficiency of an economic market.

In order to convey a sense of the power and versatility of calculus, we conclude with a list of some of the questions that you will be able to answer using calculus.

1. How can we design a roller coaster for a safe and smooth ride?
   (See the Applied Project following Section 2.3.)
2. How far away from an airport should a pilot start descent?
   (See the Applied Project following Section 2.5.)
3. How can we explain the fact that the angle of elevation from an observer up to the highest point in a rainbow is always 42°?
   (See the Applied Project following Section 3.1.)
4. How can we estimate the amount of work that was required to build the Pyramid of Khufu in ancient Egypt?
   (See Exercise 36 in Section 5.4.)
5. With what speed must a projectile be launched so that it escapes the earth's gravitation pull?
   (See Exercise 77 in Section 7.8.)
6. How can we explain the changes in the thickness of sea ice over time and why cracks in the ice tend to "heal"?
   (See Exercise 56 in Section 9.3.)
7. Does a ball thrown upward take longer to reach its maximum height or to fall back down to its original height?
   (See the Applied Project following Section 9.5.)
8. How can we fit curves together to design shapes to represent letters on a laser printer?
   (See the Applied Project following Section 10.2.)
9. How can we explain the fact that planets and satellites move in elliptical orbits?
   (See the Applied Project following Section 13.4.)
10. How can we distribute water flow among turbines at a hydroelectric station so as to maximize the total energy production?
    (See the Applied Project following Section 14.8.)

**The electrical power produced by a wind turbine can be estimated by a mathematical function that incorporates several factors. We will explore this function in Exercise 1.2.25 and determine the expected power output of a particular turbine for various wind speeds.**

# Functions and Limits

**THE FUNDAMENTAL OBJECTS THAT WE** deal with in calculus are functions. We stress that a function can be represented in different ways: by an equation, in a table, by a graph, or in words. We look at the main types of functions that occur in calculus and describe the process of using these functions as mathematical models of real-world phenomena.

In *A Preview of Calculus* (immediately preceding this chapter) we saw how the idea of a limit underlies the various branches of calculus. It is therefore appropriate to begin our study of calculus by investigating limits of functions and their properties.

## 1.1 Four Ways to Represent a Function

### Functions

Functions arise whenever one quantity depends on another. Consider the following four situations.

**A.** The area $A$ of a circle depends on the radius $r$ of the circle. The rule that connects $r$ and $A$ is given by the equation $A = \pi r^2$. With each positive number $r$ there is associated one value of $A$, and we say that $A$ is a *function* of $r$.

**B.** The human population of the world $P$ depends on the time $t$. Table 1 gives estimates of the world population $P$ at time $t$, for certain years. For instance,

$$P \approx 2{,}560{,}000{,}000 \qquad \text{when } t = 1950$$

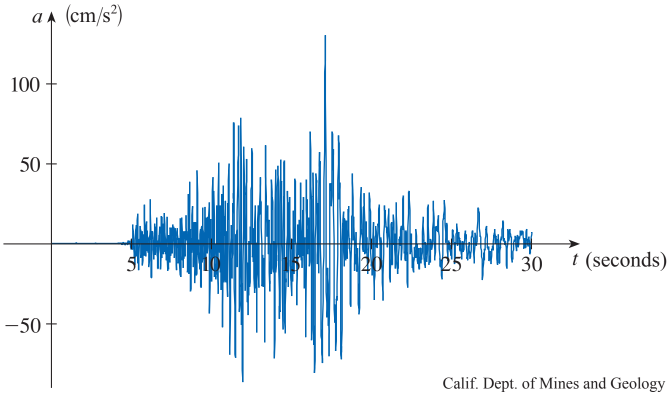
For each value of the time $t$ there is a corresponding value of $P$, and we say that $P$ is a function of $t$.

**Table 1 World Population**

| Year | Population (millions) |
|---|---|
| 1900 | 1650 |
| 1910 | 1750 |
| 1920 | 1860 |
| 1930 | 2070 |
| 1940 | 2300 |
| 1950 | 2560 |
| 1960 | 3040 |
| 1970 | 3710 |
| 1980 | 4450 |
| 1990 | 5280 |
| 2000 | 6080 |
| 2010 | 6870 |

**C.** The cost $C$ of mailing an envelope depends on its weight $w$. Although there is no simple formula that connects $w$ and $C$, the post office has a rule for determining $C$ when $w$ is known.

**D.** The vertical acceleration $a$ of the ground as measured by a seismograph during an earthquake is a function of the elapsed time $t$. Figure 1 shows a graph generated by seismic activity during the Northridge earthquake that shook Los Angeles in 1994. For a given value of $t$, the graph provides a corresponding value of $a$.



Calif. Dept. of Mines and Geology

**FIGURE 1**
Vertical ground acceleration during the Northridge earthquake

Each of these examples describes a rule whereby, given a number ($r$ in Example A), another number ($A$) is assigned. In each case we say that the second number is a function of the first number. If $f$ represents the rule that connects $A$ to $r$ in Example A, then we express this in **function notation** as $A = f(r)$.

A **function** $f$ is a rule that assigns to each element $x$ in a set $D$ exactly one element, called $f(x)$, in a set $E$.

We usually consider functions for which the sets $D$ and $E$ are sets of real numbers. The set $D$ is called the **domain** of the function. The number $f(x)$ is the **value of $f$ at $x$** and is read "$f$ of $x$." The **range** of $f$ is the set of all possible values of $f(x)$ as $x$ varies

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

throughout the domain. A symbol that represents an arbitrary number in the *domain* of a function $f$ is called an **independent variable**. A symbol that represents a number in the *range* of $f$ is called a **dependent variable**. In Example A, for instance, $r$ is the independent variable and $A$ is the dependent variable.

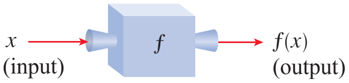


**FIGURE 2**
Machine diagram for a function $f$

It's helpful to think of a function as a **machine** (see Figure 2). If $x$ is in the domain of the function $f$, then when $x$ enters the machine, it's accepted as an **input** and the machine produces an **output** $f(x)$ according to the rule of the function. So we can think of the domain as the set of all possible inputs and the range as the set of all possible outputs. The preprogrammed functions in a calculator are good examples of a function as a machine. For example, if you input a number and press the squaring key, the calculator displays the output, the square of the input.

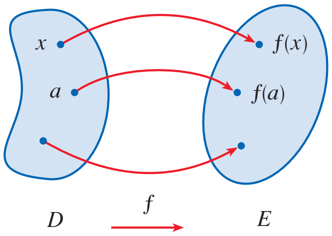

**FIGURE 3**
Arrow diagram for $f$

Another way to picture a function is by an **arrow diagram** as in Figure 3. Each arrow connects an element of $D$ to an element of $E$. The arrow indicates that $f(x)$ is associated with $x$, $f(a)$ is associated with $a$, and so on.

Perhaps the most useful method for visualizing a function is its graph. If $f$ is a function with domain $D$, then its **graph** is the set of ordered pairs

$$\{(x, f(x)) \mid x \in D\}$$

(Notice that these are input-output pairs.) In other words, the graph of $f$ consists of all points $(x, y)$ in the coordinate plane such that $y = f(x)$ and $x$ is in the domain of $f$.

The graph of a function $f$ gives us a useful picture of the behavior or "life history" of a function. Since the $y$-coordinate of any point $(x, y)$ on the graph is $y = f(x)$, we can read the value of $f(x)$ from the graph as being the height of the graph above the point $x$. (See Figure 4.) The graph of $f$ also allows us to picture the domain of $f$ on the $x$-axis and its range on the $y$-axis as in Figure 5.

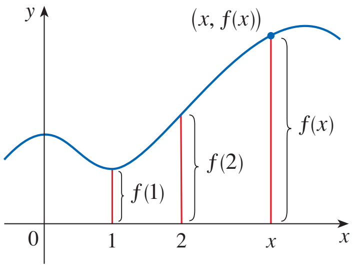

**FIGURE 4**

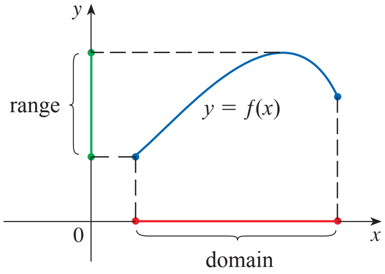

**FIGURE 5**

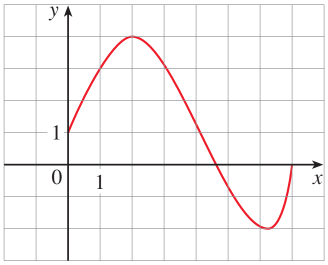

**FIGURE 6**

**EXAMPLE 1** The graph of a function $f$ is shown in Figure 6.
(a) Find the values of $f(1)$ and $f(5)$.
(b) What are the domain and range of $f$?

**SOLUTION**

(a) We see from Figure 6 that the point $(1, 3)$ lies on the graph of $f$, so the value of $f$ at 1 is $f(1) = 3$. (In other words, the point on the graph that lies above $x = 1$ is 3 units above the $x$-axis.)

When $x = 5$, the graph lies about 0.7 units below the $x$-axis, so we estimate that $f(5) \approx -0.7$.

(b) We see that $f(x)$ is defined when $0 \leqslant x \leqslant 7$, so the domain of $f$ is the closed interval $[0, 7]$. Notice that $f$ takes on all values from $-2$ to 4, so the range of $f$ is

$$\{y \mid -2 \leqslant y \leqslant 4\} = [-2, 4] \qquad \blacksquare$$

The notation for intervals is given in Appendix A.

In calculus, the most common method of defining a function is by an algebraic equation. For example, the equation $y = 2x - 1$ defines $y$ as a function of $x$. We can express this in function notation as $f(x) = 2x - 1$.

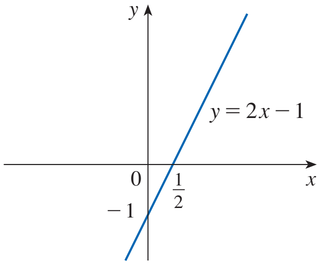

**FIGURE 7**

**EXAMPLE 2** Sketch the graph and find the domain and range of each function.

(a) $f(x) = 2x - 1$ (b) $g(x) = x^2$

**SOLUTION**

(a) The equation of the graph is $y = 2x - 1$, and we recognize this as being the equation of a line with slope 2 and $y$-intercept $-1$. (Recall the slope-intercept form of the equation of a line: $y = mx + b$. See Appendix B.) This enables us to sketch a portion of the graph of $f$ in Figure 7. The expression $2x - 1$ is defined for all real numbers, so the domain of $f$ is the set of all real numbers, which we denote by $\mathbb{R}$. The graph shows that the range is also $\mathbb{R}$.

(b) Since $g(2) = 2^2 = 4$ and $g(-1) = (-1)^2 = 1$, we could plot the points $(2, 4)$ and $(-1, 1)$, together with a few other points on the graph, and join them to produce the graph (Figure 8). The equation of the graph is $y = x^2$, which represents a parabola (see Appendix C). The domain of $g$ is $\mathbb{R}$. The range of $g$ consists of all values of $g(x)$, that is, all numbers of the form $x^2$. But $x^2 \geqslant 0$ for all numbers $x$ and any positive number $y$ is a square. So the range of $g$ is $\{y \mid y \geqslant 0\} = [0, \infty)$. This can also be seen from Figure 8. ■

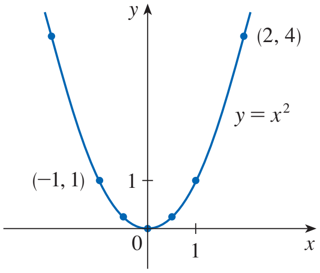

**FIGURE 8**

**EXAMPLE 3** If $f(x) = 2x^2 - 5x + 1$ and $h \neq 0$, evaluate $\dfrac{f(a+h) - f(a)}{h}$.

**SOLUTION** We first evaluate $f(a + h)$ by replacing $x$ by $a + h$ in the expression for $f(x)$:

$$\begin{aligned} f(a+h) &= 2(a+h)^2 - 5(a+h) + 1 \\ &= 2(a^2 + 2ah + h^2) - 5(a+h) + 1 \\ &= 2a^2 + 4ah + 2h^2 - 5a - 5h + 1 \end{aligned}$$

Then we substitute into the given expression and simplify:

$$\begin{aligned} \frac{f(a+h) - f(a)}{h} &= \frac{(2a^2 + 4ah + 2h^2 - 5a - 5h + 1) - (2a^2 - 5a + 1)}{h} \\ &= \frac{2a^2 + 4ah + 2h^2 - 5a - 5h + 1 - 2a^2 + 5a - 1}{h} \\ &= \frac{4ah + 2h^2 - 5h}{h} = 4a + 2h - 5 \end{aligned}$$ ■

The expression

$$\frac{f(a+h) - f(a)}{h}$$

in Example 3 is called a **difference quotient** and occurs frequently in calculus. As we will see in Chapter 2, it represents the average rate of change of $f(x)$ between $x = a$ and $x = a + h$.

## Representations of Functions

We consider four different ways to represent a function:

| | |
|---|---|
| • verbally | (by a description in words) |
| • numerically | (by a table of values) |
| • visually | (by a graph) |
| • algebraically | (by an explicit formula) |

If a single function can be represented in all four ways, it's often useful to go from one representation to another to gain additional insight into the function. (In Example 2, for instance, we started with algebraic formulas and then obtained graphs.) But certain functions are described more naturally by one method than by another. With this in mind, let's reexamine the four situations that we considered at the beginning of this section.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**A.** The most useful representation of the area of a circle as a function of its radius is probably the algebraic formula $A = \pi r^2$ or, in function notation, $A(r) = \pi r^2$. It is also possible to compile a table of values or sketch a graph (half a parabola). Because a circle has to have a positive radius, the domain is $\{r \mid r > 0\} = (0, \infty)$ and the range is also $(0, \infty)$.

**Table 2** **World Population**

| $t$ (years since 1900) | Population (millions) |
|---|---|
| 0 | 1650 |
| 10 | 1750 |
| 20 | 1860 |
| 30 | 2070 |
| 40 | 2300 |
| 50 | 2560 |
| 60 | 3040 |
| 70 | 3710 |
| 80 | 4450 |
| 90 | 5280 |
| 100 | 6080 |
| 110 | 6870 |

**B.** We are given a description of the function in words: $P(t)$ is the human population of the world at time $t$. Let's measure $t$ so that $t = 0$ corresponds to the year 1900. Table 2 provides a convenient representation of this function. If we plot the ordered pairs in the table, we get the graph (called a *scatter plot*) in Figure 9. It too is a useful representation; the graph allows us to absorb all the data at once. What about a formula? Of course, it's impossible to devise an explicit formula that gives the exact human population $P(t)$ at any time $t$. But it is possible to find an expression for a function that *approximates* $P(t)$. In fact, using methods explained in Section 1.2, we obtain an approximation for the population $P$:

$$P(t) \approx f(t) = (1.43653 \times 10^9) \cdot (1.01395)^t$$

Figure 10 shows that it is a reasonably good "fit." The function $f$ is called a *mathematical model* for population growth. In other words, it is a function with an explicit formula that approximates the behavior of our given function. We will see, however, that the ideas of calculus can be applied to a table of values; an explicit formula is not necessary.

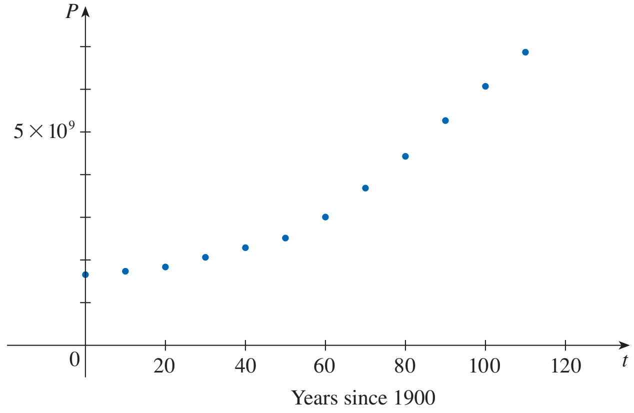

**FIGURE 9**

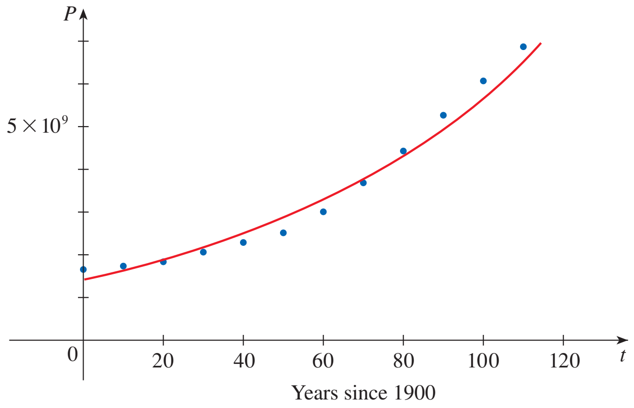

**FIGURE 10**

The function $P$ is typical of the functions that arise whenever we attempt to apply calculus to the real world. We start with a verbal description of a function. Then we may be able to construct a table of values of the function, perhaps from instrument readings in a scientific experiment. Even though we don't have complete knowledge of the values of the function, we will see throughout the book that it is still possible to perform the operations of calculus on such a function.

A function defined by a table of values is called a *tabular* function.

**Table 3**

| $w$ (ounces) | $C(w)$ (dollars) |
|---|---|
| $0 < w \leqslant 1$ | 1.00 |
| $1 < w \leqslant 2$ | 1.15 |
| $2 < w \leqslant 3$ | 1.30 |
| $3 < w \leqslant 4$ | 1.45 |
| $4 < w \leqslant 5$ | 1.60 |
| $\vdots$ | $\vdots$ |

**C.** Again, the function is described in words: Let $C(w)$ be the cost of mailing a large envelope with weight $w$. The rule that the US Postal Service used as of 2019 is as follows: The cost is 1 dollar for up to 1 oz, plus 15 cents for each additional ounce (or less) up to 13 oz. A table of values is the most convenient representation for this function (see Table 3), though it is possible to sketch a graph (see Example 10).

**D.** The graph shown in Figure 1 is the most natural representation of the vertical acceleration function $a(t)$. It's true that a table of values could be compiled, and it is even possible to devise an approximate formula. But everything a geologist needs to know—amplitudes and patterns—can be seen easily from the graph. (The same is true for the patterns seen in electrocardiograms of heart patients and polygraphs for lie-detection.)

In the next example we sketch the graph of a function that is defined verbally.

**EXAMPLE 4** When you turn on a hot-water faucet that is connected to a hot-water tank, the temperature $T$ of the water depends on how long the water has been running. Draw a rough graph of $T$ as a function of the time $t$ that has elapsed since the faucet was turned on.

**SOLUTION** The initial temperature of the running water is close to room temperature because the water has been sitting in the pipes. When the water from the hot-water tank starts flowing from the faucet, $T$ increases quickly. In the next phase, $T$ is constant at the temperature of the heated water in the tank. When the tank is drained, $T$ decreases to the temperature of the water supply. This enables us to make the rough sketch of $T$ as a function of $t$ shown in Figure 11. ■

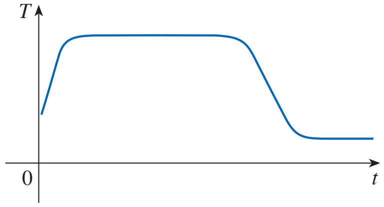

**FIGURE 11**

In the following example we start with a verbal description of a function in a physical situation and obtain an explicit algebraic formula. The ability to do this is a useful skill in solving calculus problems that ask for the maximum or minimum values of quantities.

**EXAMPLE 5** A rectangular storage container with an open top has a volume of 10 $m^3$. The length of its base is twice its width. Material for the base costs \$10 per square meter; material for the sides costs \$6 per square meter. Express the cost of materials as a function of the width of the base.

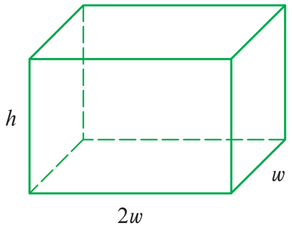

**FIGURE 12**

**SOLUTION** We draw a diagram as in Figure 12 and introduce notation by letting $w$ and $2w$ be the width and length of the base, respectively, and $h$ be the height.

The area of the base is $(2w)w = 2w^2$, so the cost, in dollars, of the material for the base is $10(2w^2)$. Two of the sides have area $wh$ and the other two have area $2wh$, so the cost of the material for the sides is $6[2(wh) + 2(2wh)]$. The total cost is therefore

$$C = 10(2w^2) + 6[2(wh) + 2(2wh)] = 20w^2 + 36wh$$

To express $C$ as a function of $w$ alone, we need to eliminate $h$ and we do so by using the fact that the volume is 10 $m^3$. Thus

$$w(2w)h = 10$$

which gives
$$h = \frac{10}{2w^2} = \frac{5}{w^2}$$

PS In setting up applied functions as in Example 5, it may be useful to review the principles of problem solving at the end of this chapter, particularly *Step 1: Understand the Problem.*

Substituting this into the expression for $C$, we have

$$C = 20w^2 + 36w\left(\frac{5}{w^2}\right) = 20w^2 + \frac{180}{w}$$

Therefore the equation

$$C(w) = 20w^2 + \frac{180}{w} \qquad w > 0$$

expresses $C$ as a function of $w$. ■

In the next example we find the domain of a function that is defined algebraically. If a function is given by a formula and the domain is not stated explicitly, we use the following **domain convention**: the domain of the function is the set of all inputs for which the formula makes sense and gives a real-number output.

**EXAMPLE 6** Find the domain of each function.

(a) $f(x) = \sqrt{x + 2}$ (b) $g(x) = \dfrac{1}{x^2 - x}$

**SOLUTION**

(a) Because the square root of a negative number is not defined (as a real number), the domain of $f$ consists of all values of $x$ such that $x + 2 \geqslant 0$. This is equivalent to $x \geqslant -2$, so the domain is the interval $[-2, \infty)$.

(b) Since

$$g(x) = \frac{1}{x^2 - x} = \frac{1}{x(x - 1)}$$

and division by 0 is not allowed, we see that $g(x)$ is not defined when $x = 0$ or $x = 1$. So the domain of $g$ is

$$\{x \mid x \neq 0, x \neq 1\}$$

which could also be written in interval notation as

$$(-\infty, 0) \cup (0, 1) \cup (1, \infty)$$ ■

## Which Rules Define Functions?

Not every equation defines a function. The equation $y = x^2$ defines $y$ as a function of $x$ because the equation determines exactly one value of $y$ for each value of $x$. However, the equation $y^2 = x$ does *not* define $y$ as a function of $x$ because some input values $x$ correspond to more than one output $y$; for instance, for the input $x = 4$ the equation gives the outputs $y = 2$ and $y = -2$.

Similarly, not every table defines a function. Table 3 defined $C$ as a function of $w$—each package weight $w$ corresponds to exactly one mailing cost. On the other hand, Table 4 does *not* define $y$ as a function of $x$ because some input values $x$ in the table correspond to more than one output $y$; for instance, the input $x = 5$ gives the outputs $y = 7$ and $y = 8$.

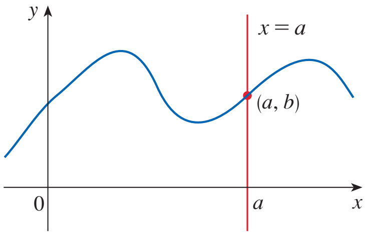
**Table 4**

| $x$ | 2 | 4 | 5 | 5 | 6 |
|---|---|---|---|---|---|
| $y$ | 3 | 6 | 7 | 8 | 9 |

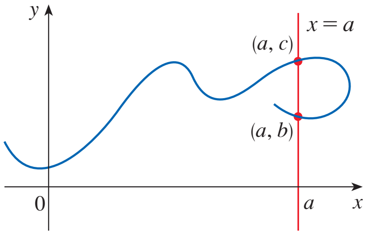
What about curves drawn in the $xy$-plane? Which curves are graphs of functions? The following test gives an answer.

**The Vertical Line Test** A curve in the $xy$-plane is the graph of a function of $x$ if and only if no vertical line intersects the curve more than once.

The reason for the truth of the Vertical Line Test can be seen in Figure 13. If each vertical line $x = a$ intersects a curve only once, at $(a, b)$, then exactly one function value is defined by $f(a) = b$. But if a line $x = a$ intersects the curve twice, at $(a, b)$ and $(a, c)$, then the curve can't represent a function because a function can't assign two different values to $a$.



(a) This curve represents a function.



(b) This curve doesn't represent a function.

**FIGURE 13**

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

For example, the parabola $x = y^2 - 2$ shown in Figure 14(a) is not the graph of a function of $x$ because, as you can see, there are vertical lines that intersect the parabola twice. The parabola, however, does contain the graphs of *two* functions of $x$. Notice that the equation $x = y^2 - 2$ implies $y^2 = x + 2$, so $y = \pm\sqrt{x+2}$. Thus the upper and lower halves of the parabola are the graphs of the functions $f(x) = \sqrt{x+2}$ [from Example 6(a)] and $g(x) = -\sqrt{x+2}$. [See Figures 14(b) and (c).]

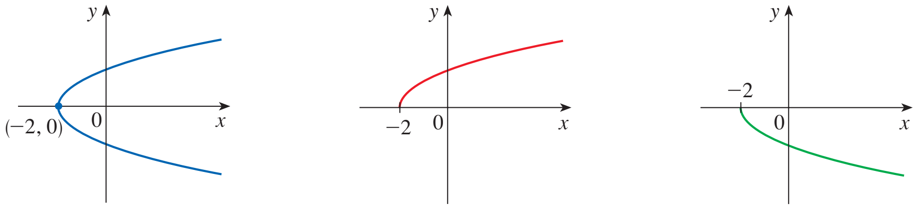


**FIGURE 14** (a) $x = y^2 - 2$ (b) $y = \sqrt{x+2}$ (c) $y = -\sqrt{x+2}$

We observe that if we reverse the roles of $x$ and $y$, then the equation $x = h(y) = y^2 - 2$ *does* define $x$ as a function of $y$ (with $y$ as the independent variable and $x$ as the dependent variable). The graph of the function $h$ is the parabola in Figure 14(a).

## Piecewise Defined Functions

The functions in the following four examples are defined by different formulas in different parts of their domains. Such functions are called **piecewise defined functions**.

**EXAMPLE 7** A function $f$ is defined by

$$f(x) = \begin{cases} 1 - x & \text{if } x \leqslant -1 \\ x^2 & \text{if } x > -1 \end{cases}$$

Evaluate $f(-2)$, $f(-1)$, and $f(0)$ and sketch the graph.

**SOLUTION** Remember that a function is a rule. For this particular function the rule is the following: First look at the value of the input $x$. If it happens that $x \leqslant -1$, then the value of $f(x)$ is $1 - x$. On the other hand, if $x > -1$, then the value of $f(x)$ is $x^2$. Note that even though two different formulas are used, $f$ is *one* function, not two.

$$\text{Since } -2 \leqslant -1, \text{ we have } f(-2) = 1 - (-2) = 3.$$

$$\text{Since } -1 \leqslant -1, \text{ we have } f(-1) = 1 - (-1) = 2.$$

$$\text{Since } 0 > -1, \text{ we have } f(0) = 0^2 = 0.$$

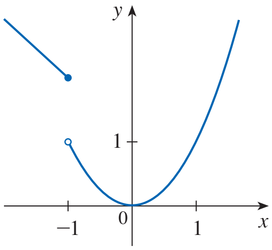

**FIGURE 15**

How do we draw the graph of $f$? We observe that if $x \leqslant -1$, then $f(x) = 1 - x$, so the part of the graph of $f$ that lies to the left of the vertical line $x = -1$ must coincide with the line $y = 1 - x$, which has slope $-1$ and $y$-intercept 1. If $x > -1$, then $f(x) = x^2$, so the part of the graph of $f$ that lies to the right of the line $x = -1$ must coincide with the graph of $y = x^2$, which is a parabola. This enables us to sketch the graph in Figure 15. The solid dot indicates that the point $(-1, 2)$ is included on the graph; the open dot indicates that the point $(-1, 1)$ is excluded from the graph. ■

The next example of a piecewise defined function is the absolute value function. Recall that the **absolute value** of a number $a$, denoted by $|a|$, is the distance from $a$ to 0 on the real number line. Distances are always positive or 0, so we have

For a more extensive review of absolute values, see Appendix A.

$$|a| \geqslant 0 \qquad \text{for every number } a$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

For example,

$$|3| = 3 \qquad |-3| = 3 \qquad |0| = 0 \qquad |\sqrt{2} - 1| = \sqrt{2} - 1 \qquad |3 - \pi| = \pi - 3$$

In general, we have

$$\boxed{\begin{aligned} |a| &= a && \text{if } a \geqslant 0 \\ |a| &= -a && \text{if } a < 0 \end{aligned}}$$

(Remember that if $a$ is negative, then $-a$ is positive.)

**EXAMPLE 8** Sketch the graph of the absolute value function $f(x) = |x|$.

**SOLUTION** From the preceding discussion we know that

$$|x| = \begin{cases} x & \text{if } x \geqslant 0 \\ -x & \text{if } x < 0 \end{cases}$$

Using the same method as in Example 7, we see that the graph of $f$ coincides with the line $y = x$ to the right of the $y$-axis and coincides with the line $y = -x$ to the left of the $y$-axis (see Figure 16). ■

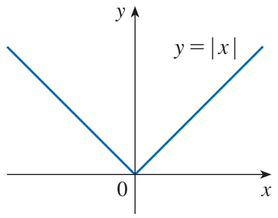

**FIGURE 16**

**EXAMPLE 9** Find a formula for the function $f$ graphed in Figure 17.

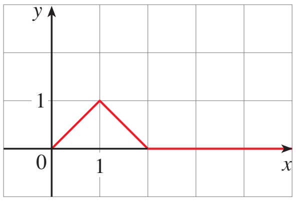

**FIGURE 17**

The point-slope form of the equation of a line is $y - y_1 = m(x - x_1)$. See Appendix B.

**SOLUTION** The line through (0, 0) and (1, 1) has slope $m = 1$ and $y$-intercept $b = 0$, so its equation is $y = x$. Thus, for the part of the graph of $f$ that joins (0, 0) to (1, 1), we have

$$f(x) = x \qquad \text{if } 0 \leqslant x \leqslant 1$$

The line through (1, 1) and (2, 0) has slope $m = -1$, so its point-slope form is

$$y - 0 = (-1)(x - 2) \qquad \text{or} \qquad y = 2 - x$$

So we have

$$f(x) = 2 - x \qquad \text{if } 1 < x \leqslant 2$$

We also see that the graph of $f$ coincides with the $x$-axis for $x > 2$. Putting this information together, we have the following three-piece formula for $f$:

$$f(x) = \begin{cases} x & \text{if } 0 \leqslant x \leqslant 1 \\ 2 - x & \text{if } 1 < x \leqslant 2 \\ 0 & \text{if } x > 2 \end{cases}$$

■

**EXAMPLE 10** In Example C at the beginning of this section we considered the cost $C(w)$ of mailing a large envelope with weight $w$. In effect, this is a piecewise defined function because, from Table 3, we have

$$C(w) = \begin{cases} 1.00 & \text{if } 0 < w \leqslant 1 \\ 1.15 & \text{if } 1 < w \leqslant 2 \\ 1.30 & \text{if } 2 < w \leqslant 3 \\ 1.45 & \text{if } 3 < w \leqslant 4 \\ \vdots & \end{cases}$$

The graph is shown in Figure 18. ■

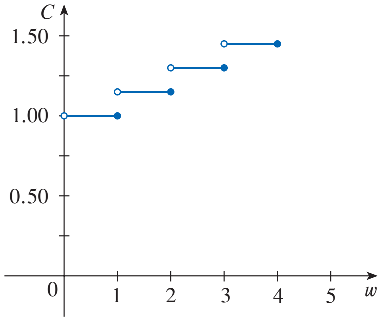

**FIGURE 18**

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Looking at Figure 18, you can see why a function like the one in Example 10 is called a **step function**.

## Even and Odd Functions

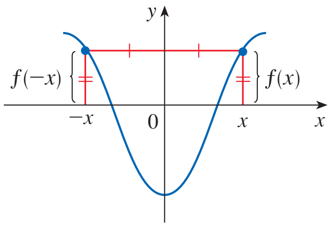

**FIGURE 19**
An even function

If a function $f$ satisfies $f(-x) = f(x)$ for every number $x$ in its domain, then $f$ is called an **even function**. For instance, the function $f(x) = x^2$ is even because

$$f(-x) = (-x)^2 = x^2 = f(x)$$

The geometric significance of an even function is that its graph is symmetric with respect to the $y$-axis (see Figure 19). This means that if we have plotted the graph of $f$ for $x \geqslant 0$, we obtain the entire graph simply by reflecting this portion about the $y$-axis.

If $f$ satisfies $f(-x) = -f(x)$ for every number $x$ in its domain, then $f$ is called an **odd function**. For example, the function $f(x) = x^3$ is odd because

$$f(-x) = (-x)^3 = -x^3 = -f(x)$$

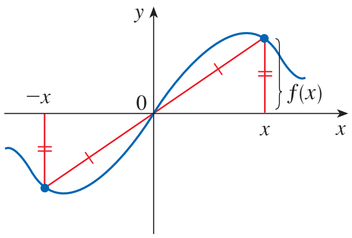

**FIGURE 20**
An odd function

The graph of an odd function is symmetric about the origin (see Figure 20). If we already have the graph of $f$ for $x \geqslant 0$, we can obtain the entire graph by rotating this portion through 180° about the origin.

**EXAMPLE 11** Determine whether each of the following functions is even, odd, or neither even nor odd.

(a) $f(x) = x^5 + x$ (b) $g(x) = 1 - x^4$ (c) $h(x) = 2x - x^2$

**SOLUTION**

(a)
$$\begin{aligned} f(-x) &= (-x)^5 + (-x) = (-1)^5x^5 + (-x) \\ &= -x^5 - x = -(x^5 + x) \\ &= -f(x) \end{aligned}$$

Therefore $f$ is an odd function.

(b)
$$g(-x) = 1 - (-x)^4 = 1 - x^4 = g(x)$$

So $g$ is even.

(c)
$$h(-x) = 2(-x) - (-x)^2 = -2x - x^2$$

Since $h(-x) \neq h(x)$ and $h(-x) \neq -h(x)$, we conclude that $h$ is neither even nor odd. ■

The graphs of the functions in Example 11 are shown in Figure 21. Notice that the graph of $h$ is symmetric neither about the $y$-axis nor about the origin.

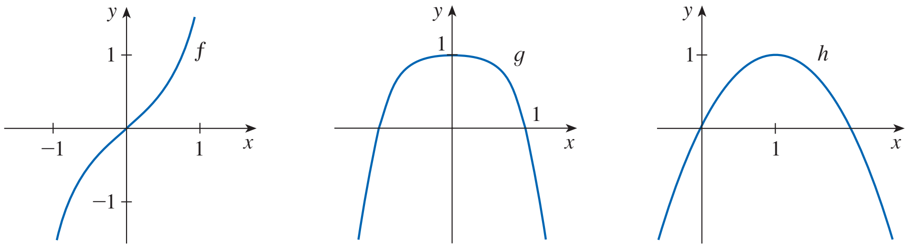

**FIGURE 21**

(a) (b) (c)

## Increasing and Decreasing Functions

The graph shown in Figure 22 rises from $A$ to $B$, falls from $B$ to $C$, and rises again from $C$ to $D$. The function $f$ is said to be increasing on the interval $[a, b]$, decreasing on $[b, c]$, and increasing again on $[c, d]$. Notice that if $x_1$ and $x_2$ are any two numbers between

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

$a$ and $b$ with $x_1 < x_2$, then $f(x_1) < f(x_2)$. We use this as the defining property of an increasing function.

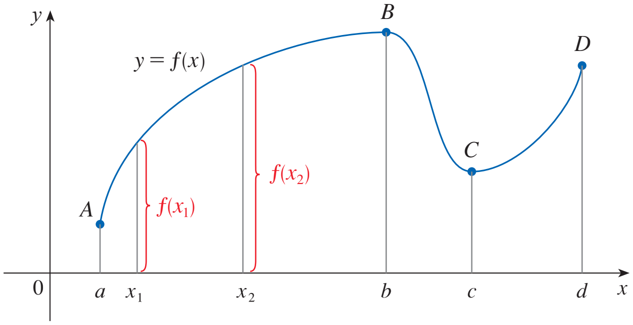

**FIGURE 22**

A function $f$ is called **increasing** on an interval $I$ if

$$f(x_1) < f(x_2) \qquad \text{whenever } x_1 < x_2 \text{ in } I$$

It is called **decreasing** on $I$ if

$$f(x_1) > f(x_2) \qquad \text{whenever } x_1 < x_2 \text{ in } I$$

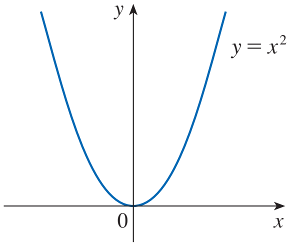

**FIGURE 23**

In the definition of an increasing function it is important to realize that the inequality $f(x_1) < f(x_2)$ must be satisfied for *every* pair of numbers $x_1$ and $x_2$ in $I$ with $x_1 < x_2$.

You can see from Figure 23 that the function $f(x) = x^2$ is decreasing on the interval $(-\infty, 0]$ and increasing on the interval $[0, \infty)$.

## 1.1 Exercises

**1.** If $f(x) = x + \sqrt{2 - x}$ and $g(u) = u + \sqrt{2 - u}$, is it true that $f = g$?

**2.** If

$$f(x) = \frac{x^2 - x}{x - 1} \qquad \text{and} \qquad g(x) = x$$

is it true that $f = g$?

**3.** The graph of a function $g$ is given.

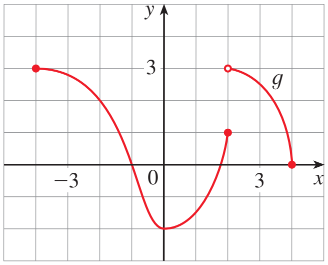
(a) State the values of $g(-2)$, $g(0)$, $g(2)$, and $g(3)$.

(b) For what value(s) of $x$ is $g(x) = 3$?

(c) For what value(s) of $x$ is $g(x) \leqslant 3$?

(d) State the domain and range of $g$.

(e) On what interval(s) is $g$ increasing?



**4.** The graphs of $f$ and $g$ are given.

(a) State the values of $f(-4)$ and $g(3)$.

(b) Which is larger, $f(-3)$ or $g(-3)$?

(c) For what values of $x$ is $f(x) = g(x)$?

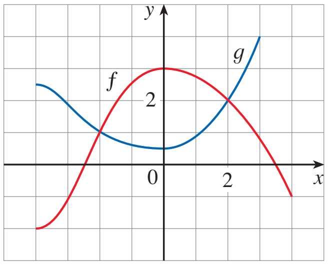
(d) On what interval(s) is $f(x) \leqslant g(x)$?

(e) State the solution of the equation $f(x) = -1$.

(f) On what interval(s) is $g$ decreasing?

(g) State the domain and range of $f$.

(h) State the domain and range of $g$.



**5.** Figure 1 was recorded by an instrument operated by the California Department of Mines and Geology at the

**73.** In a certain state the maximum speed permitted on freeways is 65 mi/h and the minimum speed is 40 mi/h. The fine for violating these limits is \$15 for every mile per hour above the maximum speed or below the minimum speed. Express the amount of the fine $F$ as a function of the driving speed $x$ and graph $F(x)$ for $0 \leqslant x \leqslant 100$.

**74.** An electricity company charges its customers a base rate of \$10 a month, plus 6 cents per kilowatt-hour (kWh) for the first 1200 kWh and 7 cents per kWh for all usage over 1200 kWh. Express the monthly cost $E$ as a function of the amount $x$ of electricity used. Then graph the function $E$ for $0 \leqslant x \leqslant 2000$.

**75.** In a certain country, income tax is assessed as follows. There is no tax on income up to \$10,000. Any income over \$10,000 is taxed at a rate of 10%, up to an income of \$20,000. Any income over \$20,000 is taxed at 15%.

(a) Sketch the graph of the tax rate $R$ as a function of the income $I$.

(b) How much tax is assessed on an income of \$14,000? On \$26,000?

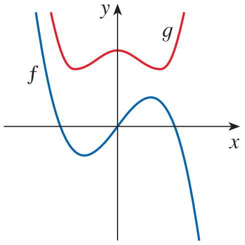
(c) Sketch the graph of the total assessed tax $T$ as a function of the income $I$.

**76.** (a) If the point (5, 3) is on the graph of an even function, what other point must also be on the graph?

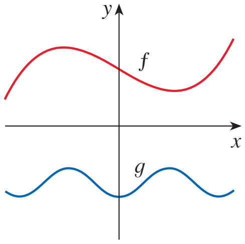
(b) If the point (5, 3) is on the graph of an odd function, what other point must also be on the graph?

**77–78** Graphs of $f$ and $g$ are shown. Decide whether each function is even, odd, or neither. Explain your reasoning.

**77.**

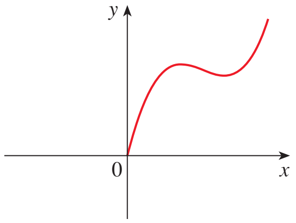


**78.**

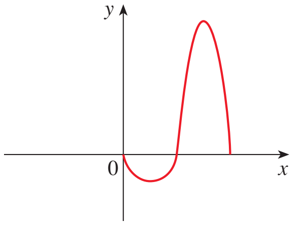


**79–80** The graph of a function defined for $x \geqslant 0$ is given. Complete the graph for $x < 0$ to make (a) an even function and (b) an odd function.

**79.**



**80.**



**81–86** Determine whether $f$ is even, odd, or neither. You may wish to use a graphing calculator or computer to check your answer visually.

**81.** $f(x) = \dfrac{x}{x^2 + 1}$

**82.** $f(x) = \dfrac{x^2}{x^4 + 1}$

**83.** $f(x) = \dfrac{x}{x + 1}$

**84.** $f(x) = x|x|$

**85.** $f(x) = 1 + 3x^2 - x^4$

**86.** $f(x) = 1 + 3x^3 - x^5$

**87.** If $f$ and $g$ are both even functions, is $f + g$ even? If $f$ and $g$ are both odd functions, is $f + g$ odd? What if $f$ is even and $g$ is odd? Justify your answers.

**88.** If $f$ and $g$ are both even functions, is the product $fg$ even? If $f$ and $g$ are both odd functions, is $fg$ odd? What if $f$ is even and $g$ is odd? Justify your answers.

## 1.2 Mathematical Models: A Catalog of Essential Functions

A **mathematical model** is a mathematical description (often by means of a function or an equation) of a real-world phenomenon such as the size of a population, the demand for a product, the speed of a falling object, the concentration of a product in a chemical reaction, the life expectancy of a person at birth, or the cost of emissions reductions. The purpose of the model is to understand the phenomenon and perhaps to make predictions about future behavior.

Given a real-world problem, our first task in the mathematical modeling process is to formulate a mathematical model by identifying and naming the independent and dependent variables and making assumptions that simplify the phenomenon enough to make it mathematically tractable. We use our knowledge of the physical situation and our

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

mathematical skills to obtain equations that relate the variables. In situations where there is no physical law to guide us, we may need to collect data (either from the Internet or a library or by conducting our own experiments) and examine the data in the form of a table in order to discern patterns. From this numerical representation of a function we may wish to obtain a graphical representation by plotting the data. The graph might even suggest a suitable algebraic formula in some cases.

The second stage is to apply the mathematics that we know (such as the calculus that will be developed throughout this book) to the mathematical model that we have formulated in order to derive mathematical conclusions. Then, in the third stage, we take those mathematical conclusions and interpret them as information about the original real-world phenomenon by way of offering explanations or making predictions. The final step is to test our predictions by checking against new real data. If the predictions don't compare well with reality, we need to refine our model or formulate a new model and start the cycle again. Figure 1 illustrates the process of mathematical modeling.

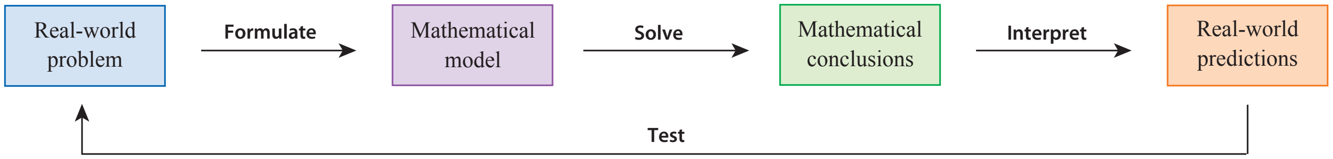


**FIGURE 1**
The modeling process

A mathematical model is never a completely accurate representation of a physical situation—it is an *idealization*. A good model simplifies reality enough to permit mathematical calculations but is accurate enough to provide valuable conclusions. It is important to realize the limitations of a model.

There are many different types of functions that can be used to model relationships observed in the real world. In what follows, we discuss the behavior and graphs of some of these functions and give examples of situations appropriately modeled by such functions.

## Linear Models

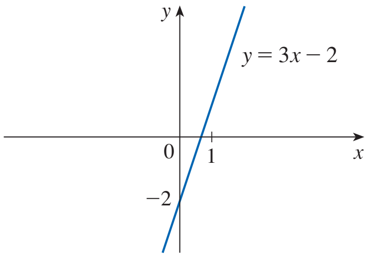
The coordinate geometry of lines is reviewed in Appendix B.

When we say that $y$ is a **linear function** of $x$, we mean that the graph of the function is a line, so we can use the slope-intercept form of the equation of a line to write a formula for the function as

$$y = f(x) = mx + b$$

where $m$ is the slope of the line and $b$ is the $y$-intercept.

A characteristic feature of linear functions is that they change at a constant rate. For instance, Figure 2 shows a graph of the linear function $f(x) = 3x - 2$ and a table of sample values. Notice that whenever $x$ increases by 0.1, the value of $f(x)$ increases by 0.3. So $f(x)$ increases three times as fast as $x$. This means that the slope of the graph of $y = 3x - 2$, namely 3, can be interpreted as the rate of change of $y$ with respect to $x$.



| $x$ | $f(x) = 3x - 2$ |
|---|---|
| 1.0 | 1.0 |
| 1.1 | 1.3 |
| 1.2 | 1.6 |
| 1.3 | 1.9 |
| 1.4 | 2.2 |
| 1.5 | 2.5 |

**EXAMPLE 1**

(a) As dry air moves upward, it expands and cools. If the ground temperature is 20°C and the temperature at a height of 1 km is 10°C, express the temperature $T$ (in °C) as a function of the height $h$ (in kilometers), assuming that a linear model is appropriate.

(b) Draw the graph of the function in part (a). What does the slope represent?

(c) What is the temperature at a height of 2.5 km?

**SOLUTION**

(a) Because we are assuming that $T$ is a linear function of $h$, we can write

$$T = mh + b$$

We are given that $T = 20$ when $h = 0$, so

$$20 = m \cdot 0 + b = b$$

In other words, the $y$-intercept is $b = 20$.

We are also given that $T = 10$ when $h = 1$, so

$$10 = m \cdot 1 + 20$$

The slope of the line is therefore $m = 10 - 20 = -10$ and the required linear function is

$$T = -10h + 20$$

(b) The graph is sketched in Figure 3. The slope is $m = -10$°C/km, and this represents the rate of change of temperature with respect to height.

(c) At a height of $h = 2.5$ km, the temperature is

$$T = -10(2.5) + 20 = -5°\text{C}$$

■

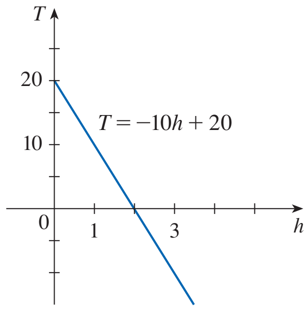

**FIGURE 3**

If there is no physical law or principle to help us formulate a model, we construct an **empirical model**, which is based entirely on collected data. We seek a curve that "fits" the data in the sense that it captures the basic trend of the data points.

**Table 1**

| Year | $CO_2$ level (in ppm) | Year | $CO_2$ level (in ppm) |
|---|---|---|---|
| 1980 | 338.7 | 2000 | 369.4 |
| 1984 | 344.4 | 2004 | 377.5 |
| 1988 | 351.5 | 2008 | 385.6 |
| 1992 | 356.3 | 2012 | 393.8 |
| 1996 | 362.4 | 2016 | 404.2 |

**EXAMPLE 2** Table 1 lists the average carbon dioxide level in the atmosphere, measured in parts per million at Mauna Loa Observatory from 1980 to 2016. Use the data in Table 1 to find a model for the carbon dioxide level.

**SOLUTION** We use the data in Table 1 to make the scatter plot in Figure 4, where $t$ represents time (in years) and $C$ represents the $CO_2$ level (in parts per million, ppm).

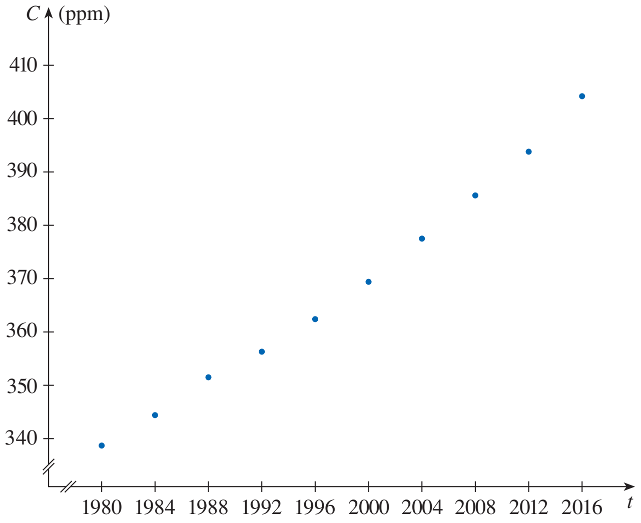

**FIGURE 4**

Scatter plot for the average $CO_2$ level

Notice that the data points appear to lie close to a straight line, so it's natural to choose a linear model in this case. But there are many possible lines that approximate these data points, so which one should we use? One possibility is the line that passes through the first and last data points. The slope of this line is

$$\frac{404.2 - 338.7}{2016 - 1980} = \frac{65.5}{36} \approx 1.819$$

We write its equation as

$$C - 338.7 = 1.819(t - 1980)$$

or

$$\boxed{1} \qquad C = 1.819t - 3262.92$$

Equation 1 gives one possible linear model for the carbon dioxide level; it is graphed in Figure 5. Notice that our model gives values higher than most of the actual $CO_2$ levels. A better linear model is obtained by a procedure from statistics called *linear regression*. Many graphing calculators and computer software applications can determine the regression line for a set of data. One such calculator gives the slope and $y$-intercept of the regression line for the data from Table 1 as

A computer or graphing calculator finds the regression line by the **method of least squares**, which is to minimize the sum of the squares of the vertical distances between the data points and the line. The details are explained in Exercise 14.7.61.

$$m = 1.78242 \qquad b = -3192.90$$

So our least squares model for the $CO_2$ level is

$$\boxed{2} \qquad C = 1.78242t - 3192.90$$

In Figure 6 we graph the regression line as well as the data points. Comparing with Figure 5, we see that the regression line gives a better fit.

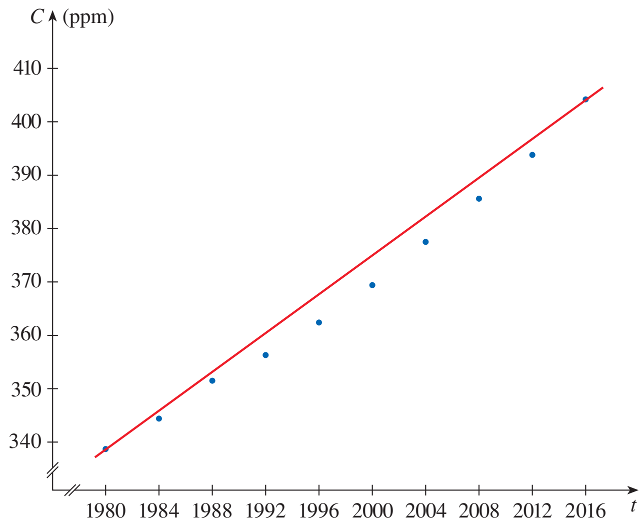

**FIGURE 5**
Linear model through first and last data points

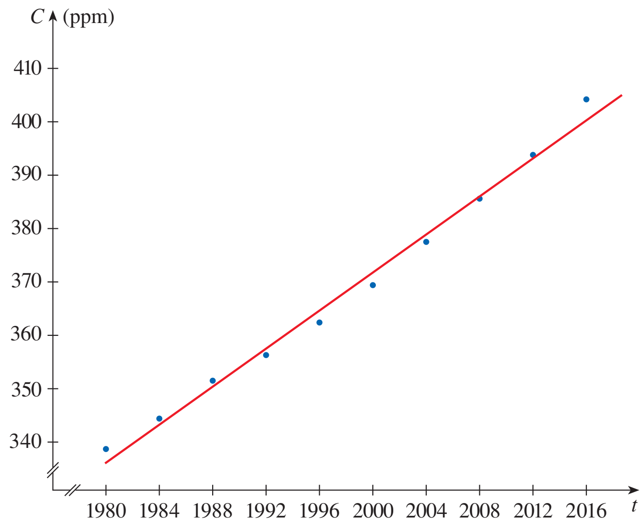

**FIGURE 6**
The regression line ■

**EXAMPLE 3** Use the linear model given by Equation 2 to estimate the average $CO_2$ level for 1987 and to predict the level for the year 2025. According to this model, when will the $CO_2$ level exceed 440 parts per million?

**SOLUTION** Using Equation 2 with $t = 1987$, we estimate that the average $CO_2$ level in 1987 was

$$C(1987) = 1.78242(1987) - 3192.90 \approx 348.77$$

This is an example of *interpolation* because we have estimated a value *between* observed values. (In fact, the Mauna Loa Observatory reported that the average $CO_2$ level in 1987 was 348.93 ppm, so our estimate is quite accurate.)

With $t = 2025$, we get

$$C(2025) = 1.78242(2025) - 3192.90 \approx 416.50$$

So we predict that the average $CO_2$ level in the year 2025 will be 416.5 ppm. This is an example of *extrapolation* because we have predicted a value *outside* the time frame of observations. Consequently, we are far less certain about the accuracy of our prediction.

Using Equation 2, we see that the $CO_2$ level exceeds 440 ppm when

$$1.78242t - 3192.90 > 440$$

Solving this inequality, we get

$$t > \frac{3632.9}{1.78242} \approx 2038.18$$

We therefore predict that the $CO_2$ level will exceed 440 ppm by the year 2038. This prediction is risky because it involves a time quite remote from our observations. In fact, we see from Figure 6 that the trend has been for $CO_2$ levels to increase rather more rapidly in recent years, so the level might exceed 440 ppm well before 2038.

## Polynomials

A function $P$ is called a **polynomial** if

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

where $n$ is a nonnegative integer and the numbers $a_0, a_1, a_2, \ldots, a_n$ are constants called the **coefficients** of the polynomial. The domain of any polynomial is $\mathbb{R} = (-\infty, \infty)$. If the **leading coefficient** $a_n \neq 0$, then the **degree** of the polynomial is $n$. For example, the function

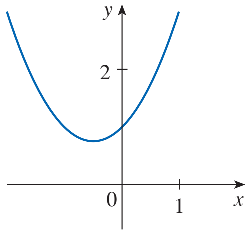
$$P(x) = 2x^6 - x^4 + \tfrac{2}{5}x^3 + \sqrt{2}$$

is a polynomial of degree 6.

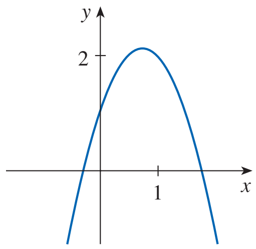
A polynomial of degree 1 is of the form $P(x) = mx + b$ and so it is a linear function. A polynomial of degree 2 is of the form $P(x) = ax^2 + bx + c$ and is called a **quadratic function**. Its graph is always a parabola obtained by shifting the parabola $y = ax^2$, as we will see in Section 1.3. The parabola opens upward if $a > 0$ and downward if $a < 0$. (See Figure 7.)

A polynomial of degree 3 is of the form

$$P(x) = ax^3 + bx^2 + cx + d \qquad a \neq 0$$



(a) $y = x^2 + x + 1$



(b) $y = -2x^2 + 3x + 1$

**FIGURE 7**
The graphs of quadratic functions are parabolas.

and is called a **cubic function**. Figure 8 shows the graph of a cubic function in part (a) and graphs of polynomials of degrees 4 and 5 in parts (b) and (c). We will see later why the graphs have these shapes.

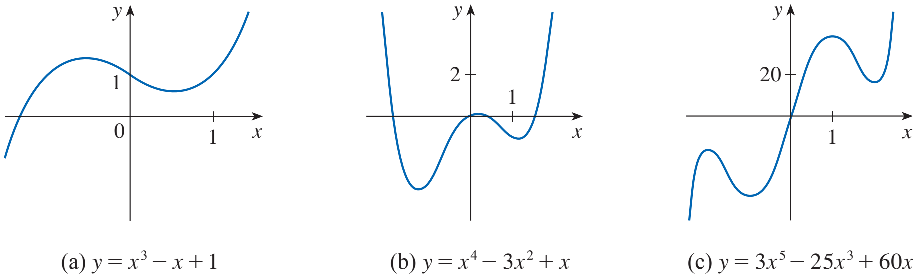

**FIGURE 8**

(a) $y = x^3 - x + 1$ (b) $y = x^4 - 3x^2 + x$ (c) $y = 3x^5 - 25x^3 + 60x$

Polynomials are commonly used to model various quantities that occur in the natural and social sciences. For instance, in Section 2.7 we will explain why economists often use a polynomial $P(x)$ to represent the cost of producing $x$ units of a commodity. In the following example we use a quadratic function to model the fall of a ball.

**Table 2**

| Time (seconds) | Height (meters) |
|---|---|
| 0 | 450 |
| 1 | 445 |
| 2 | 431 |
| 3 | 408 |
| 4 | 375 |
| 5 | 332 |
| 6 | 279 |
| 7 | 216 |
| 8 | 143 |
| 9 | 61 |

**EXAMPLE 4** A ball is dropped from the upper observation deck of the CN Tower, 450 m above the ground, and its height $h$ above the ground is recorded at 1-second intervals in Table 2. Find a model to fit the data and use the model to predict the time at which the ball hits the ground.

**SOLUTION** We draw a scatter plot of the data in Figure 9 and observe that a linear model is inappropriate. But it looks as if the data points might lie on a parabola, so we try a quadratic model instead. Using a graphing calculator or computer algebra system (which uses the least squares method), we obtain the following quadratic model:

$$\boxed{3} \qquad h = 449.36 + 0.96t - 4.90t^2$$

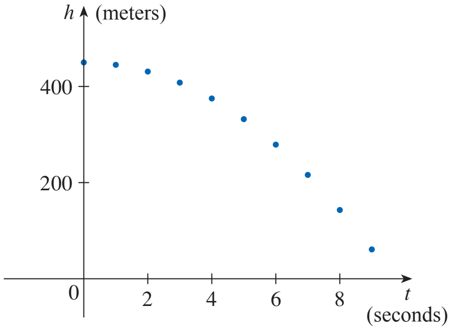

**FIGURE 9**
Scatter plot for a falling ball

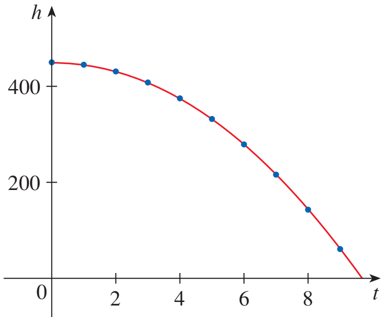

**FIGURE 10**
Quadratic model for a falling ball

In Figure 10 we plot the graph of Equation 3 together with the data points and see that the quadratic model gives a very good fit.

The ball hits the ground when $h = 0$, so we solve the quadratic equation

$$-4.90t^2 + 0.96t + 449.36 = 0$$

The quadratic formula gives

$$t = \frac{-0.96 \pm \sqrt{(0.96)^2 - 4(-4.90)(449.36)}}{2(-4.90)}$$

The positive root is $t \approx 9.67$, so we predict that the ball will hit the ground after falling about 9.7 seconds. ■

## ■ Power Functions

A function of the form $f(x) = x^a$, where $a$ is a constant, is called a **power function**. We consider several cases.

### (i) $a = n$, where $n$ is a positive integer

The graphs of $f(x) = x^n$ for $n = 1, 2, 3, 4$, and 5 are shown in Figure 11. (These are polynomials with only one term.) We already know the shape of the graphs of $y = x$ (a line through the origin with slope 1) and $y = x^2$ [a parabola, see Example 1.1.2(b)].

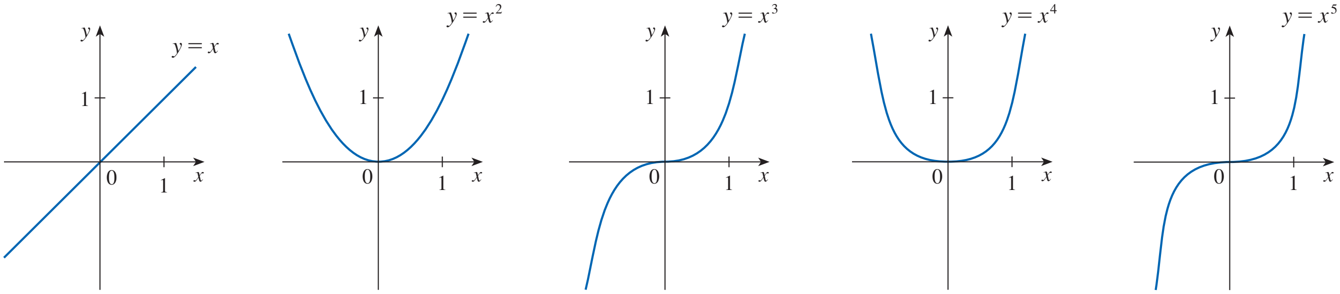

**FIGURE 11** Graphs of $f(x) = x^n$ for $n = 1, 2, 3, 4, 5$

The general shape of the graph of $f(x) = x^n$ depends on whether $n$ is even or odd. If $n$ is even, then $f(x) = x^n$ is an even function and its graph is similar to the parabola $y = x^2$. If $n$ is odd, then $f(x) = x^n$ is an odd function and its graph is similar to that of $y = x^3$. Notice from Figure 12, however, that as $n$ increases, the graph of $y = x^n$ becomes flatter near 0 and steeper when $|x| \geqslant 1$. (If $x$ is small, then $x^2$ is smaller, $x^3$ is even smaller, $x^4$ is smaller still, and so on.)

A **family of functions** is a collection of functions whose equations are related. Figure 12 shows two families of power functions, one with even powers and one with odd powers.

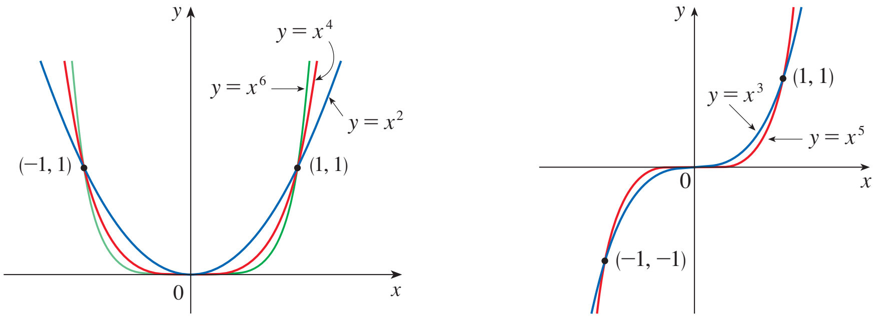

**FIGURE 12**

### (ii) $a = 1/n$, where $n$ is a positive integer

The function $f(x) = x^{1/n} = \sqrt[n]{x}$ is a **root function**. For $n = 2$ it is the square root function $f(x) = \sqrt{x}$, whose domain is $[0, \infty)$ and whose graph is the upper half of the

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

parabola $x = y^2$. [See Figure 13(a).] For other even values of $n$, the graph of $y = \sqrt[n]{x}$ is similar to that of $y = \sqrt{x}$. For $n = 3$ we have the cube root function $f(x) = \sqrt[3]{x}$ whose domain is $\mathbb{R}$ (recall that every real number has a cube root) and whose graph is shown in Figure 13(b). The graph of $y = \sqrt[n]{x}$ for $n$ odd $(n > 3)$ is similar to that of $y = \sqrt[3]{x}$.

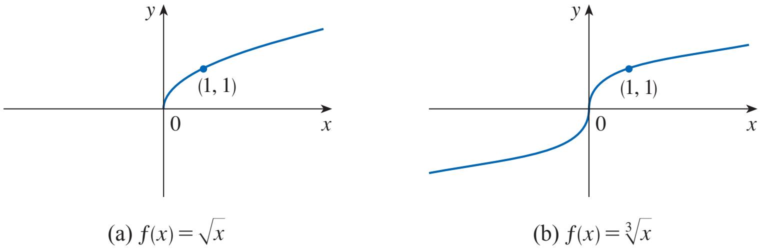

**FIGURE 13**
Graphs of root functions

(a) $f(x) = \sqrt{x}$

(b) $f(x) = \sqrt[3]{x}$

### (iii) $a = -1$

The graph of the **reciprocal function** $f(x) = x^{-1} = 1/x$ is shown in Figure 14. Its graph has the equation $y = 1/x$, or $xy = 1$, and is a hyperbola with the coordinate axes as its asymptotes. This function arises in physics and chemistry in connection with Boyle's Law, which says that when the temperature is constant, the volume $V$ of a gas is inversely proportional to the pressure $P$:

$$V = \frac{C}{P}$$

where $C$ is a constant. Thus the graph of $V$ as a function of $P$ (see Figure 15) has the same general shape as the right half of Figure 14.

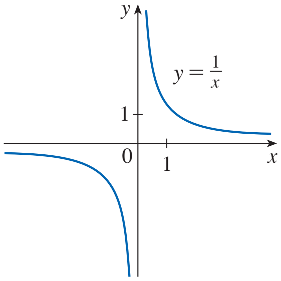

**FIGURE 14**
The reciprocal function

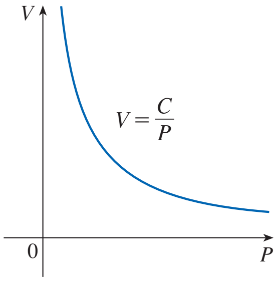

**FIGURE 15**
Volume as a function of pressure at constant temperature

### (iv) $a = -2$

Among the remaining negative powers for the power function $f(x) = x^a$, by far the most important is that of $a = -2$. Many natural laws state that one quantity is inversely proportional to the square of another quantity. In other words, the first quantity is modeled by a function of the form $f(x) = C/x^2$ and we refer to this as an **inverse square law**. For instance, the illumination $I$ of an object by a light source is inversely proportional to the square of the distance $x$ from the source:

$$I = \frac{C}{x^2}$$

where $C$ is a constant. Thus the graph of $I$ as a function of $x$ (see Figure 17) has the same general shape as the right half of Figure 16.

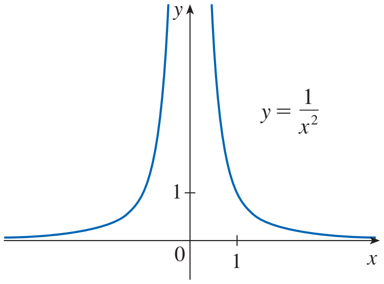

**FIGURE 16**
The reciprocal of the squaring function

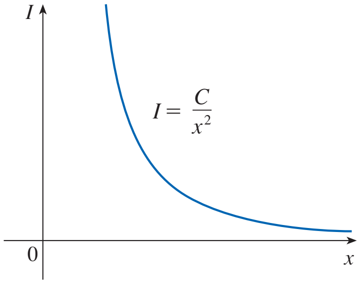

**FIGURE 17**
Illumination from a light source as a function of distance from the source

Inverse square laws model gravitational force, loudness of sound, and electrostatic force between two charged particles. See Exercise 37 for a geometric reason why inverse square laws often occur in nature.

Power functions are also used to model species-area relationships (Exercises 35–36) and the period of revolution of a planet as a function of its distance from the sun (see Exercise 34).

## Rational Functions

A **rational function** $f$ is a ratio of two polynomials:

$$f(x) = \frac{P(x)}{Q(x)}$$

where $P$ and $Q$ are polynomials. The domain consists of all values of $x$ such that $Q(x) \neq 0$. A simple example of a rational function is the function $f(x) = 1/x$, whose domain is $\{x \mid x \neq 0\}$; this is the reciprocal function graphed in Figure 14. The function

$$f(x) = \frac{2x^4 - x^2 + 1}{x^2 - 4}$$

is a rational function with domain $\{x \mid x \neq \pm 2\}$. Its graph is shown in Figure 18.

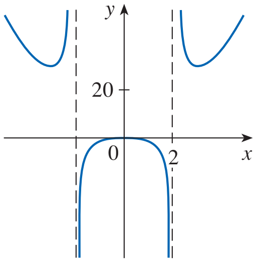

**FIGURE 18**
$f(x) = \frac{2x^4 - x^2 + 1}{x^2 - 4}$

## Algebraic Functions

A function $f$ is called an **algebraic function** if it can be constructed using algebraic operations (such as addition, subtraction, multiplication, division, and taking roots) starting with polynomials. Any rational function is automatically an algebraic function. Here are two more examples:

$$f(x) = \sqrt{x^2 + 1} \qquad g(x) = \frac{x^4 - 16x^2}{x + \sqrt{x}} + (x - 2)\sqrt[3]{x + 1}$$

In Chapter 3 we will sketch a variety of algebraic functions, and we will see that their graphs can assume many different shapes.

An example of an algebraic function occurs in the theory of relativity. The mass of a particle with velocity $v$ is

$$m = f(v) = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

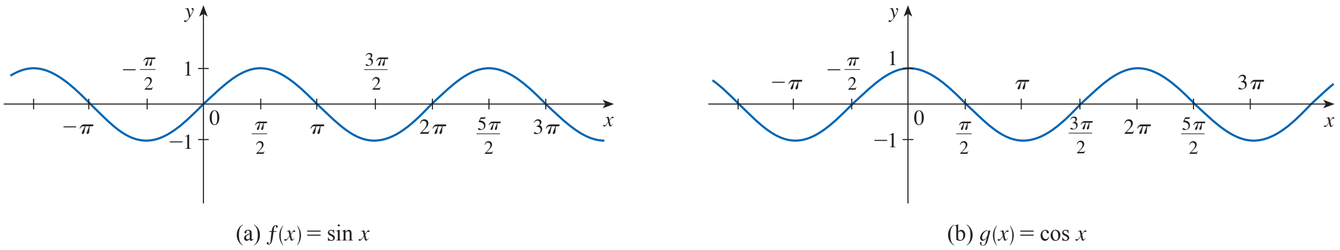
where $m_0$ is the rest mass of the particle and $c = 3.0 \times 10^5$ km/s is the speed of light in a vacuum.

Functions that are not algebraic are called **transcendental**; these include the trigonometric, exponential, and logarithmic functions.

## Trigonometric Functions

The Reference Pages are located at the front and back of the book.

Trigonometry and the trigonometric functions are reviewed on Reference Page 2 and also in Appendix D. In calculus the convention is that *radian measure* is always used (except when otherwise indicated). For example, when we use the function $f(x) = \sin x$, it is understood that $\sin x$ means the sine of the angle whose radian measure is $x$. Thus the graphs of the sine and cosine functions are as shown in Figure 19.



(a) $f(x) = \sin x$

(b) $g(x) = \cos x$

**FIGURE 19**

Notice that for both the sine and cosine functions the domain is $(-\infty, \infty)$ and the range is the closed interval $[-1, 1]$. Thus, for all values of $x$, we have

$$\boxed{-1 \leqslant \sin x \leqslant 1 \qquad -1 \leqslant \cos x \leqslant 1}$$

or, in terms of absolute values,

$$|\sin x| \leqslant 1 \qquad |\cos x| \leqslant 1$$

An important property of the sine and cosine functions is that they are periodic functions and have period $2\pi$. This means that, for all values of $x$,

$$\boxed{\sin(x + 2\pi) = \sin x \qquad \cos(x + 2\pi) = \cos x}$$

The periodic nature of these functions makes them suitable for modeling repetitive phenomena such as tides, vibrating springs, and sound waves. For instance, in Example 1.3.4 we will see that a reasonable model for the number of hours of daylight in Philadelphia $t$ days after January 1 is given by the function

$$L(t) = 12 + 2.8 \sin\left[\frac{2\pi}{365}(t - 80)\right]$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 5** Find the domain of the function $f(x) = \dfrac{1}{1 - 2\cos x}$.

**SOLUTION** This function is defined for all values of $x$ except for those that make the denominator 0. But

$$1 - 2\cos x = 0 \iff \cos x = \frac{1}{2} \iff x = \frac{\pi}{3} + 2n\pi \quad \text{or} \quad x = \frac{5\pi}{3} + 2n\pi$$

where $n$ is any integer (because the cosine function has period $2\pi$). So the domain of $f$ is the set of all real numbers except for the ones noted above. ■

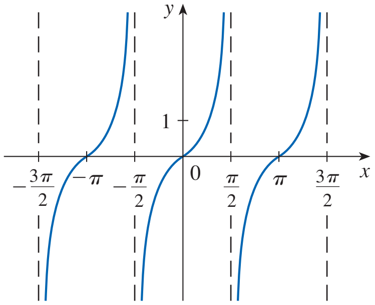


**FIGURE 20**
$y = \tan x$

The tangent function is related to the sine and cosine functions by the equation

$$\tan x = \frac{\sin x}{\cos x}$$

and its graph is shown in Figure 20. It is undefined whenever $\cos x = 0$, that is, when $x = \pm\pi/2, \pm3\pi/2, \ldots$. Its range is $(-\infty, \infty)$. Notice that the tangent function has period $\pi$:

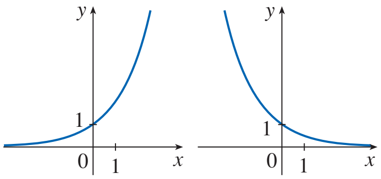
$$\tan(x + \pi) = \tan x \qquad \text{for all } x$$

The remaining three trigonometric functions (cosecant, secant, and cotangent) are the reciprocals of the sine, cosine, and tangent functions. Their graphs are shown in Appendix D.

## ■ Exponential Functions

The **exponential functions** are the functions of the form $f(x) = b^x$, where the base $b$ is a positive constant. The graphs of $y = 2^x$ and $y = (0.5)^x$ are shown in Figure 21. In both cases the domain is $(-\infty, \infty)$ and the range is $(0, \infty)$.

Exponential functions will be studied in detail in Chapter 6, and we will see that they are useful for modeling many natural phenomena, such as when populations grow (if $b > 1$) or decline (if $b < 1$).



(a) $y = 2^x$ (b) $y = (0.5)^x$

**FIGURE 21**

## ■ Logarithmic Functions

The **logarithmic functions** $f(x) = \log_b x$, where the base $b$ is a positive constant, are the inverse functions of the exponential functions. They will be studied in Chapter 6. Figure 22 shows the graphs of four logarithmic functions with various bases. In each case the domain is $(0, \infty)$, the range is $(-\infty, \infty)$, and the function increases slowly when $x > 1$.

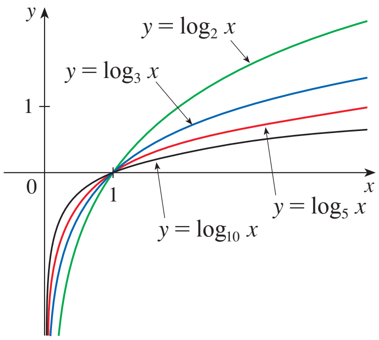


**FIGURE 22**

**EXAMPLE 6** Classify the following functions as one of the types of functions that we have discussed.

(a) $f(x) = 5^x$ (b) $g(x) = x^5$ (c) $h(x) = \dfrac{1 + x}{1 - \sqrt{x}}$ (d) $u(t) = 1 - t + 5t^4$

**SOLUTION**

(a) $f(x) = 5^x$ is an exponential function. (The variable $x$ is the exponent.)

(b) $g(x) = x^5$ is a power function. (The variable $x$ is the base.) We could also consider it to be a polynomial of degree 5.

(c) $h(x) = \dfrac{1 + x}{1 - \sqrt{x}}$ is an algebraic function. (It is not a rational function because the denominator is not a polynomial.)

(d) $u(t) = 1 - t + 5t^4$ is a polynomial of degree 4. ■

Table 3 (on the following page) shows a summary of graphs of some families of essential functions that will be used frequently throughout the book.

## 1.2 Exercises

**1–2** Classify each function as a power function, root function, polynomial (state its degree), rational function, algebraic function, trigonometric function, exponential function, or logarithmic function.

**1.** (a) $f(x) = x^3 + 3x^2$ (b) $g(t) = \cos^2 t - \sin t$

(c) $r(t) = t^{\sqrt{3}}$ (d) $v(t) = 8^t$

(e) $y = \dfrac{\sqrt{x}}{x^2 + 1}$ (f) $g(u) = \log_{10} u$

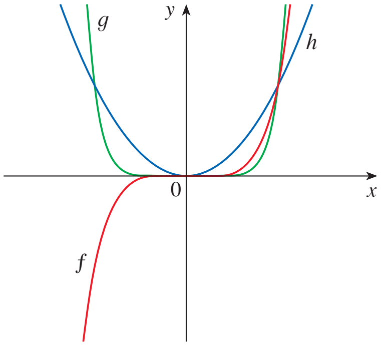
**2.** (a) $f(t) = \dfrac{3t^2 + 2}{t}$ (b) $h(r) = 2.3^r$

(c) $s(t) = \sqrt{t + 4}$ (d) $y = x^4 + 5$

(e) $g(x) = \sqrt[3]{x}$ (f) $y = \dfrac{1}{x^2}$

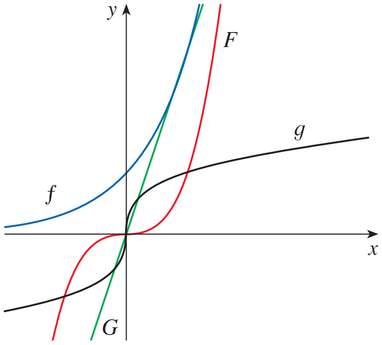
**3–4** Match each equation with its graph. Explain your choices. (Don't use a computer or graphing calculator.)

**3.** (a) $y = x^2$ (b) $y = x^5$ (c) $y = x^8$



**4.** (a) $y = 3x$ (b) $y = 3^x$

(c) $y = x^3$ (d) $y = \sqrt[3]{x}$



**5–6** Find the domain of the function.

**5.** $f(x) = \dfrac{\cos x}{1 - \sin x}$ **6.** $g(x) = \dfrac{1}{1 - \tan x}$

**7.** (a) Find an equation for the family of linear functions with slope 2 and sketch several members of the family.
(b) Find an equation for the family of linear functions such that $f(2) = 1$. Sketch several members of the family.
(c) Which function belongs to both families?

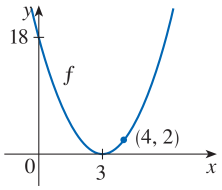
**8.** What do all members of the family of linear functions $f(x) = 1 + m(x + 3)$ have in common? Sketch several members of the family.

**9.** What do all members of the family of linear functions $f(x) = c - x$ have in common? Sketch several members of the family.

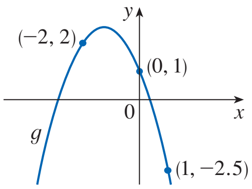
**10.** Sketch several members of the family of polynomials $P(x) = x^3 - cx^2$. How does the graph change when $c$ changes?

**11–12** Find a formula for the quadratic function whose graph is shown.

**11.**



**12.**



**13.** Find a formula for a cubic function $f$ if $f(1) = 6$ and $f(-1) = f(0) = f(2) = 0$.

**14.** Recent studies indicate that the average surface temperature of the earth has been rising steadily. Some scientists have modeled the temperature by the linear function $T = 0.02t + 8.50$, where $T$ is temperature in °C and $t$ represents years since 1900.
(a) What do the slope and $T$-intercept represent?
(b) Use the equation to predict the earth's average surface temperature in 2100.

**15.** If the recommended adult dosage for a drug is $D$ (in mg), then to determine the appropriate dosage $c$ for a child of age $a$, pharmacists use the equation $c = 0.0417D(a + 1)$. Suppose the dosage for an adult is 200 mg.
(a) Find the slope of the graph of $c$. What does it represent?
(b) What is the dosage for a newborn?

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**16.** The manager of a weekend flea market knows from past experience that if he charges $x$ dollars for a rental space at the market, then the number $y$ of spaces that will be rented is given by the equation $y = 200 - 4x$.

(a) Sketch a graph of this linear function. (Remember that the rental charge per space and the number of spaces rented can't be negative quantities.)

(b) What do the slope, the $y$-intercept, and the $x$-intercept of the graph represent?

**17.** The relationship between the Fahrenheit $(F)$ and Celsius $(C)$ temperature scales is given by the linear function $F = \frac{9}{5}C + 32$.

(a) Sketch a graph of this function.

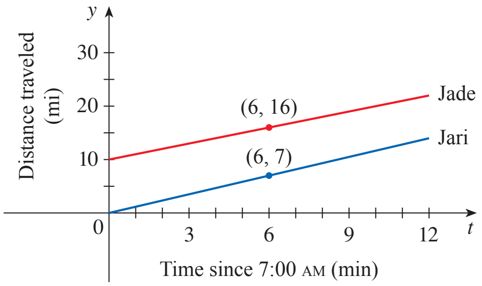
(b) What is the slope of the graph and what does it represent? What is the $F$-intercept and what does it represent?

**18.** Jade and her roommate Jari commute to work each morning, traveling west on I-10. One morning Jade left for work at 6:50 AM, but Jari left 10 minutes later. Both drove at a constant speed. The graphs show the distance (in miles) each of them has traveled on I-10, $t$ minutes after 7:00 AM.

(a) Use the graph to decide which driver is traveling faster.

(b) Find the speed (in mi/h) at which each of them is driving.

(c) Find linear functions $f$ and $g$ that model the distances traveled by Jade and Jari as functions of $t$ (in minutes).



**19.** The manager of a furniture factory finds that it costs \$2200 to manufacture 100 chairs in one day and \$4800 to produce 300 chairs in one day.

(a) Express the cost as a function of the number of chairs produced, assuming that it is linear. Then sketch the graph.

(b) What is the slope of the graph and what does it represent?

(c) What is the $y$-intercept of the graph and what does it represent?

**20.** The monthly cost of driving a car depends on the number of miles driven. Lynn found that in May it cost her \$380 to drive 480 mi and in June it cost her \$460 to drive 800 mi.

(a) Express the monthly cost $C$ as a function of the distance driven $d$, assuming that a linear relationship gives a suitable model.

(b) Use part (a) to predict the cost of driving 1500 miles per month.

(c) Draw the graph of the linear function. What does the slope represent?

(d) What does the $C$-intercept represent?

(e) Why does a linear function give a suitable model in this situation?

**21.** At the surface of the ocean, the water pressure is the same as the air pressure above the water, 15 $\text{lb/in}^2$. Below the surface, the water pressure increases by 4.34 $\text{lb/in}^2$ for every 10 ft of descent.

(a) Express the water pressure as a function of the depth below the ocean surface.

(b) At what depth is the pressure 100 $\text{lb/in}^2$?

**22.** The resistance $R$ of a wire of fixed length is related to its diameter $x$ by an inverse square law, that is, by a function of the form $R(x) = kx^{-2}$.

(a) A wire of fixed length and 0.005 meters in diameter has a resistance of 140 ohms. Find the value of $k$.

(b) Find the resistance of a wire made of the same material and of the same length as the wire in part (a) but with a diameter of 0.008 meters.

**23.** The illumination of an object by a light source is related to the distance from the source by an inverse square law. Suppose that after dark you are sitting in a room with just one lamp, trying to read a book. The light is too dim, so you move your chair halfway to the lamp. How much brighter is the light?

**24.** The pressure $P$ of a sample of oxygen gas that is compressed at a constant temperature is related to the volume $V$ of gas by a reciprocal function of the form $P = k/V$.

(a) A sample of oxygen gas that occupies 0.671 $\text{m}^3$ exerts a pressure of 39 kPa at a temperature of 293 K (absolute temperature measured on the Kelvin scale). Find the value of $k$ in the given model.

(b) If the sample expands to a volume of 0.916 $\text{m}^3$, find the new pressure.

**25.** The power output of a wind turbine depends on many factors. It can be shown using physical principles that the power $P$ generated by a wind turbine is modeled by

$$P = kAv^3$$

where $v$ is the wind speed, $A$ is the area swept out by the blades, and $k$ is a constant that depends on air density, efficiency of the turbine, and the design of the wind turbine blades.

(a) If only wind speed is doubled, by what factor is the power output increased?

(b) If only the length of the blades is doubled, by what factor is the power output increased?

(c) For a particular wind turbine, the length of the blades is 30 m and $k = 0.214 \text{ kg/m}^3$. Find the power output (in watts, $\text{W} = \text{m}^2 \cdot \text{kg/s}^3$) when the wind speed is 10 m/s, 15 m/s, and 25 m/s.

**26.** Astronomers infer the radiant exitance (radiant flux emitted per unit area) of stars using the Stefan Boltzmann Law:

$$E(T) = (5.67 \times 10^{-8})T^4$$

where $E$ is the energy radiated per unit of surface area

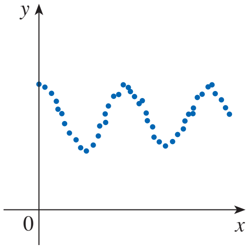
measured in watts (W) and $T$ is the absolute temperature measured in kelvins (K).

(a) Graph the function $E$ for temperatures $T$ between 100 K and 300 K.

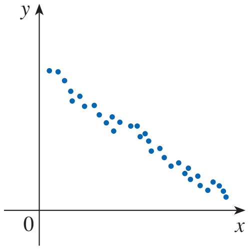
(b) Use the graph to describe the change in energy $E$ as the temperature $T$ increases.

**27–28** For each scatter plot, decide what type of function you might choose as a model for the data. Explain your choices.

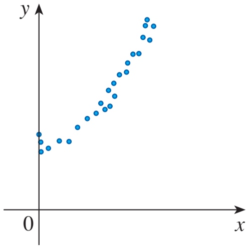
**27.** (a)



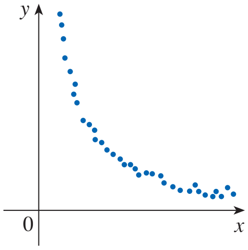
(b)



**28.** (a)



(b)



T **29.** The table shows (lifetime) peptic ulcer rates (per 100 population) for various family incomes as reported by the National Health Interview Survey.

(a) Make a scatter plot of these data and decide whether a linear model is appropriate.

(b) Find and graph a linear model using the first and last data points.

(c) Find and graph the regression line.

(d) Use the linear model in part (c) to estimate the ulcer rate for people with an income of \$25,000.

(e) According to the model, how likely is someone with an income of \$80,000 to suffer from peptic ulcers?

(f) Do you think it would be reasonable to apply the model to someone with an income of \$200,000?

| Income | Ulcer rate (per 100 population) |
|---|---|
| \$4,000 | 14.1 |
| \$6,000 | 13.0 |
| \$8,000 | 13.4 |
| \$12,000 | 12.5 |
| \$16,000 | 12.0 |
| \$20,000 | 12.4 |
| \$30,000 | 10.5 |
| \$45,000 | 9.4 |
| \$60,000 | 8.2 |

T **30.** When laboratory rats are exposed to asbestos fibers, some of them develop lung tumors. The table lists the results of several experiments by different scientists.

(a) Find the regression line for the data.

(b) Make a scatter plot and graph the regression line. Does the regression line appear to be a suitable model for the data?

(c) What does the $y$-intercept of the regression line represent?

| Asbestos exposure (fibers/mL) | Percent of mice that develop lung tumors | Asbestos exposure (fibers/mL) | Percent of mice that develop lung tumors |
|---|---|---|---|
| 50 | 2 | 1600 | 42 |
| 400 | 6 | 1800 | 37 |
| 500 | 5 | 2000 | 38 |
| 900 | 10 | 3000 | 50 |
| 1100 | 26 | | |

T **31.** Anthropologists use a linear model that relates human femur (thighbone) length to height. The model allows an anthropologist to determine the height of an individual when only a partial skeleton (including the femur) is found. Here we find the model by analyzing the data on femur length and height for the eight males given in the table.

(a) Make a scatter plot of the data.

(b) Find and graph the regression line that models the data.

(c) An anthropologist finds a human femur of length 53 cm. How tall was the person?

| Femur length (cm) | Height (cm) | Femur length (cm) | Height (cm) |
|---|---|---|---|
| 50.1 | 178.5 | 44.5 | 168.3 |
| 48.3 | 173.6 | 42.7 | 165.0 |
| 45.2 | 164.8 | 39.5 | 155.4 |
| 44.7 | 163.7 | 38.0 | 155.8 |

T **32.** The table shows average US retail residential prices of electricity from 2000 to 2016, measured in cents per kilowatt hour.

(a) Make a scatter plot. Is a linear model appropriate?

(b) Find and graph the regression line.

(c) Use your linear model from part (b) to estimate the average retail price of electricity in 2005 and 2017.

| Years since 2000 | Cents/kWh | Years since 2000 | Cents/kWh |
|---|---|---|---|
| 0 | 8.24 | 10 | 11.54 |
| 2 | 8.44 | 12 | 11.88 |
| 4 | 8.95 | 14 | 12.52 |
| 6 | 10.40 | 16 | 12.90 |
| 8 | 11.26 | | |

T **33.** The table shows world average daily oil consumption from 1985 to 2015, measured in thousands of barrels per day.

(a) Make a scatter plot and decide whether a linear model is appropriate.

(b) Find and graph the regression line.

(c) Use the linear model to estimate the oil consumption in 2002 and 2017.

| Years since 1985 | Thousands of barrels of oil per day |
|---|---|
| 0 | 60,083 |
| 5 | 66,533 |
| 10 | 70,099 |
| 15 | 76,784 |
| 20 | 84,077 |
| 25 | 87,302 |
| 30 | 94,071 |

*Source:* US Energy Information Administration

T **34.** The table shows the mean (average) distances $d$ of the planets from the sun (taking the unit of measurement to be the distance from the earth to the sun) and their periods $T$ (time of revolution in years).

(a) Fit a power model to the data.

(b) Kepler's Third Law of Planetary Motion states that

"The square of the period of revolution of a planet is proportional to the cube of its mean distance from the sun."

Does your model corroborate Kepler's Third Law?

| Planet | $d$ | $T$ |
|---|---|---|
| Mercury | 0.387 | 0.241 |
| Venus | 0.723 | 0.615 |
| Earth | 1.000 | 1.000 |
| Mars | 1.523 | 1.881 |
| Jupiter | 5.203 | 11.861 |
| Saturn | 9.541 | 29.457 |
| Uranus | 19.190 | 84.008 |
| Neptune | 30.086 | 164.784 |

**35.** It makes sense that the larger the area of a region, the larger the number of species that inhabit the region. Many ecologists have modeled the species-area relation with a power function. In particular, the number of species $S$ of bats living in caves in central Mexico has been related to the surface area $A$ of the caves by the equation $S = 0.7A^{0.3}$.

(a) The cave called *Misión Imposible* near Puebla, Mexico, has a surface area of $A = 60\text{ m}^2$. How many species of bats would you expect to find in that cave?

(b) If you discover that four species of bats live in a cave, estimate the area of the cave.

T **36.** The table shows the number $N$ of species of reptiles and amphibians inhabiting Caribbean islands and the area $A$ of the island in square miles.

(a) Use a power function to model $N$ as a function of $A$.

(b) The Caribbean island of Dominica has area 291 $\text{mi}^2$. How many species of reptiles and amphibians would you expect to find on Dominica?

| Island | $A$ | $N$ |
|---|---|---|
| Saba | 4 | 5 |
| Monserrat | 40 | 9 |
| Puerto Rico | 3,459 | 40 |
| Jamaica | 4,411 | 39 |
| Hispaniola | 29,418 | 84 |
| Cuba | 44,218 | 76 |

**37.** Suppose that a force or energy originates from a point source and spreads its influence equally in all directions, such as the light from a lightbulb or the gravitational force of a planet. So at a distance $r$ from the source, the intensity $I$ of the force or energy is equal to the source strength $S$ divided by the surface area of a sphere of radius $r$. Show that $I$ satisfies the inverse square law $I = k/r^2$, where $k$ is a positive constant.

## 1.3 New Functions from Old Functions

In this section we start with the basic functions we discussed in Section 1.2 and obtain new functions by shifting, stretching, and reflecting their graphs. We also show how to combine pairs of functions by the standard arithmetic operations and by composition.

### Transformations of Functions

By applying certain transformations to the graph of a given function we can obtain the graphs of related functions. This will give us the ability to sketch the graphs of many functions quickly by hand. It will also enable us to write equations for given graphs.

Let's first consider **translations** of graphs. If $c$ is a positive number, then the graph of $y = f(x) + c$ is just the graph of $y = f(x)$ shifted upward a distance of $c$ units (because each $y$-coordinate is increased by the same number $c$). Likewise, if $g(x) = f(x - c)$, where $c > 0$, then the value of $g$ at $x$ is the same as the value of $f$ at $x - c$ ($c$ units to the left of $x$). Therefore the graph of $y = f(x - c)$ is just the graph of $y = f(x)$ shifted $c$ units to the right (see Figure 1).

**Vertical and Horizontal Shifts** Suppose $c > 0$. To obtain the graph of

$y = f(x) + c$, shift the graph of $y = f(x)$ a distance $c$ units upward
$y = f(x) - c$, shift the graph of $y = f(x)$ a distance $c$ units downward
$y = f(x - c)$, shift the graph of $y = f(x)$ a distance $c$ units to the right
$y = f(x + c)$, shift the graph of $y = f(x)$ a distance $c$ units to the left

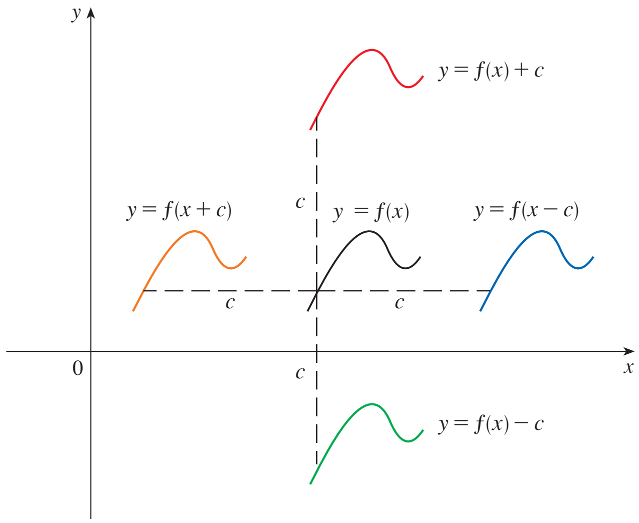

**FIGURE 1** Translating the graph of $f$

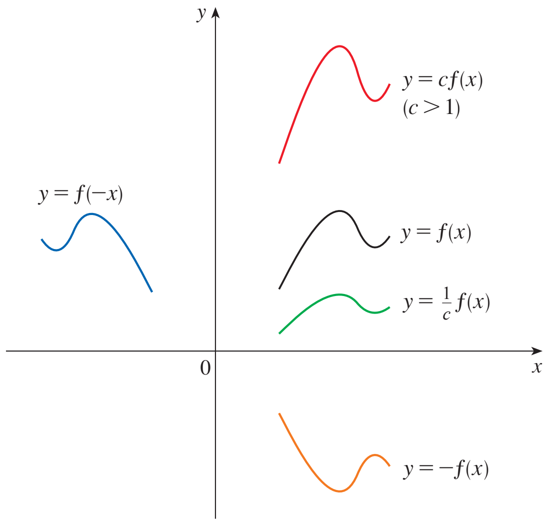

**FIGURE 2** Stretching and reflecting the graph of $f$

Now let's consider the **stretching** and **reflecting** transformations. If $c > 1$, then the graph of $y = cf(x)$ is the graph of $y = f(x)$ stretched by a factor of $c$ in the vertical direction (because each $y$-coordinate is multiplied by the same number $c$). The graph of $y = -f(x)$ is the graph of $y = f(x)$ reflected about the $x$-axis because the point $(x, y)$ is replaced by the point $(x, -y)$. (See Figure 2 and the following chart, where the results of other stretching, shrinking, and reflecting transformations are also given.)

**Vertical and Horizontal Stretching and Reflecting** Suppose $c > 1$. To obtain the graph of

$y = cf(x)$, stretch the graph of $y = f(x)$ vertically by a factor of $c$
$y = (1/c)f(x)$, shrink the graph of $y = f(x)$ vertically by a factor of $c$
$y = f(cx)$, shrink the graph of $y = f(x)$ horizontally by a factor of $c$
$y = f(x/c)$, stretch the graph of $y = f(x)$ horizontally by a factor of $c$
$y = -f(x)$, reflect the graph of $y = f(x)$ about the $x$-axis
$y = f(-x)$, reflect the graph of $y = f(x)$ about the $y$-axis

Figure 3 illustrates these stretching transformations when applied to the cosine function with $c = 2$. For instance, in order to get the graph of $y = 2\cos x$ we multiply the $y$-coordinate of each point on the graph of $y = \cos x$ by 2. This means that the graph of $y = \cos x$ gets stretched vertically by a factor of 2.

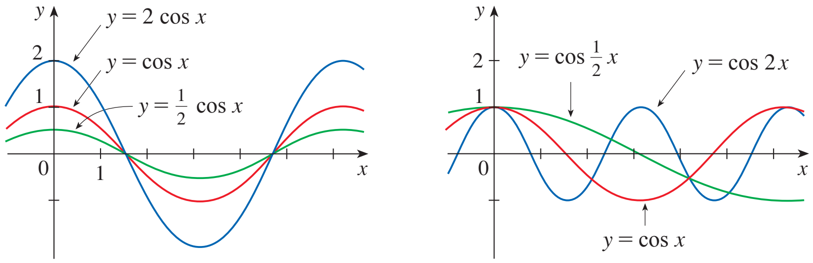

**FIGURE 3**

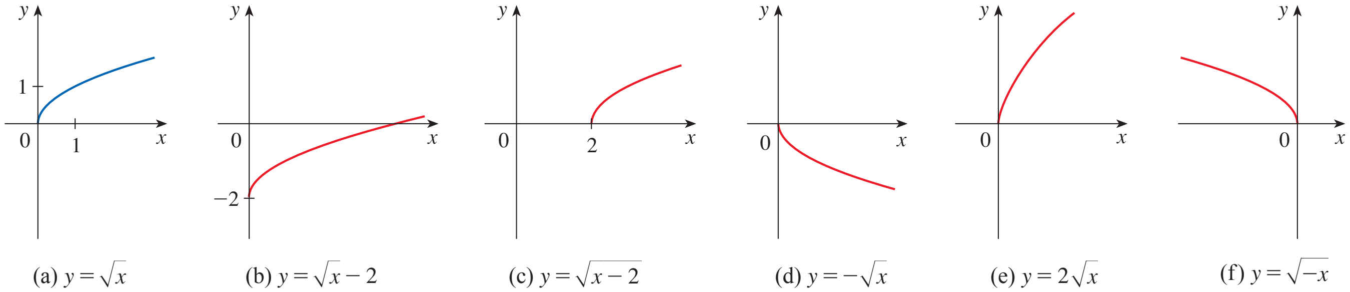
**EXAMPLE 1** Given the graph of $y = \sqrt{x}$, use transformations to graph $y = \sqrt{x} - 2$, $y = \sqrt{x - 2}$, $y = -\sqrt{x}$, $y = 2\sqrt{x}$, and $y = \sqrt{-x}$.

**SOLUTION** The graph of the square root function $y = \sqrt{x}$, obtained from Figure 1.2.13(a), is shown in Figure 4(a). In the other parts of the figure we sketch $y = \sqrt{x} - 2$ by shifting 2 units downward, $y = \sqrt{x - 2}$ by shifting 2 units to the right, $y = -\sqrt{x}$ by reflecting about the $x$-axis, $y = 2\sqrt{x}$ by stretching vertically by a factor of 2, and $y = \sqrt{-x}$ by reflecting about the $y$-axis.



(a) $y = \sqrt{x}$ (b) $y = \sqrt{x} - 2$ (c) $y = \sqrt{x - 2}$ (d) $y = -\sqrt{x}$ (e) $y = 2\sqrt{x}$ (f) $y = \sqrt{-x}$

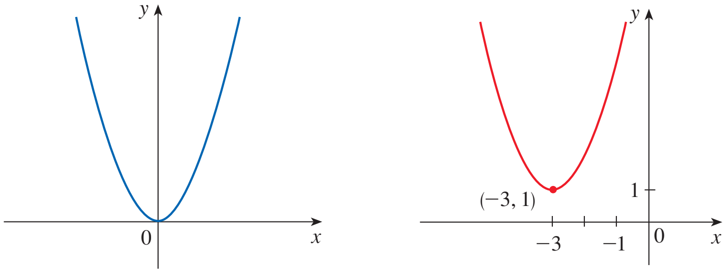
**FIGURE 4** ■

**EXAMPLE 2** Sketch the graph of the function $f(x) = x^2 + 6x + 10$.

**SOLUTION** Completing the square, we write the equation of the graph as

$$y = x^2 + 6x + 10 = (x + 3)^2 + 1$$

This means we obtain the desired graph by starting with the parabola $y = x^2$ and shifting 3 units to the left and then 1 unit upward (see Figure 5).



(a) $y = x^2$ (b) $y = (x + 3)^2 + 1$

**FIGURE 5** ■

**EXAMPLE 3** Sketch the graph of each function.

(a) $y = \sin 2x$ (b) $y = 1 - \sin x$

**SOLUTION**

(a) We obtain the graph of $y = \sin 2x$ from that of $y = \sin x$ by compressing horizontally by a factor of 2. (See Figures 6 and 7.) Because the period of $y = \sin x$ is $2\pi$, the period of $y = \sin 2x$ is $2\pi/2 = \pi$.

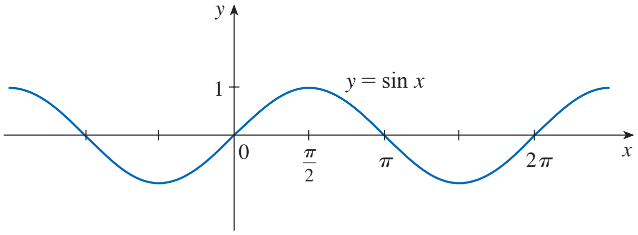


**FIGURE 6**

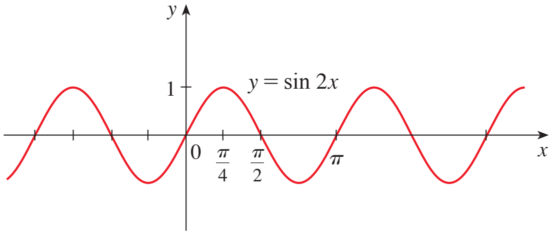

**FIGURE 7**

(b) To obtain the graph of $y = 1 - \sin x$, we again start with $y = \sin x$. We reflect about the $x$-axis to get the graph of $y = -\sin x$ and then we shift 1 unit upward to get $y = 1 - \sin x$. (See Figure 8.)

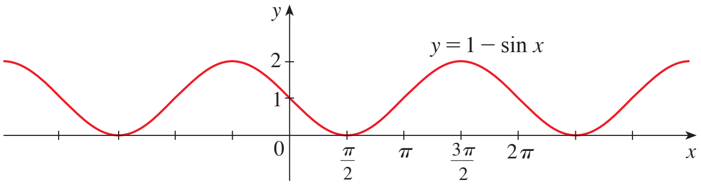

**FIGURE 8**

■

**EXAMPLE 4** Figure 9 shows graphs of the number of hours of daylight as functions of the time of the year at several latitudes. Given that Philadelphia is located at approximately 40°N latitude, find a function that models the length of daylight at Philadelphia.

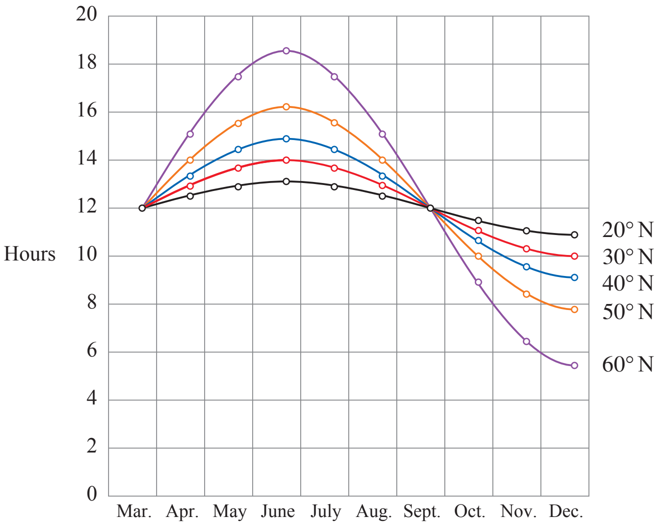

**FIGURE 9**
Graph of the length of daylight from March 21 through December 21 at various latitudes

*Source:* Adapted from L. Harrison, *Daylight, Twilight, Darkness and Time* (New York: Silver, Burdett, 1935), 40.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**SOLUTION** Notice that each curve resembles a shifted and stretched sine function. By looking at the blue curve we see that, at the latitude of Philadelphia, daylight lasts about 14.8 hours on June 21 and 9.2 hours on December 21, so the amplitude of the curve (the factor by which we have to stretch the sine curve vertically) is $\frac{1}{2}(14.8 - 9.2) = 2.8$.

By what factor do we need to stretch the sine curve horizontally if we measure the time $t$ in days? Because there are about 365 days in a year, the period of our model should be 365. But the period of $y = \sin t$ is $2\pi$, so the horizontal stretching factor is $2\pi/365$.

We also notice that the curve begins its cycle on March 21, the 80th day of the year, so we have to shift the curve 80 units to the right. In addition, we shift it 12 units upward. Therefore we model the length of daylight in Philadelphia on the $t$th day of the year by the function

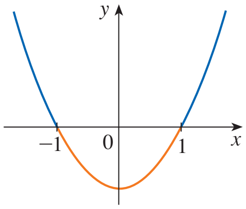
$$L(t) = 12 + 2.8 \sin\left[\frac{2\pi}{365}(t - 80)\right]$$

■

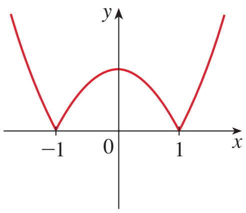
Another transformation of some interest is taking the *absolute value* of a function. If $y = |f(x)|$, then according to the definition of absolute value, $y = f(x)$ when $f(x) \geqslant 0$ and $y = -f(x)$ when $f(x) < 0$. This tells us how to get the graph of $y = |f(x)|$ from the graph of $y = f(x)$: the part of the graph that lies above the $x$-axis remains the same, and the part that lies below the $x$-axis is reflected about the $x$-axis.

**EXAMPLE 5** Sketch the graph of the function $y = |x^2 - 1|$.

**SOLUTION** We first graph the parabola $y = x^2 - 1$ in Figure 10(a) by shifting the parabola $y = x^2$ downward 1 unit. We see that the graph lies below the $x$-axis when $-1 < x < 1$, so we reflect that part of the graph about the $x$-axis to obtain the graph of $y = |x^2 - 1|$ in Figure 10(b). ■



(a) $y = x^2 - 1$



(b) $y = |x^2 - 1|$

**FIGURE 10**

## Combinations of Functions

Two functions $f$ and $g$ can be combined to form new functions $f + g$, $f - g$, $fg$, and $f/g$ in a manner similar to the way we add, subtract, multiply, and divide real numbers.

**Definitio** Given two functions $f$ and $g$, the **sum**, **difference**, **product**, and **quotient** functions are defined by

$$(f + g)(x) = f(x) + g(x) \qquad (f - g)(x) = f(x) - g(x)$$

$$(fg)(x) = f(x)\,g(x) \qquad \left(\frac{f}{g}\right)(x) = \frac{f(x)}{g(x)}$$

If the domain of $f$ is $A$ and the domain of $g$ is $B$, then the domain of $f + g$ (and the domain of $f - g$) is the intersection $A \cap B$ because both $f(x)$ and $g(x)$ have to be defined. For example, the domain of $f(x) = \sqrt{x}$ is $A = [0, \infty)$ and the domain of $g(x) = \sqrt{2 - x}$ is $B = (-\infty, 2]$, so the domain of $(f + g)(x) = \sqrt{x} + \sqrt{2 - x}$ is $A \cap B = [0, 2]$.

The domain of $fg$ is also $A \cap B$. Because we can't divide by 0, the domain of $f/g$ is $\{x \in A \cap B \mid g(x) \neq 0\}$. For instance, if $f(x) = x^2$ and $g(x) = x - 1$, then the domain of the rational function $(f/g)(x) = x^2/(x - 1)$ is $\{x \mid x \neq 1\}$, or $(-\infty, 1) \cup (1, \infty)$.

There is another way of combining two functions to obtain a new function. For example, suppose that $y = f(u) = \sqrt{u}$ and $u = g(x) = x^2 + 1$. Since $y$ is a function of $u$ and $u$ is, in turn, a function of $x$, it follows that $y$ is ultimately a function of $x$. We compute this by substitution:

$$y = f(u) = f(g(x)) = f(x^2 + 1) = \sqrt{x^2 + 1}$$

The procedure is called *composition* because the new function is *composed* of the two given functions $f$ and $g$.

In general, given any two functions $f$ and $g$, we start with a number $x$ in the domain of $g$ and calculate $g(x)$. If this number $g(x)$ is in the domain of $f$, then we can calculate the value of $f(g(x))$. Notice that the output of one function is used as the input to the next function. The result is a new function $h(x) = f(g(x))$ obtained by substituting $g$ into $f$. It is called the *composition* (or *composite*) of $f$ and $g$ and is denoted by $f \circ g$ ("$f$ circle $g$").

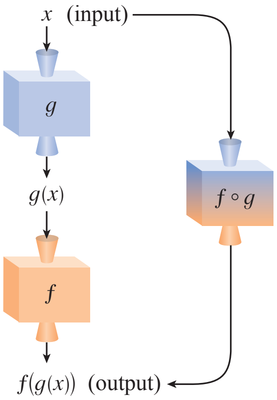


**FIGURE 11**
The $f \circ g$ machine is composed of the $g$ machine (first) and then the $f$ machine.

**Definitio** Given two functions $f$ and $g$, the **composite function** $f \circ g$ (also called the **composition** of $f$ and $g$) is defined by

$$(f \circ g)(x) = f(g(x))$$

The domain of $f \circ g$ is the set of all $x$ in the domain of $g$ such that $g(x)$ is in the domain of $f$. In other words, $(f \circ g)(x)$ is defined whenever both $g(x)$ and $f(g(x))$ are defined. Figure 11 shows how to picture $f \circ g$ in terms of machines.

**EXAMPLE 6** If $f(x) = x^2$ and $g(x) = x - 3$, find the composite functions $f \circ g$ and $g \circ f$.

**SOLUTION** We have

$$(f \circ g)(x) = f(g(x)) = f(x - 3) = (x - 3)^2$$

$$(g \circ f)(x) = g(f(x)) = g(x^2) = x^2 - 3$$

■

**NOTE** You can see from Example 6 that, in general, $f \circ g \neq g \circ f$. Remember, the notation $f \circ g$ means that the function $g$ is applied first and then $f$ is applied second. In Example 6, $f \circ g$ is the function that *first* subtracts 3 and *then* squares; $g \circ f$ is the function that *first* squares and *then* subtracts 3.

**EXAMPLE 7** If $f(x) = \sqrt{x}$ and $g(x) = \sqrt{2 - x}$, find each function and its domain.

(a) $f \circ g$ (b) $g \circ f$ (c) $f \circ f$ (d) $g \circ g$

**SOLUTION**

(a) $$(f \circ g)(x) = f(g(x)) = f\left(\sqrt{2 - x}\right) = \sqrt{\sqrt{2 - x}} = \sqrt[4]{2 - x}$$

The domain of $f \circ g$ is $\{x \mid 2 - x \geqslant 0\} = \{x \mid x \leqslant 2\} = (-\infty, 2]$.

(b) $$(g \circ f)(x) = g(f(x)) = g\left(\sqrt{x}\right) = \sqrt{2 - \sqrt{x}}$$

If $0 \leqslant a \leqslant b$, then $a^2 \leqslant b^2$.

For $\sqrt{x}$ to be defined we must have $x \geqslant 0$. For $\sqrt{2 - \sqrt{x}}$ to be defined we must have $2 - \sqrt{x} \geqslant 0$, that is, $\sqrt{x} \leqslant 2$, or $x \leqslant 4$. Thus we have $0 \leqslant x \leqslant 4$, so the domain of $g \circ f$ is the closed interval $[0, 4]$.

(c) $$(f \circ f)(x) = f(f(x)) = f\left(\sqrt{x}\right) = \sqrt{\sqrt{x}} = \sqrt[4]{x}$$

The domain of $f \circ f$ is $[0, \infty)$.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(d) $$(g \circ g)(x) = g(g(x)) = g\left(\sqrt{2-x}\right) = \sqrt{2-\sqrt{2-x}}$$

This expression is defined when both $2 - x \geqslant 0$ and $2 - \sqrt{2-x} \geqslant 0$. The first inequality means $x \leqslant 2$, and the second is equivalent to $\sqrt{2-x} \leqslant 2$, or $2 - x \leqslant 4$, or $x \geqslant -2$. Thus $-2 \leqslant x \leqslant 2$, so the domain of $g \circ g$ is the closed interval $[-2, 2]$. ■

It is possible to take the composition of three or more functions. For instance, the composite function $f \circ g \circ h$ is found by first applying $h$, then $g$, and then $f$ as follows:

$$(f \circ g \circ h)(x) = f(g(h(x)))$$

**EXAMPLE 8** Find $f \circ g \circ h$ if $f(x) = x/(x+1)$, $g(x) = x^{10}$, and $h(x) = x + 3$.

**SOLUTION**

$$\begin{aligned}(f \circ g \circ h)(x) &= f(g(h(x))) = f(g(x+3)) \\ &= f((x+3)^{10}) = \frac{(x+3)^{10}}{(x+3)^{10}+1}\end{aligned}$$ ■

So far we have used composition to build complicated functions from simpler ones. But in calculus it is often useful to be able to *decompose* a complicated function into simpler ones, as in the following example.

**EXAMPLE 9** Given $F(x) = \cos^2(x+9)$, find functions $f$, $g$, and $h$ such that $F = f \circ g \circ h$.

**SOLUTION** Since $F(x) = [\cos(x+9)]^2$, the formula for $F$ says: first add 9, then take the cosine of the result, and finally square. So we let

$$h(x) = x + 9 \qquad g(x) = \cos x \qquad f(x) = x^2$$

Then $$\begin{aligned}(f \circ g \circ h)(x) &= f(g(h(x))) = f(g(x+9)) = f(\cos(x+9)) \\ &= [\cos(x+9)]^2 = F(x)\end{aligned}$$ ■

## 1.3 Exercises

**1.** Suppose the graph of $f$ is given. Write equations for the graphs that are obtained from the graph of $f$ as follows.

(a) Shift 3 units upward.

(b) Shift 3 units downward.

(c) Shift 3 units to the right.

(d) Shift 3 units to the left.

(e) Reflect about the $x$-axis.

(f) Reflect about the $y$-axis.

(g) Stretch vertically by a factor of 3.

(h) Shrink vertically by a factor of 3.

**2.** Explain how each graph is obtained from the graph of $y = f(x)$.

(a) $y = f(x) + 8$ (b) $y = f(x + 8)$

(c) $y = 8f(x)$ (d) $y = f(8x)$

(e) $y = -f(x) - 1$ (f) $y = 8f\left(\frac{1}{8}x\right)$

**3.** The graph of $y = f(x)$ is given. Match each equation with its graph and give reasons for your choices.

(a) $y = f(x - 4)$ (b) $y = f(x) + 3$

(c) $y = \frac{1}{3}f(x)$ (d) $y = -f(x + 4)$

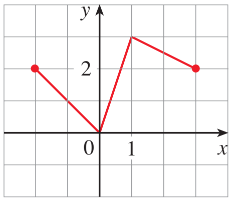
(e) $y = 2f(x + 6)$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**4.** The graph of $f$ is given. Draw the graphs of the following functions.

(a) $y = f(x) - 3$ (b) $y = f(x + 1)$

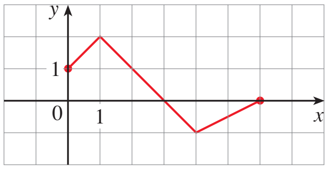
(c) $y = \frac{1}{2}f(x)$ (d) $y = -f(x)$



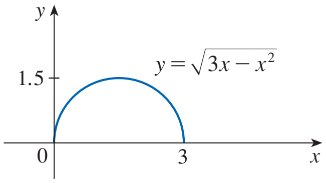
**5.** The graph of $f$ is given. Use it to graph the following functions.

(a) $y = f(2x)$ (b) $y = f\left(\frac{1}{2}x\right)$

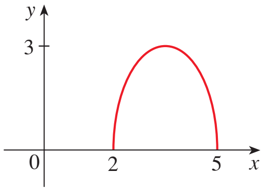
(c) $y = f(-x)$ (d) $y = -f(-x)$



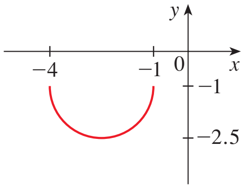
**6–7** The graph of $y = \sqrt{3x - x^2}$ is given. Use transformations to create a function whose graph is as shown.



**6.**



**7.**



**8.** (a) How is the graph of $y = 1 + \sqrt{x}$ related to the graph of $y = \sqrt{x}$? Use your answer and Figure 4(a) to sketch the graph of $y = 1 + \sqrt{x}$.

(b) How is the graph of $y = 5 \sin \pi x$ related to the graph of $y = \sin x$? Use your answer and Figure 6 to sketch the graph of $y = 5 \sin \pi x$.

**9–26** Graph the function by hand, not by plotting points, but by starting with the graph of one of the standard functions given in Table 1.2.3, and then applying the appropriate transformations.

**9.** $y = 1 + x^2$

**10.** $y = (x + 1)^2$

**11.** $y = |x + 2|$

**12.** $y = 1 - x^3$

**13.** $y = \dfrac{1}{x} + 2$

**14.** $y = -\sqrt{x} - 1$

**15.** $y = \sin 4x$

**16.** $y = 1 + \dfrac{1}{x^2}$

**17.** $y = 2 + \sqrt{x + 1}$

**18.** $y = -(x - 1)^2 + 3$

**19.** $y = x^2 - 2x + 5$

**20.** $y = (x + 1)^3 + 2$

**21.** $y = 2 - |x|$

**22.** $y = 2 - 2 \cos x$

**23.** $y = 3 \sin \frac{1}{2}x + 1$

**24.** $y = \dfrac{1}{4} \tan\left(x - \dfrac{\pi}{4}\right)$

**25.** $y = |\cos \pi x|$

**26.** $y = |\sqrt{x} - 1|$

**27.** The city of New Orleans is located at latitude 30°N. Use Figure 9 to find a function that models the number of hours of daylight at New Orleans as a function of the time of year. To check the accuracy of your model, use the fact that on March 31 the sun rises at 5:51 AM and sets at 6:18 PM in New Orleans.

**28.** A variable star is one whose brightness alternately increases and decreases. For the most visible variable star, Delta Cephei, the time between periods of maximum brightness is 5.4 days, the average brightness (or magnitude) of the star is 4.0, and its brightness varies by $\pm 0.35$ magnitude. Find a function that models the brightness of Delta Cephei as a function of time.

**29.** Some of the highest tides in the world occur in the Bay of Fundy on the Atlantic Coast of Canada. At Hopewell Cape the water depth at low tide is about 2.0 m and at high tide it is about 12.0 m. The natural period of oscillation is about 12 hours and on a particular day, high tide occurred at 6:45 AM. Find a function involving the cosine function that models the water depth $D(t)$ (in meters) as a function of time $t$ (in hours after midnight) on that day.

**30.** In a normal respiratory cycle the volume of air that moves into and out of the lungs is about 500 mL. The reserve and residue volumes of air that remain in the lungs occupy about 2000 mL and a single respiratory cycle for an average human takes about 4 seconds. Find a model for the total volume of air $V(t)$ in the lungs as a function of time.

**31.** (a) How is the graph of $y = f(|x|)$ related to the graph of $f$?

(b) Sketch the graph of $y = \sin |x|$.

(c) Sketch the graph of $y = \sqrt{|x|}$.

**32.** Use the given graph of $f$ to sketch the graph of $y = 1/f(x)$. Which features of $f$ are the most important in sketching $y = 1/f(x)$? Explain how they are used.

**33–34** Find (a) $f + g$, (b) $f - g$, (c) $fg$, and (d) $f/g$ and state their domains.

**33.** $f(x) = \sqrt{25 - x^2}$, $g(x) = \sqrt{x + 1}$

**34.** $f(x) = \dfrac{1}{x - 1}$, $g(x) = \dfrac{1}{x} - 2$

**35–40** Find the functions (a) $f \circ g$, (b) $g \circ f$, (c) $f \circ f$, and (d) $g \circ g$ and their domains.

**35.** $f(x) = x^3 + 5$, $g(x) = \sqrt[3]{x}$

**36.** $f(x) = \dfrac{1}{x}$, $g(x) = 2x + 1$

**37.** $f(x) = \dfrac{1}{\sqrt{x}}$, $g(x) = x + 1$

**38.** $f(x) = \dfrac{x}{x + 1}$, $g(x) = 2x - 1$

**39.** $f(x) = \dfrac{2}{x}$, $g(x) = \sin x$

**40.** $f(x) = \sqrt{5 - x}$, $g(x) = \sqrt{x - 1}$

**41–44** Find $f \circ g \circ h$.

**41.** $f(x) = 3x - 2$, $g(x) = \sin x$, $h(x) = x^2$

**42.** $f(x) = |x - 4|$, $g(x) = 2^x$, $h(x) = \sqrt{x}$

**43.** $f(x) = \sqrt{x - 3}$, $g(x) = x^2$, $h(x) = x^3 + 2$

**44.** $f(x) = \tan x$, $g(x) = \dfrac{x}{x - 1}$, $h(x) = \sqrt[3]{x}$

**45–50** Express the function in the form $f \circ g$.

**45.** $F(x) = (2x + x^2)^4$

**46.** $F(x) = \cos^2 x$

**47.** $F(x) = \dfrac{\sqrt[3]{x}}{1 + \sqrt[3]{x}}$

**48.** $G(x) = \sqrt[3]{\dfrac{x}{1 + x}}$

**49.** $v(t) = \sec(t^2)\tan(t^2)$

**50.** $H(x) = \sqrt{1 + \sqrt{x}}$

**51–54** Express the function in the form $f \circ g \circ h$.

**51.** $R(x) = \sqrt{\sqrt{x} - 1}$

**52.** $H(x) = \sqrt[8]{2 + |x|}$

**53.** $S(t) = \sin^2(\cos t)$

**54.** $H(t) = \cos\left(\sqrt{\tan t} + 1\right)$

**55–56** Use the table to evaluate each expression.

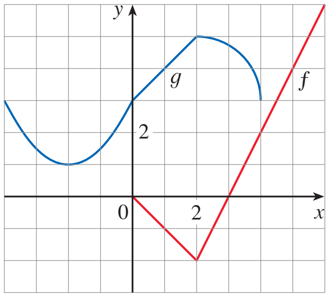
| $x$ | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|
| $f(x)$ | 3 | 1 | 5 | 6 | 2 | 4 |
| $g(x)$ | 5 | 3 | 4 | 1 | 3 | 2 |

**55.** (a) $f(g(3))$ (b) $g(f(2))$
(c) $(f \circ g)(5)$ (d) $(g \circ f)(5)$

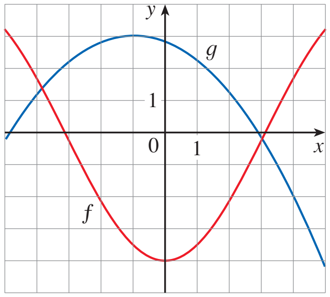
**56.** (a) $g(g(g(2)))$ (b) $(f \circ f \circ f)(1)$
(c) $(f \circ f \circ g)(1)$ (d) $(g \circ f \circ g)(3)$

**57.** Use the given graphs of $f$ and $g$ to evaluate each expression, or explain why it is undefined.

(a) $f(g(2))$ (b) $g(f(0))$ (c) $(f \circ g)(0)$
(d) $(g \circ f)(6)$ (e) $(g \circ g)(-2)$ (f) $(f \circ f)(4)$



**58.** Use the given graphs of $f$ and $g$ to estimate the value of $f(g(x))$ for $x = -5, -4, -3, \ldots, 5$. Use these estimates to sketch a rough graph of $f \circ g$.



**59.** A stone is dropped into a lake, creating a circular ripple that travels outward at a speed of 60 cm/s.

(a) Express the radius $r$ of this circle as a function of the time $t$ (in seconds).

(b) If $A$ is the area of this circle as a function of the radius, find $A \circ r$ and interpret it.

**60.** A spherical balloon is being inflated and the radius of the balloon is increasing at a rate of 2 cm/s.

(a) Express the radius $r$ of the balloon as a function of the time $t$ (in seconds).

(b) If $V$ is the volume of the balloon as a function of the radius, find $V \circ r$ and interpret it.

**61.** A ship is moving at a speed of 30 km/h parallel to a straight shoreline. The ship is 6 km from shore and it passes a lighthouse at noon.

(a) Express the distance $s$ between the lighthouse and the ship as a function of $d$, the distance the ship has traveled since noon; that is, find $f$ so that $s = f(d)$.

(b) Express $d$ as a function of $t$, the time elapsed since noon; that is, find $g$ so that $d = g(t)$.

(c) Find $f \circ g$. What does this function represent?

**62.** An airplane is flying at a speed of 350 mi/h at an altitude of one mile and passes directly over a radar station at time $t = 0$.
(a) Express the horizontal distance $d$ (in miles) that the plane has flown as a function of $t$.
(b) Express the distance $s$ between the plane and the radar station as a function of $d$.
(c) Use composition to express $s$ as a function of $t$.

**63. The Heaviside Function** The *Heaviside function* $H$ is defined by

$$H(t) = \begin{cases} 0 & \text{if } t < 0 \\ 1 & \text{if } t \geqslant 0 \end{cases}$$

It is used in the study of electric circuits to represent the sudden surge of electric current, or voltage, when a switch is instantaneously turned on.
(a) Sketch the graph of the Heaviside function.
(b) Sketch the graph of the voltage $V(t)$ in a circuit if the switch is turned on at time $t = 0$ and 120 volts are applied instantaneously to the circuit. Write a formula for $V(t)$ in terms of $H(t)$.
(c) Sketch the graph of the voltage $V(t)$ in a circuit if the switch is turned on at time $t = 5$ seconds and 240 volts are applied instantaneously to the circuit. Write a formula for $V(t)$ in terms of $H(t)$. (Note that starting at $t = 5$ corresponds to a translation.)

**64. The Ramp Function** The Heaviside function defined in Exercise 63 can also be used to define the *ramp function* $y = ctH(t)$, which represents a gradual increase in voltage or current in a circuit.
(a) Sketch the graph of the ramp function $y = tH(t)$.
(b) Sketch the graph of the voltage $V(t)$ in a circuit if the switch is turned on at time $t = 0$ and the voltage is gradually increased to 120 volts over a 60-second time interval. Write a formula for $V(t)$ in terms of $H(t)$ for $t \leqslant 60$.
(c) Sketch the graph of the voltage $V(t)$ in a circuit if the switch is turned on at time $t = 7$ seconds and the voltage is gradually increased to 100 volts over a period of 25 seconds. Write a formula for $V(t)$ in terms of $H(t)$ for $t \leqslant 32$.

**65.** Let $f$ and $g$ be linear functions with equations $f(x) = m_1x + b_1$ and $g(x) = m_2x + b_2$. Is $f \circ g$ also a linear function? If so, what is the slope of its graph?

**66.** If you invest $x$ dollars at 4% interest compounded annually, then the amount $A(x)$ of the investment after one year is $A(x) = 1.04x$. Find $A \circ A$, $A \circ A \circ A$, and $A \circ A \circ A \circ A$. What do these compositions represent? Find a formula for the composition of $n$ copies of $A$.

**67.** (a) If $g(x) = 2x + 1$ and $h(x) = 4x^2 + 4x + 7$, find a function $f$ such that $f \circ g = h$. (Think about what operations you would have to perform on the formula for $g$ to end up with the formula for $h$.)
(b) If $f(x) = 3x + 5$ and $h(x) = 3x^2 + 3x + 2$, find a function $g$ such that $f \circ g = h$.

**68.** If $f(x) = x + 4$ and $h(x) = 4x - 1$, find a function $g$ such that $g \circ f = h$.

**69.** Suppose $g$ is an even function and let $h = f \circ g$. Is $h$ always an even function?

**70.** Suppose $g$ is an odd function and let $h = f \circ g$. Is $h$ always an odd function? What if $f$ is odd? What if $f$ is even?

**71.** Let $f(x)$ be a function with domain $\mathbb{R}$.
(a) Show that $E(x) = f(x) + f(-x)$ is an even function.
(b) Show that $O(x) = f(x) - f(-x)$ is an odd function.
(c) Prove that every function $f(x)$ can be written as a sum of an even function and an odd function.
(d) Express the function $f(x) = 2^x + (x - 3)^2$ as a sum of an even function and an odd function.

## 1.4 The Tangent and Velocity Problems

In this section we see how limits arise when we attempt to find the tangent to a curve or the velocity of an object.

### The Tangent Problem

The word *tangent* is derived from the Latin word *tangens*, which means "touching." We can think of a tangent to a curve as a line that touches the curve and follows the same direction as the curve at the point of contact. How can this idea be made precise?

For a circle we could simply follow Euclid and say that a tangent is a line $\ell$ that intersects the circle once and only once, as in Figure 1(a). For more complicated curves this definition is inadequate. Figure l(b) shows a line $\ell$ that appears to be a tangent to the curve $C$ at point $P$, but it intersects $C$ twice.

To be specific, let's look at the problem of trying to find a tangent line $\ell$ to the parabola $y = x^2$ in the following example.

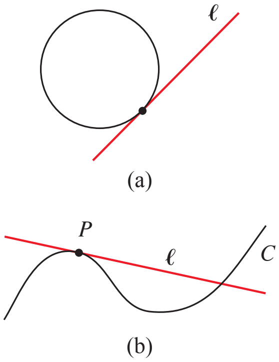

**FIGURE 1**

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 1** Find an equation of the tangent line to the parabola $y = x^2$ at the point $P(1, 1)$.

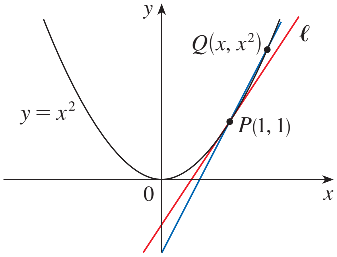

**FIGURE 2**

**SOLUTION** We will be able to find an equation of the tangent line $\ell$ as soon as we know its slope $m$. The difficulty is that we know only one point, $P$, on $\ell$, whereas we need two points to compute the slope. But observe that we can compute an approximation to $m$ by choosing a nearby point $Q(x, x^2)$ on the parabola (as in Figure 2) and computing the slope $m_{PQ}$ of the secant line $PQ$. (A **secant line**, from the Latin word *secans*, meaning cutting, is a line that cuts [intersects] a curve more than once.)

We choose $x \neq 1$ so that $Q \neq P$. Then

$$m_{PQ} = \frac{x^2 - 1}{x - 1}$$

For instance, for the point $Q(1.5, 2.25)$ we have

$$m_{PQ} = \frac{2.25 - 1}{1.5 - 1} = \frac{1.25}{0.5} = 2.5$$

The following tables show the values of $m_{PQ}$ for several values of $x$ close to 1. The closer $Q$ is to $P$, the closer $x$ is to 1 and, it appears from the tables, the closer $m_{PQ}$ is to 2. This suggests that the slope of the tangent line $\ell$ should be $m = 2$.

| $x$ | $m_{PQ}$ |
|---|---|
| 2 | 3 |
| 1.5 | 2.5 |
| 1.1 | 2.1 |
| 1.01 | 2.01 |
| 1.001 | 2.001 |

| $x$ | $m_{PQ}$ |
|---|---|
| 0 | 1 |
| 0.5 | 1.5 |
| 0.9 | 1.9 |
| 0.99 | 1.99 |
| 0.999 | 1.999 |

We say that the slope of the tangent line is the *limit* of the slopes of the secant lines, and we express this symbolically by writing

$$\lim_{Q \to P} m_{PQ} = m \qquad \text{and} \qquad \lim_{x \to 1} \frac{x^2 - 1}{x - 1} = 2$$

Assuming that the slope of the tangent line is indeed 2, we use the point-slope form of the equation of a line [$y - y_1 = m(x - x_1)$, see Appendix B] to write the equation of the tangent line through $(1, 1)$ as

$$y - 1 = 2(x - 1) \qquad \text{or} \qquad y = 2x - 1$$ ■

Figure 3 illustrates the limiting process that occurs in Example 1. As $Q$ approaches $P$ along the parabola, the corresponding secant lines rotate about $P$ and approach the tangent line $\ell$.

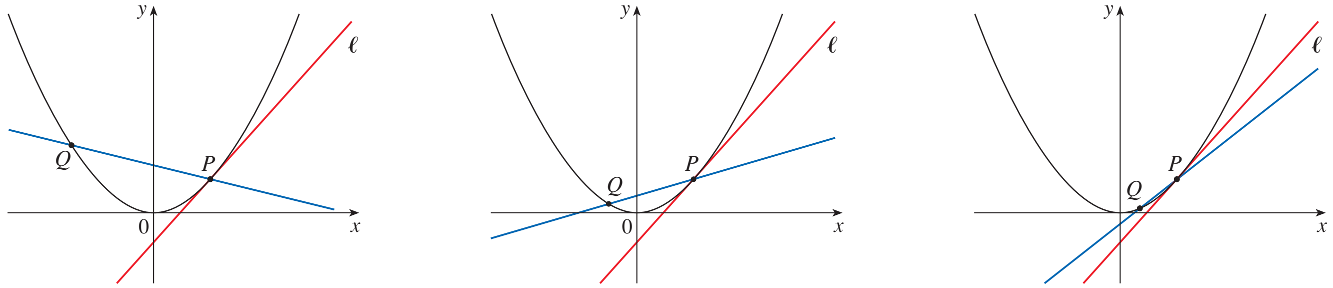
*Q* approaches *P* from the right



*Q* approaches *P* from the left

**FIGURE 3**

Many functions that occur in the sciences are not described by explicit equations; they are defined by experimental data. The next example shows how to estimate the slope of the tangent line to the graph of such a function.

| $t$ | $Q$ |
|---|---|
| 0 | 10 |
| 0.02 | 8.187 |
| 0.04 | 6.703 |
| 0.06 | 5.488 |
| 0.08 | 4.493 |
| 0.1 | 3.676 |

**EXAMPLE 2** A pulse laser operates by storing charge on a capacitor and releasing it suddenly when the laser is fired. The data in the table describe the charge $Q$ remaining on the capacitor (measured in coulombs) at time $t$ (measured in seconds after the laser is fired). Use the data to draw the graph of this function and estimate the slope of the tangent line at the point where $t = 0.04$. (*Note:* The slope of the tangent line represents the electric current flowing from the capacitor to the laser [measured in amperes].)

**SOLUTION** In Figure 4 we plot the given data and use these points to sketch a curve that approximates the graph of the function.

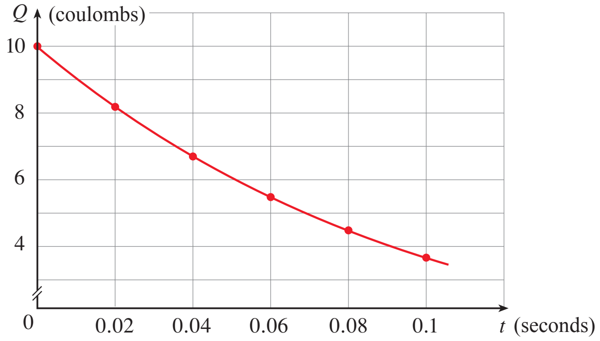


**FIGURE 4**

Given the points $P(0.04, 6.703)$ and $R(0, 10)$ on the graph, we find that the slope of the secant line $PR$ is

$$m_{PR} = \frac{10 - 6.703}{0 - 0.04} = -82.425$$

| $R$ | $m_{PR}$ |
|---|---|
| (0, 10) | −82.425 |
| (0.02, 8.187) | −74.200 |
| (0.06, 5.488) | −60.750 |
| (0.08, 4.493) | −55.250 |
| (0.1, 3.676) | −50.450 |

The table at the left shows the results of similar calculations for the slopes of other secant lines. From this table we would expect the slope of the tangent line at $t = 0.04$ to lie somewhere between $-74.20$ and $-60.75$. In fact, the average of the slopes of the two closest secant lines is

$$\tfrac{1}{2}(-74.20 - 60.75) = -67.475$$

So, by this method, we estimate the slope of the tangent line to be about $-67.5$.

Another method is to draw an approximation to the tangent line at $P$ and measure the sides of the triangle $ABC$, as in Figure 5.

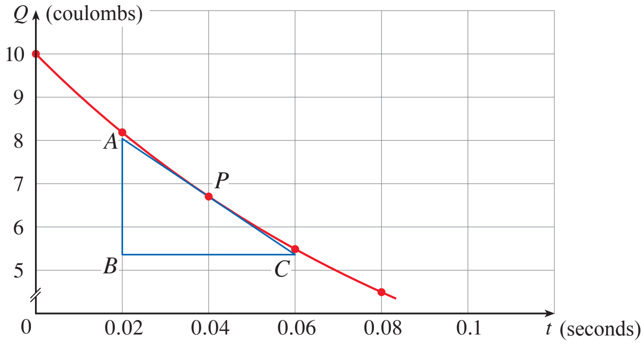

**FIGURE 5**

The physical meaning of the answer in Example 2 is that the electric current flowing from the capacitor to the laser after 0.04 seconds is about −65 amperes.

This gives an estimate of the slope of the tangent line as

$$-\frac{|AB|}{|BC|} \approx -\frac{8.0 - 5.4}{0.06 - 0.02} = -65.0$$ ■

## The Velocity Problem

If you watch the speedometer of a car as you drive in city traffic, you see that the speed doesn't stay the same for very long; that is, the velocity of the car is not constant. We assume from watching the speedometer that the car has a definite velocity at each moment, but how is the "instantaneous" velocity defined?

Let's consider the *velocity problem:* Find the instantaneous velocity of an object moving along a straight path at a specific time if the position of the object at any time is known. In the next example, we investigate the velocity of a falling ball. Through experiments carried out four centuries ago, Galileo discovered that the distance fallen by any freely falling body is proportional to the square of the time it has been falling. (This model for free fall neglects air resistance.) If the distance fallen after $t$ seconds is denoted by $s(t)$ and measured in meters, then (at the earth's surface) Galileo's observation is expressed by the equation

$$s(t) = 4.9t^2$$

Steve Allen / Stockbyte / Getty Images

CN Tower in Toronto

**EXAMPLE 3** Suppose that a ball is dropped from the upper observation deck of the CN Tower in Toronto, 450 m above the ground. Find the velocity of the ball after 5 seconds.

**SOLUTION** The difficulty in finding the instantaneous velocity at 5 seconds is that we are dealing with a single instant of time ($t = 5$), so no time interval is involved. However, we can approximate the desired quantity by computing the average velocity over the brief time interval of a tenth of a second from $t = 5$ to $t = 5.1$:

$$\begin{aligned}\text{average velocity} &= \frac{\text{change in position}}{\text{time elapsed}}\\ &= \frac{s(5.1) - s(5)}{0.1}\\ &= \frac{4.9(5.1)^2 - 4.9(5)^2}{0.1} = 49.49 \text{ m/s}\end{aligned}$$

The following table shows the results of similar calculations of the average velocity over successively smaller time periods.

| Time interval | Average velocity (m/s) |
|---|---|
| $5 \leqslant t \leqslant 5.1$ | 49.49 |
| $5 \leqslant t \leqslant 5.05$ | 49.245 |
| $5 \leqslant t \leqslant 5.01$ | 49.049 |
| $5 \leqslant t \leqslant 5.001$ | 49.0049 |

It appears that as we shorten the time period, the average velocity is becoming closer to 49 m/s. The **instantaneous velocity** when $t = 5$ is defined to be the *limiting value* of these average velocities over shorter and shorter time periods that start at $t = 5$. Thus it appears that the (instantaneous) velocity after 5 seconds is 49 m/s. ■

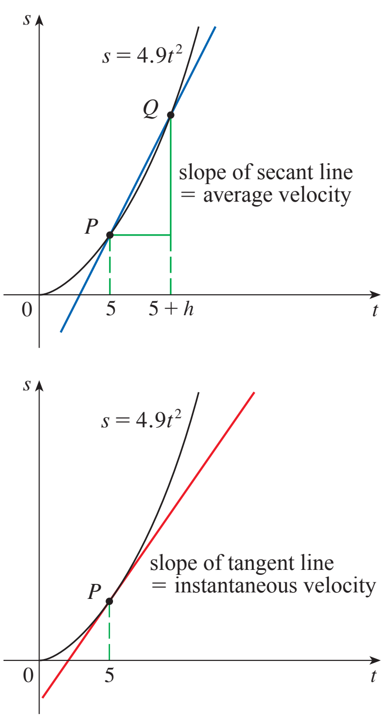

**FIGURE 6**

You may have the feeling that the calculations used in solving this problem are very similar to those used earlier in this section to find tangents. In fact, there is a close connection between the tangent problem and the velocity problem. If we draw the graph of the distance function of the ball (as in Figure 6) and we consider the points $P(5, 4.9(5)^2)$ and $Q(5 + h, 4.9(5 + h)^2)$ on the graph, then the slope of the secant line $PQ$ is

$$m_{PQ} = \frac{4.9(5 + h)^2 - 4.9(5)^2}{(5 + h) - 5}$$

which is the same as the average velocity over the time interval $[5, 5 + h]$. Therefore the velocity at time $t = 5$ (the limit of these average velocities as $h$ approaches 0) must be equal to the slope of the tangent line at $P$ (the limit of the slopes of the secant lines).

Examples 1 and 3 show that in order to solve tangent and velocity problems we must be able to find limits. After studying methods for computing limits in the next four sections, we will return to the problems of finding tangents and velocities in Chapter 2.

## 1.4 Exercises

**1.** A tank holds 1000 gallons of water, which drains from the bottom of the tank in half an hour. The values in the table show the volume $V$ of water remaining in the tank (in gallons) after $t$ minutes.

| $t$ (min) | 5 | 10 | 15 | 20 | 25 | 30 |
|---|---|---|---|---|---|---|
| $V$ (gal) | 694 | 444 | 250 | 111 | 28 | 0 |

(a) If $P$ is the point (15, 250) on the graph of $V$, find the slopes of the secant lines $PQ$ when $Q$ is the point on the graph with $t = 5, 10, 20, 25$, and 30.

(b) Estimate the slope of the tangent line at $P$ by averaging the slopes of two secant lines.

(c) Use a graph of $V$ to estimate the slope of the tangent line at $P$. (This slope represents the rate at which the water is flowing from the tank after 15 minutes.)

**2.** A student bought a smartwatch that tracks the number of steps she walks throughout the day. The table shows the number of steps recorded $t$ minutes after 3:00 PM on the first day she wore the watch.

| $t$ (min) | 0 | 10 | 20 | 30 | 40 |
|---|---|---|---|---|---|
| Steps | 3438 | 4559 | 5622 | 6536 | 7398 |

(a) Find the slopes of the secant lines corresponding to the given intervals of $t$. What do these slopes represent?
(i) [0, 40] (ii) [10, 20] (iii) [20, 30]

(b) Estimate the student's walking pace, in steps per minute, at 3:20 PM by averaging the slopes of two secant lines.

**3.** The point $P(2, -1)$ lies on the curve $y = 1/(1 - x)$.

(a) If $Q$ is the point $(x, 1/(1 - x))$, find the slope of the secant line $PQ$ (correct to six decimal places) for the following values of $x$:
(i) 1.5 (ii) 1.9 (iii) 1.99 (iv) 1.999
(v) 2.5 (vi) 2.1 (vii) 2.01 (viii) 2.001

(b) Using the results of part (a), guess the value of the slope of the tangent line to the curve at $P(2, -1)$.

(c) Using the slope from part (b), find an equation of the tangent line to the curve at $P(2, -1)$.

**4.** The point $P(0.5, 0)$ lies on the curve $y = \cos \pi x$.

(a) If $Q$ is the point $(x, \cos \pi x)$, find the slope of the secant line $PQ$ (correct to six decimal places) for the following values of $x$:
(i) 0 (ii) 0.4 (iii) 0.49
(iv) 0.499 (v) 1 (vi) 0.6
(vii) 0.51 (viii) 0.501

(b) Using the results of part (a), guess the value of the slope of the tangent line to the curve at $P(0.5, 0)$.

(c) Using the slope from part (b), find an equation of the tangent line to the curve at $P(0.5, 0)$.

(d) Sketch the curve, two of the secant lines, and the tangent line.

**5.** The deck of a bridge is suspended 275 feet above a river. If a pebble falls off the side of the bridge, the height, in feet, of the pebble above the water surface after $t$ seconds is given by $y = 275 - 16t^2$.

(a) Find the average velocity of the pebble for the time period beginning when $t = 4$ and lasting
(i) 0.1 seconds (ii) 0.05 seconds (iii) 0.01 seconds

(b) Estimate the instantaneous velocity of the pebble after 4 seconds.

**6.** If a rock is thrown upward on the planet Mars with a velocity of 10 m/s, its height in meters $t$ seconds later is given by $y = 10t - 1.86t^2$.

(a) Find the average velocity over the given time intervals:
(i) [1, 2] (ii) [1, 1.5] (iii) [1, 1.1]
(iv) [1, 1.01] (v) [1, 1.001]

(b) Estimate the instantaneous velocity when $t = 1$.

**7.** The table shows the position of a motorcyclist after accelerating from rest.

| $t$ (seconds) | 0 | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|---|
| $s$ (feet) | 0 | 4.9 | 20.6 | 46.5 | 79.2 | 124.8 | 176.7 |

(a) Find the average velocity for each time period:
(i) [2, 4] (ii) [3, 4] (iii) [4, 5] (iv) [4, 6]

(b) Use the graph of $s$ as a function of $t$ to estimate the instantaneous velocity when $t = 3$.

**8.** The displacement (in centimeters) of a particle moving back and forth along a straight line is given by the equation of motion $s = 2 \sin \pi t + 3 \cos \pi t$, where $t$ is measured in seconds.

(a) Find the average velocity during each time period:
(i) [1, 2] (ii) [1, 1.1]
(iii) [1, 1.01] (iv) [1, 1.001]

(b) Estimate the instantaneous velocity of the particle when $t = 1$.

**9.** The point $P(1, 0)$ lies on the curve $y = \sin(10\pi/x)$.

(a) If $Q$ is the point $(x, \sin(10\pi/x))$, find the slope of the secant line $PQ$ (correct to four decimal places) for $x = 2$, 1.5, 1.4, 1.3, 1.2, 1.1, 0.5, 0.6, 0.7, 0.8, and 0.9. Do the slopes appear to be approaching a limit?

(b) Use a graph of the curve to explain why the slopes of the secant lines in part (a) are not close to the slope of the tangent line at $P$.

(c) By choosing appropriate secant lines, estimate the slope of the tangent line at $P$.

## 1.5 The Limit of a Function

Having seen in the preceding section how limits arise when we want to find the tangent to a curve or the velocity of an object, we now turn our attention to limits in general and numerical and graphical methods for computing them.

### Finding Limits Numerically and Graphically

Let's investigate the behavior of the function $f$ defined by $f(x) = (x - 1)/(x^2 - 1)$ for values of $x$ near 1. The following table gives values of $f(x)$ for values of $x$ close to 1 but not equal to 1.

| $x < 1$ | $f(x)$ | $x > 1$ | $f(x)$ |
|---|---|---|---|
| 0.5 | 0.666667 | 1.5 | 0.400000 |
| 0.9 | 0.526316 | 1.1 | 0.476190 |
| 0.99 | 0.502513 | 1.01 | 0.497512 |
| 0.999 | 0.500250 | 1.001 | 0.499750 |
| 0.9999 | 0.500025 | 1.0001 | 0.499975 |
| ↓ 1 | ↓ 0.5 | ↓ 1 | ↓ 0.5 |

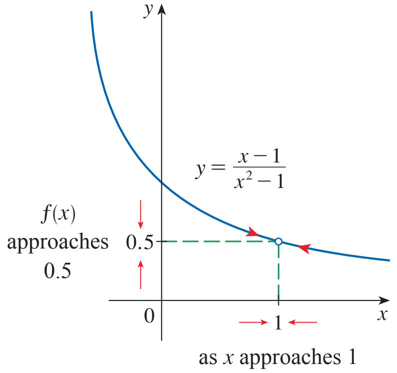

**FIGURE 1**

From the table and the graph of $f$ shown in Figure 1 we see that the closer $x$ is to 1 (on either side of 1), the closer $f(x)$ is to 0.5. In fact, it appears that we can make the values of $f(x)$ as close as we like to 0.5 by taking $x$ sufficiently close to 1. We express this by saying "the limit of the function $f(x) = (x - 1)/(x^2 - 1)$ as $x$ approaches 1 is equal to 0.5." The notation for this is

$$\lim_{x \to 1} \frac{x - 1}{x^2 - 1} = 0.5$$

In general, we use the following notation.

**1 Intuitive Definition of a Limi** Suppose $f(x)$ is defined when $x$ is near the number $a$. (This means that $f$ is defined on some open interval that contains $a$, except possibly at $a$ itself.) Then we write

$$\lim_{x \to a} f(x) = L$$

and say "the limit of $f(x)$, as $x$ approaches $a$, equals $L$"

if we can make the values of $f(x)$ arbitrarily close to $L$ (as close to $L$ as we like) by restricting $x$ to be sufficiently close to $a$ (on either side of $a$) but not equal to $a$.

Roughly speaking, this says that the values of $f(x)$ approach $L$ as $x$ approaches $a$. In other words, the values of $f(x)$ tend to get closer and closer to the number $L$ as $x$ gets closer and closer to the number $a$ (from either side of $a$) but $x \neq a$. (A more precise definition will be given in Section 1.7.)

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

An alternative notation for

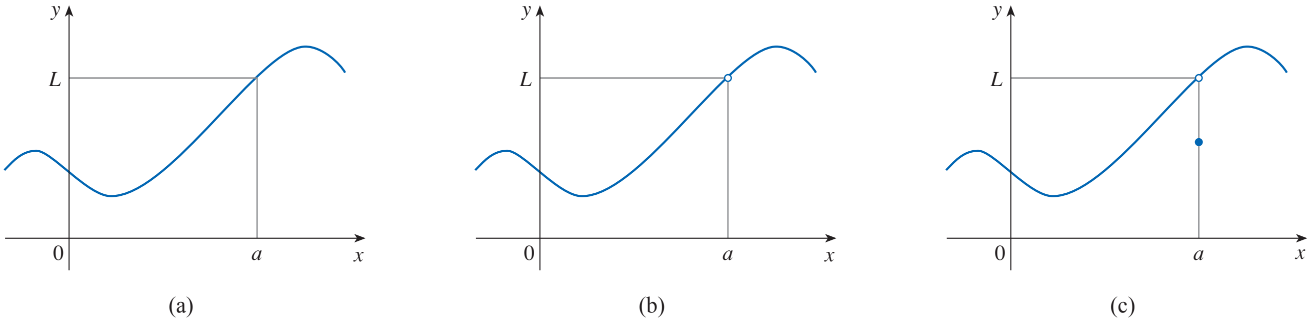
$$\lim_{x \to a} f(x) = L$$

is $$f(x) \to L \qquad \text{as} \qquad x \to a$$

which is usually read "$f(x)$ approaches $L$ as $x$ approaches $a$."

Notice the phrase "but $x$ not equal to $a$" in the definition of limit. This means that in finding the limit of $f(x)$ as $x$ approaches $a$, we never consider $x = a$. In fact, $f(x)$ need not even be defined when $x = a$. The only thing that matters is how $f$ is defined *near* $a$.

Figure 2 shows the graphs of three functions. Note that in part (b), $f(a)$ is not defined and in part (c), $f(a) \neq L$. But in each case, regardless of what happens at $a$, it is true that $\lim_{x \to a} f(x) = L$.



(a) (b) (c)

**FIGURE 2** $\lim_{x \to a} f(x) = L$ in all three cases

**EXAMPLE 1** Estimate the value of $\displaystyle\lim_{t \to 0} \frac{\sqrt{t^2 + 9} - 3}{t^2}$.

**SOLUTION** The table lists values of the function for several values of $t$ near 0.

| $t$ | $\dfrac{\sqrt{t^2 + 9} - 3}{t^2}$ |
|---|---|
| $\pm 1.0$ | 0.162277 . . . |
| $\pm 0.5$ | 0.165525 . . . |
| $\pm 0.1$ | 0.166620 . . . |
| $\pm 0.05$ | 0.166655 . . . |
| $\pm 0.01$ | 0.166666 . . . |

As $t$ approaches 0, the values of the function seem to approach 0.1666666 . . . and so we guess that

$$\lim_{t \to 0} \frac{\sqrt{t^2 + 9} - 3}{t^2} = \frac{1}{6} \qquad ■$$

| $t$ | $\dfrac{\sqrt{t^2 + 9} - 3}{t^2}$ |
|---|---|
| $\pm 0.001$ | 0.166667 |
| $\pm 0.0001$ | 0.166670 |
| $\pm 0.00001$ | 0.167000 |
| $\pm 0.000001$ | 0.000000 |

In Example 1 what would have happened if we had taken even smaller values of $t$? The table in the margin shows the results from one calculator; you can see that something strange seems to be happening.

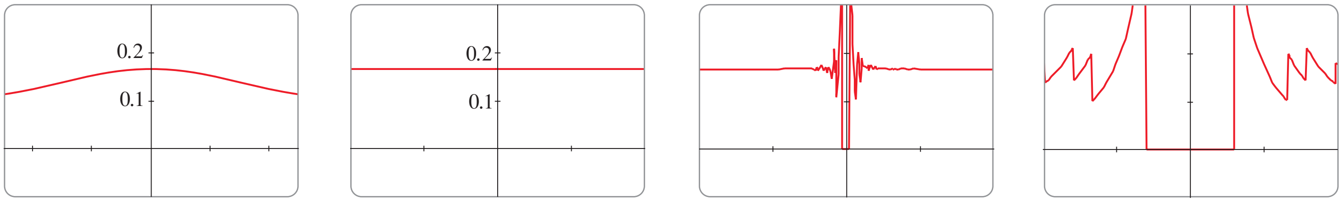
If you try these calculations on your own calculator you might get different values, but eventually you will get the value 0 if you make $t$ sufficiently small. Does this mean that the answer is really 0 instead of $\frac{1}{6}$? No, the value of the limit is $\frac{1}{6}$, as we will show in the next section. The problem is that the calculator gave false values because $\sqrt{t^2 + 9}$ is very close to 3 when $t$ is small. (In fact, when $t$ is sufficiently small, a calculator's value for $\sqrt{t^2 + 9}$ is $3.000\ldots$ to as many digits as the calculator is capable of carrying.)

**www.StewartCalculus.com**
For a further explanation of why calculators sometimes give false values, click on *Lies My Calculator and Computer Told Me*. In particular, see the section called *The Perils of Subtraction*.

Something similar happens when we try to graph the function

$$f(t) = \frac{\sqrt{t^2 + 9} - 3}{t^2}$$

of Example 1 on a graphing calculator or computer. Parts (a) and (b) of Figure 3 show quite accurate graphs of $f$, and if we trace along the curve, we can estimate easily that the limit is about $\frac{1}{6}$. But if we zoom in too much, as in parts (c) and (d), then we get inaccurate graphs, again due to rounding errors within the calculations.



(a) $-5 \leqslant t \leqslant 5$ (b) $-0.1 \leqslant t \leqslant 0.1$ (c) $-10^{-6} \leqslant t \leqslant 10^{-6}$ (d) $-10^{-7} \leqslant t \leqslant 10^{-7}$

**FIGURE 3**

**EXAMPLE 2** Guess the value of $\displaystyle\lim_{x \to 0} \frac{\sin x}{x}$.

**SOLUTION** The function $f(x) = (\sin x)/x$ is not defined when $x = 0$. Using a calculator (and remembering that, if $x \in \mathbb{R}$, $\sin x$ means the sine of the angle whose *radian* measure is $x$), we construct a table of values correct to eight decimal places. From the table at the left and the graph in Figure 4 we guess that

| $x$ | $\dfrac{\sin x}{x}$ |
|---|---|
| ±1.0 | 0.84147098 |
| ±0.5 | 0.95885108 |
| ±0.4 | 0.97354586 |
| ±0.3 | 0.98506736 |
| ±0.2 | 0.99334665 |
| ±0.1 | 0.99833417 |
| ±0.05 | 0.99958339 |
| ±0.01 | 0.99998333 |
| ±0.005 | 0.99999583 |
| ±0.001 | 0.99999983 |

$$\lim_{x \to 0} \frac{\sin x}{x} = 1$$

This guess is in fact correct, as will be proved in Chapter 2 using a geometric argument.

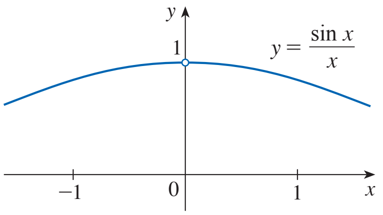


**FIGURE 4**

■

**EXAMPLE 3** Find $\lim\limits_{x\to 0}\left(x^3 + \dfrac{\cos 5x}{10{,}000}\right)$.

**SOLUTION** As before, we construct a table of values. From the first table it appears that the limit might be zero.

| $x$ | $x^3 + \dfrac{\cos 5x}{10{,}000}$ |
|---|---|
| 1 | 1.000028 |
| 0.5 | 0.124920 |
| 0.1 | 0.001088 |
| 0.05 | 0.000222 |
| 0.01 | 0.000101 |

| $x$ | $x^3 + \dfrac{\cos 5x}{10{,}000}$ |
|---|---|
| 0.005 | 0.00010009 |
| 0.001 | 0.00010000 |

But if we persevere with smaller values of $x$, the second table suggests that the limit is more likely to be 0.0001. In Section 1.8 we will be able to show that $\lim_{x\to 0}\cos 5x = 1$ and that it follows that

$$\lim_{x\to 0}\left(x^3 + \frac{\cos 5x}{10{,}000}\right) = \frac{1}{10{,}000} = 0.0001$$

■

## One-Sided Limits

The Heaviside function $H$ is defined by

$$H(t) = \begin{cases} 0 & \text{if } t < 0 \\ 1 & \text{if } t \geqslant 0 \end{cases}$$

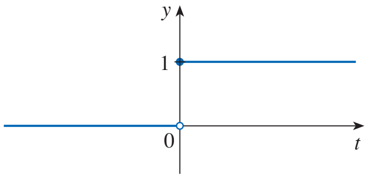

**FIGURE 5**
The Heaviside function

(This function is named after the electrical engineer Oliver Heaviside [1850–1925] and can be used to describe an electric current that is switched on at time $t = 0$.) Its graph is shown in Figure 5.

There is no single number that $H(t)$ approaches as $t$ approaches 0, so $\lim_{t\to 0} H(t)$ does not exist. However, as $t$ approaches 0 from the left, $H(t)$ approaches 0. As $t$ approaches 0 from the right, $H(t)$ approaches 1. We indicate this situation symbolically by writing

$$\lim_{t\to 0^-} H(t) = 0 \qquad \text{and} \qquad \lim_{t\to 0^+} H(t) = 1$$

and we call these *one-sided limits*. The notation $t \to 0^-$ indicates that we consider only values of $t$ that are less than 0. Likewise, $t \to 0^+$ indicates that we consider only values of $t$ that are greater than 0.

**2 Intuitive Definition of One-Sided Limits** We write

$$\lim_{x\to a^-} f(x) = L$$

and say that the **left-hand limit** of $f(x)$ as $x$ approaches $a$ [or the limit of $f(x)$ as $x$ approaches $a$ *from the left*] is equal to $L$ if we can make the values of $f(x)$ arbitrarily close to $L$ by restricting $x$ to be sufficiently close to $a$ with *$x$ less than $a$*.

We write

$$\lim_{x\to a^+} f(x) = L$$

and say that the **right-hand limit** of $f(x)$ as $x$ approaches $a$ [or the limit of $f(x)$ as $x$ approaches $a$ *from the right*] is equal to $L$ if we can make the values of $f(x)$ arbitrarily close to $L$ by restricting $x$ to be sufficiently close to $a$ with *$x$ greater than $a$*.

For instance, the notation $x \to 5^-$ means that we consider only $x < 5$, and $x \to 5^+$ means that we consider only $x > 5$. Definition 2 is illustrated in Figure 6.

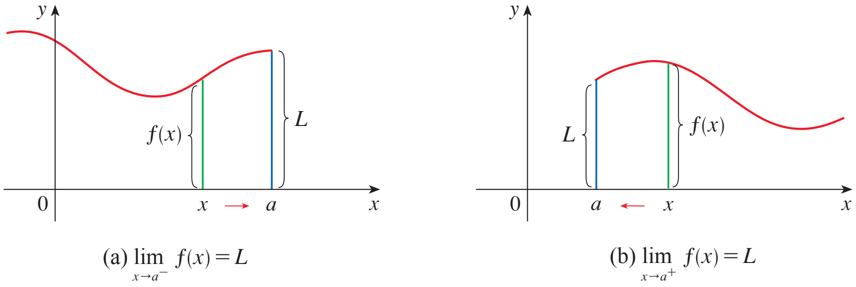

**FIGURE 6**

(a) $\lim_{x\to a^-} f(x) = L$ (b) $\lim_{x\to a^+} f(x) = L$

Notice that Definition 2 differs from Definition 1 only in that we require $x$ to be less than (or greater than) $a$. By comparing these definitions, we see that the following is true.

$$\boxed{3}\quad \lim_{x\to a} f(x) = L \quad \text{if and only if} \quad \lim_{x\to a^-} f(x) = L \quad \text{and} \quad \lim_{x\to a^+} f(x) = L$$

**EXAMPLE 4** The graph of a function $g$ is shown in Figure 7.

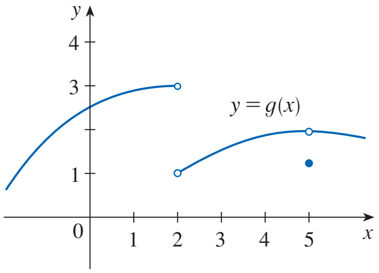

**FIGURE 7**

Use the graph to state the values (if they exist) of the following:

(a) $\lim_{x\to 2^-} g(x)$ (b) $\lim_{x\to 2^+} g(x)$ (c) $\lim_{x\to 2} g(x)$

(d) $\lim_{x\to 5^-} g(x)$ (e) $\lim_{x\to 5^+} g(x)$ (f) $\lim_{x\to 5} g(x)$

**SOLUTION** Looking at the graph we see that the values of $g(x)$ approach 3 as $x$ approaches 2 from the left, but they approach 1 as $x$ approaches 2 from the right. Therefore

$$\text{(a)} \quad \lim_{x\to 2^-} g(x) = 3 \qquad \text{and} \qquad \text{(b)} \quad \lim_{x\to 2^+} g(x) = 1$$

(c) Since the left and right limits are different, we conclude from (3) that $\lim_{x\to 2} g(x)$ does not exist.

The graph also shows that

$$\text{(d)} \quad \lim_{x\to 5^-} g(x) = 2 \qquad \text{and} \qquad \text{(e)} \quad \lim_{x\to 5^+} g(x) = 2$$

(f) This time the left and right limits are the same and so, by (3), we have

$$\lim_{x\to 5} g(x) = 2$$

Despite this fact, notice that $g(5) \neq 2$. ■

## How Can a Limit Fail to Exist?

We have seen that a limit fails to exist at a number $a$ if the left- and right-hand limits are not equal (as in Example 4). The next two examples illustrate additional ways that a limit can fail to exist.

**EXAMPLE 5** Investigate $\lim_{x\to 0} \sin \dfrac{\pi}{x}$.

**Limits and Technology**
Some software applications, including computer algebra systems (CAS), can compute limits. In order to avoid the types of pitfalls demonstrated in Examples 1, 3, and 5, such applications don't find limits by numerical experimentation. Instead, they use more sophisticated techniques such as computing infinite series. You are encouraged to use one of these resources to compute the limits in the examples of this section and check your answers to the exercises in this chapter.

**SOLUTION** Notice that the function $f(x) = \sin(\pi/x)$ is undefined at 0. Evaluating the function for some small values of $x$, we get

$$f(1) = \sin \pi = 0 \qquad f\left(\tfrac{1}{2}\right) = \sin 2\pi = 0$$

$$f\left(\tfrac{1}{3}\right) = \sin 3\pi = 0 \qquad f\left(\tfrac{1}{4}\right) = \sin 4\pi = 0$$

$$f(0.1) = \sin 10\pi = 0 \qquad f(0.01) = \sin 100\pi = 0$$

Similarly, $f(0.001) = f(0.0001) = 0$. On the basis of this information we might be tempted to guess that the limit is 0, but this time our guess is wrong. Note that although $f(1/n) = \sin n\pi = 0$ for any integer $n$, it is also true that $f(x) = 1$ for infinitely many values of $x$ (such as $2/5$ or $2/101$) that approach 0. You can see this from the graph of $f$ shown in Figure 8.

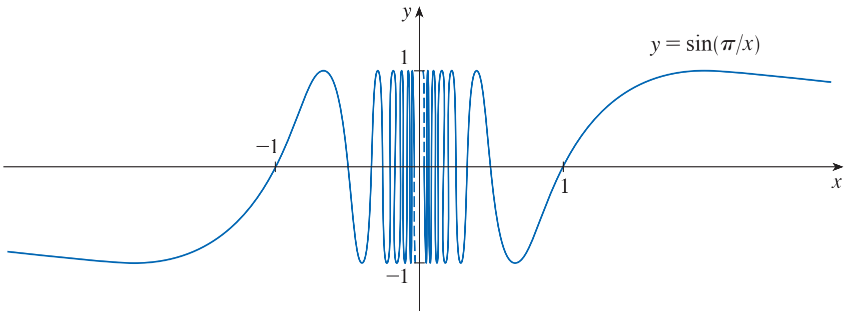

**FIGURE 8**

The dashed lines near the $y$-axis indicate that the values of $\sin(\pi/x)$ oscillate between 1 and $-1$ infinitely often as $x$ approaches 0.

Since the values of $f(x)$ do not approach a fixed number as $x$ approaches 0,

$$\lim_{x\to 0} \sin \frac{\pi}{x} \quad \text{does not exist}$$

■

Examples 3 and 5 illustrate some of the pitfalls in guessing the value of a limit. It is easy to guess the wrong value if we use inappropriate values of $x$, but it is difficult to know when to stop calculating values. And, as the discussion after Example 1 shows, sometimes calculators and computers give the wrong values. In the next section, however, we will develop foolproof methods for calculating limits.

Another way a limit at a number $a$ can fail to exist is when the function values grow arbitrarily large (in absolute value) as $x$ approaches $a$.

**EXAMPLE 6** Find $\lim_{x \to 0} \dfrac{1}{x^2}$ if it exists.

**SOLUTION** As $x$ becomes close to 0, $x^2$ also becomes close to 0, and $1/x^2$ becomes very large. (See the following table.) In fact, it appears from the graph of the function $f(x) = 1/x^2$ shown in Figure 9 that the values of $f(x)$ can be made arbitrarily large by taking $x$ close enough to 0. Thus the values of $f(x)$ do not approach a number, so $\lim_{x \to 0} (1/x^2)$ does not exist.

| $x$ | $\dfrac{1}{x^2}$ |
|---|---|
| $\pm 1$ | 1 |
| $\pm 0.5$ | 4 |
| $\pm 0.2$ | 25 |
| $\pm 0.1$ | 100 |
| $\pm 0.05$ | 400 |
| $\pm 0.01$ | 10,000 |
| $\pm 0.001$ | 1,000,000 |

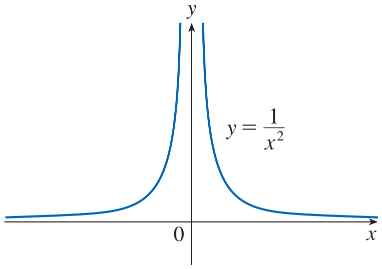

**FIGURE 9**

■

## Infinite Limits; Vertical Asymptotes

To indicate the kind of behavior exhibited in Example 6, we use the notation

$$\lim_{x \to 0} \frac{1}{x^2} = \infty$$

This does not mean that we are regarding $\infty$ as a number. Nor does it mean that the limit exists. It simply expresses the particular way in which the limit does not exist: $1/x^2$ can be made as large as we like by taking $x$ close enough to 0.

In general, we write symbolically

$$\lim_{x \to a} f(x) = \infty$$

to indicate that the values of $f(x)$ tend to become larger and larger (or "increase without bound") as $x$ becomes closer and closer to $a$.

**4 Intuitive Definition of an Infinite Limit** Let $f$ be a function defined on both sides of $a$, except possibly at $a$ itself. Then

$$\lim_{x \to a} f(x) = \infty$$

means that the values of $f(x)$ can be made arbitrarily large (as large as we please) by taking $x$ sufficiently close to $a$, but not equal to $a$.

Another notation for $\lim_{x \to a} f(x) = \infty$ is

$$f(x) \to \infty \qquad \text{as} \qquad x \to a$$

Again, the symbol $\infty$ is not a number, but the expression $\lim_{x \to a} f(x) = \infty$ is often read as

"the limit of $f(x)$, as $x$ approaches $a$, is infinity"

or "$f(x)$ becomes infinite as $x$ approaches $a$"

or "$f(x)$ increases without bound as $x$ approaches $a$"

This definition is illustrated graphically in Figure 10.

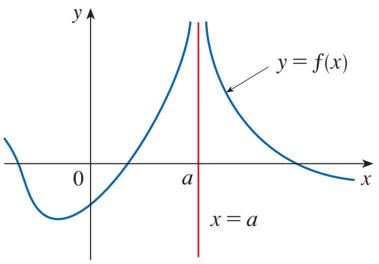

**FIGURE 10**
$\lim_{x \to a} f(x) = \infty$

When we say a number is "large negative," we mean that it is negative but its magnitude (absolute value) is large.

A similar sort of limit, for functions that become large negative as $x$ gets close to $a$, is defined in Definition 5 and is illustrated in Figure 11.

**5 Definitio** Let $f$ be a function defined on both sides of $a$, except possibly at $a$ itself. Then

$$\lim_{x \to a} f(x) = -\infty$$

means that the values of $f(x)$ can be made arbitrarily large negative by taking $x$ sufficiently close to $a$, but not equal to $a$.

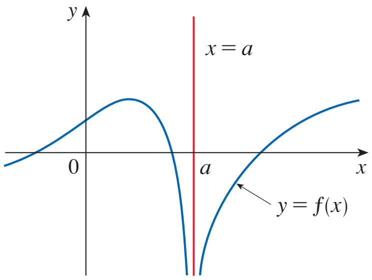

**FIGURE 11**
$\lim_{x \to a} f(x) = -\infty$

The symbol $\lim_{x \to a} f(x) = -\infty$ can be read as "the limit of $f(x)$, as $x$ approaches $a$, is negative infinity" or "$f(x)$ decreases without bound as $x$ approaches $a$." As an example we have

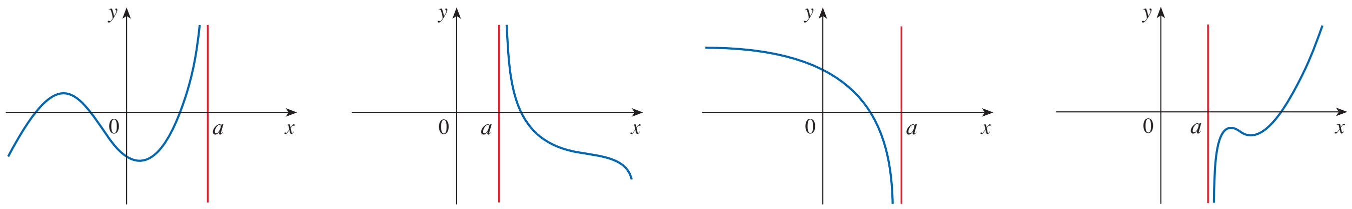
$$\lim_{x \to 0} \left( -\frac{1}{x^2} \right) = -\infty$$

Similar definitions can be given for the one-sided infinite limits

$$\lim_{x \to a^-} f(x) = \infty \qquad \lim_{x \to a^+} f(x) = \infty$$

$$\lim_{x \to a^-} f(x) = -\infty \qquad \lim_{x \to a^+} f(x) = -\infty$$

remembering that $x \to a^-$ means that we consider only values of $x$ that are less than $a$, and similarly $x \to a^+$ means that we consider only $x > a$. Illustrations of these four cases are given in Figure 12.



(a) $\lim_{x \to a^-} f(x) = \infty$ (b) $\lim_{x \to a^+} f(x) = \infty$ (c) $\lim_{x \to a^-} f(x) = -\infty$ (d) $\lim_{x \to a^+} f(x) = -\infty$

**FIGURE 12**

**6 Definitio** The vertical line $x = a$ is called a **vertical asymptote** of the curve $y = f(x)$ if at least one of the following statements is true:

$$\lim_{x \to a} f(x) = \infty \qquad \lim_{x \to a^-} f(x) = \infty \qquad \lim_{x \to a^+} f(x) = \infty$$

$$\lim_{x \to a} f(x) = -\infty \qquad \lim_{x \to a^-} f(x) = -\infty \qquad \lim_{x \to a^+} f(x) = -\infty$$

For instance, the $y$-axis is a vertical asymptote of the curve $y = 1/x^2$ because $\lim_{x \to 0} (1/x^2) = \infty$. In Figure 12 the line $x = a$ is a vertical asymptote in each of the

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

four cases shown. In general, knowledge of vertical asymptotes is very useful in sketching graphs.

**EXAMPLE 7** Does the curve $y = \dfrac{2x}{x-3}$ have a vertical asymptote?

**SOLUTION** There is a potential vertical asymptote where the denominator is 0, that is, at $x = 3$, so we investigate the one-sided limits there.

If $x$ is close to 3 but larger than 3, then the denominator $x - 3$ is a small positive number and $2x$ is close to 6. So the quotient $2x/(x - 3)$ is a large *positive* number. [For instance, if $x = 3.01$ then $2x/(x - 3) = 6.02/0.01 = 602$.] Thus, intuitively, we see that

$$\lim_{x \to 3^+} \frac{2x}{x-3} = \infty$$

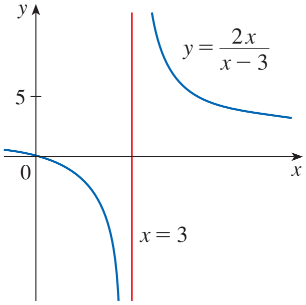


**FIGURE 13**

Likewise, if $x$ is close to 3 but smaller than 3, then $x - 3$ is a small negative number but $2x$ is still a positive number (close to 6). So $2x/(x - 3)$ is a numerically large *negative* number. Thus

$$\lim_{x \to 3^-} \frac{2x}{x-3} = -\infty$$

The graph of the curve $y = 2x/(x - 3)$ is given in Figure 13. According to Definition 6, the line $x = 3$ is a vertical asymptote. ■

**NOTE** Neither of the limits in Examples 6 and 7 exist, but in Example 6 we can write $\lim_{x \to 0} (1/x^2) = \infty$ because $f(x) \to \infty$ as $x$ approaches 0 from either the left or the right. In Example 7, $f(x) \to \infty$ as $x$ approaches 3 from the right but $f(x) \to -\infty$ as $x$ approaches 3 from the left, so we simply say that $\lim_{x \to 3} f(x)$ does not exist.

**EXAMPLE 8** Find the vertical asymptotes of $f(x) = \tan x$.

**SOLUTION** Because

$$\tan x = \frac{\sin x}{\cos x}$$

there are potential vertical asymptotes where $\cos x = 0$. In fact, since $\cos x \to 0^+$ as $x \to (\pi/2)^-$ and $\cos x \to 0^-$ as $x \to (\pi/2)^+$, whereas $\sin x$ is positive (near 1) when $x$ is near $\pi/2$, we have

$$\lim_{x \to (\pi/2)^-} \tan x = \infty$$

and

$$\lim_{x \to (\pi/2)^+} \tan x = -\infty$$

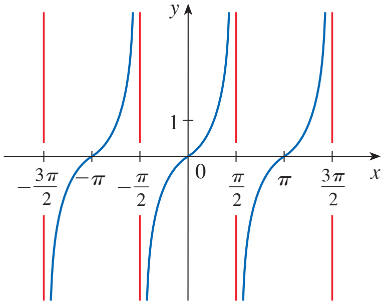

**FIGURE 14**
$y = \tan x$

This shows that the line $x = \pi/2$ is a vertical asymptote. Similar reasoning shows that the lines $x = \pi/2 + n\pi$, where $n$ is an integer, are all vertical asymptotes of $f(x) = \tan x$. The graph in Figure 14 confirms this. ■

## 1.5 Exercises

**1.** Explain in your own words what is meant by the equation

$$\lim_{x\to 2} f(x) = 5$$

Is it possible for this statement to be true and yet $f(2) = 3$? Explain.

**2.** Explain what it means to say that

$$\lim_{x\to 1^-} f(x) = 3 \qquad \text{and} \qquad \lim_{x\to 1^+} f(x) = 7$$

In this situation is it possible that $\lim_{x\to 1} f(x)$ exists? Explain.

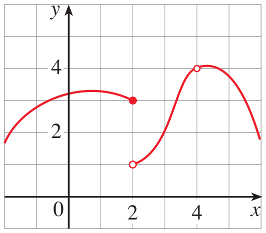
**3.** Explain the meaning of each of the following.

(a) $\lim_{x\to -3} f(x) = \infty$ (b) $\lim_{x\to 4^+} f(x) = -\infty$

**4.** Use the given graph of $f$ to state the value of each quantity, if it exists. If it does not exist, explain why.

(a) $\lim_{x\to 2^-} f(x)$ (b) $\lim_{x\to 2^+} f(x)$ (c) $\lim_{x\to 2} f(x)$

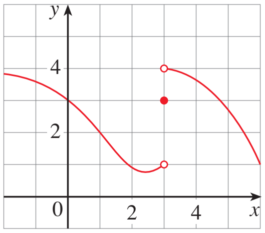
(d) $f(2)$ (e) $\lim_{x\to 4} f(x)$ (f) $f(4)$



**5.** For the function $f$ whose graph is given, state the value of each quantity, if it exists. If it does not exist, explain why.

(a) $\lim_{x\to 1} f(x)$ (b) $\lim_{x\to 3^-} f(x)$ (c) $\lim_{x\to 3^+} f(x)$

(d) $\lim_{x\to 3} f(x)$ (e) $f(3)$



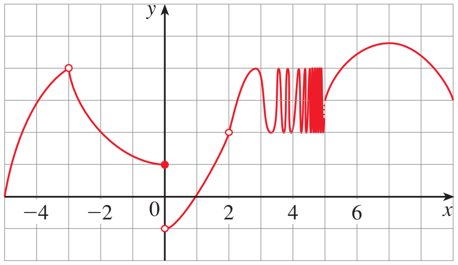
**6.** For the function $h$ whose graph is given, state the value of each quantity, if it exists. If it does not exist, explain why.

(a) $\lim_{x\to -3^-} h(x)$ (b) $\lim_{x\to -3^+} h(x)$ (c) $\lim_{x\to -3} h(x)$

(d) $h(-3)$ (e) $\lim_{x\to 0^-} h(x)$ (f) $\lim_{x\to 0^+} h(x)$

(g) $\lim_{x\to 0} h(x)$ (h) $h(0)$ (i) $\lim_{x\to 2} h(x)$

(j) $h(2)$ (k) $\lim_{x\to 5^+} h(x)$ (l) $\lim_{x\to 5^-} h(x)$



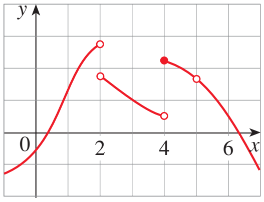
**7.** For the function $g$ whose graph is shown, find a number $a$ that satisfies the given description.

(a) $\lim_{x\to a} g(x)$ does not exist but $g(a)$ is defined.

(b) $\lim_{x\to a} g(x)$ exists but $g(a)$ is not defined.

(c) $\lim_{x\to a^-} g(x)$ and $\lim_{x\to a^+} g(x)$ both exist but $\lim_{x\to a} g(x)$ does not exist.

(d) $\lim_{x\to a^+} g(x) = g(a)$ but $\lim_{x\to a^-} g(x) \neq g(a)$.



**8.** For the function $A$ whose graph is shown, state the following.

(a) $\lim_{x\to -3} A(x)$ (b) $\lim_{x\to 2^-} A(x)$

(c) $\lim_{x\to 2^+} A(x)$ (d) $\lim_{x\to -1} A(x)$

(e) The equations of the vertical asymptotes

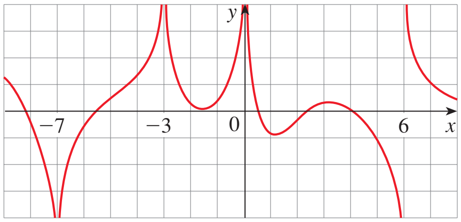
Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**9.** For the function $f$ whose graph is shown, state the following.

(a) $\lim_{x \to -7} f(x)$ (b) $\lim_{x \to -3} f(x)$ (c) $\lim_{x \to 0} f(x)$

(d) $\lim_{x \to 6^-} f(x)$ (e) $\lim_{x \to 6^+} f(x)$

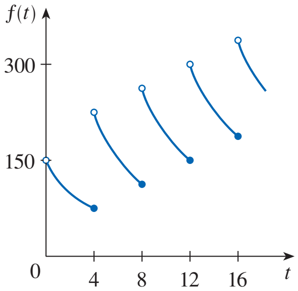
(f) The equations of the vertical asymptotes



**10.** A patient receives a 150-mg injection of a drug every 4 hours. The graph shows the amount $f(t)$ of the drug in the bloodstream after $t$ hours. Find

$$\lim_{t \to 12^-} f(t) \qquad \text{and} \qquad \lim_{t \to 12^+} f(t)$$

and explain the significance of these one-sided limits.



**11–12** Sketch the graph of the function and use it to determine the values of $a$ for which $\lim_{x \to a} f(x)$ exists.

**11.** $f(x) = \begin{cases} \cos x & \text{if } x \leqslant 0 \\ 1 - x & \text{if } 0 < x < 1 \\ 1/x & \text{if } x \geqslant 1 \end{cases}$

**12.** $f(x) = \begin{cases} \sqrt[3]{x} & \text{if } x \leqslant -1 \\ x & \text{if } -1 < x \leqslant 2 \\ (x-1)^2 & \text{if } x > 2 \end{cases}$

---

**13–14** Use the graph of the function $f$ to state the value of each limit, if it exists. If it does not exist, explain why.

(a) $\lim_{x \to 0^-} f(x)$ (b) $\lim_{x \to 0^+} f(x)$ (c) $\lim_{x \to 0} f(x)$

**13.** $f(x) = x\sqrt{1 + x^{-2}}$

**14.** $f(x) = \dfrac{3^{1/x} - 2}{3^{1/x} + 1}$

---

**15–18** Sketch the graph of an example of a function $f$ that satisfies all of the given conditions.

**15.** $\lim_{x \to 1^-} f(x) = 3, \quad \lim_{x \to 1^+} f(x) = 0, \quad f(1) = 2$

**16.** $\lim_{x \to 0} f(x) = 4, \quad \lim_{x \to 8^-} f(x) = 1, \quad \lim_{x \to 8^+} f(x) = -3,$
$f(0) = 6, \quad f(8) = -1$

**17.** $\lim_{x \to -1^-} f(x) = 0, \quad \lim_{x \to -1^+} f(x) = 1, \quad \lim_{x \to 2} f(x) = 3,$
$f(-1) = 2, \quad f(2) = 1$

**18.** $\lim_{x \to -3^-} f(x) = 3, \quad \lim_{x \to -3^+} f(x) = 2, \quad \lim_{x \to 3^-} f(x) = -1,$
$\lim_{x \to 3^+} f(x) = 2, \quad f(-3) = 2, \quad f(3) = 0$

---

**19–22** Guess the value of the limit (if it exists) by evaluating the function at the given numbers (correct to six decimal places).

**19.** $\lim_{x \to 3} \dfrac{x^2 - 3x}{x^2 - 9}$,
$x = 3.1, 3.05, 3.01, 3.001, 3.0001,$
$2.9, 2.95, 2.99, 2.999, 2.9999$

**20.** $\lim_{x \to -3} \dfrac{x^2 - 3x}{x^2 - 9}$,
$x = -2.5, -2.9, -2.95, -2.99, -2.999, -2.9999,$
$-3.5, -3.1, -3.05, -3.01, -3.001, -3.0001$

**21.** $\lim_{x \to 0} \dfrac{\sin x}{x + \tan x}$,
$x = \pm 1, \pm 0.5, \pm 0.2, \pm 0.1, \pm 0.05, \pm 0.01$

**22.** $\lim_{h \to 0} \dfrac{(2 + h)^5 - 32}{h}$,
$h = \pm 0.5, \pm 0.1, \pm 0.01, \pm 0.001, \pm 0.0001$

---

**23–26** Use a table of values to estimate the value of the limit. If you have a graphing device, use it to confirm your result graphically.

**23.** $\lim_{\theta \to 0} \dfrac{\sin 3\theta}{\tan 2\theta}$

**24.** $\lim_{p \to -1} \dfrac{1 + p^9}{1 + p^{15}}$

**25.** $\lim_{x \to 0^+} x^x$

**26.** $\lim_{t \to 0} \dfrac{5^t - 1}{t}$

---

**27–36** Determine the infinite limit.

**27.** $\lim_{x \to 5^+} \dfrac{x + 1}{x - 5}$

**28.** $\lim_{x \to 5^-} \dfrac{x + 1}{x - 5}$

**29.** $\lim_{x \to 2} \dfrac{x^2}{(x - 2)^2}$

**30.** $\lim_{x \to 3^-} \dfrac{\sqrt{x}}{(x - 3)^5}$

**31.** $\lim_{x \to -2^+} \dfrac{x - 1}{x^2(x + 2)}$

**32.** $\lim_{x \to 0} \dfrac{x - 1}{x^2(x + 2)}$

**33.** $\lim_{x\to(\pi/2)^+} \frac{1}{x}\sec x$

**34.** $\lim_{x\to\pi^-} x\cot x$

**35.** $\lim_{x\to 1} \frac{x^2+2x}{x^2-2x+1}$

**36.** $\lim_{x\to 3^-} \frac{x^2+4x}{x^2-2x-3}$

---

**37.** Find the vertical asymptote of the function

$$f(x) = \frac{x-1}{2x+4}$$

**38.** (a) Find the vertical asymptotes of the function

$$y = \frac{x^2+1}{3x-2x^2}$$

(b) Confirm your answer to part (a) by graphing the function.

**39.** Determine $\lim_{x\to 1^-} \frac{1}{x^3-1}$ and $\lim_{x\to 1^+} \frac{1}{x^3-1}$

(a) by evaluating $f(x) = 1/(x^3-1)$ for values of $x$ that approach 1 from the left and from the right,

(b) by reasoning as in Example 7, and

(c) from a graph of $f$.

**40.** (a) By graphing the function

$$f(x) = \frac{\cos 2x - \cos x}{x^2}$$

and zooming in toward the point where the graph crosses the $y$-axis, estimate the value of $\lim_{x\to 0} f(x)$.

(b) Check your answer in part (a) by evaluating $f(x)$ for values of $x$ that approach 0.

**41.** (a) Evaluate the function

$$f(x) = x^2 - \frac{2^x}{1000}$$

for $x = 1$, 0.8, 0.6, 0.4, 0.2, 0.1, and 0.05, and guess the value of

$$\lim_{x\to 0}\left(x^2 - \frac{2^x}{1000}\right)$$

(b) Evaluate $f(x)$ for $x = 0.04$, 0.02, 0.01, 0.005, 0.003, and 0.001. Guess again.

**42.** (a) Evaluate the function

$$h(x) = \frac{\tan x - x}{x^3}$$

for $x = 1$, 0.5, 0.1, 0.05, 0.01, and 0.005.

(b) Guess the value of $\lim_{x\to 0} \frac{\tan x - x}{x^3}$.

(c) Evaluate $h(x)$ for successively smaller values of $x$ until you finally reach a value of 0 for $h(x)$. Are you still confident that your guess in part (b) is correct? Explain why you eventually obtained 0 values. (In Section 6.8 a method for evaluating this limit will be explained.)

(d) Graph the function $h$ in the viewing rectangle $[-1, 1]$ by $[0, 1]$. Then zoom in toward the point where the graph crosses the $y$-axis to estimate the limit of $h(x)$ as $x$ approaches 0. Continue to zoom in until you observe distortions in the graph of $h$. Compare with the results of part (c).

**43.** Use a graph to estimate the equations of all the vertical asymptotes of the curve

$$y = \tan(2\sin x) \qquad -\pi \leqslant x \leqslant \pi$$

Then find the exact equations of these asymptotes.

**44.** Consider the function $f(x) = \tan \frac{1}{x}$.

(a) Show that $f(x) = 0$ for $x = \frac{1}{\pi}, \frac{1}{2\pi}, \frac{1}{3\pi}, \dots$

(b) Show that $f(x) = 1$ for $x = \frac{4}{\pi}, \frac{4}{5\pi}, \frac{4}{9\pi}, \dots$

(c) What can you conclude about $\lim_{x\to 0^+} \tan \frac{1}{x}$?

**45.** In the theory of relativity, the mass of a particle with velocity $v$ is

$$m = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

where $m_0$ is the mass of the particle at rest and $c$ is the speed of light. What happens as $v \to c^-$?

# 1.6 Calculating Limits Using the Limit Laws

## Properties of Limits

In Section 1.5 we used calculators and graphs to guess the values of limits, but we saw that such methods don't always lead to the correct answers. In this section we use the following properties of limits, called the *Limit Laws*, to calculate limits.

**Limit Laws** Suppose that $c$ is a constant and the limits

$$\lim_{x\to a} f(x) \qquad \text{and} \qquad \lim_{x\to a} g(x)$$

exist. Then

**1.** $\displaystyle\lim_{x\to a}\,[f(x)+g(x)] = \lim_{x\to a} f(x) + \lim_{x\to a} g(x)$

**2.** $\displaystyle\lim_{x\to a}\,[f(x)-g(x)] = \lim_{x\to a} f(x) - \lim_{x\to a} g(x)$

**3.** $\displaystyle\lim_{x\to a}\,[cf(x)] = c\lim_{x\to a} f(x)$

**4.** $\displaystyle\lim_{x\to a}\,[f(x)\,g(x)] = \lim_{x\to a} f(x)\cdot\lim_{x\to a} g(x)$

**5.** $\displaystyle\lim_{x\to a}\frac{f(x)}{g(x)} = \frac{\displaystyle\lim_{x\to a} f(x)}{\displaystyle\lim_{x\to a} g(x)} \quad \text{if } \lim_{x\to a} g(x) \neq 0$

These five laws can be stated verbally as follows:

**Sum Law** **1.** The limit of a sum is the sum of the limits.

**Difference Law** **2.** The limit of a difference is the difference of the limits.

**Constant Multiple Law** **3.** The limit of a constant times a function is the constant times the limit of the function.

**Product Law** **4.** The limit of a product is the product of the limits.

**Quotient Law** **5.** The limit of a quotient is the quotient of the limits (provided that the limit of the denominator is not 0).

It is easy to believe that these properties are true. For instance, if $f(x)$ is close to $L$ and $g(x)$ is close to $M$, it is reasonable to conclude that $f(x)+g(x)$ is close to $L+M$. This gives us an intuitive basis for believing that Law 1 is true. In Section 1.7 we give a precise definition of a limit and use it to prove this law. The proofs of the remaining laws are given in Appendix F.

**EXAMPLE 1** Use the Limit Laws and the graphs of $f$ and $g$ in Figure 1 to evaluate the following limits, if they exist.

(a) $\displaystyle\lim_{x\to -2}\,[f(x)+5g(x)]$ (b) $\displaystyle\lim_{x\to 1}\,[f(x)g(x)]$ (c) $\displaystyle\lim_{x\to 2}\frac{f(x)}{g(x)}$

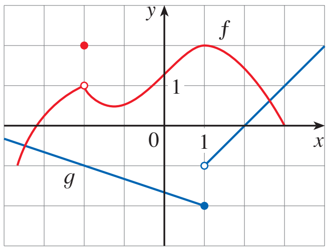


**FIGURE 1**

**SOLUTION**

(a) From the graphs of $f$ and $g$ we see that

$$\lim_{x\to -2} f(x) = 1 \qquad \text{and} \qquad \lim_{x\to -2} g(x) = -1$$

Therefore we have

$$\begin{aligned}\lim_{x\to -2}\,[f(x)+5g(x)] &= \lim_{x\to -2} f(x) + \lim_{x\to -2}\,[5g(x)] && \text{(by Limit Law 1)}\\ &= \lim_{x\to -2} f(x) + 5\lim_{x\to -2} g(x) && \text{(by Limit Law 3)}\\ &= 1 + 5(-1) = -4\end{aligned}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(b) We see that $\lim_{x\to 1} f(x) = 2$. But $\lim_{x\to 1} g(x)$ does not exist because the left and right limits are different:

$$\lim_{x\to 1^-} g(x) = -2 \qquad \lim_{x\to 1^+} g(x) = -1$$

So we can't use Law 4 for the desired limit. But we can use Law 4 for the one-sided limits:

$$\lim_{x\to 1^-} [f(x)g(x)] = \lim_{x\to 1^-} f(x) \cdot \lim_{x\to 1^-} g(x) = 2 \cdot (-2) = -4$$

$$\lim_{x\to 1^+} [f(x)g(x)] = \lim_{x\to 1^+} f(x) \cdot \lim_{x\to 1^+} g(x) = 2 \cdot (-1) = -2$$

The left and right limits aren't equal, so $\lim_{x\to 1} [f(x)g(x)]$ does not exist.

(c) The graphs show that

$$\lim_{x\to 2} f(x) \approx 1.4 \qquad \text{and} \qquad \lim_{x\to 2} g(x) = 0$$

Because the limit of the denominator is 0, we can't use Law 5. The given limit does not exist because the denominator approaches 0 while the numerator approaches a nonzero number. ■

If we use the Product Law repeatedly with $g(x) = f(x)$, we obtain the following law.

**Power Law**

**6.** $\lim_{x\to a} [f(x)]^n = \left[\lim_{x\to a} f(x)\right]^n$ where $n$ is a positive integer

A similar property, which you are asked to prove in Exercise 1.8.69, holds for roots:

**Root Law**

**7.** $\lim_{x\to a} \sqrt[n]{f(x)} = \sqrt[n]{\lim_{x\to a} f(x)}$ where $n$ is a positive integer

[If $n$ is even, we assume that $\lim_{x\to a} f(x) > 0$.]

In applying these seven limit laws, we need to use two special limits:

**8.** $\lim_{x\to a} c = c$ **9.** $\lim_{x\to a} x = a$

These limits are obvious from an intuitive point of view (state them in words or draw graphs of $y = c$ and $y = x$), but proofs based on the precise definition are requested in Exercises 1.7.23–24.

If we now put $f(x) = x$ in Law 6 and use Law 9, we get a useful special limit for power functions.

**10.** $\lim_{x\to a} x^n = a^n$ where $n$ is a positive integer

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

If we put $f(x) = x$ in Law 7 and use Law 9, we get a similar special limit for roots. (For square roots the proof is outlined in Exercise 1.7.37.)

**11.** $\lim_{x \to a} \sqrt[n]{x} = \sqrt[n]{a}$ where $n$ is a positive integer

(If $n$ is even, we assume that $a > 0$.)

**EXAMPLE 2** Evaluate the following limits and justify each step.

(a) $\lim_{x \to 5} (2x^2 - 3x + 4)$ (b) $\lim_{x \to -2} \dfrac{x^3 + 2x^2 - 1}{5 - 3x}$

**SOLUTION**

(a)
$$\begin{aligned} \lim_{x \to 5} (2x^2 - 3x + 4) &= \lim_{x \to 5} (2x^2) - \lim_{x \to 5} (3x) + \lim_{x \to 5} 4 && \text{(by Laws 2 and 1)} \\ &= 2 \lim_{x \to 5} x^2 - 3 \lim_{x \to 5} x + \lim_{x \to 5} 4 && \text{(by 3)} \\ &= 2(5^2) - 3(5) + 4 && \text{(by 10, 9, and 8)} \\ &= 39 \end{aligned}$$

(b) We start by using Law 5, but its use is fully justified only at the final stage when we see that the limits of the numerator and denominator exist and the limit of the denominator is not 0.

$$\begin{aligned} \lim_{x \to -2} \frac{x^3 + 2x^2 - 1}{5 - 3x} &= \frac{\lim_{x \to -2} (x^3 + 2x^2 - 1)}{\lim_{x \to -2} (5 - 3x)} && \text{(by Law 5)} \\ &= \frac{\lim_{x \to -2} x^3 + 2 \lim_{x \to -2} x^2 - \lim_{x \to -2} 1}{\lim_{x \to -2} 5 - 3 \lim_{x \to -2} x} && \text{(by 1, 2, and 3)} \\ &= \frac{(-2)^3 + 2(-2)^2 - 1}{5 - 3(-2)} && \text{(by 10, 9, and 8)} \\ &= -\frac{1}{11} \end{aligned}$$

■

## Evaluating Limits by Direct Substitution

In Example 2(a) we determined that $\lim_{x \to 5} f(x) = 39$, where $f(x) = 2x^2 - 3x + 4$. Notice that $f(5) = 39$; in other words, we would have gotten the correct result simply by substituting 5 for $x$. Similarly, direct substitution provides the correct answer in part (b). The functions in Example 2 are a polynomial and a rational function, respectively, and similar use of the Limit Laws proves that direct substitution always works for such functions (see Exercises 59 and 60). We state this fact as follows.

**Direct Substitution Property** If $f$ is a polynomial or a rational function and $a$ is in the domain of $f$, then

$$\lim_{x \to a} f(x) = f(a)$$

### Newton and Limits

Isaac Newton was born on Christmas Day in 1642, the year of Galileo's death. When he entered Cambridge University in 1661 Newton didn't know much mathematics, but he learned quickly by reading Euclid and Descartes and by attending the lectures of Isaac Barrow. Cambridge was closed because of the plague from 1665 to 1666, and Newton returned home to reflect on what he had learned. Those two years were amazingly productive for at that time he made four of his major discoveries: (1) his representation of functions as sums of infinite series, including the binomial theorem; (2) his work on differential and integral calculus; (3) his laws of motion and law of universal gravitation; and (4) his prism experiments on the nature of light and color. Because of a fear of controversy and criticism, he was reluctant to publish his discoveries and it wasn't until 1687, at the urging of the astronomer Halley, that Newton published *Principia Mathematica*. In this work, the greatest scientific treatise ever written, Newton set forth his version of calculus and used it to investigate mechanics, fluid dynamics, and wave motion, and to explain the motion of planets and comets.

The beginnings of calculus are found in the calculations of areas and volumes by ancient Greek scholars such as Eudoxus and Archimedes. Although aspects of the idea of a limit are implicit in their "method of exhaustion," Eudoxus and Archimedes never explicitly formulated the concept of a limit. Likewise, mathematicians such as Cavalieri, Fermat, and Barrow, the immediate precursors of Newton in the development of calculus, did not actually use limits. It was Isaac Newton who was the first to talk explicitly about limits. He explained that the main idea behind limits is that quantities "approach nearer than by any given difference." Newton stated that the limit was the basic concept in calculus, but it was left to later mathematicians like Cauchy to clarify his ideas about limits.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Functions that have the Direct Substitution Property are called *continuous at a* and will be studied in Section 1.8. However, not all limits can be evaluated initially by direct substitution, as the following examples show.

**EXAMPLE 3** Find $\lim_{x \to 1} \dfrac{x^2 - 1}{x - 1}$.

**SOLUTION** Let $f(x) = (x^2 - 1)/(x - 1)$. We can't find the limit by substituting $x = 1$ because $f(1)$ isn't defined. Nor can we apply the Quotient Law, because the limit of the denominator is 0. Instead, we need to do some preliminary algebra. We factor the numerator as a difference of squares:

$$\frac{x^2 - 1}{x - 1} = \frac{(x - 1)(x + 1)}{x - 1}$$

Notice that in Example 3 we do not have an infinite limit even though the denominator approaches 0 as $x \to 1$. When both numerator and denominator approach 0, the limit may be infinite or it may be some finite value.

The numerator and denominator have a common factor of $x - 1$. When we take the limit as $x$ approaches 1, we have $x \neq 1$ and so $x - 1 \neq 0$. Therefore we can cancel the common factor, $x - 1$, and then compute the limit by direct substitution as follows:

$$\begin{aligned} \lim_{x \to 1} \frac{x^2 - 1}{x - 1} &= \lim_{x \to 1} \frac{(x - 1)(x + 1)}{x - 1} \\ &= \lim_{x \to 1} (x + 1) = 1 + 1 = 2 \end{aligned}$$

The limit in this example arose in Example 1.4.1 in finding the tangent to the parabola $y = x^2$ at the point $(1, 1)$. ■

**NOTE** In Example 3 we were able to compute the limit by replacing the given function $f(x) = (x^2 - 1)/(x - 1)$ by a simpler function, $g(x) = x + 1$, that has the same limit. This is valid because $f(x) = g(x)$ except when $x = 1$, and in computing a limit as $x$ approaches 1 we don't consider what happens when $x$ is actually *equal* to 1. In general, we have the following useful fact.

If $f(x) = g(x)$ when $x \neq a$, then $\lim_{x \to a} f(x) = \lim_{x \to a} g(x)$, provided the limits exist.

**EXAMPLE 4** Find $\lim_{x \to 1} g(x)$ where

$$g(x) = \begin{cases} x + 1 & \text{if } x \neq 1 \\ \pi & \text{if } x = 1 \end{cases}$$

**SOLUTION** Here $g$ is defined at $x = 1$ and $g(1) = \pi$, but the value of a limit as $x$ *approaches* 1 does not depend on the value of the function *at* 1. Since $g(x) = x + 1$ for $x \neq 1$, we have

$$\lim_{x \to 1} g(x) = \lim_{x \to 1} (x + 1) = 2$$ ■

Note that the values of the functions in Examples 3 and 4 are identical except when $x = 1$ (see Figure 2) and so they have the same limit as $x$ approaches 1.

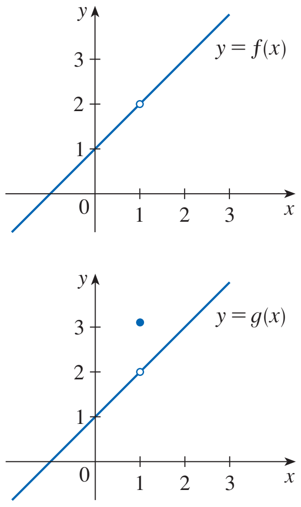

**FIGURE 2**
The graphs of the functions $f$ (from Example 3) and $g$ (from Example 4)

**EXAMPLE 5** Evaluate $\lim_{h\to 0}\dfrac{(3+h)^2-9}{h}$.

**SOLUTION** If we define

$$F(h)=\frac{(3+h)^2-9}{h}$$

then, as in Example 3, we can't compute $\lim_{h\to 0}F(h)$ by letting $h=0$ because $F(0)$ is undefined. But if we simplify $F(h)$ algebraically, we find that

$$F(h)=\frac{(9+6h+h^2)-9}{h}=\frac{6h+h^2}{h}$$

$$=\frac{h(6+h)}{h}=6+h$$

(Recall that we consider only $h\neq 0$ when letting $h$ approach 0.) Thus

$$\lim_{h\to 0}\frac{(3+h)^2-9}{h}=\lim_{h\to 0}(6+h)=6$$ ■

**EXAMPLE 6** Find $\lim_{t\to 0}\dfrac{\sqrt{t^2+9}-3}{t^2}$.

**SOLUTION** We can't apply the Quotient Law immediately because the limit of the denominator is 0. Here the preliminary algebra consists of rationalizing the numerator:

$$\lim_{t\to 0}\frac{\sqrt{t^2+9}-3}{t^2}=\lim_{t\to 0}\frac{\sqrt{t^2+9}-3}{t^2}\cdot\frac{\sqrt{t^2+9}+3}{\sqrt{t^2+9}+3}$$

$$=\lim_{t\to 0}\frac{(t^2+9)-9}{t^2\left(\sqrt{t^2+9}+3\right)}$$

$$=\lim_{t\to 0}\frac{t^2}{t^2\left(\sqrt{t^2+9}+3\right)}$$

$$=\lim_{t\to 0}\frac{1}{\sqrt{t^2+9}+3}$$

$$=\frac{1}{\sqrt{\lim_{t\to 0}(t^2+9)}+3}$$

(Here we use several properties of limits: 5, 1, 7, 8, 10.)

$$=\frac{1}{3+3}=\frac{1}{6}$$

This calculation confirms the guess that we made in Example 1.5.1. ■

## Using One-Sided Limits

Some limits are best calculated by first finding the left- and right-hand limits. The following theorem is a reminder of what we discovered in Section 1.5. It says that a two-sided limit exists if and only if both of the one-sided limits exist and are equal.

**1 Theorem** $\lim_{x\to a} f(x) = L \quad \text{if and only if} \quad \lim_{x\to a^-} f(x) = L = \lim_{x\to a^+} f(x)$

When computing one-sided limits, we use the fact that the Limit Laws also hold for one-sided limits.

**EXAMPLE 7** Show that $\lim_{x\to 0} |x| = 0$.

**SOLUTION** Recall that

$$|x| = \begin{cases} x & \text{if } x \geqslant 0 \\ -x & \text{if } x < 0 \end{cases}$$

The result of Example 7 looks plausible from Figure 3.

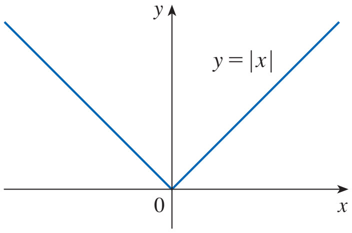

**FIGURE 3**

Since $|x| = x$ for $x > 0$, we have

$$\lim_{x\to 0^+} |x| = \lim_{x\to 0^+} x = 0$$

For $x < 0$ we have $|x| = -x$ and so

$$\lim_{x\to 0^-} |x| = \lim_{x\to 0^-} (-x) = 0$$

Therefore, by Theorem 1,

$$\lim_{x\to 0} |x| = 0$$

■

**EXAMPLE 8** Prove that $\lim_{x\to 0} \dfrac{|x|}{x}$ does not exist.

**SOLUTION** Using the facts that $|x| = x$ when $x > 0$ and $|x| = -x$ when $x < 0$, we have

$$\lim_{x\to 0^+} \frac{|x|}{x} = \lim_{x\to 0^+} \frac{x}{x} = \lim_{x\to 0^+} 1 = 1$$

$$\lim_{x\to 0^-} \frac{|x|}{x} = \lim_{x\to 0^-} \frac{-x}{x} = \lim_{x\to 0^-} (-1) = -1$$

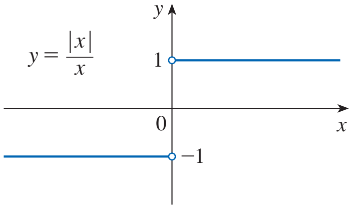

**FIGURE 4**

Since the right- and left-hand limits are different, it follows from Theorem 1 that $\lim_{x\to 0} |x|/x$ does not exist. The graph of the function $f(x) = |x|/x$ is shown in Figure 4 and supports the one-sided limits that we found. ■

**EXAMPLE 9** If

$$f(x) = \begin{cases} \sqrt{x-4} & \text{if } x > 4 \\ 8 - 2x & \text{if } x < 4 \end{cases}$$

determine whether $\lim_{x\to 4} f(x)$ exists.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

It is shown in Example 1.7.4 that $\lim_{x\to 0^+}\sqrt{x} = 0$.

**SOLUTION** Since $f(x) = \sqrt{x-4}$ for $x > 4$, we have

$$\lim_{x\to 4^+} f(x) = \lim_{x\to 4^+} \sqrt{x-4} = \sqrt{4-4} = 0$$

Since $f(x) = 8 - 2x$ for $x < 4$, we have

$$\lim_{x\to 4^-} f(x) = \lim_{x\to 4^-} (8-2x) = 8 - 2\cdot 4 = 0$$

The right- and left-hand limits are equal. Thus the limit exists and

$$\lim_{x\to 4} f(x) = 0$$

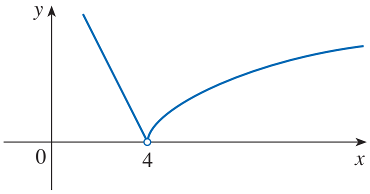

**FIGURE 5**

The graph of $f$ is shown in Figure 5. ■

Other notations for $[\![x]\!]$ are $[x]$ and $\lfloor x \rfloor$. The greatest integer function is sometimes called the *floor function*.

**EXAMPLE 10** The **greatest integer function** is defined by $[\![x]\!]$ = the largest integer that is less than or equal to $x$. (For instance, $[\![4]\!] = 4$, $[\![4.8]\!] = 4$, $[\![\pi]\!] = 3$, $[\![\sqrt{2}]\!] = 1$, $[\![-\frac{1}{2}]\!] = -1$.) Show that $\lim_{x\to 3} [\![x]\!]$ does not exist.

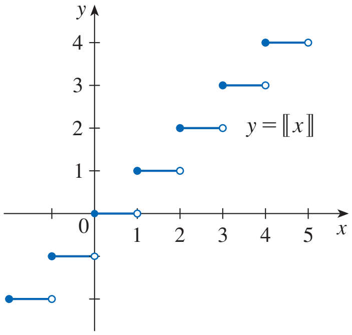

**FIGURE 6**
Greatest integer function

**SOLUTION** The graph of the greatest integer function is shown in Figure 6. Since $[\![x]\!] = 3$ for $3 \leqslant x < 4$, we have

$$\lim_{x\to 3^+} [\![x]\!] = \lim_{x\to 3^+} 3 = 3$$

Since $[\![x]\!] = 2$ for $2 \leqslant x < 3$, we have

$$\lim_{x\to 3^-} [\![x]\!] = \lim_{x\to 3^-} 2 = 2$$

Because these one-sided limits are not equal, $\lim_{x\to 3} [\![x]\!]$ does not exist by Theorem 1. ■

## The Squeeze Theorem

The following two theorems describe how the limits of functions are related when the values of one function are greater than (or equal to) those of another. Their proofs can be found in Appendix F.

**2 Theorem** If $f(x) \leqslant g(x)$ when $x$ is near $a$ (except possibly at $a$) and the limits of $f$ and $g$ both exist as $x$ approaches $a$, then

$$\lim_{x\to a} f(x) \leqslant \lim_{x\to a} g(x)$$

**3 The Squeeze Theorem** If $f(x) \leqslant g(x) \leqslant h(x)$ when $x$ is near $a$ (except possibly at $a$) and

$$\lim_{x\to a} f(x) = \lim_{x\to a} h(x) = L$$

then $$\lim_{x\to a} g(x) = L$$

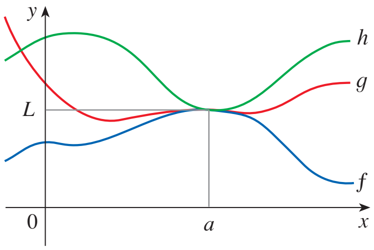

**FIGURE 7**

The Squeeze Theorem, which is sometimes called the Sandwich Theorem or the Pinching Theorem, is illustrated by Figure 7. It says that if $g(x)$ is squeezed between $f(x)$ and $h(x)$ near $a$, and if $f$ and $h$ have the same limit $L$ at $a$, then $g$ is forced to have the same limit $L$ at $a$.

**EXAMPLE 11** Show that $\lim\limits_{x\to 0} x^2 \sin \dfrac{1}{x} = 0$.

**SOLUTION** First note that we **cannot** rewrite the limit as the product of the limits $\lim_{x\to 0} x^2$ and $\lim_{x\to 0} \sin(1/x)$ because $\lim_{x\to 0} \sin(1/x)$ does not exist (see Example 1.5.5).

We *can* find the limit by using the Squeeze Theorem. To apply the Squeeze Theorem we need to find a function $f$ smaller than $g(x) = x^2 \sin(1/x)$ and a function $h$ bigger than $g$ such that both $f(x)$ and $h(x)$ approach 0 as $x \to 0$. To do this we use our knowledge of the sine function. Because the sine of any number lies between $-1$ and 1, we can write

$$\boxed{4} \qquad -1 \leqslant \sin \frac{1}{x} \leqslant 1$$

Any inequality remains true when multiplied by a positive number. We know that $x^2 \geqslant 0$ for all $x$ and so, multiplying each side of the inequalities in (4) by $x^2$, we get

$$-x^2 \leqslant x^2 \sin \frac{1}{x} \leqslant x^2$$

as illustrated by Figure 8. We know that

$$\lim_{x\to 0} x^2 = 0 \qquad \text{and} \qquad \lim_{x\to 0} (-x^2) = 0$$

Taking $f(x) = -x^2$, $g(x) = x^2 \sin(1/x)$, and $h(x) = x^2$ in the Squeeze Theorem, we obtain

$$\lim_{x\to 0} x^2 \sin \frac{1}{x} = 0$$ ■

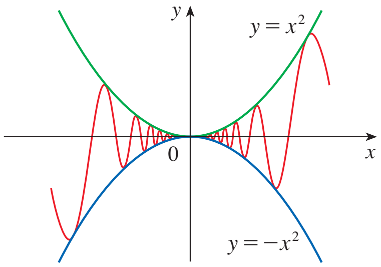

**FIGURE 8**
$y = x^2 \sin(1/x)$

## 1.6 Exercises

**1.** Given that

$$\lim_{x\to 2} f(x) = 4 \qquad \lim_{x\to 2} g(x) = -2 \qquad \lim_{x\to 2} h(x) = 0$$

find the limits that exist. If the limit does not exist, explain why.

(a) $\lim\limits_{x\to 2} [f(x) + 5g(x)]$ (b) $\lim\limits_{x\to 2} [g(x)]^3$

(c) $\lim\limits_{x\to 2} \sqrt{f(x)}$ (d) $\lim\limits_{x\to 2} \dfrac{3f(x)}{g(x)}$

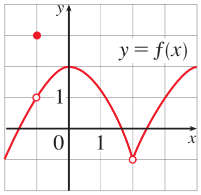
(e) $\lim\limits_{x\to 2} \dfrac{g(x)}{h(x)}$ (f) $\lim\limits_{x\to 2} \dfrac{g(x)\,h(x)}{f(x)}$

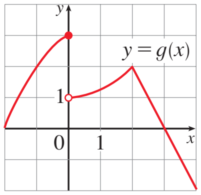
**2.** The graphs of $f$ and $g$ are given. Use them to evaluate each limit, if it exists. If the limit does not exist, explain why.

(a) $\lim\limits_{x\to 2} [f(x) + g(x)]$ (b) $\lim\limits_{x\to 0} [f(x) - g(x)]$

(c) $\lim\limits_{x\to -1} [f(x)g(x)]$ (d) $\lim\limits_{x\to 3} \dfrac{f(x)}{g(x)}$

(e) $\lim\limits_{x\to 2} [x^2 f(x)]$ (f) $f(-1) + \lim\limits_{x\to -1} g(x)$





**3–9** Evaluate the limit and justify each step by indicating the appropriate Limit Law(s).

**3.** $\lim\limits_{x\to 5} (4x^2 - 5x)$

**4.** $\lim\limits_{x\to -3} (2x^3 + 6x^2 - 9)$

**5.** $\lim\limits_{v\to 2} (v^2 + 2v)(2v^3 - 5)$

**6.** $\lim\limits_{t\to 7} \dfrac{3t^2 + 1}{t^2 - 5t + 2}$

**7.** $\lim\limits_{u\to -2} \sqrt{9 - u^3 + 2u^2}$

**8.** $\lim\limits_{x\to 3} \sqrt[3]{x + 5}\,(2x^2 - 3x)$

**9.** $\lim\limits_{t\to -1} \left(\dfrac{2t^5 - t^4}{5t^2 + 4}\right)^3$

**10.** (a) What is wrong with the following equation?

$$\frac{x^2 + x - 6}{x - 2} = x + 3$$

(b) In view of part (a), explain why the equation

$$\lim_{x \to 2} \frac{x^2 + x - 6}{x - 2} = \lim_{x \to 2} (x + 3)$$

is correct.

**11–34** Evaluate the limit, if it exists.

**11.** $\displaystyle \lim_{x \to -2} (3x - 7)$

**12.** $\displaystyle \lim_{x \to 6} \left(8 - \tfrac{1}{2}x\right)$

**13.** $\displaystyle \lim_{t \to 4} \frac{t^2 - 2t - 8}{t - 4}$

**14.** $\displaystyle \lim_{x \to -3} \frac{x^2 + 3x}{x^2 - x - 12}$

**15.** $\displaystyle \lim_{x \to 2} \frac{x^2 + 5x + 4}{x - 2}$

**16.** $\displaystyle \lim_{x \to 4} \frac{x^2 + 3x}{x^2 - x - 12}$

**17.** $\displaystyle \lim_{x \to -2} \frac{x^2 - x - 6}{3x^2 + 5x - 2}$

**18.** $\displaystyle \lim_{x \to -5} \frac{2x^2 + 9x - 5}{x^2 - 25}$

**19.** $\displaystyle \lim_{t \to 3} \frac{t^3 - 27}{t^2 - 9}$

**20.** $\displaystyle \lim_{u \to -1} \frac{u + 1}{u^3 + 1}$

**21.** $\displaystyle \lim_{h \to 0} \frac{(h - 3)^2 - 9}{h}$

**22.** $\displaystyle \lim_{x \to 9} \frac{9 - x}{3 - \sqrt{x}}$

**23.** $\displaystyle \lim_{h \to 0} \frac{\sqrt{9 + h} - 3}{h}$

**24.** $\displaystyle \lim_{x \to 2} \frac{2 - x}{\sqrt{x + 2} - 2}$

**25.** $\displaystyle \lim_{x \to 3} \frac{\dfrac{1}{x} - \dfrac{1}{3}}{x - 3}$

**26.** $\displaystyle \lim_{h \to 0} \frac{(-2 + h)^{-1} + 2^{-1}}{h}$

**27.** $\displaystyle \lim_{t \to 0} \frac{\sqrt{1 + t} - \sqrt{1 - t}}{t}$

**28.** $\displaystyle \lim_{t \to 0} \left(\frac{1}{t} - \frac{1}{t^2 + t}\right)$

**29.** $\displaystyle \lim_{x \to 16} \frac{4 - \sqrt{x}}{16x - x^2}$

**30.** $\displaystyle \lim_{x \to 2} \frac{x^2 - 4x + 4}{x^4 - 3x^2 - 4}$

**31.** $\displaystyle \lim_{t \to 0} \left(\frac{1}{t\sqrt{1 + t}} - \frac{1}{t}\right)$

**32.** $\displaystyle \lim_{x \to -4} \frac{\sqrt{x^2 + 9} - 5}{x + 4}$

**33.** $\displaystyle \lim_{h \to 0} \frac{(x + h)^3 - x^3}{h}$

**34.** $\displaystyle \lim_{h \to 0} \frac{\dfrac{1}{(x + h)^2} - \dfrac{1}{x^2}}{h}$

---

**35.** (a) Estimate the value of

$$\lim_{x \to 0} \frac{x}{\sqrt{1 + 3x} - 1}$$

by graphing the function $f(x) = x/\left(\sqrt{1 + 3x} - 1\right)$.

(b) Make a table of values of $f(x)$ for $x$ close to 0 and guess the value of the limit.

(c) Use the Limit Laws to prove that your guess is correct.

**36.** (a) Use a graph of

$$f(x) = \frac{\sqrt{3 + x} - \sqrt{3}}{x}$$

to estimate the value of $\lim_{x \to 0} f(x)$ to two decimal places.

(b) Use a table of values of $f(x)$ to estimate the limit to four decimal places.

(c) Use the Limit Laws to find the exact value of the limit.

**37.** Use the Squeeze Theorem to show that

$$\lim_{x \to 0} x^2 \cos 20\pi x = 0$$

Illustrate by graphing the functions $f(x) = -x^2$, $g(x) = x^2 \cos 20\pi x$, and $h(x) = x^2$ on the same screen.

**38.** Use the Squeeze Theorem to show that

$$\lim_{x \to 0} \sqrt{x^3 + x^2}\, \sin \frac{\pi}{x} = 0$$

Illustrate by graphing the functions $f$, $g$, and $h$ (in the notation of the Squeeze Theorem) on the same screen.

**39.** If $4x - 9 \leqslant f(x) \leqslant x^2 - 4x + 7$ for $x \geqslant 0$, find $\displaystyle \lim_{x \to 4} f(x)$.

**40.** If $2x \leqslant g(x) \leqslant x^4 - x^2 + 2$ for all $x$, evaluate $\displaystyle \lim_{x \to 1} g(x)$.

**41.** Prove that $\displaystyle \lim_{x \to 0} x^4 \cos \frac{2}{x} = 0$.

**42.** Prove that $\displaystyle \lim_{x \to 0^+} \sqrt{x}\, [1 + \sin^2(2\pi/x)] = 0$.

**43–48** Find the limit, if it exists. If the limit does not exist, explain why.

**43.** $\displaystyle \lim_{x \to -4} \left(|x + 4| - 2x\right)$

**44.** $\displaystyle \lim_{x \to -4} \frac{|x + 4|}{2x + 8}$

**45.** $\displaystyle \lim_{x \to 0.5^-} \frac{2x - 1}{|2x^3 - x^2|}$

**46.** $\displaystyle \lim_{x \to -2} \frac{2 - |x|}{2 + x}$

**47.** $\displaystyle \lim_{x \to 0^-} \left(\frac{1}{x} - \frac{1}{|x|}\right)$

**48.** $\displaystyle \lim_{x \to 0^+} \left(\frac{1}{x} - \frac{1}{|x|}\right)$

---

**49. The Signum Function** The *signum* (or sign) *function*, denoted by sgn, is defined by

$$\operatorname{sgn} x = \begin{cases} -1 & \text{if } x < 0 \\ 0 & \text{if } x = 0 \\ 1 & \text{if } x > 0 \end{cases}$$

(a) Sketch the graph of this function.

(b) Find each of the following limits or explain why it does not exist.

(i) $\displaystyle \lim_{x \to 0^+} \operatorname{sgn} x$ (ii) $\displaystyle \lim_{x \to 0^-} \operatorname{sgn} x$

(iii) $\displaystyle \lim_{x \to 0} \operatorname{sgn} x$ (iv) $\displaystyle \lim_{x \to 0} |\operatorname{sgn} x|$

**50.** Let $g(x) = \operatorname{sgn}(\sin x)$.

(a) Find each of the following limits or explain why it does not exist.

(i) $\lim_{x\to 0^+} g(x)$ (ii) $\lim_{x\to 0^-} g(x)$ (iii) $\lim_{x\to 0} g(x)$

(iv) $\lim_{x\to \pi^+} g(x)$ (v) $\lim_{x\to \pi^-} g(x)$ (vi) $\lim_{x\to \pi} g(x)$

(b) For which values of $a$ does $\lim_{x\to a} g(x)$ not exist?

(c) Sketch a graph of $g$.

**51.** Let $g(x) = \dfrac{x^2 + x - 6}{|x - 2|}$.

(a) Find

(i) $\lim_{x\to 2^+} g(x)$ (ii) $\lim_{x\to 2^-} g(x)$

(b) Does $\lim_{x\to 2} g(x)$ exist?

(c) Sketch the graph of $g$.

**52.** Let

$$f(x) = \begin{cases} x^2 + 1 & \text{if } x < 1 \\ (x - 2)^2 & \text{if } x \geqslant 1 \end{cases}$$

(a) Find $\lim_{x\to 1^-} f(x)$ and $\lim_{x\to 1^+} f(x)$.

(b) Does $\lim_{x\to 1} f(x)$ exist?

(c) Sketch the graph of $f$.

**53.** Let

$$B(t) = \begin{cases} 4 - \frac{1}{2}t & \text{if } t < 2 \\ \sqrt{t + c} & \text{if } t \geqslant 2 \end{cases}$$

Find the value of $c$ so that $\lim_{t\to 2} B(t)$ exists.

**54.** Let

$$g(x) = \begin{cases} x & \text{if } x < 1 \\ 3 & \text{if } x = 1 \\ 2 - x^2 & \text{if } 1 < x \leqslant 2 \\ x - 3 & \text{if } x > 2 \end{cases}$$

(a) Evaluate each of the following, if it exists.

(i) $\lim_{x\to 1^-} g(x)$ (ii) $\lim_{x\to 1} g(x)$ (iii) $g(1)$

(iv) $\lim_{x\to 2^-} g(x)$ (v) $\lim_{x\to 2^+} g(x)$ (vi) $\lim_{x\to 2} g(x)$

(b) Sketch the graph of $g$.

**55.** (a) If the symbol $[\![\ ]\!]$ denotes the greatest integer function defined in Example 10, evaluate

(i) $\lim_{x\to -2^+} [\![x]\!]$ (ii) $\lim_{x\to -2} [\![x]\!]$ (iii) $\lim_{x\to -2.4} [\![x]\!]$

(b) If $n$ is an integer, evaluate

(i) $\lim_{x\to n^-} [\![x]\!]$ (ii) $\lim_{x\to n^+} [\![x]\!]$

(c) For what values of $a$ does $\lim_{x\to a} [\![x]\!]$ exist?

**56.** Let $f(x) = [\![\cos x]\!]$, $-\pi \leqslant x \leqslant \pi$.

(a) Sketch the graph of $f$.

(b) Evaluate each limit, if it exists.

(i) $\lim_{x\to 0} f(x)$ (ii) $\lim_{x\to (\pi/2)^-} f(x)$

(iii) $\lim_{x\to (\pi/2)^+} f(x)$ (iv) $\lim_{x\to \pi/2} f(x)$

(c) For what values of $a$ does $\lim_{x\to a} f(x)$ exist?

**57.** If $f(x) = [\![x]\!] + [\![-x]\!]$, show that $\lim_{x\to 2} f(x)$ exists but is not equal to $f(2)$.

**58.** In the theory of relativity, the Lorentz contraction formula

$$L = L_0\sqrt{1 - v^2/c^2}$$

expresses the length $L$ of an object as a function of its velocity $v$ with respect to an observer, where $L_0$ is the length of the object at rest and $c$ is the speed of light. Find $\lim_{v\to c^-} L$ and interpret the result. Why is a left-hand limit necessary?

**59.** If $p$ is a polynomial, show that $\lim_{x\to a} p(x) = p(a)$.

**60.** If $r$ is a rational function, use Exercise 59 to show that $\lim_{x\to a} r(x) = r(a)$ for every number $a$ in the domain of $r$.

**61.** If $\lim_{x\to 1} \dfrac{f(x) - 8}{x - 1} = 10$, find $\lim_{x\to 1} f(x)$.

**62.** If $\lim_{x\to 0} \dfrac{f(x)}{x^2} = 5$, find the following limits.

(a) $\lim_{x\to 0} f(x)$ (b) $\lim_{x\to 0} \dfrac{f(x)}{x}$

**63.** If

$$f(x) = \begin{cases} x^2 & \text{if } x \text{ is rational} \\ 0 & \text{if } x \text{ is irrational} \end{cases}$$

prove that $\lim_{x\to 0} f(x) = 0$.

**64.** Show by means of an example that $\lim_{x\to a} [f(x) + g(x)]$ may exist even though neither $\lim_{x\to a} f(x)$ nor $\lim_{x\to a} g(x)$ exists.

**65.** Show by means of an example that $\lim_{x\to a} [f(x)\,g(x)]$ may exist even though neither $\lim_{x\to a} f(x)$ nor $\lim_{x\to a} g(x)$ exists.

**66.** Evaluate $\lim_{x\to 2} \dfrac{\sqrt{6 - x} - 2}{\sqrt{3 - x} - 1}$.

**67.** Is there a number $a$ such that

$$\lim_{x\to -2} \frac{3x^2 + ax + a + 3}{x^2 + x - 2}$$

exists? If so, find the value of $a$ and the value of the limit.

**68.** The figure shows a fixed circle $C_1$ with equation $(x - 1)^2 + y^2 = 1$ and a shrinking circle $C_2$ with radius $r$ and center the origin. $P$ is the point $(0, r)$, $Q$ is the upper point of intersection of the two circles, and $R$ is the point of intersection of the line $PQ$ and the $x$-axis. What happens to $R$ as $C_2$ shrinks, that is, as $r \to 0^+$?

# 1.7 The Precise Definition of a Limit

The intuitive definition of a limit given in Section 1.5 is inadequate for some purposes because such phrases as "$x$ is close to 2" and "$f(x)$ gets closer and closer to $L$" are vague. In order to be able to prove conclusively that

$$\lim_{x \to 0} \left( x^3 + \frac{\cos 5x}{10{,}000} \right) = 0.0001 \qquad \text{or} \qquad \lim_{x \to 0} \frac{\sin x}{x} = 1$$

we must make the definition of a limit precise.

## The Precise Definition of a Limit

To motivate the precise definition of a limit, let's consider the function

$$f(x) = \begin{cases} 2x - 1 & \text{if } x \neq 3 \\ 6 & \text{if } x = 3 \end{cases}$$

Intuitively, it is clear that when $x$ is close to 3 but $x \neq 3$, then $f(x)$ is close to 5, and so $\lim_{x \to 3} f(x) = 5$.

To obtain more detailed information about how $f(x)$ varies when $x$ is close to 3, we ask the following question:

How close to 3 does $x$ have to be so that $f(x)$ differs from 5 by less than 0.1?

The distance from $x$ to 3 is $|x - 3|$ and the distance from $f(x)$ to 5 is $|f(x) - 5|$, so our problem is to find a number $\delta$ (the Greek letter delta) such that

$$|f(x) - 5| < 0.1 \qquad \text{if} \qquad |x - 3| < \delta \quad \text{but } x \neq 3$$

If $|x - 3| > 0$, then $x \neq 3$, so an equivalent formulation of our problem is to find a number $\delta$ such that

$$|f(x) - 5| < 0.1 \qquad \text{if} \qquad 0 < |x - 3| < \delta$$

Notice that if $0 < |x - 3| < (0.1)/2 = 0.05$, then

$$|f(x) - 5| = |(2x - 1) - 5| = |2x - 6| = 2|x - 3| < 2(0.05) = 0.1$$

that is, $$|f(x) - 5| < 0.1 \qquad \text{if} \qquad 0 < |x - 3| < 0.05$$

Thus an answer to the problem is given by $\delta = 0.05$; that is, if $x$ is within a distance of 0.05 from 3, then $f(x)$ will be within a distance of 0.1 from 5.

If we change the number 0.1 in our problem to the smaller number 0.01, then by using the same method we find that $f(x)$ will differ from 5 by less than 0.01 provided that $x$ differs from 3 by less than $(0.01)/2 = 0.005$:

$$|f(x) - 5| < 0.01 \qquad \text{if} \qquad 0 < |x - 3| < 0.005$$

Similarly,

$$|f(x) - 5| < 0.001 \qquad \text{if} \qquad 0 < |x - 3| < 0.0005$$

The numbers 0.1, 0.01, and 0.001 that we have considered are *error tolerances* that we might allow. For 5 to be the precise limit of $f(x)$ as $x$ approaches 3, we must not only be able to bring the difference between $f(x)$ and 5 below each of these three numbers; we must be able to bring it below *any* positive number. And, by the same reasoning, we can! If we write $\varepsilon$ (the Greek letter epsilon) for an arbitrary positive number, then we find as before that

$$\boxed{1} \qquad |f(x)-5|<\varepsilon \qquad \text{if} \qquad 0<|x-3|<\delta=\frac{\varepsilon}{2}$$

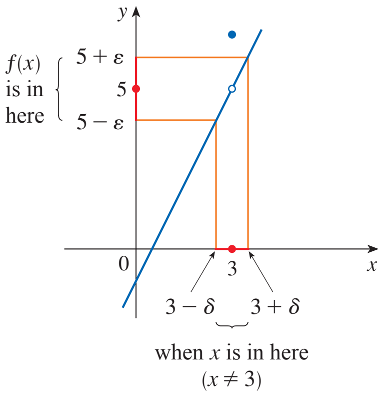

**FIGURE 1**

This is a precise way of saying that $f(x)$ is close to 5 when $x$ is close to 3 because (1) says that we can make the values of $f(x)$ within an arbitrary distance $\varepsilon$ from 5 by restricting the values of $x$ to be within a distance $\varepsilon/2$ from 3 (but $x \neq 3$).

Note that (1) can be rewritten as follows:

$$\text{if} \quad 3-\delta<x<3+\delta \quad (x\neq 3) \qquad \text{then} \qquad 5-\varepsilon<f(x)<5+\varepsilon$$

and this is illustrated in Figure 1. By taking the values of $x$ ($\neq 3$) to lie in the interval $(3-\delta, 3+\delta)$ we can make the values of $f(x)$ lie in the interval $(5-\varepsilon, 5+\varepsilon)$.

Using (1) as a model, we give a precise definition of a limit.

$\boxed{2}$ **Precise Definition of a Limi** Let $f$ be a function defined on some open interval that contains the number $a$, except possibly at $a$ itself. Then we say that the **limit of $f(x)$ as $x$ approaches $a$ is $L$**, and we write

$$\lim_{x\to a} f(x) = L$$

if for every number $\varepsilon>0$ there is a number $\delta>0$ such that

$$\text{if} \quad 0<|x-a|<\delta \qquad \text{then} \qquad |f(x)-L|<\varepsilon$$

It is traditional to use the Greek letters $\varepsilon$ and $\delta$ in the precise definition of a limit.

Since $|x-a|$ is the distance from $x$ to $a$ and $|f(x)-L|$ is the distance from $f(x)$ to $L$, and since $\varepsilon$ can be arbitrarily small, the definition of a limit can be expressed in words as follows:

> $\lim_{x\to a} f(x) = L$ means that the distance between $f(x)$ and $L$ can be made arbitrarily small by requiring that the distance from $x$ to $a$ be sufficiently small (but not 0).

Alternatively,

> $\lim_{x\to a} f(x) = L$ means that the values of $f(x)$ can be made as close as we please to $L$ by requiring $x$ to be close enough to $a$ (but not equal to $a$).

We can also reformulate Definition 2 in terms of intervals by observing that the inequality $|x-a|<\delta$ is equivalent to $-\delta<x-a<\delta$, which in turn can be written as $a-\delta<x<a+\delta$. Also $0<|x-a|$ is true if and only if $x-a\neq 0$, that is, $x\neq a$. Similarly, the inequality $|f(x)-L|<\varepsilon$ is equivalent to the pair of inequalities $L-\varepsilon<f(x)<L+\varepsilon$. Therefore, in terms of intervals, Definition 2 can be stated as follows:

> $\lim_{x\to a} f(x) = L$ means that for every $\varepsilon>0$ (no matter how small $\varepsilon$ is) we can find $\delta>0$ such that if $x$ lies in the open interval $(a-\delta, a+\delta)$ and $x\neq a$, then $f(x)$ lies in the open interval $(L-\varepsilon, L+\varepsilon)$.

We interpret this statement geometrically by representing a function by an arrow diagram as in Figure 2, where $f$ maps a subset of $\mathbb{R}$ onto another subset of $\mathbb{R}$.

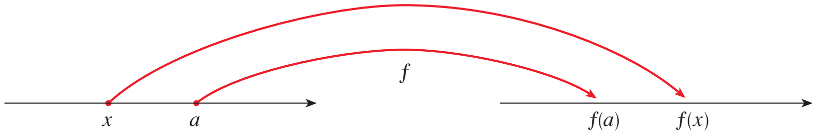

**FIGURE 2**

The definition of limit says that if any small interval $(L - \varepsilon, L + \varepsilon)$ is given around $L$, then we can find an interval $(a - \delta, a + \delta)$ around $a$ such that $f$ maps all the points in $(a - \delta, a + \delta)$ (except possibly $a$) into the interval $(L - \varepsilon, L + \varepsilon)$. (See Figure 3.)

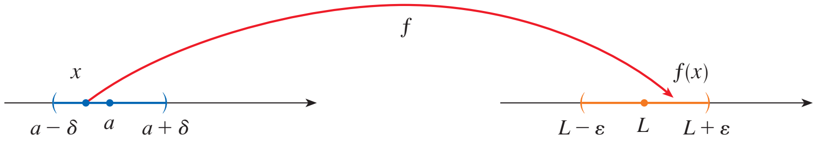

**FIGURE 3**

Another geometric interpretation of limits can be given in terms of the graph of a function. If $\varepsilon > 0$ is given, then we draw the horizontal lines $y = L + \varepsilon$ and $y = L - \varepsilon$ and the graph of $f$. (See Figure 4.) If $\lim_{x \to a} f(x) = L$, then we can find a number $\delta > 0$ such that if we restrict $x$ to lie in the interval $(a - \delta, a + \delta)$ and take $x \neq a$, then the curve $y = f(x)$ lies between the lines $y = L - \varepsilon$ and $y = L + \varepsilon$. (See Figure 5.) You can see that if such a $\delta$ has been found, then any smaller $\delta$ will also work.

It is important to realize that the process illustrated in Figures 4 and 5 must work for *every* positive number $\varepsilon$, no matter how small it is chosen. Figure 6 shows that if a smaller $\varepsilon$ is chosen, then a smaller $\delta$ may be required.

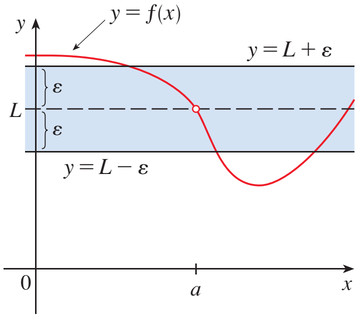

**FIGURE 4**

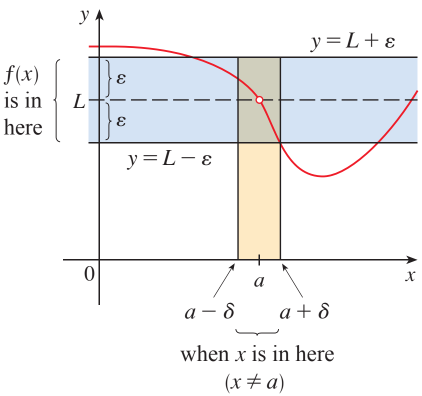

**FIGURE 5**

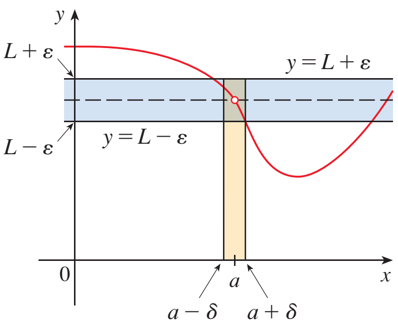

**FIGURE 6**

**EXAMPLE 1** Since $f(x) = x^3 - 5x + 6$ is a polynomial, we know from the Direct Substitution Property that $\lim_{x \to 1} f(x) = f(1) = 1^3 - 5(1) + 6 = 2$. Use a graph to find a number $\delta$ such that if $x$ is within $\delta$ of 1, then $y$ is within 0.2 of 2, that is,

$$\text{if} \quad |x - 1| < \delta \quad \text{then} \quad |(x^3 - 5x + 6) - 2| < 0.2$$

In other words, find a number $\delta$ that corresponds to $\varepsilon = 0.2$ in the definition of a limit for the function $f(x) = x^3 - 5x + 6$ with $a = 1$ and $L = 2$.

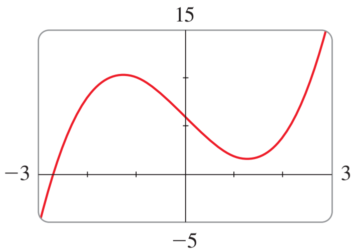

**FIGURE 7**

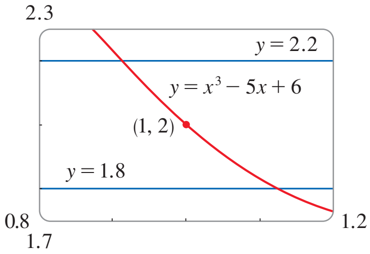

**FIGURE 8**

**SOLUTION** A graph of $f$ is shown in Figure 7; we are interested in the region near the point (1, 2). Notice that we can rewrite the inequality

$$|(x^3 - 5x + 6) - 2| < 0.2$$

as

$$-0.2 < (x^3 - 5x + 6) - 2 < 0.2$$

or equivalently

$$1.8 < x^3 - 5x + 6 < 2.2$$

So we need to determine the values of $x$ for which the curve $y = x^3 - 5x + 6$ lies between the horizontal lines $y = 1.8$ and $y = 2.2$. Therefore we graph the curves $y = x^3 - 5x + 6$, $y = 1.8$, and $y = 2.2$ near the point (1, 2) in Figure 8. We estimate that the $x$-coordinate of the point of intersection of the line $y = 2.2$ and the curve $y = x^3 - 5x + 6$ is about 0.911. Similarly, $y = x^3 - 5x + 6$ intersects the line $y = 1.8$ when $x \approx 1.124$. So, rounding toward 1 to be safe, we can say that

$$\text{if} \qquad 0.92 < x < 1.12 \qquad \text{then} \qquad 1.8 < x^3 - 5x + 6 < 2.2$$

This interval (0.92, 1.12) is not symmetric about $x = 1$. The distance from $x = 1$ to the left endpoint is $1 - 0.92 = 0.08$ and the distance to the right endpoint is 0.12. We can choose $\delta$ to be the smaller of these numbers, that is, $\delta = 0.08$. Then we can rewrite our inequalities in terms of distances as follows:

$$\text{if} \qquad |x - 1| < 0.08 \qquad \text{then} \qquad |(x^3 - 5x + 6) - 2| < 0.2$$

This just says that by keeping $x$ within 0.08 of 1, we are able to keep $f(x)$ within 0.2 of 2.

Although we chose $\delta = 0.08$, any smaller positive value of $\delta$ would also have worked. ■

The graphical procedure used in Example 1 gives an illustration of the definition for $\varepsilon = 0.2$, but it does not *prove* that the limit is equal to 2. A proof has to provide a $\delta$ for *every* $\varepsilon$.

In proving limit statements it may be helpful to think of the definition of limit as a challenge. First it challenges you with a number $\varepsilon$. Then you must be able to produce a suitable $\delta$. You have to be able to do this for every $\varepsilon > 0$, not just a particular $\varepsilon$.

Imagine a contest between two people, A and B, and imagine yourself to be B. Person A stipulates that the fixed number $L$ should be approximated by the values of $f(x)$ to within a degree of accuracy $\varepsilon$ (say, 0.01). Person B then responds by finding a number $\delta$ such that if $0 < |x - a| < \delta$, then $|f(x) - L| < \varepsilon$. Then A may become more exacting and challenge B with a smaller value of $\varepsilon$ (say, 0.0001). Again B has to respond by finding a corresponding $\delta$. Usually the smaller the value of $\varepsilon$, the smaller the corresponding value of $\delta$ must be. If B always wins, no matter how small A makes $\varepsilon$, then $\lim_{x \to a} f(x) = L$.

**EXAMPLE 2** Prove that $\lim\limits_{x \to 3} (4x - 5) = 7$.

**SOLUTION**

**1.** *Preliminary analysis of the problem (guessing a value for $\delta$).* Let $\varepsilon$ be a given positive number. We want to find a number $\delta$ such that

$$\text{if} \qquad 0 < |x - 3| < \delta \qquad \text{then} \qquad |(4x - 5) - 7| < \varepsilon$$

But $|(4x - 5) - 7| = |4x - 12| = |4(x - 3)| = 4|x - 3|$. Therefore we want $\delta$ such that

$$\text{if} \quad 0 < |x - 3| < \delta \quad \text{then} \quad 4|x - 3| < \varepsilon$$

that is,
$$\text{if} \quad 0 < |x - 3| < \delta \quad \text{then} \quad |x - 3| < \frac{\varepsilon}{4}$$

This suggests that we should choose $\delta = \varepsilon/4$.

**2.** *Proof (showing that this $\delta$ works).* Given $\varepsilon > 0$, choose $\delta = \varepsilon/4$. If $0 < |x - 3| < \delta$, then

$$|(4x - 5) - 7| = |4x - 12| = 4|x - 3| < 4\delta = 4\left(\frac{\varepsilon}{4}\right) = \varepsilon$$

Thus
$$\text{if} \quad 0 < |x - 3| < \delta \quad \text{then} \quad |(4x - 5) - 7| < \varepsilon$$

Therefore, by the definition of a limit,

$$\lim_{x \to 3} (4x - 5) = 7$$

This example is illustrated by Figure 9.

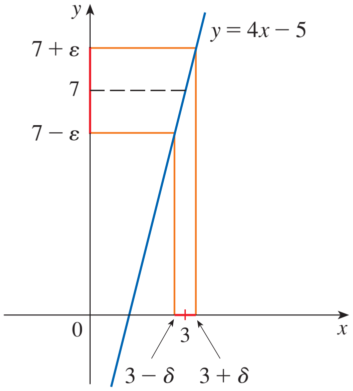

**FIGURE 9**

■

Note that in the solution of Example 2 there were two stages—guessing and proving. We made a preliminary analysis that enabled us to guess a value for $\delta$. But then in the second stage we had to go back and prove in a careful, logical fashion that we had made a correct guess. This procedure is typical of much of mathematics. Sometimes it is necessary to first make an intelligent guess about the answer to a problem and then prove that the guess is correct.

**EXAMPLE 3** Prove that $\lim_{x \to 3} x^2 = 9$.

**SOLUTION**

**1.** *Guessing a value for $\delta$.* Let $\varepsilon > 0$ be given. We have to find a number $\delta > 0$ such that

$$\text{if} \quad 0 < |x - 3| < \delta \quad \text{then} \quad |x^2 - 9| < \varepsilon$$

To connect $|x^2 - 9|$ with $|x - 3|$ we write $|x^2 - 9| = |(x + 3)(x - 3)|$. Then we want

$$\text{if} \quad 0 < |x - 3| < \delta \quad \text{then} \quad |x + 3||x - 3| < \varepsilon$$

### Cauchy and Limits

After the invention of calculus in the 17th century, there followed a period of free development of the subject in the 18th century. Mathematicians like the Bernoulli brothers and Euler were eager to exploit the power of calculus and boldly explored the consequences of this new and wonderful mathematical theory without worrying too much about whether their proofs were completely correct.

The 19th century, by contrast, was the Age of Rigor in mathematics. There was a movement to go back to the foundations of the subject—to provide careful definitions and rigorous proofs. At the forefront of this movement was the French mathematician Augustin-Louis Cauchy (1789–1857), who started out as a military engineer before becoming a mathematics professor in Paris. Cauchy took Newton's idea of a limit, which was kept alive in the 18th century by the French mathematician Jean d'Alembert, and made it more precise. His definition of a limit reads as follows: "When the successive values attributed to a variable approach indefinitely a fixed value so as to end by differing from it by as little as one wishes, this last is called the *limit* of all the others." But when Cauchy used this definition in examples and proofs, he often employed delta-epsilon inequalities similar to the ones in this section. A typical Cauchy proof starts with: "Designate by $\delta$ and $\varepsilon$ two very small numbers; . . ." He used $\varepsilon$ because of the correspondence between epsilon and the French word *erreur* and $\delta$ because delta corresponds to *différence*. Later, the German mathematician Karl Weierstrass (1815–1897) stated the definition of a limit exactly as in our Definition 2.

Notice that if we can find a positive constant $C$ such that $|x+3| < C$, then

$$|x+3||x-3| < C|x-3|$$

and we can make $C|x-3| < \varepsilon$ by taking $|x-3| < \varepsilon/C$, so we could choose $\delta = \varepsilon/C$.

We can find such a number $C$ if we restrict $x$ to lie in some interval centered at 3. In fact, since we are interested only in values of $x$ that are close to 3, it is reasonable to assume that $x$ is within a distance 1 from 3, that is, $|x-3| < 1$. Then $2 < x < 4$, so $5 < x+3 < 7$. Thus we have $|x+3| < 7$, and so $C = 7$ is a suitable choice for the constant.

But now there are two restrictions on $|x-3|$, namely

$$|x-3| < 1 \qquad \text{and} \qquad |x-3| < \frac{\varepsilon}{C} = \frac{\varepsilon}{7}$$

To make sure that both of these inequalities are satisfied, we take $\delta$ to be the smaller of the two numbers 1 and $\varepsilon/7$. The notation for this is $\delta = \min\{1, \varepsilon/7\}$.

**2.** *Showing that this* $\delta$ *works.* Given $\varepsilon > 0$, let $\delta = \min\{1, \varepsilon/7\}$. If $0 < |x-3| < \delta$, then $|x-3| < 1 \Rightarrow 2 < x < 4 \Rightarrow |x+3| < 7$ (as in part 1). We also have $|x-3| < \varepsilon/7$, so

$$|x^2-9| = |x+3||x-3| < 7 \cdot \frac{\varepsilon}{7} = \varepsilon$$

This shows that $\lim_{x \to 3} x^2 = 9$. ■

## One-Sided Limits

The intuitive definitions of one-sided limits that were given in Section 1.5 can be precisely reformulated as follows.

### 3 Precise Definition of Left-Hand Limit

$$\lim_{x \to a^-} f(x) = L$$

if for every number $\varepsilon > 0$ there is a number $\delta > 0$ such that

$$\text{if} \qquad a - \delta < x < a \qquad \text{then} \qquad |f(x) - L| < \varepsilon$$

### 4 Precise Definition of Right-Hand Limit

$$\lim_{x \to a^+} f(x) = L$$

if for every number $\varepsilon > 0$ there is a number $\delta > 0$ such that

$$\text{if} \qquad a < x < a + \delta \qquad \text{then} \qquad |f(x) - L| < \varepsilon$$

Notice that Definition 3 is the same as Definition 2 except that $x$ is restricted to lie in the *left* half $(a-\delta, a)$ of the interval $(a-\delta, a+\delta)$. In Definition 4, $x$ is restricted to lie in the *right* half $(a, a+\delta)$ of the interval $(a-\delta, a+\delta)$.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 4** Use Definition 4 to prove that $\lim_{x \to 0^+} \sqrt{x} = 0$.

**SOLUTION**

**1.** *Guessing a value for* $\delta$. Let $\varepsilon$ be a given positive number. Here $a = 0$ and $L = 0$, so we want to find a number $\delta$ such that

$$\text{if} \quad 0 < x < \delta \quad \text{then} \quad |\sqrt{x} - 0| < \varepsilon$$

that is,

$$\text{if} \quad 0 < x < \delta \quad \text{then} \quad \sqrt{x} < \varepsilon$$

or, squaring both sides of the inequality $\sqrt{x} < \varepsilon$, we get

$$\text{if} \quad 0 < x < \delta \quad \text{then} \quad x < \varepsilon^2$$

This suggests that we should choose $\delta = \varepsilon^2$.

**2.** *Showing that this* $\delta$ *works.* Given $\varepsilon > 0$, let $\delta = \varepsilon^2$. If $0 < x < \delta$, then

$$\sqrt{x} < \sqrt{\delta} = \sqrt{\varepsilon^2} = \varepsilon$$

so

$$|\sqrt{x} - 0| < \varepsilon$$

According to Definition 4, this shows that $\lim_{x \to 0^+} \sqrt{x} = 0$. ■

## ■ The Limit Laws

As the preceding examples show, it is not always easy to prove that limit statements are true using the $\varepsilon$, $\delta$ definition. In fact, if we had been given a more complicated function such as $f(x) = (6x^2 - 8x + 9)/(2x^2 - 1)$, a proof would require a great deal of ingenuity. Fortunately this is unnecessary because the Limit Laws stated in Section 1.6 can be proved using Definition 2, and then the limits of complicated functions can be found rigorously from the Limit Laws without resorting to the definition directly.

For instance, we prove the Sum Law: If $\lim_{x \to a} f(x) = L$ and $\lim_{x \to a} g(x) = M$ both exist, then

$$\lim_{x \to a} [f(x) + g(x)] = L + M$$

The remaining laws are proved in the exercises and in Appendix F.

**PROOF OF THE SUM LAW** Let $\varepsilon > 0$ be given. We must find $\delta > 0$ such that

$$\text{if} \quad 0 < |x - a| < \delta \quad \text{then} \quad |f(x) + g(x) - (L + M)| < \varepsilon$$

Triangle Inequality:

$$|a + b| \leqslant |a| + |b|$$

(See Appendix A.)

Using the Triangle Inequality we can write

$$\boxed{5} \qquad \begin{aligned} |f(x) + g(x) - (L + M)| &= |(f(x) - L) + (g(x) - M)| \\ &\leqslant |f(x) - L| + |g(x) - M| \end{aligned}$$

We make $|f(x) + g(x) - (L + M)|$ less than $\varepsilon$ by making each of the terms $|f(x) - L|$ and $|g(x) - M|$ less than $\varepsilon/2$.

Since $\varepsilon/2 > 0$ and $\lim_{x \to a} f(x) = L$, there exists a number $\delta_1 > 0$ such that

$$\text{if} \quad 0 < |x - a| < \delta_1 \quad \text{then} \quad |f(x) - L| < \frac{\varepsilon}{2}$$

Similarly, since $\lim_{x \to a} g(x) = M$, there exists a number $\delta_2 > 0$ such that

$$\text{if} \quad 0 < |x - a| < \delta_2 \quad \text{then} \quad |g(x) - M| < \frac{\varepsilon}{2}$$

Let $\delta = \min\{\delta_1, \delta_2\}$, the smaller of the numbers $\delta_1$ and $\delta_2$. Notice that

$$\text{if} \quad 0 < |x - a| < \delta \quad \text{then} \quad 0 < |x - a| < \delta_1 \quad \text{and} \quad 0 < |x - a| < \delta_2$$

and so
$$|f(x) - L| < \frac{\varepsilon}{2} \quad \text{and} \quad |g(x) - M| < \frac{\varepsilon}{2}$$

Therefore, by (5),

$$\begin{aligned} |f(x) + g(x) - (L + M)| &\leqslant |f(x) - L| + |g(x) - M| \\ &< \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon \end{aligned}$$

To summarize,

$$\text{if} \quad 0 < |x - a| < \delta \quad \text{then} \quad |f(x) + g(x) - (L + M)| < \varepsilon$$

Thus, by the definition of a limit,

$$\lim_{x \to a} [f(x) + g(x)] = L + M$$ ■

## Infinite Limits

Infinite limits can also be defined in a precise way. The following is a precise version of Definition 1.5.4.

**6 Precise Definition of an Infinite Limit** Let $f$ be a function defined on some open interval that contains the number $a$, except possibly at $a$ itself. Then

$$\lim_{x \to a} f(x) = \infty$$

means that for every positive number $M$ there is a positive number $\delta$ such that

$$\text{if} \quad 0 < |x - a| < \delta \quad \text{then} \quad f(x) > M$$

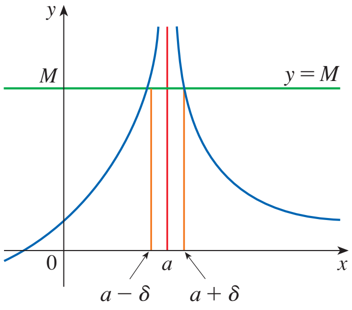

**FIGURE 10**

This says that the values of $f(x)$ can be made arbitrarily large (larger than any given number $M$) by requiring $x$ to be close enough to $a$ (within a distance $\delta$, where $\delta$ depends on $M$, but with $x \neq a$). A geometric illustration is shown in Figure 10.

Given any horizontal line $y = M$, we can find a number $\delta > 0$ such that if we restrict $x$ to lie in the interval $(a - \delta, a + \delta)$ but $x \neq a$, then the curve $y = f(x)$ lies above the line $y = M$. You can see that if a larger $M$ is chosen, then a smaller $\delta$ may be required.

**EXAMPLE 5** Use Definition 6 to prove that $\lim_{x \to 0} \frac{1}{x^2} = \infty$.

**SOLUTION** Let $M$ be a given positive number. We want to find a number $\delta$ such that

$$\text{if} \quad 0 < |x| < \delta \quad \text{then} \quad 1/x^2 > M$$

But
$$\frac{1}{x^2} > M \iff x^2 < \frac{1}{M} \iff \sqrt{x^2} < \sqrt{\frac{1}{M}} \iff |x| < \frac{1}{\sqrt{M}}$$

So if we choose $\delta = 1/\sqrt{M}$ and $0 < |x| < \delta = 1/\sqrt{M}$, then $1/x^2 > M$. This shows that $1/x^2 \to \infty$ as $x \to 0$. ■

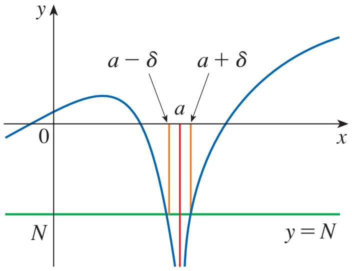

**FIGURE 11**

Similarly, the following is a precise version of Definition 1.5.5. It is illustrated by Figure 11.

**7 Definitio** Let $f$ be a function defined on some open interval that contains the number $a$, except possibly at $a$ itself. Then

$$\lim_{x \to a} f(x) = -\infty$$

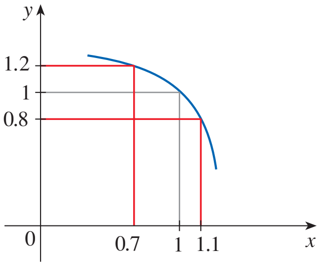
means that for every negative number $N$ there is a positive number $\delta$ such that

$$\text{if} \quad 0 < |x - a| < \delta \quad \text{then} \quad f(x) < N$$

## 1.7 Exercises

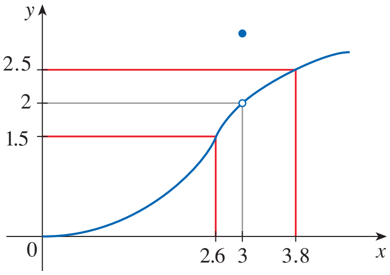
**1.** Use the given graph of $f$ to find a number $\delta$ such that

$$\text{if} \quad |x - 1| < \delta \quad \text{then} \quad |f(x) - 1| < 0.2$$



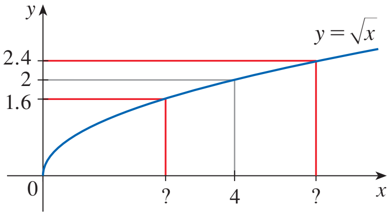
**2.** Use the given graph of $f$ to find a number $\delta$ such that

$$\text{if} \quad 0 < |x - 3| < \delta \quad \text{then} \quad |f(x) - 2| < 0.5$$



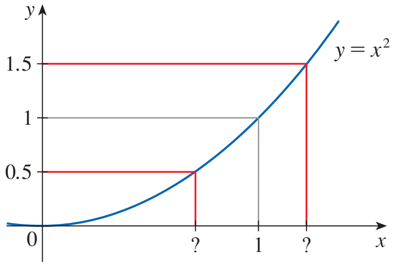
**3.** Use the given graph of $f(x) = \sqrt{x}$ to find a number $\delta$ such that

$$\text{if} \quad |x - 4| < \delta \quad \text{then} \quad |\sqrt{x} - 2| < 0.4$$



**4.** Use the given graph of $f(x) = x^2$ to find a number $\delta$ such that

$$\text{if} \quad |x - 1| < \delta \quad \text{then} \quad |x^2 - 1| < \tfrac{1}{2}$$



**5.** Use a graph to find a number $\delta$ such that

$$\text{if} \quad |x - 2| < \delta \quad \text{then} \quad \left|\sqrt{x^2 + 5} - 3\right| < 0.3$$

**6.** Use a graph to find a number $\delta$ such that

$$\text{if} \quad \left|x - \frac{\pi}{6}\right| < \delta \quad \text{then} \quad \left|\cos^2 x - \frac{3}{4}\right| < 0.1$$

**7.** For the limit

$$\lim_{x \to 2} (x^3 - 3x + 4) = 6$$

illustrate Definition 2 by finding values of $\delta$ that correspond to $\varepsilon = 0.2$ and $\varepsilon = 0.1$.

**8.** For the limit

$$\lim_{x \to 2} \frac{4x + 1}{3x - 4} = 4.5$$

illustrate Definition 2 by finding values of $\delta$ that correspond to $\varepsilon = 0.5$ and $\varepsilon = 0.1$.

**9.** (a) Use a graph to find a number $\delta$ such that

$$\text{if} \quad 4 < x < 4 + \delta \quad \text{then} \quad \frac{x^2 + 4}{\sqrt{x - 4}} > 100$$

(b) What limit does part (a) suggest is true?

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**10.** Given that $\lim_{x\to\pi} \csc^2 x = \infty$, illustrate Definition 6 by finding values of $\delta$ that correspond to (a) $M = 500$ and (b) $M = 1000$.

**11.** A machinist is required to manufacture a circular metal disk with area $1000 \text{ cm}^2$.
(a) What radius produces such a disk?
(b) If the machinist is allowed an error tolerance of $\pm 5 \text{ cm}^2$ in the area of the disk, how close to the ideal radius in part (a) must the machinist control the radius?
(c) In terms of the $\varepsilon$, $\delta$ definition of $\lim_{x\to a} f(x) = L$, what is $x$? What is $f(x)$? What is $a$? What is $L$? What value of $\varepsilon$ is given? What is the corresponding value of $\delta$?

**12.** Crystal growth furnaces are used in research to determine how best to manufacture crystals used in electronic components. For proper growth of a crystal, the temperature must be controlled accurately by adjusting the input power. Suppose the relationship is given by

$$T(w) = 0.1w^2 + 2.155w + 20$$

where $T$ is the temperature in degrees Celsius and $w$ is the power input in watts.
(a) How much power is needed to maintain the temperature at 200°C?
(b) If the temperature is allowed to vary from 200°C by up to ±1°C, what range of wattage is allowed for the input power?
(c) In terms of the $\varepsilon$, $\delta$ definition of $\lim_{x\to a} f(x) = L$, what is $x$? What is $f(x)$? What is $a$? What is $L$? What value of $\varepsilon$ is given? What is the corresponding value of $\delta$?

**13.** (a) Find a number $\delta$ such that if $|x - 2| < \delta$, then $|4x - 8| < \varepsilon$, where $\varepsilon = 0.1$.
(b) Repeat part (a) with $\varepsilon = 0.01$.

**14.** Given that $\lim_{x\to 2}(5x - 7) = 3$, illustrate Definition 2 by finding values of $\delta$ that correspond to $\varepsilon = 0.1$, $\varepsilon = 0.05$, and $\varepsilon = 0.01$.

**15–18** Prove the statement using the $\varepsilon$, $\delta$ definition of a limit and illustrate with a diagram like Figure 9.

**15.** $\lim_{x\to 4} \left(\frac{1}{2}x - 1\right) = 1$

**16.** $\lim_{x\to 2} (2 - 3x) = -4$

**17.** $\lim_{x\to -2} (-2x + 1) = 5$

**18.** $\lim_{x\to 1} (2x - 5) = -3$

**19–32** Prove the statement using the $\varepsilon$, $\delta$ definition of a limit.

**19.** $\lim_{x\to 9} \left(1 - \frac{1}{3}x\right) = -2$

**20.** $\lim_{x\to 5} \left(\frac{3}{2}x - \frac{1}{2}\right) = 7$

**21.** $\lim_{x\to 4} \dfrac{x^2 - 2x - 8}{x - 4} = 6$

**22.** $\lim_{x\to -1.5} \dfrac{9 - 4x^2}{3 + 2x} = 6$

**23.** $\lim_{x\to a} x = a$

**24.** $\lim_{x\to a} c = c$

**25.** $\lim_{x\to 0} x^2 = 0$

**26.** $\lim_{x\to 0} x^3 = 0$

**27.** $\lim_{x\to 0} |x| = 0$

**28.** $\lim_{x\to -6^+} \sqrt[8]{6 + x} = 0$

**29.** $\lim_{x\to 2} (x^2 - 4x + 5) = 1$

**30.** $\lim_{x\to 2} (x^2 + 2x - 7) = 1$

**31.** $\lim_{x\to -2} (x^2 - 1) = 3$

**32.** $\lim_{x\to 2} x^3 = 8$

**33.** Verify that another possible choice of $\delta$ for showing that $\lim_{x\to 3} x^2 = 9$ in Example 3 is $\delta = \min\{2, \varepsilon/8\}$.

**34.** Verify, by a geometric argument, that the largest possible choice of $\delta$ for showing that $\lim_{x\to 3} x^2 = 9$ is $\delta = \sqrt{9 + \varepsilon} - 3$.

**35.** (a) For the limit $\lim_{x\to 1}(x^3 + x + 1) = 3$, use a graph to find a value of $\delta$ that corresponds to $\varepsilon = 0.4$.
(b) By solving the cubic equation $x^3 + x + 1 = 3 + \varepsilon$, find the largest possible value of $\delta$ that works for any given $\varepsilon > 0$.
(c) Put $\varepsilon = 0.4$ in your answer to part (b) and compare with your answer to part (a).

**36.** Prove that $\lim_{x\to 2} \dfrac{1}{x} = \dfrac{1}{2}$.

**37.** Prove that $\lim_{x\to a} \sqrt{x} = \sqrt{a}$ if $a > 0$.

$$\left[\textit{Hint}\text{: Use } \left|\sqrt{x} - \sqrt{a}\right| = \frac{|x - a|}{\sqrt{x} + \sqrt{a}}.\right]$$

**38.** If $H$ is the Heaviside function defined in Section 1.5, prove, using Definition 2, that $\lim_{t\to 0} H(t)$ does not exist. [*Hint:* Use an indirect proof as follows. Suppose that the limit is $L$. Take $\varepsilon = \frac{1}{2}$ in the definition of a limit and try to arrive at a contradiction.]

**39.** If the function $f$ is defined by

$$f(x) = \begin{cases} 0 & \text{if } x \text{ is rational} \\ 1 & \text{if } x \text{ is irrational} \end{cases}$$

prove that $\lim_{x\to 0} f(x)$ does not exist.

**40.** By comparing Definitions 2, 3, and 4, prove Theorem 1.6.1:

$$\lim_{x\to a} f(x) = L \quad \text{if and only if} \quad \lim_{x\to a^-} f(x) = L = \lim_{x\to a^+} f(x)$$

**41.** How close to $-3$ do we have to take $x$ so that

$$\frac{1}{(x + 3)^4} > 10{,}000$$

**42.** Prove, using Definition 6, that $\lim_{x\to -3} \dfrac{1}{(x + 3)^4} = \infty$.

**43.** Prove that $\lim_{x\to -1^-} \dfrac{5}{(x + 1)^3} = -\infty$.

**44.** Suppose that $\lim_{x\to a} f(x) = \infty$ and $\lim_{x\to a} g(x) = c$, where $c$ is a real number. Prove each statement.
(a) $\lim_{x\to a} [f(x) + g(x)] = \infty$
(b) $\lim_{x\to a} [f(x)g(x)] = \infty$ if $c > 0$
(c) $\lim_{x\to a} [f(x)g(x)] = -\infty$ if $c < 0$

# 1.8 Continuity

## Continuity of a Function

We noticed in Section 1.6 that the limit of a function as $x$ approaches $a$ can often be found simply by calculating the value of the function at $a$. Functions having this property are called *continuous at $a$*. We will see that the mathematical definition of continuity corresponds closely with the meaning of the word *continuity* in everyday language. (A continuous process is one that takes place without interruption.)

**1 Definitio** A function $f$ is **continuous at a number $a$** if

$$\lim_{x \to a} f(x) = f(a)$$

As illustrated in Figure 1, if $f$ is continuous, then the points $(x, f(x))$ on the graph of $f$ approach the point $(a, f(a))$ on the graph. So there is no gap in the curve.

Notice that Definition 1 implicitly requires three things if $f$ is continuous at $a$:

1. $f(a)$ is defined (that is, $a$ is in the domain of $f$)
2. $\lim_{x \to a} f(x)$ exists
3. $\lim_{x \to a} f(x) = f(a)$

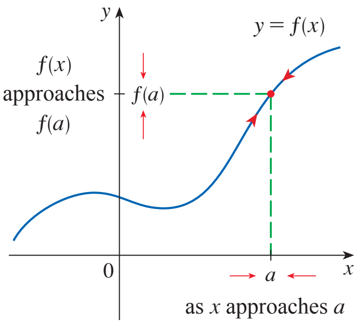


**FIGURE 1**

The definition says that $f$ is continuous at $a$ if $f(x)$ approaches $f(a)$ as $x$ approaches $a$. Thus a continuous function $f$ has the property that a small change in $x$ produces only a small change in $f(x)$. In fact, the change in $f(x)$ can be kept as small as we please by keeping the change in $x$ sufficiently small.

If $f$ is defined near $a$ (in other words, $f$ is defined on an open interval containing $a$, except perhaps at $a$), we say that $f$ is **discontinuous at $a$** (or $f$ has a **discontinuity** at $a$) if $f$ is not continuous at $a$.

Physical phenomena are usually continuous. For instance, the displacement or velocity of a moving vehicle varies continuously with time, as does a person's height. But discontinuities do occur in such situations as electric currents. [The Heaviside function, introduced in Section 1.5, is discontinuous at 0 because $\lim_{t \to 0} H(t)$ does not exist.]

Geometrically, you can think of a function that is continuous at every number in an interval as a function whose graph has no break in it: the graph can be drawn without removing your pen from the paper.

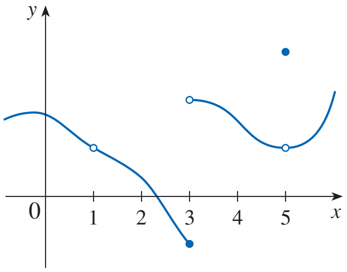

**FIGURE 2**

**EXAMPLE 1** Figure 2 shows the graph of a function $f$. At which numbers is $f$ discontinuous? Why?

**SOLUTION** It looks as if there is a discontinuity when $a = 1$ because the graph has a break there. The official reason that $f$ is discontinuous at 1 is that $f(1)$ is not defined.

The graph also has a break when $a = 3$, but the reason for the discontinuity is different. Here, $f(3)$ is defined, but $\lim_{x \to 3} f(x)$ does not exist (because the left and right limits are different). So $f$ is discontinuous at 3.

What about $a = 5$? Here, $f(5)$ is defined and $\lim_{x \to 5} f(x)$ exists (because the left and right limits are the same). But

$$\lim_{x \to 5} f(x) \neq f(5)$$

So $f$ is discontinuous at 5. ■

Now let's see how to detect discontinuities when a function is defined by a formula.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 2** Where are each of the following functions discontinuous?

(a) $f(x) = \dfrac{x^2 - x - 2}{x - 2}$ (b) $f(x) = \begin{cases} \dfrac{x^2 - x - 2}{x - 2} & \text{if } x \neq 2 \\ 1 & \text{if } x = 2 \end{cases}$

(c) $f(x) = \begin{cases} \dfrac{1}{x^2} & \text{if } x \neq 0 \\ 1 & \text{if } x = 0 \end{cases}$ (d) $f(x) = [\![ x ]\!]$

**SOLUTION**

(a) Notice that $f(2)$ is not defined, so $f$ is discontinuous at 2. Later we'll see why $f$ is continuous at all other numbers.

(b) Here $f(2) = 1$ is defined and

$$\lim_{x \to 2} f(x) = \lim_{x \to 2} \frac{x^2 - x - 2}{x - 2} = \lim_{x \to 2} \frac{(x - 2)(x + 1)}{x - 2} = \lim_{x \to 2} (x + 1) = 3$$

exists. But

$$\lim_{x \to 2} f(x) \neq f(2)$$

so $f$ is not continuous at 2.

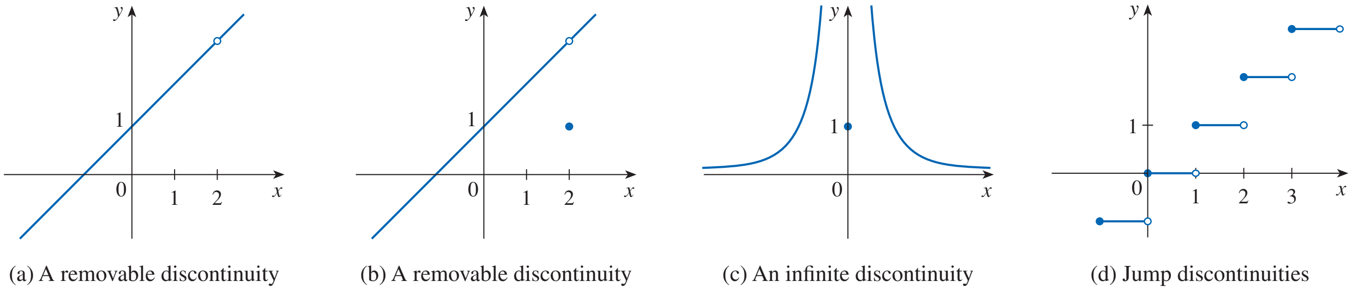
(c) Here $f(0) = 1$ is defined but

$$\lim_{x \to 0} f(x) = \lim_{x \to 0} \frac{1}{x^2}$$

does not exist. (See Example 1.5.6.) So $f$ is discontinuous at 0.

(d) The greatest integer function $f(x) = [\![ x ]\!]$ has discontinuities at all of the integers because $\lim_{x \to n} [\![ x ]\!]$ does not exist if $n$ is an integer. (See Example 1.6.10 and Exercise 1.6.55.) ■

Figure 3 shows the graphs of the functions in Example 2. In each case the graph can't be drawn without lifting the pen from the paper because a hole or break or jump occurs in the graph. The kind of discontinuity illustrated in parts (a) and (b) is called **removable** because we could remove the discontinuity by redefining $f$ at just the single number 2. [If we redefine $f$ to be 3 at $x = 2$, then $f$ is equivalent to the function $g(x) = x + 1$, which is continuous.] The discontinuity in part (c) is called an **infinite discontinuity**. The discontinuities in part (d) are called **jump discontinuities** because the function "jumps" from one value to another.



(a) A removable discontinuity (b) A removable discontinuity (c) An infinite discontinuity (d) Jump discontinuities

**FIGURE 3** Graphs of the functions in Example 2

**2 Definition** A function $f$ is **continuous from the right at a number *a*** if

$$\lim_{x \to a^+} f(x) = f(a)$$

and $f$ is **continuous from the left at *a*** if

$$\lim_{x \to a^-} f(x) = f(a)$$

**EXAMPLE 3** At each integer $n$, the function $f(x) = \llbracket x \rrbracket$ [see Figure 3(d)] is continuous from the right but discontinuous from the left because

$$\lim_{x \to n^+} f(x) = \lim_{x \to n^+} \llbracket x \rrbracket = n = f(n)$$

but

$$\lim_{x \to n^-} f(x) = \lim_{x \to n^-} \llbracket x \rrbracket = n - 1 \neq f(n)$$

■

**3 Definition** A function $f$ is **continuous on an interval** if it is continuous at every number in the interval. (If $f$ is defined only on one side of an endpoint of the interval, we understand *continuous* at the endpoint to mean *continuous from the right* or *continuous from the left.*)

**EXAMPLE 4** Show that the function $f(x) = 1 - \sqrt{1 - x^2}$ is continuous on the interval $[-1, 1]$.

**SOLUTION** If $-1 < a < 1$, then using the Limit Laws from Section 1.6, we have

$$\begin{aligned} \lim_{x \to a} f(x) &= \lim_{x \to a} \left(1 - \sqrt{1 - x^2}\right) \\ &= 1 - \lim_{x \to a} \sqrt{1 - x^2} && \text{(by Laws 2 and 8)} \\ &= 1 - \sqrt{\lim_{x \to a} (1 - x^2)} && \text{(by 7)} \\ &= 1 - \sqrt{1 - a^2} && \text{(by 2, 8, and 10)} \\ &= f(a) \end{aligned}$$

Thus, by Definition l, $f$ is continuous at $a$ if $-1 < a < 1$. Similar calculations show that

$$\lim_{x \to -1^+} f(x) = 1 = f(-1) \qquad \text{and} \qquad \lim_{x \to 1^-} f(x) = 1 = f(1)$$

so $f$ is continuous from the right at $-1$ and continuous from the left at 1. Therefore, according to Definition 3, $f$ is continuous on $[-1, 1]$.

The graph of $f$ is sketched in Figure 4. It is the lower half of the circle

$$x^2 + (y - 1)^2 = 1$$

■

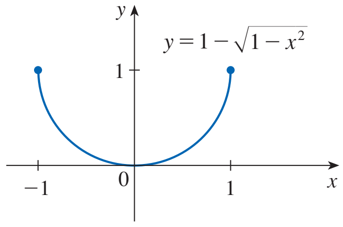


**FIGURE 4**

## Properties of Continuous Functions

Instead of always using Definitions 1, 2, and 3 to verify the continuity of a function as we did in Example 4, it is often convenient to use the next theorem, which shows how to build up complicated continuous functions from simple ones.

**4 Theorem** If $f$ and $g$ are continuous at $a$ and $c$ is a constant, then the following functions are also continuous at $a$:

**1.** $f + g$ **2.** $f - g$ **3.** $cf$

**4.** $fg$ **5.** $\dfrac{f}{g}$ if $g(a) \neq 0$

**PROOF** Each of the five parts of this theorem follows from the corresponding Limit Law in Section 1.6. For instance, we give the proof of part 1. Since $f$ and $g$ are continuous at $a$, we have

$$\lim_{x\to a} f(x) = f(a) \qquad \text{and} \qquad \lim_{x\to a} g(x) = g(a)$$

Therefore

$$\begin{aligned}\lim_{x\to a} (f + g)(x) &= \lim_{x\to a} [f(x) + g(x)] \\ &= \lim_{x\to a} f(x) + \lim_{x\to a} g(x) \qquad \text{(by Law 1)} \\ &= f(a) + g(a) \\ &= (f + g)(a)\end{aligned}$$

This shows that $f + g$ is continuous at $a$. ■

It follows from Theorem 4 and Definition 3 that if $f$ and $g$ are continuous on an interval, then so are the functions $f + g$, $f - g$, $cf$, $fg$, and (if $g$ is never 0) $f/g$. The following theorem was stated in Section 1.6 as the Direct Substitution Property.

**5 Theorem**

(a) Any polynomial is continuous everywhere; that is, it is continuous on $\mathbb{R} = (-\infty, \infty)$.

(b) Any rational function is continuous wherever it is defined; that is, it is continuous on its domain.

**PROOF**

(a) A polynomial is a function of the form

$$P(x) = c_n x^n + c_{n-1} x^{n-1} + \cdots + c_1 x + c_0$$

where $c_0, c_1, \ldots, c_n$ are constants. We know that

$$\lim_{x\to a} c_0 = c_0 \qquad \text{(by Law 8)}$$

and
$$\lim_{x\to a} x^m = a^m \qquad m = 1, 2, \ldots, n \qquad \text{(by 10)}$$

This equation is precisely the statement that the function $f(x) = x^m$ is a continuous function. Thus, by part 3 of Theorem 4, the function $g(x) = cx^m$ is continuous. Since $P$ is a sum of functions of this form and a constant function, it follows from part 1 of Theorem 4 that $P$ is continuous.

(b) A rational function is a function of the form

$$f(x) = \frac{P(x)}{Q(x)}$$

where $P$ and $Q$ are polynomials. The domain of $f$ is $D = \{x \in \mathbb{R} \mid Q(x) \neq 0\}$. We know from part (a) that $P$ and $Q$ are continuous everywhere. Thus, by part 5 of Theorem 4, $f$ is continuous at every number in $D$. ■

As an illustration of Theorem 5, observe that the volume of a sphere varies continuously with its radius because the formula $V(r) = \frac{4}{3}\pi r^3$ shows that $V$ is a polynomial function of $r$. Likewise, if a ball is thrown vertically into the air with an initial velocity of 50 ft/s, then the height of the ball in feet $t$ seconds later is given by the formula $h = 50t - 16t^2$. Again this is a polynomial function, so the height is a continuous function of the elapsed time, as we might expect.

Knowledge of which functions are continuous enables us to evaluate some limits very quickly, as the following example shows. Compare it with Example 1.6.2(b).

**EXAMPLE 5** Find $\displaystyle\lim_{x \to -2} \frac{x^3 + 2x^2 - 1}{5 - 3x}$.

**SOLUTION** The function

$$f(x) = \frac{x^3 + 2x^2 - 1}{5 - 3x}$$

is rational, so by Theorem 5 it is continuous on its domain, which is $\left\{x \mid x \neq \frac{5}{3}\right\}$. Therefore

$$\lim_{x \to -2} \frac{x^3 + 2x^2 - 1}{5 - 3x} = \lim_{x \to -2} f(x) = f(-2)$$

$$= \frac{(-2)^3 + 2(-2)^2 - 1}{5 - 3(-2)} = -\frac{1}{11}$$ ■

It turns out that most of the familiar functions are continuous at every number in their domains. For instance, Limit Law 11 in Section 1.6 is exactly the statement that root functions are continuous.

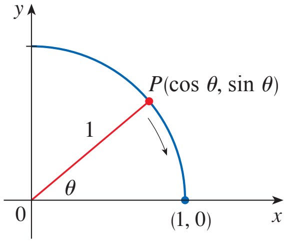

**FIGURE 5**

From the appearance of the graphs of the sine and cosine functions (Figure 1.2.19), we would certainly guess that they are continuous. We know from the definitions of $\sin\theta$ and $\cos\theta$ that the coordinates of the point $P$ in Figure 5 are $(\cos\theta, \sin\theta)$. As $\theta \to 0$, we see that $P$ approaches the point $(1, 0)$ and so $\cos\theta \to 1$ and $\sin\theta \to 0$. Thus

**6** $$\lim_{\theta \to 0} \cos\theta = 1 \qquad \lim_{\theta \to 0} \sin\theta = 0$$

Another way to establish the limits in (6) is to use the Squeeze Theorem with the inequality $\sin\theta < \theta$ (for $\theta > 0$), which is proved in Section 2.4.

Since $\cos 0 = 1$ and $\sin 0 = 0$, the equations in (6) assert that the cosine and sine functions are continuous at 0. The addition formulas for cosine and sine can then be used to deduce that these functions are continuous everywhere (see Exercises 66 and 67).

It follows from part 5 of Theorem 4 that

$$\tan x = \frac{\sin x}{\cos x}$$

is continuous except where $\cos x = 0$. This happens when $x$ is an odd integer multiple

of $\pi/2$, so $y = \tan x$ has infinite discontinuities when $x = \pm\pi/2, \pm3\pi/2, \pm5\pi/2$, and so on (see Figure 6).

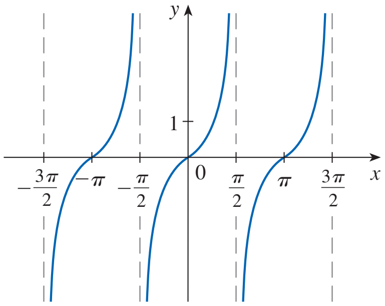

**FIGURE 6**
$y = \tan x$

**7 Theorem** The following types of functions are continuous at every number in their domains:

- polynomials
- rational functions
- root functions
- trigonometric functions

**EXAMPLE 6** On what intervals is each function continuous?

(a) $f(x) = x^{100} - 2x^{37} + 75$

(b) $g(x) = \dfrac{x^2 + 2x + 17}{x^2 - 1}$

(c) $h(x) = \sqrt{x} + \dfrac{x + 1}{x - 1} - \dfrac{x + 1}{x^2 + 1}$

**SOLUTION**

(a) $f$ is a polynomial, so it is continuous on $(-\infty, \infty)$ by Theorem 5(a).

(b) $g$ is a rational function, so by Theorem 5(b), it is continuous on its domain, which is $D = \{x \mid x^2 - 1 \neq 0\} = \{x \mid x \neq \pm1\}$. Thus $g$ is continuous on the intervals $(-\infty, -1)$, $(-1, 1)$, and $(1, \infty)$.

(c) We can write $h(x) = F(x) + G(x) - H(x)$, where

$$F(x) = \sqrt{x} \qquad G(x) = \frac{x + 1}{x - 1} \qquad H(x) = \frac{x + 1}{x^2 + 1}$$

$F$ is continuous on $[0, \infty)$ by Theorem 7. $G$ is a rational function, so it is continuous everywhere except when $x - 1 = 0$, that is, $x = 1$. $H$ is also a rational function, but its denominator is never 0, so $H$ is continuous everywhere. Thus, by parts 1 and 2 of Theorem 4, $h$ is continuous on the intervals $[0, 1)$ and $(1, \infty)$. ■

**EXAMPLE 7** Evaluate $\displaystyle\lim_{x \to \pi} \frac{\sin x}{2 + \cos x}$.

**SOLUTION** Theorem 7 tells us that $y = \sin x$ is continuous. The function in the denominator, $y = 2 + \cos x$, is the sum of two continuous functions and is therefore continuous. Notice that this function is never 0 because $\cos x \geqslant -1$ for all $x$ and so $2 + \cos x > 0$ everywhere. Thus the ratio

$$f(x) = \frac{\sin x}{2 + \cos x}$$

is continuous everywhere. Hence, by the definition of a continuous function,

$$\lim_{x \to \pi} \frac{\sin x}{2 + \cos x} = \lim_{x \to \pi} f(x) = f(\pi) = \frac{\sin \pi}{2 + \cos \pi} = \frac{0}{2 - 1} = 0 \qquad ■$$

Another way of combining continuous functions $f$ and $g$ to get a new continuous function is to form the composite function $f \circ g$. This fact is a consequence of the following theorem.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

This theorem says that a limit symbol can be moved through a function symbol if the function is continuous and the limit exists. In other words, the order of these two symbols can be reversed.

**8 Theorem** If $f$ is continuous at $b$ and $\lim_{x\to a} g(x) = b$, then $\lim_{x\to a} f(g(x)) = f(b)$. In other words,

$$\lim_{x\to a} f(g(x)) = f\left(\lim_{x\to a} g(x)\right)$$

Intuitively, Theorem 8 is reasonable because if $x$ is close to $a$, then $g(x)$ is close to $b$, and since $f$ is continuous at $b$, if $g(x)$ is close to $b$, then $f(g(x))$ is close to $f(b)$. A proof of Theorem 8 is given in Appendix F.

Let's now apply Theorem 8 in the special case where $f(x) = \sqrt[n]{x}$, with $n$ being a positive integer. Then

$$f(g(x)) = \sqrt[n]{g(x)}$$

and
$$f\left(\lim_{x\to a} g(x)\right) = \sqrt[n]{\lim_{x\to a} g(x)}$$

If we put these expressions into Theorem 8, we get

$$\lim_{x\to a} \sqrt[n]{g(x)} = \sqrt[n]{\lim_{x\to a} g(x)}$$

and so Limit Law 7 has now been proved. (We assume that the roots exist.)

**9 Theorem** If $g$ is continuous at $a$ and $f$ is continuous at $g(a)$, then the composite function $f \circ g$ given by $(f \circ g)(x) = f(g(x))$ is continuous at $a$.

This theorem is often expressed informally by saying "a continuous function of a continuous function is a continuous function."

**PROOF** Since $g$ is continuous at $a$, we have

$$\lim_{x\to a} g(x) = g(a)$$

Since $f$ is continuous at $b = g(a)$, we can apply Theorem 8 to obtain

$$\lim_{x\to a} f(g(x)) = f(g(a))$$

which is precisely the statement that the function $h(x) = f(g(x))$ is continuous at $a$; that is, $f \circ g$ is continuous at $a$. ■

**EXAMPLE 8** Where are the following functions continuous?

(a) $h(x) = \sin(x^2)$ (b) $F(x) = \dfrac{1}{\sqrt{x^2 + 7} - 4}$

**SOLUTION**

(a) We have $h(x) = f(g(x))$, where

$$g(x) = x^2 \qquad \text{and} \qquad f(x) = \sin x$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Now $g$ is continuous on $\mathbb{R}$ since it is a polynomial, and $f$ is also continuous everywhere. Thus $h = f \circ g$ is continuous on $\mathbb{R}$ by Theorem 9.

(b) Notice that $F$ can be broken up as the composition of four continuous functions:

$$F = f \circ g \circ h \circ k \qquad \text{or} \qquad F(x) = f(g(h(k(x))))$$

where $\quad f(x) = \dfrac{1}{x} \qquad g(x) = x - 4 \qquad h(x) = \sqrt{x} \qquad k(x) = x^2 + 7$

We know that each of these functions is continuous on its domain (by Theorems 5 and 7), so by Theorem 9, $F$ is continuous on its domain, which is

$$\{x \in \mathbb{R} \mid \sqrt{x^2 + 7} \neq 4\} = \{x \mid x \neq \pm 3\} = (-\infty, -3) \cup (-3, 3) \cup (3, \infty) \qquad ■$$

## ■ The Intermediate Value Theorem

An important property of continuous functions is expressed by the following theorem, whose proof is found in more advanced books on calculus.

**10 The Intermediate Value Theorem** Suppose that $f$ is continuous on the closed interval $[a, b]$ and let $N$ be any number between $f(a)$ and $f(b)$, where $f(a) \neq f(b)$. Then there exists a number $c$ in $(a, b)$ such that $f(c) = N$.

The Intermediate Value Theorem states that a continuous function takes on every intermediate value between the function values $f(a)$ and $f(b)$. It is illustrated by Figure 7. Note that the value $N$ can be taken on once [as in part (a)] or more than once [as in part (b)].

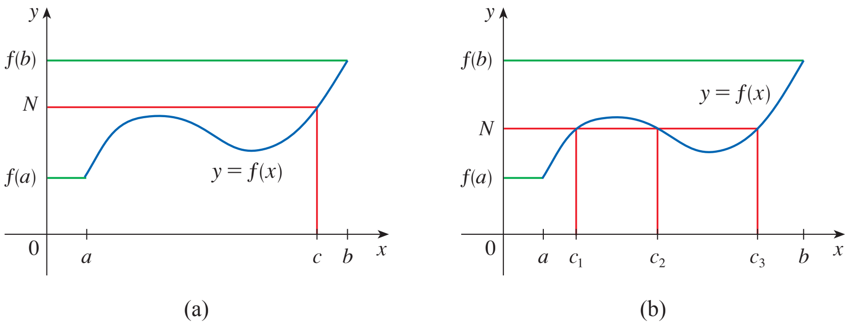

**FIGURE 7**

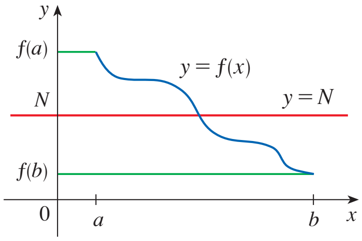

**FIGURE 8**

If we think of a continuous function as a function whose graph has no hole or break, then it is easy to believe that the Intermediate Value Theorem is true. In geometric terms it says that if any horizontal line $y = N$ is given between $y = f(a)$ and $y = f(b)$ as in Figure 8, then the graph of $f$ can't jump over the line. It must intersect $y = N$ somewhere.

It is important that the function $f$ in Theorem 10 be continuous. The Intermediate Value Theorem is not true in general for discontinuous functions (see Exercise 52).

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

One use of the Intermediate Value Theorem is in locating solutions of equations as in the following example.

**EXAMPLE 9** Show that there is a solution of the equation

$$4x^3 - 6x^2 + 3x - 2 = 0$$

between 1 and 2.

**SOLUTION** Let $f(x) = 4x^3 - 6x^2 + 3x - 2$. We are looking for a solution of the given equation, that is, a number $c$ between 1 and 2 such that $f(c) = 0$. Therefore we take $a = 1$, $b = 2$, and $N = 0$ in Theorem 10. We have

$$f(1) = 4 - 6 + 3 - 2 = -1 < 0$$

and
$$f(2) = 32 - 24 + 6 - 2 = 12 > 0$$

Thus $f(1) < 0 < f(2)$; that is, $N = 0$ is a number between $f(1)$ and $f(2)$. The function $f$ is continuous since it is a polynomial, so the Intermediate Value Theorem says there is a number $c$ between 1 and 2 such that $f(c) = 0$. In other words, the equation $4x^3 - 6x^2 + 3x - 2 = 0$ has at least one solution $c$ in the interval $(1, 2)$.

In fact, we can locate a solution more precisely by using the Intermediate Value Theorem again. Since

$$f(1.2) = -0.128 < 0 \qquad \text{and} \qquad f(1.3) = 0.548 > 0$$

a solution must lie between 1.2 and 1.3. A calculator gives, by trial and error,

$$f(1.22) = -0.007008 < 0 \qquad \text{and} \qquad f(1.23) = 0.056068 > 0$$

so a solution lies in the interval $(1.22, 1.23)$. ■

We can use a graphing calculator or computer to illustrate the use of the Intermediate Value Theorem in Example 9. Figure 9 shows the graph of $f$ in the viewing rectangle $[-1, 3]$ by $[-3, 3]$ and you can see that the graph crosses the $x$-axis between 1 and 2. Figure 10 shows the result of zooming in to the viewing rectangle $[1.2, 1.3]$ by $[-0.2, 0.2]$.

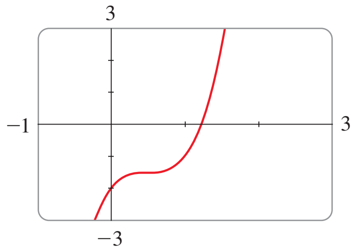

**FIGURE 9**

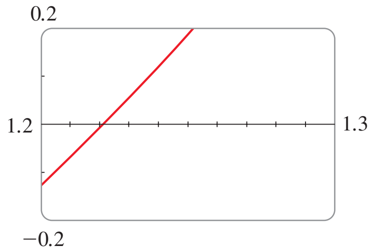

**FIGURE 10**

In fact, the Intermediate Value Theorem plays a role in the very way these graphing devices work. A computer calculates a finite number of points on the graph and turns on the pixels that contain these calculated points. It assumes that the function is continuous and takes on all the intermediate values between two consecutive points. The computer therefore "connects the dots" by turning on the intermediate pixels.

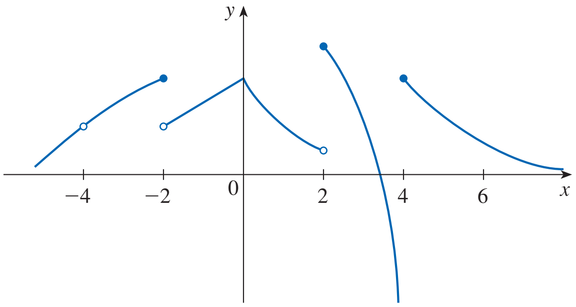
## 1.8 Exercises

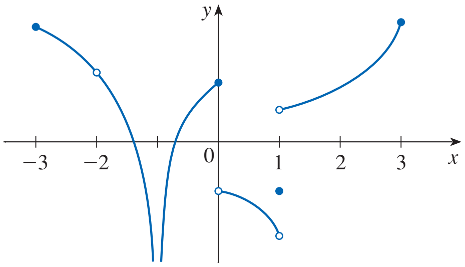
**1.** Write an equation that expresses the fact that a function $f$ is continuous at the number 4.

**2.** If $f$ is continuous on $(-\infty, \infty)$, what can you say about its graph?

**3.** (a) From the given graph of $f$, state the numbers at which $f$ is discontinuous and explain why.
(b) For each of the numbers stated in part (a), determine whether $f$ is continuous from the right, or from the left, or neither.

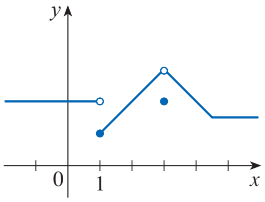


**4.** From the given graph of $g$, state the numbers at which $g$ is discontinuous and explain why.

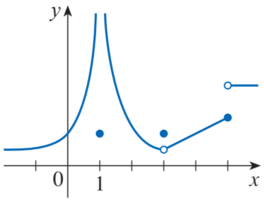


**5–6** The graph of a function $f$ is given.
(a) At what numbers $a$ does $\lim_{x \to a} f(x)$ not exist?
(b) At what numbers $a$ is $f$ not continuous?
(c) At what numbers $a$ does $\lim_{x \to a} f(x)$ exist but $f$ is not continuous at $a$?

**5.**



**6.**



**7–10** Sketch the graph of a function $f$ that is defined on $\mathbb{R}$ and continuous except for the stated discontinuities.

**7.** Removable discontinuity at $-2$, infinite discontinuity at 2

**8.** Jump discontinuity at $-3$, removable discontinuity at 4

**9.** Discontinuities at 0 and 3, but continuous from the right at 0 and from the left at 3

**10.** Continuous only from the left at $-1$, not continuous from the left or right at 3

**11.** The toll $T$ charged for driving on a certain stretch of a toll road is \$5 except during rush hours (between 7 AM and 10 AM and between 4 PM and 7 PM) when the toll is \$7.
(a) Sketch a graph of $T$ as a function of the time $t$, measured in hours past midnight.
(b) Discuss the discontinuities of this function and their significance to someone who uses the road.

**12.** Explain why each function is continuous or discontinuous.
(a) The temperature at a specific location as a function of time
(b) The temperature at a specific time as a function of the distance due west from New York City
(c) The altitude above sea level as a function of the distance due west from New York City
(d) The cost of a taxi ride as a function of the distance traveled
(e) The current in the circuit for the lights in a room as a function of time

**13–16** Use the definition of continuity and the properties of limits to show that the function is continuous at the given number $a$.

**13.** $f(x) = 3x^2 + (x + 2)^5, \quad a = -1$

**14.** $g(t) = \dfrac{t^2 + 5t}{2t + 1}, \quad a = 2$

**15.** $p(v) = 2\sqrt{3v^2 + 1}, \quad a = 1$

**16.** $f(r) = \sqrt[3]{4r^2 - 2r + 7}, \quad a = -2$

**17–18** Use the definition of continuity and the properties of limits to show that the function is continuous on the given interval.

**17.** $f(x) = x + \sqrt{x - 4}, \quad [4, \infty)$

**18.** $g(x) = \dfrac{x - 1}{3x + 6}, \quad (-\infty, -2)$

**19–24** Explain why the function is discontinuous at the given number $a$. Sketch the graph of the function.

**19.** $f(x) = \dfrac{1}{x + 2} \qquad a = -2$

**20.** $f(x) = \begin{cases} \dfrac{1}{x + 2} & \text{if } x \neq -2 \\ 1 & \text{if } x = -2 \end{cases} \qquad a = -2$

**21.** $f(x) = \begin{cases} 1 - x^2 & \text{if } x < 1 \\ 1/x & \text{if } x \geqslant 1 \end{cases} \qquad a = 1$

**22.** $f(x) = \begin{cases} \dfrac{x^2 - x}{x^2 - 1} & \text{if } x \neq 1 \\ 1 & \text{if } x = 1 \end{cases} \qquad a = 1$

**23.** $f(x) = \begin{cases} \cos x & \text{if } x < 0 \\ 0 & \text{if } x = 0 \\ 1 - x^2 & \text{if } x > 0 \end{cases} \qquad a = 0$

**24.** $f(x) = \begin{cases} \dfrac{2x^2 - 5x - 3}{x - 3} & \text{if } x \neq 3 \\ 6 & \text{if } x = 3 \end{cases} \qquad a = 3$

---

**25–26**

(a) Show that $f$ has a removable discontinuity at $x = 3$.

(b) Redefine $f(3)$ so that $f$ is continuous at $x = 3$ (and thus the discontinuity is "removed").

**25.** $f(x) = \dfrac{x - 3}{x^2 - 9}$ **26.** $f(x) = \dfrac{x^2 - 7x + 12}{x - 3}$

---

**27–34** Explain, using Theorems 4, 5, 7, and 9, why the function is continuous at every number in its domain. State the domain.

**27.** $f(x) = \dfrac{x^2}{\sqrt{x^4 + 2}}$ **28.** $g(v) = \dfrac{3v - 1}{v^2 + 2v - 15}$

**29.** $h(t) = \dfrac{\cos(t^2)}{1 - t^2}$ **30.** $g(u) = \dfrac{1}{u} - \dfrac{u^2}{u - 2}$

**31.** $L(v) = v\sqrt{9 - v^2}$

**32.** $B(u) = \sqrt{3u - 2} + \sqrt[3]{2u - 3}$

**33.** $M(x) = \sqrt{1 + \dfrac{1}{x}}$ **34.** $F(x) = \sin(\cos(\sin x))$

---

**35–38** Use continuity to evaluate the limit.

**35.** $\lim\limits_{x \to 2} x\sqrt{20 - x^2}$ **36.** $\lim\limits_{\theta \to \pi/2} \sin(\tan(\cos \theta))$

**37.** $\lim\limits_{x \to \pi/4} x^2 \tan x$ **38.** $\lim\limits_{x \to 2} x^3/\sqrt{x^2 + x - 2}$

---

**39–40** Locate the discontinuities of the function and illustrate by graphing.

**39.** $f(x) = \dfrac{1}{\sqrt{1 - \sin x}}$ **40.** $y = \tan\sqrt{x}$

---

**41–42** Show that $f$ is continuous on $(-\infty, \infty)$.

**41.** $f(x) = \begin{cases} 1 - x^2 & \text{if } x \leqslant 1 \\ \sqrt{x - 1} & \text{if } x > 1 \end{cases}$

**42.** $f(x) = \begin{cases} \sin x & \text{if } x < \pi/4 \\ \cos x & \text{if } x \geqslant \pi/4 \end{cases}$

---

**43–45** Find the numbers at which $f$ is discontinuous. At which of these numbers is $f$ continuous from the right, from the left, or neither? Sketch the graph of $f$.

**43.** $f(x) = \begin{cases} x^2 & \text{if } x < -1 \\ x & \text{if } -1 \leqslant x < 1 \\ 1/x & \text{if } x \geqslant 1 \end{cases}$

**44.** $f(x) = \begin{cases} x^2 + 1 & \text{if } x \leqslant 1 \\ 3 - x & \text{if } 1 < x \leqslant 4 \\ \sqrt{x} & \text{if } x > 4 \end{cases}$

**45.** $f(x) = \begin{cases} x + 2 & \text{if } x < 0 \\ 2x^2 & \text{if } 0 \leqslant x \leqslant 1 \\ 2 - x & \text{if } x > 1 \end{cases}$

---

**46.** The gravitational force exerted by the planet Earth on a unit mass at a distance $r$ from the center of the planet is

$$F(r) = \begin{cases} \dfrac{GMr}{R^3} & \text{if } r < R \\ \dfrac{GM}{r^2} & \text{if } r \geqslant R \end{cases}$$

where $M$ is the mass of Earth, $R$ is its radius, and $G$ is the gravitational constant. Is $F$ a continuous function of $r$?

**47.** For what value of the constant $c$ is the function $f$ continuous on $(-\infty, \infty)$?

$$f(x) = \begin{cases} cx^2 + 2x & \text{if } x < 2 \\ x^3 - cx & \text{if } x \geqslant 2 \end{cases}$$

**48.** Find the values of $a$ and $b$ that make $f$ continuous everywhere.

$$f(x) = \begin{cases} \dfrac{x^2 - 4}{x - 2} & \text{if } x < 2 \\ ax^2 - bx + 3 & \text{if } 2 \leqslant x < 3 \\ 2x - a + b & \text{if } x \geqslant 3 \end{cases}$$

**49.** Suppose $f$ and $g$ are continuous functions such that $g(2) = 6$ and $\lim_{x \to 2} [3f(x) + f(x)g(x)] = 36$. Find $f(2)$.

**50.** Let $f(x) = 1/x$ and $g(x) = 1/x^2$.
(a) Find $(f \circ g)(x)$.
(b) Is $f \circ g$ continuous everywhere? Explain.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**51.** Which of the following functions $f$ has a removable discontinuity at $a$? If the discontinuity is removable, find a function $g$ that agrees with $f$ for $x \neq a$ and is continuous at $a$.

(a) $f(x) = \dfrac{x^4 - 1}{x - 1}, \quad a = 1$

(b) $f(x) = \dfrac{x^3 - x^2 - 2x}{x - 2}, \quad a = 2$

(c) $f(x) = [\![ \sin x ]\!], \quad a = \pi$

**52.** Suppose that a function $f$ is continuous on $[0, 1]$ except at 0.25 and that $f(0) = 1$ and $f(1) = 3$. Let $N = 2$. Sketch two possible graphs of $f$, one showing that $f$ might not satisfy the conclusion of the Intermediate Value Theorem and one showing that $f$ might still satisfy the conclusion of the Intermediate Value Theorem (even though it doesn't satisfy the hypothesis).

**53.** If $f(x) = x^2 + 10 \sin x$, show that there is a number $c$ such that $f(c) = 1000$.

**54.** Suppose $f$ is continuous on $[1, 5]$ and the only solutions of the equation $f(x) = 6$ are $x = 1$ and $x = 4$. If $f(2) = 8$, explain why $f(3) > 6$.

**55–58** Use the Intermediate Value Theorem to show that there is a solution of the given equation in the specified interval.

**55.** $-x^3 + 4x + 1 = 0, \quad (-1, 0)$

**56.** $2/x = x - \sqrt{x}, \quad (2, 3)$

**57.** $\cos x = x, \quad (0, 1)$

**58.** $\sin x = x^2 - x, \quad (1, 2)$

---

**59–60**

(a) Prove that the equation has at least one real solution.

(b) Use a calculator to find an interval of length 0.01 that contains a solution.

**59.** $\cos x = x^3$

**60.** $x^5 - x^2 + 2x + 3 = 0$

---

**61–62**

(a) Prove that the equation has at least one real solution.

(b) Find the solution correct to three decimal places, by graphing.

**61.** $x^5 - x^2 - 4 = 0$

**62.** $\sqrt{x - 5} = \dfrac{1}{x + 3}$

---

**63–64** Prove, without graphing, that the graph of the function has at least two $x$-intercepts in the specified interval.

**63.** $y = \sin x^3, \quad (1, 2)$

**64.** $y = x^2 - 3 + 1/x, \quad (0, 2)$

---

**65.** Prove that $f$ is continuous at $a$ if and only if

$$\lim_{h \to 0} f(a + h) = f(a)$$

**66.** To prove that sine is continuous, we need to show that $\lim_{x \to a} \sin x = \sin a$ for every real number $a$. By Exercise 65 an equivalent statement is that

$$\lim_{h \to 0} \sin(a + h) = \sin a$$

Use (6) to show that this is true.

**67.** Prove that cosine is a continuous function.

**68.** (a) Prove Theorem 4, part 3.

(b) Prove Theorem 4, part 5.

**69.** Use Theorem 8 to prove Limit Laws 6 and 7 from Section 1.6.

**70.** Is there a number that is exactly 1 more than its cube?

**71.** For what values of $x$ is $f$ continuous?

$$f(x) = \begin{cases} 0 & \text{if } x \text{ is rational} \\ 1 & \text{if } x \text{ is irrational} \end{cases}$$

**72.** For what values of $x$ is $g$ continuous?

$$g(x) = \begin{cases} 0 & \text{if } x \text{ is rational} \\ x & \text{if } x \text{ is irrational} \end{cases}$$

**73.** Show that the function

$$f(x) = \begin{cases} x^4 \sin(1/x) & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

is continuous on $(-\infty, \infty)$.

**74.** If $a$ and $b$ are positive numbers, prove that the equation

$$\frac{a}{x^3 + 2x^2 - 1} + \frac{b}{x^3 + x - 2} = 0$$

has at least one solution in the interval $(-1, 1)$.

**75.** A Tibetan monk leaves the monastery at 7:00 AM and takes his usual path to the top of the mountain, arriving at 7:00 PM. The following morning, he starts at 7:00 AM at the top and takes the same path back, arriving at the monastery at 7:00 PM. Use the Intermediate Value Theorem to show that there is a point on the path that the monk will cross at exactly the same time of day on both days.

**76. Absolute Value and Continuity**

(a) Show that the absolute value function $F(x) = |x|$ is continuous everywhere.

(b) Prove that if $f$ is a continuous function on an interval, then so is $|f|$.

(c) Is the converse of the statement in part (b) also true? In other words, if $|f|$ is continuous, does it follow that $f$ is continuous? If so, prove it. If not, find a counterexample.

## 1 REVIEW

### CONCEPT CHECK

Answers to the Concept Check are available at StewartCalculus.com.

**1.** (a) What is a function? What are its domain and range?
 (b) What is the graph of a function?
 (c) How can you tell whether a given curve is the graph of a function?

**2.** Discuss four ways of representing a function. Illustrate your discussion with examples.

**3.** (a) What is an even function? How can you tell if a function is even by looking at its graph? Give three examples of an even function.
 (b) What is an odd function? How can you tell if a function is odd by looking at its graph? Give three examples of an odd function.

**4.** What is an increasing function?

**5.** What is a mathematical model?

**6.** Give an example of each type of function.
 (a) Linear function (b) Power function
 (c) Exponential function (d) Quadratic function
 (e) Polynomial of degree 5 (f) Rational function

**7.** Sketch by hand, on the same axes, the graphs of the following functions.
 (a) $f(x) = x$ (b) $g(x) = x^2$
 (c) $h(x) = x^3$ (d) $j(x) = x^4$

**8.** Draw, by hand, a rough sketch of the graph of each function.
 (a) $y = \sin x$ (b) $y = \cos x$ (c) $y = \tan x$
 (d) $y = 1/x$ (e) $y = |x|$ (f) $y = \sqrt{x}$

**9.** Suppose that $f$ has domain $A$ and $g$ has domain $B$.
 (a) What is the domain of $f + g$?
 (b) What is the domain of $fg$?
 (c) What is the domain of $f/g$?

**10.** How is the composite function $f \circ g$ defined? What is its domain?

**11.** Suppose the graph of $f$ is given. Write an equation for each of the graphs that are obtained from the graph of $f$ as follows.
 (a) Shift 2 units upward. (b) Shift 2 units downward.
 (c) Shift 2 units to the right. (d) Shift 2 units to the left.
 (e) Reflect about the $x$-axis. (f) Reflect about the $y$-axis.
 (g) Stretch vertically by a factor of 2.
 (h) Shrink vertically by a factor of 2.
 (i) Stretch horizontally by a factor of 2.
 (j) Shrink horizontally by a factor of 2.

**12.** Explain what each of the following means and illustrate with a sketch.
 (a) $\lim_{x \to a} f(x) = L$ (b) $\lim_{x \to a^+} f(x) = L$ (c) $\lim_{x \to a^-} f(x) = L$
 (d) $\lim_{x \to a} f(x) = \infty$ (e) $\lim_{x \to a} f(x) = -\infty$

**13.** Describe several ways in which a limit can fail to exist. Illustrate with sketches.

**14.** What does it mean to say that the line $x = a$ is a vertical asymptote of the curve $y = f(x)$? Draw curves to illustrate the various possibilities.

**15.** State the following Limit Laws.
 (a) Sum Law (b) Difference Law
 (c) Constant Multiple Law (d) Product Law
 (e) Quotient Law (f) Power Law
 (g) Root Law

**16.** What does the Squeeze Theorem say?

**17.** (a) What does it mean for $f$ to be continuous at $a$?
 (b) What does it mean for $f$ to be continuous on the interval $(-\infty, \infty)$? What can you say about the graph of such a function?

**18.** (a) Give examples of functions that are continuous on $[-1, 1]$.
 (b) Give an example of a function that is not continuous on $[0, 1]$.

**19.** What does the Intermediate Value Theorem say?

### TRUE-FALSE QUIZ

Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

**1.** If $f$ is a function, then $f(s + t) = f(s) + f(t)$.

**2.** If $f(s) = f(t)$, then $s = t$.

**3.** If $f$ is a function, then $f(3x) = 3f(x)$.

**4.** If $x_1 < x_2$ and $f$ is a decreasing function, then $f(x_1) > f(x_2)$.

**5.** A vertical line intersects the graph of a function at most once.

**6.** If $x$ is any real number, then $\sqrt{x^2} = x$.

**7.** $\lim_{x \to 4} \left( \frac{2x}{x - 4} - \frac{8}{x - 4} \right) = \lim_{x \to 4} \frac{2x}{x - 4} - \lim_{x \to 4} \frac{8}{x - 4}$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**8.** $\lim_{x \to 1} \frac{x^2 + 6x - 7}{x^2 + 5x - 6} = \frac{\lim_{x \to 1} (x^2 + 6x - 7)}{\lim_{x \to 1} (x^2 + 5x - 6)}$

**9.** $\lim_{x \to 1} \frac{x - 3}{x^2 + 2x - 4} = \frac{\lim_{x \to 1} (x - 3)}{\lim_{x \to 1} (x^2 + 2x - 4)}$

**10.** $\frac{x^2 - 9}{x - 3} = x + 3$

**11.** $\lim_{x \to 3} \frac{x^2 - 9}{x - 3} = \lim_{x \to 3} (x + 3)$

**12.** If $\lim_{x \to 5} f(x) = 2$ and $\lim_{x \to 5} g(x) = 0$, then $\lim_{x \to 5} [f(x)/g(x)]$ does not exist.

**13.** If $\lim_{x \to 5} f(x) = 0$ and $\lim_{x \to 5} g(x) = 0$, then $\lim_{x \to 5} [f(x)/g(x)]$ does not exist.

**14.** If neither $\lim_{x \to a} f(x)$ nor $\lim_{x \to a} g(x)$ exists, then $\lim_{x \to a} [f(x) + g(x)]$ does not exist.

**15.** If $\lim_{x \to a} f(x)$ exists but $\lim_{x \to a} g(x)$ does not exist, then $\lim_{x \to a} [f(x) + g(x)]$ does not exist.

**16.** If $\lim_{x \to 6} [f(x)\,g(x)]$ exists, then the limit must be $f(6)\,g(6)$.

**17.** If $p$ is a polynomial, then $\lim_{x \to b} p(x) = p(b)$.

**18.** If $\lim_{x \to 0} f(x) = \infty$ and $\lim_{x \to 0} g(x) = \infty$, then $\lim_{x \to 0} [f(x) - g(x)] = 0$.

**19.** If the line $x = 1$ is a vertical asymptote of $y = f(x)$, then $f$ is not defined at 1.

**20.** If $f(1) > 0$ and $f(3) < 0$, then there exists a number $c$ between 1 and 3 such that $f(c) = 0$.

**21.** If $f$ is continuous at 5 and $f(5) = 2$ and $f(4) = 3$, then $\lim_{x \to 2} f(4x^2 - 11) = 2$.

**22.** If $f$ is continuous on $[-1, 1]$ and $f(-1) = 4$ and $f(1) = 3$, then there exists a number $r$ such that $|r| < 1$ and $f(r) = \pi$.

**23.** Let $f$ be a function such that $\lim_{x \to 0} f(x) = 6$. Then there exists a positive number $\delta$ such that if $0 < |x| < \delta$, then $|f(x) - 6| < 1$.

**24.** If $f(x) > 1$ for all $x$ and $\lim_{x \to 0} f(x)$ exists, then $\lim_{x \to 0} f(x) > 1$.

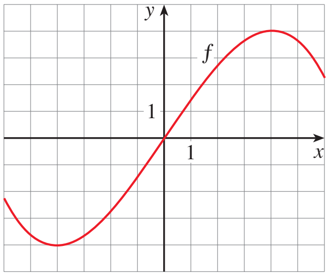
**25.** The equation $x^{10} - 10x^2 + 5 = 0$ has a solution in the interval $(0, 2)$.

**26.** If $f$ is continuous at $a$, so is $|f|$.

**27.** If $|f|$ is continuous at $a$, so is $f$.

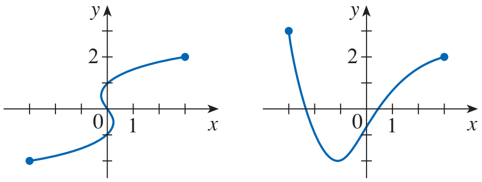
## EXERCISES

**1.** Let $f$ be the function whose graph is given.



(a) Estimate the value of $f(2)$.
(b) Estimate the values of $x$ such that $f(x) = 3$.
(c) State the domain of $f$.
(d) State the range of $f$.
(e) On what interval is $f$ increasing?
(f) Is $f$ even, odd, or neither even nor odd? Explain.

**2.** Determine whether each curve is the graph of a function of $x$. If it is, state the domain and range of the function.



**3.** If $f(x) = x^2 - 2x + 3$, evaluate the difference quotient

$$\frac{f(a + h) - f(a)}{h}$$

**4.** Sketch a rough graph of the yield of a crop as a function of the amount of fertilizer used.

**5–8** Find the domain and range of the function. Write your answer in interval notation.

**5.** $f(x) = 2/(3x - 1)$

**6.** $g(x) = \sqrt{16 - x^4}$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**7.** $y = 1 + \sin x$

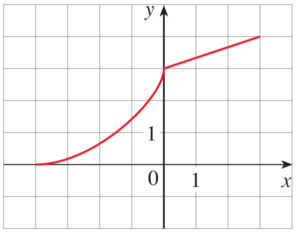
**8.** $F(t) = 3 + \cos 2t$

**9.** Suppose that the graph of $f$ is given. Describe how the graphs of the following functions can be obtained from the graph of $f$.

(a) $y = f(x) + 5$
(b) $y = f(x + 5)$
(c) $y = 1 + 2f(x)$
(d) $y = f(x - 2) - 2$
(e) $y = -f(x)$
(f) $y = 3 - f(x)$

**10.** The graph of $f$ is given. Draw the graphs of the following functions.

(a) $y = f(x - 8)$
(b) $y = -f(x)$
(c) $y = 2 - f(x)$
(d) $y = \frac{1}{2}f(x) - 1$



**11–16** Use transformations to sketch the graph of the function.

**11.** $f(x) = x^3 + 2$

**12.** $f(x) = (x - 3)^2$

**13.** $y = \sqrt{x + 2}$

**14.** $y = \dfrac{1}{x - 1}$

**15.** $g(x) = 1 + \cos 2x$

**16.** $f(x) = \begin{cases} 1 + x & \text{if } x < 0 \\ 1 + x^2 & \text{if } x \geqslant 0 \end{cases}$

**17.** Determine whether $f$ is even, odd, or neither even nor odd.

(a) $f(x) = 2x^5 - 3x^2 + 2$
(b) $f(x) = x^3 - x^7$
(c) $f(x) = 1 - \cos 2x$
(d) $f(x) = 1 + \sin x$
(e) $f(x) = (x + 1)^2$

**18.** Find an expression for the function whose graph consists of the line segment from the point $(-2, 2)$ to the point $(-1, 0)$ together with the top half of the circle with center the origin and radius 1.

**19.** If $f(x) = \sqrt{x}$ and $g(x) = \sin x$, find the functions (a) $f \circ g$, (b) $g \circ f$, (c) $f \circ f$, (d) $g \circ g$, and their domains.

**20.** Express the function $F(x) = 1/\sqrt{x + \sqrt{x}}$ as a composition of three functions.

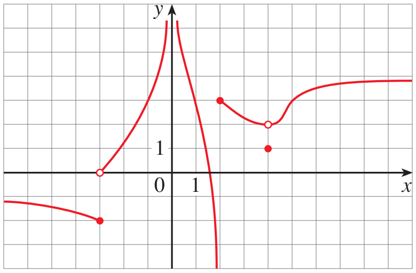
**21.** Life expectancy has improved dramatically in recent decades. The table gives the life expectancy at birth (in years) of males born in the United States. Use a scatter plot to choose an appropriate type of model. Use your model to predict the life span of a male born in the year 2030.

| Birth year | Life expectancy | Birth year | Life expectancy |
|---|---|---|---|
| 1900 | 48.3 | 1960 | 66.6 |
| 1910 | 51.1 | 1970 | 67.1 |
| 1920 | 55.2 | 1980 | 70.0 |
| 1930 | 57.4 | 1990 | 71.8 |
| 1940 | 62.5 | 2000 | 73.0 |
| 1950 | 65.6 | 2010 | 76.2 |

**22.** A small-appliance manufacturer finds that it costs \$9000 to produce 1000 toaster ovens a week and \$12,000 to produce 1500 toaster ovens a week.

(a) Express the cost as a function of the number of toaster ovens produced, assuming that it is linear. Then sketch the graph.
(b) What is the slope of the graph and what does it represent?
(c) What is the $y$-intercept of the graph and what does it represent?

**23.** The graph of $f$ is given.



(a) Find each limit, or explain why it does not exist.

(i) $\lim\limits_{x \to 2^+} f(x)$
(ii) $\lim\limits_{x \to -3^+} f(x)$
(iii) $\lim\limits_{x \to -3} f(x)$
(iv) $\lim\limits_{x \to 4} f(x)$
(v) $\lim\limits_{x \to 0} f(x)$
(vi) $\lim\limits_{x \to 2^-} f(x)$

(b) State the equations of the vertical asymptotes.
(c) At what numbers is $f$ discontinuous? Explain.

**24.** Sketch the graph of an example of a function $f$ that satisfies all of the following conditions:

$$\lim_{x \to 0^+} f(x) = -2, \quad \lim_{x \to 0^-} f(x) = 1, \quad f(0) = -1,$$

$$\lim_{x \to 2^-} f(x) = \infty, \quad \lim_{x \to 2^+} f(x) = -\infty$$

**25–38** Find the limit.

**25.** $\lim_{x \to 0} \cos(x^3 + 3x)$

**26.** $\lim_{x \to 3} \dfrac{x^2 - 9}{x^2 + 2x - 3}$

**27.** $\lim_{x \to -3} \dfrac{x^2 - 9}{x^2 + 2x - 3}$

**28.** $\lim_{x \to 1^+} \dfrac{x^2 - 9}{x^2 + 2x - 3}$

**29.** $\lim_{h \to 0} \dfrac{(h - 1)^3 + 1}{h}$

**30.** $\lim_{t \to 2} \dfrac{t^2 - 4}{t^3 - 8}$

**31.** $\lim_{r \to 9} \dfrac{\sqrt{r}}{(r - 9)^4}$

**32.** $\lim_{v \to 4^+} \dfrac{4 - v}{|4 - v|}$

**33.** $\lim_{r \to -1} \dfrac{r^2 - 3r - 4}{4r^2 + r - 3}$

**34.** $\lim_{t \to 5} \dfrac{3 - \sqrt{t + 4}}{t - 5}$

**35.** $\lim_{s \to 16} \dfrac{4 - \sqrt{s}}{s - 16}$

**36.** $\lim_{v \to 2} \dfrac{v^2 + 2v - 8}{v^4 - 16}$

**37.** $\lim_{x \to 0} \dfrac{1 - \sqrt{1 - x^2}}{x}$

**38.** $\lim_{x \to 1} \left( \dfrac{1}{x - 1} + \dfrac{1}{x^2 - 3x + 2} \right)$

**39.** If $2x - 1 \leqslant f(x) \leqslant x^2$ for $0 < x < 3$, find $\lim_{x \to 1} f(x)$.

**40.** Prove that $\lim_{x \to 0} x^2 \cos(1/x^2) = 0$.

**41–44** Prove the statement using the precise definition of a limit.

**41.** $\lim_{x \to 2} (14 - 5x) = 4$

**42.** $\lim_{x \to 0} \sqrt[3]{x} = 0$

**43.** $\lim_{x \to 2} (x^2 - 3x) = -2$

**44.** $\lim_{x \to 4^+} \dfrac{2}{\sqrt{x - 4}} = \infty$

**45.** Let

$$f(x) = \begin{cases} \sqrt{-x} & \text{if } x < 0 \\ 3 - x & \text{if } 0 \leqslant x < 3 \\ (x - 3)^2 & \text{if } x > 3 \end{cases}$$

(a) Evaluate each limit, if it exists.

(i) $\lim_{x \to 0^+} f(x)$ (ii) $\lim_{x \to 0^-} f(x)$ (iii) $\lim_{x \to 0} f(x)$

(iv) $\lim_{x \to 3^-} f(x)$ (v) $\lim_{x \to 3^+} f(x)$ (vi) $\lim_{x \to 3} f(x)$

(b) Where is $f$ discontinuous?

(c) Sketch the graph of $f$.

**46.** Let

$$g(x) = \begin{cases} 2x - x^2 & \text{if } 0 \leqslant x \leqslant 2 \\ 2 - x & \text{if } 2 < x \leqslant 3 \\ x - 4 & \text{if } 3 < x < 4 \\ \pi & \text{if } x \geqslant 4 \end{cases}$$

(a) For each of the numbers 2, 3, and 4, determine whether $g$ is continuous from the left, continuous from the right, or continuous at the number.

(b) Sketch the graph of $g$.

**47–48** Show that the function is continuous on its domain. State the domain.

**47.** $h(x) = \sqrt[4]{x} + x^3 \cos x$

**48.** $g(x) = \dfrac{\sqrt{x^2 - 9}}{x^2 - 2}$

**49–50** Use the Intermediate Value Theorem to show that there is a solution of the equation in the given interval.

**49.** $x^5 - x^3 + 3x - 5 = 0$, $(1, 2)$

**50.** $2 \sin x = 3 - 2x$, $(0, 1)$

**51.** Suppose that $|f(x)| \leqslant g(x)$ for all $x$, where $\lim_{x \to a} g(x) = 0$. Find $\lim_{x \to a} f(x)$.

**52.** Let $f(x) = [\![ x ]\!] + [\![ -x ]\!]$.

(a) For what values of $a$ does $\lim_{x \to a} f(x)$ exist?

(b) At what numbers is $f$ discontinuous?

# Principles of Problem Solving

There are no hard and fast rules that will ensure success in solving problems. However, it is possible to outline some general steps in the problem-solving process and to give some principles that may be useful in the solution of certain problems. These steps and principles are just common sense made explicit. They have been adapted from George Polya's book *How To Solve It*.

## 1 UNDERSTAND THE PROBLEM

The first step is to read the problem and make sure that you understand it clearly. Ask yourself the following questions:

*What is the unknown?*

*What are the given quantities?*

*What are the given conditions?*

For many problems it is useful to

*draw a diagram*

and identify the given and required quantities on the diagram.

Usually it is necessary to

*introduce suitable notation*

In choosing symbols for the unknown quantities we often use letters such as $a$, $b$, $c$, $m$, $n$, $x$, and $y$, but in some cases it helps to use initials as suggestive symbols; for instance, $V$ for volume or $t$ for time.

## 2 THINK OF A PLAN

Find a connection between the given information and the unknown that will enable you to calculate the unknown. It often helps to ask yourself explicitly: "How can I relate the given to the unknown?" If you don't see a connection immediately, the following ideas may be helpful in devising a plan.

**Try to Recognize Something Familiar** Relate the given situation to previous knowledge. Look at the unknown and try to recall a more familiar problem that has a similar unknown.

**Try to Recognize Patterns** Some problems are solved by recognizing that some kind of pattern is occurring. The pattern could be geometric, or numerical, or algebraic. If you can see regularity or repetition in a problem, you might be able to guess what the continuing pattern is and then prove it.

**Use Analogy** Try to think of an analogous problem—that is, a similar problem, a related problem—but one that is easier than the original problem. If you can solve the similar, simpler problem, then it might give you the clues you need to solve the original, more difficult problem. For instance, if a problem involves very large numbers, you could first try a similar problem with smaller numbers. Or if the problem involves three-dimensional geometry, you could look for a similar problem in two-dimensional geometry. Or if the problem you start with is a general one, you could first try a special case.

**Introduce Something Extra** It may sometimes be necessary to introduce something new—an auxiliary aid—to help make the connection between the given and the unknown. For instance, in a problem where a diagram is useful the auxiliary aid could be a new line drawn in a diagram. In a more algebraic problem it could be a new unknown that is related to the original unknown.

**Take Cases** We may sometimes have to split a problem into several cases and give a different argument for each of the cases. For instance, we often have to use this strategy in dealing with absolute value.

**Work Backward** Sometimes it is useful to imagine that your problem is solved and then to work backward, step by step, until you arrive at the given data. At this point you may be able to reverse your steps and thereby construct a solution to the original problem. This procedure is commonly used in solving equations. For instance, in solving the equation $3x - 5 = 7$, we suppose that $x$ is a number that satisfies $3x - 5 = 7$ and work backward. We add 5 to each side of the equation and then divide each side by 3 to get $x = 4$. Since each of these steps can be reversed, we have solved the problem.

**Establish Subgoals** In a complex problem it is often useful to set subgoals (in which the desired situation is only partially fulfilled). If we can first reach these subgoals, then we may be able to build on them to reach our final goal.

**Indirect Reasoning** Sometimes it is appropriate to attack a problem indirectly. In using proof by contradiction to prove that $P$ implies $Q$, we assume that $P$ is true and $Q$ is false and try to see why this can't happen. Somehow we have to use this information and arrive at a contradiction to what we absolutely know is true.

**Mathematical Induction** In proving statements that involve a positive integer $n$, it is frequently helpful to use the following principle.

**Principle of Mathematical Induction** Let $S_n$ be a statement about the positive integer $n$. Suppose that

1. $S_1$ is true.
2. $S_{k+1}$ is true whenever $S_k$ is true.

Then $S_n$ is true for all positive integers $n$.

This is reasonable because, since $S_1$ is true, it follows from condition 2 (with $k = 1$) that $S_2$ is true. Then, using condition 2 with $k = 2$, we see that $S_3$ is true. Again using condition 2, this time with $k = 3$, we have that $S_4$ is true. This procedure can be followed indefinitely.

## 3 CARRY OUT THE PLAN

In Step 2 a plan was devised. In carrying out that plan we have to check each stage of the plan and write the details that prove that each stage is correct.

## 4 LOOK BACK

Having completed our solution, it is wise to look back over it, partly to see if we have made errors in the solution and partly to see if we can think of an easier way to solve the problem. Another reason for looking back is that it will familiarize us with the method of solution and this may be useful for solving a future problem. Descartes said, "Every problem that I solved became a rule which served afterwards to solve other problems."

These principles of problem solving are illustrated in the following examples. Before you look at the solutions, try to solve these problems yourself, referring to these principles of problem solving if you get stuck. You may find it useful to refer to this section from time to time as you solve the exercises in the remaining chapters of this book.

As the first example illustrates, it is often necessary to use the problem-solving principle of *taking cases* when dealing with absolute values.

**EXAMPLE 1** Solve the inequality $|x - 3| + |x + 2| < 11$.

**SOLUTION** Recall the definition of absolute value:

$$|x| = \begin{cases} x & \text{if } x \geqslant 0 \\ -x & \text{if } x < 0 \end{cases}$$

It follows that

$$|x - 3| = \begin{cases} x - 3 & \text{if } x - 3 \geqslant 0 \\ -(x - 3) & \text{if } x - 3 < 0 \end{cases}$$

$$= \begin{cases} x - 3 & \text{if } x \geqslant 3 \\ -x + 3 & \text{if } x < 3 \end{cases}$$

Similarly

$$|x + 2| = \begin{cases} x + 2 & \text{if } x + 2 \geqslant 0 \\ -(x + 2) & \text{if } x + 2 < 0 \end{cases}$$

$$= \begin{cases} x + 2 & \text{if } x \geqslant -2 \\ -x - 2 & \text{if } x < -2 \end{cases}$$

**PS** Take cases.

These expressions show that we must consider three cases:

$$x < -2 \qquad -2 \leqslant x < 3 \qquad x \geqslant 3$$

**CASE I** If $x < -2$, we have

$$\begin{aligned} |x - 3| + |x + 2| &< 11 \\ -x + 3 - x - 2 &< 11 \\ -2x &< 10 \\ x &> -5 \end{aligned}$$

**CASE II** If $-2 \leqslant x < 3$, the given inequality becomes

$$\begin{aligned} -x + 3 + x + 2 &< 11 \\ 5 &< 11 \qquad \text{(always true)} \end{aligned}$$

**CASE III** If $x \geqslant 3$, the inequality becomes

$$\begin{aligned} x - 3 + x + 2 &< 11 \\ 2x &< 12 \\ x &< 6 \end{aligned}$$

Combining cases I, II, and III, we see that the inequality is satisfied when $-5 < x < 6$. So the solution is the interval $(-5, 6)$. ■

In the following example we first guess the answer by looking at special cases and recognizing a pattern. Then we prove our conjecture by mathematical induction.

In using the Principle of Mathematical Induction, we follow three steps:

**Step 1** Prove that $S_n$ is true when $n = 1$.

**Step 2** Assume that $S_n$ is true when $n = k$ and deduce that $S_n$ is true when $n = k + 1$.

**Step 3** Conclude that $S_n$ is true for all $n$ by the Principle of Mathematical Induction.

**EXAMPLE 2** If $f_0(x) = x/(x + 1)$ and $f_{n+1} = f_0 \circ f_n$ for $n = 0, 1, 2, \ldots$, find a formula for $f_n(x)$.

PS Analogy: Try a similar, simpler problem.

**SOLUTION** We start by finding formulas for $f_n(x)$ for the special cases $n = 1, 2,$ and $3$.

$$f_1(x) = (f_0 \circ f_0)(x) = f_0\big(f_0(x)\big) = f_0\left(\frac{x}{x+1}\right)$$

$$= \frac{\dfrac{x}{x+1}}{\dfrac{x}{x+1} + 1} = \frac{\dfrac{x}{x+1}}{\dfrac{2x+1}{x+1}} = \frac{x}{2x+1}$$

$$f_2(x) = (f_0 \circ f_1)(x) = f_0\big(f_1(x)\big) = f_0\left(\frac{x}{2x+1}\right)$$

$$= \frac{\dfrac{x}{2x+1}}{\dfrac{x}{2x+1} + 1} = \frac{\dfrac{x}{2x+1}}{\dfrac{3x+1}{2x+1}} = \frac{x}{3x+1}$$

$$f_3(x) = (f_0 \circ f_2)(x) = f_0\big(f_2(x)\big) = f_0\left(\frac{x}{3x+1}\right)$$

PS Look for a pattern.

$$= \frac{\dfrac{x}{3x+1}}{\dfrac{x}{3x+1} + 1} = \frac{\dfrac{x}{3x+1}}{\dfrac{4x+1}{3x+1}} = \frac{x}{4x+1}$$

We notice a pattern: the coefficient of $x$ in the denominator of $f_n(x)$ is $n + 1$ in the three cases we have computed. So we make the guess that, in general,

$$\boxed{1} \qquad f_n(x) = \frac{x}{(n+1)x + 1}$$

To prove this, we use the Principle of Mathematical Induction. We have already verified that (1) is true for $n = 1$. Assume that it is true for $n = k$, that is,

$$f_k(x) = \frac{x}{(k+1)x + 1}$$

Then

$$f_{k+1}(x) = (f_0 \circ f_k)(x) = f_0\big(f_k(x)\big) = f_0\left(\frac{x}{(k+1)x+1}\right)$$

$$= \frac{\dfrac{x}{(k+1)x+1}}{\dfrac{x}{(k+1)x+1}+1} = \frac{\dfrac{x}{(k+1)x+1}}{\dfrac{(k+2)x+1}{(k+1)x+1}} = \frac{x}{(k+2)x+1}$$

This expression shows that (1) is true for $n = k + 1$. Therefore, by mathematical induction, it is true for all positive integers $n$. ■

In the following example we show how the problem-solving strategy of *introducing something extra* is sometimes useful when we evaluate limits. The idea is to change the variable—to introduce a new variable that is related to the original variable—in such a way as to make the problem simpler. Later, in Section 4.5, we will make more extensive use of this general idea.

**EXAMPLE 3** Evaluate $\lim_{x \to 0} \dfrac{\sqrt[3]{1+cx}-1}{x}$, where $c$ is a constant.

**SOLUTION** As it stands, this limit looks challenging. In Section 1.6 we evaluated limits in which both numerator and denominator approached 0. There our strategy was to perform some sort of algebraic manipulation that led to a simplifying cancellation, but here it's not clear what kind of algebra is necessary.

So we introduce a new variable $t$ by the equation

$$t = \sqrt[3]{1+cx}$$

We also need to express $x$ in terms of $t$, so we solve this equation:

$$t^3 = 1 + cx \qquad x = \frac{t^3-1}{c} \quad \text{if } c \neq 0$$

Notice that $x \to 0$ is equivalent to $t \to 1$. This allows us to convert the given limit into one involving the variable $t$:

$$\lim_{x \to 0} \frac{\sqrt[3]{1+cx}-1}{x} = \lim_{t \to 1} \frac{t-1}{(t^3-1)/c}$$

$$= \lim_{t \to 1} \frac{c(t-1)}{t^3-1}$$

The change of variable allowed us to replace a relatively complicated limit by a simpler one of a type that we have seen before. Factoring the denominator as a difference of cubes, we get

$$\lim_{t \to 1} \frac{c(t-1)}{t^3-1} = \lim_{t \to 1} \frac{c(t-1)}{(t-1)(t^2+t+1)}$$

$$= \lim_{t \to 1} \frac{c}{t^2+t+1} = \frac{c}{3}$$

In making the change of variable we had to rule out the case $c = 0$. But if $c = 0$, the function is 0 for all nonzero $x$ and so its limit is 0. Therefore, in all cases, the limit is $c/3$. ■

The following problems are meant to test and challenge your problem-solving skills. Some of them require a considerable amount of time to think through, so don't be discouraged if you can't solve them right away. If you get stuck, you might find it helpful to refer to the discussion of the principles of problem solving.

## Problems

**1.** Solve the equation $\left|4x - |x + 1|\right| = 3$.

**2.** Solve the inequality $|x - 1| - |x - 3| \geqslant 5$.

**3.** Sketch the graph of the function $f(x) = |x^2 - 4|x| + 3|$.

**4.** Sketch the graph of the function $g(x) = |x^2 - 1| - |x^2 - 4|$.

**5.** Draw the graph of the equation $x + |x| = y + |y|$.

**6.** Sketch the region in the plane consisting of all points $(x, y)$ such that

$$|x - y| + |x| - |y| \leqslant 2$$

**7.** The notation $\max\{a, b, \ldots\}$ means the largest of the numbers $a, b, \ldots$. Sketch the graph of each function.

(a) $f(x) = \max\{x, 1/x\}$

(b) $f(x) = \max\{\sin x, \cos x\}$

(c) $f(x) = \max\{x^2, 2 + x, 2 - x\}$

**8.** Sketch the region in the plane defined by each of the following equations or inequalities.

(a) $\max\{x, 2y\} = 1$

(b) $-1 \leqslant \max\{x, 2y\} \leqslant 1$

(c) $\max\{x, y^2\} = 1$

**9.** Find the exact value of

$$\sin\frac{\pi}{100} + \sin\frac{2\pi}{100} + \sin\frac{3\pi}{100} + \cdots + \sin\frac{200\pi}{100}$$

**10.** Find the number of solutions of the equation $\sin x = \dfrac{x}{100}$.

**11.** A driver sets out on a journey. For the first half of the distance she drives at the leisurely pace of 30 mi/h; she drives the second half at 60 mi/h. What is her average speed on this trip?

**12.** Is it true that $f \circ (g + h) = f \circ g + f \circ h$?

**13.** Prove that if $n$ is a positive integer, then $7^n - 1$ is divisible by 6.

**14.** Prove that $1 + 3 + 5 + \cdots + (2n - 1) = n^2$.

**15.** If $f_0(x) = x^2$ and $f_{n+1}(x) = f_0(f_n(x))$ for $n = 0, 1, 2, \ldots$, find a formula for $f_n(x)$.

**16.** (a) If $f_0(x) = \dfrac{1}{2 - x}$ and $f_{n+1} = f_0 \circ f_n$ for $n = 0, 1, 2, \ldots,$ find an expression for $f_n(x)$ and use mathematical induction to prove it.

(b) Graph $f_0, f_1, f_2, f_3$ on the same screen and describe the effects of repeated composition.

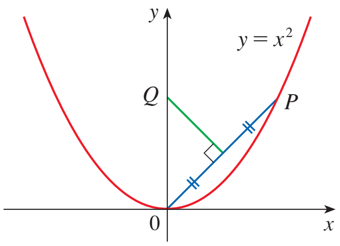
**17.** Evaluate $\displaystyle\lim_{x \to 1} \frac{\sqrt[3]{x} - 1}{\sqrt{x} - 1}$.

**18.** Find numbers $a$ and $b$ such that

$$\lim_{x \to 0} \frac{\sqrt{ax + b} - 2}{x} = 1$$

**19.** Evaluate $\displaystyle\lim_{x \to 0} \frac{|2x - 1| - |2x + 1|}{x}$.

**20.** The figure shows a point $P$ on the parabola $y = x^2$ and the point $Q$ where the perpendicular bisector of $OP$ intersects the $y$-axis. As $P$ approaches the origin along the parabola, what happens to $Q$? Does it have a limiting position? If so, find it.



**21.** Evaluate the following limits, if they exist, where $[\![ x ]\!]$ denotes the greatest integer function.

(a) $\displaystyle\lim_{x \to 0} \frac{[\![ x ]\!]}{x}$

(b) $\displaystyle\lim_{x \to 0} x [\![ 1/x ]\!]$

**22.** Sketch the region in the plane defined by each of the following equations.

(a) $[\![ x ]\!]^2 + [\![ y ]\!]^2 = 1$

(b) $[\![ x ]\!]^2 - [\![ y ]\!]^2 = 3$

(c) $[\![ x + y ]\!]^2 = 1$

(d) $[\![ x ]\!] + [\![ y ]\!] = 1$

**23.** Find all values of $a$ such that $f$ is continuous on $\mathbb{R}$:

$$f(x) = \begin{cases} x + 1 & \text{if } x \leqslant a \\ x^2 & \text{if } x > a \end{cases}$$

**24.** A **fixed point** of a function $f$ is a number $c$ in its domain such that $f(c) = c$. (The function doesn't move $c$; it stays fixed.)

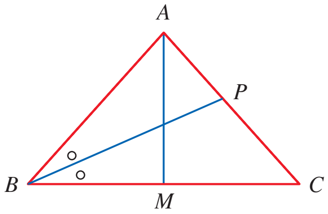
(a) Sketch the graph of a continuous function with domain $[0, 1]$ whose range also lies in $[0, 1]$. Locate a fixed point of $f$.

(b) Try to draw the graph of a continuous function with domain $[0, 1]$ and range in $[0, 1]$ that does *not* have a fixed point. What is the obstacle?

(c) Use the Intermediate Value Theorem to prove that any continuous function with domain $[0, 1]$ and range in $[0, 1]$ must have a fixed point.

**25.** If $\lim_{x \to a} [f(x) + g(x)] = 2$ and $\lim_{x \to a} [f(x) - g(x)] = 1$, find $\lim_{x \to a} [f(x)\, g(x)]$.

**26.** (a) The figure shows an isosceles triangle $ABC$ with $\angle B = \angle C$. The bisector of angle $B$ intersects the side $AC$ at the point $P$. Suppose that the base $BC$ remains fixed but the altitude $|AM|$ of the triangle approaches 0, so $A$ approaches the midpoint $M$ of $BC$. What happens to $P$ during this process? Does it have a limiting position? If so, find it.



(b) Try to sketch the path traced out by $P$ during this process. Then find an equation of this curve and use this equation to sketch the curve.

**27.** (a) If we start from 0° latitude and proceed in a westerly direction, we can let $T(x)$ denote the temperature at the point $x$ at any given time. Assuming that $T$ is a continuous function of $x$, show that at any fixed time there are at least two diametrically opposite points on the equator that have exactly the same temperature.

(b) Does the result in part (a) hold for points lying on any circle on the earth's surface?

(c) Does the result in part (a) hold for barometric pressure and for altitude above sea level?

# 2

# Derivatives

**IN THIS CHAPTER WE BEGIN** our study of differential calculus, which is concerned with how one quantity changes in relation to another quantity. The central concept of differential calculus is the *derivative*, which is an outgrowth of the velocities and slopes of tangents that we considered in Chapter 1. After learning how to calculate derivatives, we use them to solve problems involving rates of change and the approximation of functions.

## 2.1 Derivatives and Rates of Change

In Chapter 1 we defined limits and learned techniques for computing them. We now revisit the problems of finding tangent lines and velocities from Section 1.4. The special type of limit that occurs in both of these problems is called a *derivative* and we will see that it can be interpreted as a rate of change in any of the natural or social sciences or engineering.

### Tangents

If a curve $C$ has equation $y = f(x)$ and we want to find the tangent line to $C$ at the point $P(a, f(a))$, then we consider (as we did in Section 1.4) a nearby point $Q(x, f(x))$, where $x \neq a$, and compute the slope of the secant line $PQ$:

$$m_{PQ} = \frac{f(x) - f(a)}{x - a}$$

Then we let $Q$ approach $P$ along the curve $C$ by letting $x$ approach $a$. If $m_{PQ}$ approaches a number $m$, then we define the *tangent line* $\ell$ to be the line through $P$ with slope $m$. (This amounts to saying that the tangent line is the limiting position of the secant line $PQ$ as $Q$ approaches $P$. See Figure 1.)

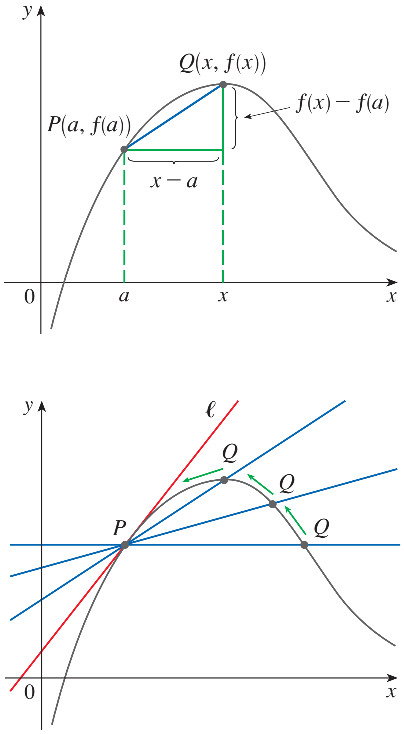

**FIGURE 1**

**1 Definitio** The **tangent line** to the curve $y = f(x)$ at the point $P(a, f(a))$ is the line through $P$ with slope

$$m = \lim_{x \to a} \frac{f(x) - f(a)}{x - a}$$

provided that this limit exists.

In our first example we confirm the guess we made in Example 1.4.1.

**EXAMPLE 1** Find an equation of the tangent line to the parabola $y = x^2$ at the point $P(1, 1)$.

**SOLUTION** Here we have $a = 1$ and $f(x) = x^2$, so the slope is

$$\begin{aligned} m &= \lim_{x \to 1} \frac{f(x) - f(1)}{x - 1} = \lim_{x \to 1} \frac{x^2 - 1}{x - 1} \\ &= \lim_{x \to 1} \frac{(x - 1)(x + 1)}{x - 1} \\ &= \lim_{x \to 1} (x + 1) = 1 + 1 = 2 \end{aligned}$$

Point-slope form for a line through the point $(x_1, y_1)$ with slope $m$:

$$y - y_1 = m(x - x_1)$$

Using the point-slope form of the equation of a line, we find that an equation of the tangent line at $(1, 1)$ is

$$y - 1 = 2(x - 1) \qquad \text{or} \qquad y = 2x - 1$$ ■

We sometimes refer to the slope of the tangent line to a curve at a point as the **slope of the curve** at the point. The idea is that if we zoom in far enough toward the point, the curve looks almost like a straight line. Figure 2 illustrates this procedure for the

curve $y = x^2$ in Example 1. The more we zoom in, the more the parabola looks like a line. In other words, the curve becomes almost indistinguishable from its tangent line.

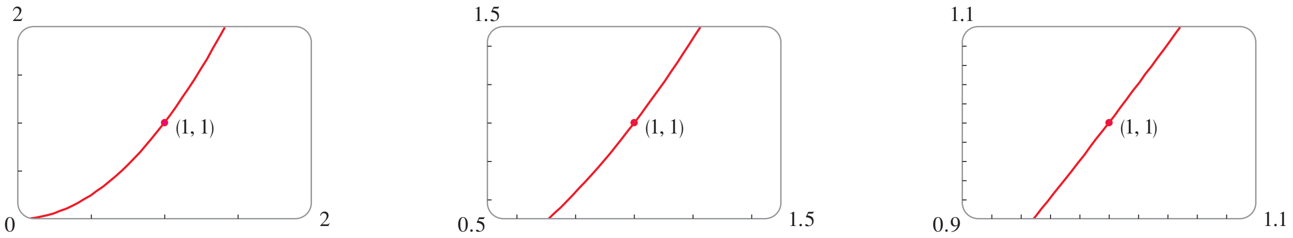

**FIGURE 2** Zooming in toward the point (1, 1) on the parabola $y = x^2$

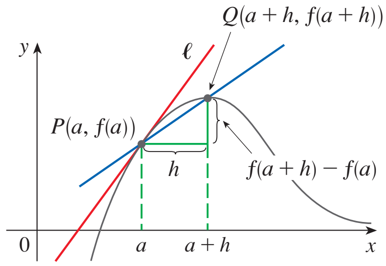

**FIGURE 3**

There is another expression for the slope of a tangent line that is sometimes easier to use. If $h = x - a$, then $x = a + h$ and so the slope of the secant line $PQ$ is

$$m_{PQ} = \frac{f(a + h) - f(a)}{h}$$

(See Figure 3 where the case $h > 0$ is illustrated and $Q$ is located to the right of $P$. If it happened that $h < 0$, however, $Q$ would be to the left of $P$.)

Notice that as $x$ approaches $a$, $h$ approaches 0 (because $h = x - a$) and so the expression for the slope of the tangent line in Definition 1 becomes

**2**
$$\boxed{m = \lim_{h \to 0} \frac{f(a + h) - f(a)}{h}}$$

**EXAMPLE 2** Find an equation of the tangent line to the hyperbola $y = 3/x$ at the point (3, 1).

**SOLUTION** Let $f(x) = 3/x$. Then, by Equation 2, the slope of the tangent at (3, 1) is

$$\begin{aligned} m &= \lim_{h \to 0} \frac{f(3 + h) - f(3)}{h} \\ &= \lim_{h \to 0} \frac{\dfrac{3}{3 + h} - 1}{h} = \lim_{h \to 0} \frac{\dfrac{3 - (3 + h)}{3 + h}}{h} \\ &= \lim_{h \to 0} \frac{-h}{h(3 + h)} = \lim_{h \to 0} -\frac{1}{3 + h} = -\frac{1}{3} \end{aligned}$$

Therefore an equation of the tangent at the point (3, 1) is

$$y - 1 = -\tfrac{1}{3}(x - 3)$$

which simplifies to

$$x + 3y - 6 = 0$$

The hyperbola and its tangent are shown in Figure 4. ■

## Velocities

In Section 1.4 we investigated the motion of a ball dropped from the CN Tower and defined its velocity to be the limiting value of average velocities over shorter and shorter time periods.

In general, suppose an object moves along a straight line according to an equation of motion $s = f(t)$, where $s$ is the displacement (directed distance) of the object from the origin at time $t$. The function $f$ that describes the motion is called the **position function** of the object. In the time interval from $t = a$ to $t = a + h$, the change in position is $f(a + h) - f(a)$. (See Figure 5.)

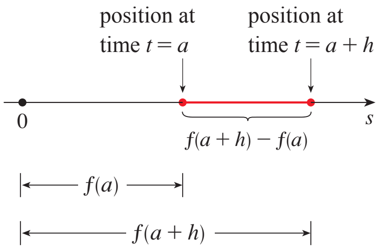

**FIGURE 5**

The average velocity over this time interval is

$$\text{average velocity} = \frac{\text{displacement}}{\text{time}} = \frac{f(a + h) - f(a)}{h}$$

which is the same as the slope of the secant line $PQ$ in Figure 6.

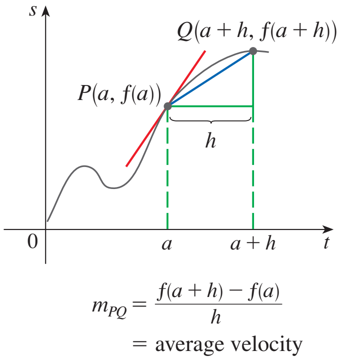

**FIGURE 6**

Now suppose we compute the average velocities over shorter and shorter time intervals $[a, a + h]$. In other words, we let $h$ approach 0. As in the example of the falling ball, we define the **velocity** (or **instantaneous velocity**) $v(a)$ at time $t = a$ to be the limit of these average velocities.

**3 Definitio** The **instantaneous velocity** of an object with position function $f(t)$ at time $t = a$ is

$$v(a) = \lim_{h \to 0} \frac{f(a + h) - f(a)}{h}$$

provided that this limit exists.

This means that the velocity at time $t = a$ is equal to the slope of the tangent line at $P$ (compare Equation 2 and the expression in Definition 3).

Now that we know how to compute limits, let's reconsider the problem of the falling ball.

**EXAMPLE 3** Suppose that a ball is dropped from the upper observation deck of the CN Tower, 450 m above the ground.

(a) What is the velocity of the ball after 5 seconds?

(b) How fast is the ball traveling when it hits the ground?

Recall from Section 1.4: The distance (in meters) fallen after $t$ seconds is $4.9t^2$.

**SOLUTION** Since two different velocities are requested, it's efficient to start by finding the velocity at a general time $t = a$. Using the equation of motion $s = f(t) = 4.9t^2$, we have

$$\begin{aligned} v(a) &= \lim_{h \to 0} \frac{f(a + h) - f(a)}{h} = \lim_{h \to 0} \frac{4.9(a + h)^2 - 4.9a^2}{h} \\ &= \lim_{h \to 0} \frac{4.9(a^2 + 2ah + h^2 - a^2)}{h} = \lim_{h \to 0} \frac{4.9(2ah + h^2)}{h} \\ &= \lim_{h \to 0} \frac{4.9h(2a + h)}{h} = \lim_{h \to 0} 4.9(2a + h) = 9.8a \end{aligned}$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(a) The velocity after 5 seconds is $v(5) = (9.8)(5) = 49$ m/s.

(b) Since the observation deck is 450 m above the ground, the ball will hit the ground at the time $t$ when $s(t) = 450$, that is,

$$4.9t^2 = 450$$

This gives

$$t^2 = \frac{450}{4.9} \qquad \text{and} \qquad t = \sqrt{\frac{450}{4.9}} \approx 9.6 \text{ s}$$

The velocity of the ball as it hits the ground is therefore

$$v\left(\sqrt{\frac{450}{4.9}}\right) = 9.8\sqrt{\frac{450}{4.9}} \approx 94 \text{ m/s}$$ ■

## ■ Derivatives

We have seen that the same type of limit arises in finding the slope of a tangent line (Equation 2) or the velocity of an object (Definition 3). In fact, limits of the form

$$\lim_{h \to 0} \frac{f(a + h) - f(a)}{h}$$

arise whenever we calculate a rate of change in any of the sciences or engineering, such as a rate of reaction in chemistry or a marginal cost in economics. Since this type of limit occurs so widely, it is given a special name and notation.

**4 Definitio** The **derivative of a function $f$ at a number $a$**, denoted by $f'(a)$, is

$f'(a)$ is read "$f$ prime of $a$."

$$f'(a) = \lim_{h \to 0} \frac{f(a + h) - f(a)}{h}$$

if this limit exists.

If we write $x = a + h$, then we have $h = x - a$ and $h$ approaches 0 if and only if $x$ approaches $a$. Therefore an equivalent way of stating the definition of the derivative, as we saw in finding tangent lines (see Definition 1), is

$$\boxed{f'(a) = \lim_{x \to a} \frac{f(x) - f(a)}{x - a}} \tag{5}$$

**EXAMPLE 4** Use Definition 4 to find the derivative of the function $f(x) = x^2 - 8x + 9$ at the numbers (a) 2 and (b) $a$.

Definitions 4 and 5 are equivalent, so we can use either one to compute the derivative. In practice, Definition 4 often leads to simpler computations.

**SOLUTION**

(a) From Definition 4 we have

$$\begin{aligned} f'(2) &= \lim_{h\to 0} \frac{f(2+h)-f(2)}{h} \\ &= \lim_{h\to 0} \frac{(2+h)^2-8(2+h)+9-(-3)}{h} \\ &= \lim_{h\to 0} \frac{4+4h+h^2-16-8h+9+3}{h} \\ &= \lim_{h\to 0} \frac{h^2-4h}{h} = \lim_{h\to 0} \frac{h(h-4)}{h} = \lim_{h\to 0} (h-4) = -4 \end{aligned}$$

(b)

$$\begin{aligned} f'(a) &= \lim_{h\to 0} \frac{f(a+h)-f(a)}{h} \\ &= \lim_{h\to 0} \frac{[(a+h)^2-8(a+h)+9]-[a^2-8a+9]}{h} \\ &= \lim_{h\to 0} \frac{a^2+2ah+h^2-8a-8h+9-a^2+8a-9}{h} \\ &= \lim_{h\to 0} \frac{2ah+h^2-8h}{h} = \lim_{h\to 0} (2a+h-8) = 2a-8 \end{aligned}$$

As a check on our work in part (a), notice that if we let $a = 2$, then $f'(2) = 2(2) - 8 = -4$. ■

**EXAMPLE 5** Use Equation 5 to find the derivative of the function $f(x) = 1/\sqrt{x}$ at the number $a$ $(a > 0)$.

**SOLUTION** From Equation 5 we get

$$\begin{aligned} f'(a) &= \lim_{x\to a} \frac{f(x)-f(a)}{x-a} \\ &= \lim_{x\to a} \frac{\dfrac{1}{\sqrt{x}}-\dfrac{1}{\sqrt{a}}}{x-a} = \lim_{x\to a} \frac{\dfrac{1}{\sqrt{x}}-\dfrac{1}{\sqrt{a}}}{x-a} \cdot \frac{\sqrt{x}\,\sqrt{a}}{\sqrt{x}\,\sqrt{a}} \\ &= \lim_{x\to a} \frac{\sqrt{a}-\sqrt{x}}{\sqrt{ax}\,(x-a)} = \lim_{x\to a} \frac{\sqrt{a}-\sqrt{x}}{\sqrt{ax}\,(x-a)} \cdot \frac{\sqrt{a}+\sqrt{x}}{\sqrt{a}+\sqrt{x}} \\ &= \lim_{x\to a} \frac{-(x-a)}{\sqrt{ax}\,(x-a)\left(\sqrt{a}+\sqrt{x}\right)} = \lim_{x\to a} \frac{-1}{\sqrt{ax}\left(\sqrt{a}+\sqrt{x}\right)} \\ &= \frac{-1}{\sqrt{a^2}\left(\sqrt{a}+\sqrt{a}\right)} = \frac{-1}{a \cdot 2\sqrt{a}} = -\frac{1}{2a^{3/2}} \end{aligned}$$

You can verify that using Definition 4 gives the same result. ■

We defined the tangent line to the curve $y = f(x)$ at the point $P(a, f(a))$ to be the line that passes through $P$ and has slope $m$ given by Equation 1 or 2. Since, by Definition 4 (and Equation 5), this is the same as the derivative $f'(a)$, we can now say the following.

The tangent line to $y = f(x)$ at $(a, f(a))$ is the line through $(a, f(a))$ whose slope is equal to $f'(a)$, the derivative of $f$ at $a$.

If we use the point-slope form of the equation of a line, we can write an equation of the tangent line to the curve $y = f(x)$ at the point $(a, f(a))$:

$$y - f(a) = f'(a)(x - a)$$

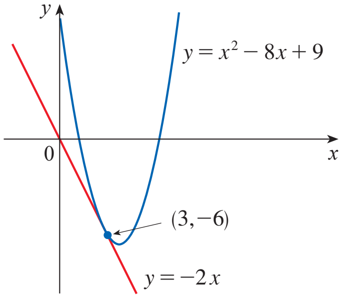

**FIGURE 7**

**EXAMPLE 6** Find an equation of the tangent line to the parabola $y = x^2 - 8x + 9$ at the point $(3, -6)$.

**SOLUTION** From Example 4(b) we know that the derivative of $f(x) = x^2 - 8x + 9$ at the number $a$ is $f'(a) = 2a - 8$. Therefore the slope of the tangent line at $(3, -6)$ is $f'(3) = 2(3) - 8 = -2$. Thus an equation of the tangent line, shown in Figure 7, is

$$y - (-6) = (-2)(x - 3) \qquad \text{or} \qquad y = -2x$$ ■

## ■ Rates of Change

Suppose $y$ is a quantity that depends on another quantity $x$. Thus $y$ is a function of $x$ and we write $y = f(x)$. If $x$ changes from $x_1$ to $x_2$, then the change in $x$ (also called the **increment** of $x$) is

$$\Delta x = x_2 - x_1$$

and the corresponding change in $y$ is

$$\Delta y = f(x_2) - f(x_1)$$

The difference quotient

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

is called the **average rate of change of $y$ with respect to $x$** over the interval $[x_1, x_2]$ and can be interpreted as the slope of the secant line $PQ$ in Figure 8.

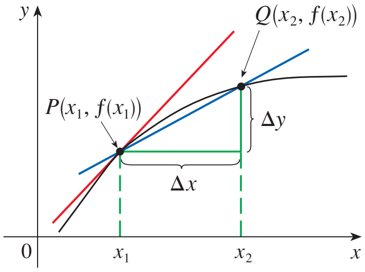

**FIGURE 8**

average rate of change $= m_{PQ}$

instantaneous rate of change = slope of tangent at $P$

By analogy with velocity, we consider the average rate of change over smaller and smaller intervals by letting $x_2$ approach $x_1$ and therefore letting $\Delta x$ approach 0. The limit of these average rates of change is called the **(instantaneous) rate of change of $y$ with respect to $x$** at $x = x_1$, which (as in the case of velocity) is interpreted as the slope of the tangent to the curve $y = f(x)$ at $P(x_1, f(x_1))$:

$$\boxed{6} \qquad \text{instantaneous rate of change} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{x_2 \to x_1} \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

We recognize this limit as being the derivative $f'(x_1)$.

We know that one interpretation of the derivative $f'(a)$ is as the slope of the tangent line to the curve $y = f(x)$ when $x = a$. We now have a second interpretation:

> The derivative $f'(a)$ is the instantaneous rate of change of $y = f(x)$ with respect to $x$ when $x = a$.

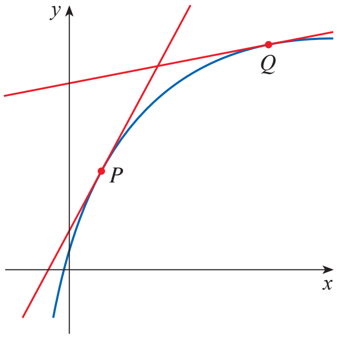

**FIGURE 9**
The $y$-values are changing rapidly at $P$ and slowly at $Q$.

The connection with the first interpretation is that if we sketch the curve $y = f(x)$, then the instantaneous rate of change is the slope of the tangent to this curve at the point where $x = a$. This means that when the derivative is large (and therefore the curve is steep, as at the point $P$ in Figure 9), the $y$-values change rapidly. When the derivative is small, the curve is relatively flat (as at point $Q$) and the $y$-values change slowly.

In particular, if $s = f(t)$ is the position function of a particle that moves along a straight line, then $f'(a)$ is the rate of change of the displacement $s$ with respect to the time $t$. In other words, $f'(a)$ *is the velocity of the particle at time* $t = a$. The **speed** of the particle is the absolute value of the velocity, that is, $|f'(a)|$.

In the next example we discuss the meaning of the derivative of a function that is defined verbally.

**EXAMPLE 7** A manufacturer produces bolts of a fabric with a fixed width. The cost of producing $x$ yards of this fabric is $C = f(x)$ dollars.
(a) What is the meaning of the derivative $f'(x)$? What are its units?
(b) In practical terms, what does it mean to say that $f'(1000) = 9$?
(c) Which do you think is greater, $f'(50)$ or $f'(500)$? What about $f'(5000)$?

**SOLUTION**
(a) The derivative $f'(x)$ is the instantaneous rate of change of $C$ with respect to $x$; that is, $f'(x)$ means the rate of change of the production cost with respect to the number of yards produced. (Economists call this rate of change the *marginal cost*. This idea is discussed in more detail in Sections 2.7 and 3.7.)

Because

$$f'(x) = \lim_{\Delta x \to 0} \frac{\Delta C}{\Delta x}$$

the units for $f'(x)$ are the same as the units for the difference quotient $\Delta C/\Delta x$. Since $\Delta C$ is measured in dollars and $\Delta x$ in yards, it follows that the units for $f'(x)$ are dollars per yard.

(b) The statement that $f'(1000) = 9$ means that, after 1000 yards of fabric have been manufactured, the rate at which the production cost is increasing is \$9/yard. (When $x = 1000$, $C$ is increasing 9 times as fast as $x$.)

Since $\Delta x = 1$ is small compared with $x = 1000$, we could use the approximation

$$f'(1000) \approx \frac{\Delta C}{\Delta x} = \frac{\Delta C}{1} = \Delta C$$

and say that the cost of manufacturing the 1000th yard (or the 1001st) is about \$9.

Here we are assuming that the cost function is well behaved; in other words, $C(x)$ doesn't oscillate rapidly near $x = 1000$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(c) The rate at which the production cost is increasing (per yard) is probably lower when $x = 500$ than when $x = 50$ (the cost of making the 500th yard is less than the cost of the 50th yard) because of economies of scale. (The manufacturer makes more efficient use of the fixed costs of production.) So

$$f'(50) > f'(500)$$

But, as production expands, the resulting large-scale operation might become inefficient and there might be overtime costs. Thus it is possible that the rate of increase of costs will eventually start to rise. So it may happen that

$$f'(5000) > f'(500)$$ ■

In the following example we estimate the rate of change of the national debt with respect to time. Here the function is defined not by a formula but by a table of values.

| $t$ | $D(t)$ |
|---|---|
| 2000 | 5662.2 |
| 2004 | 7596.1 |
| 2008 | 10,699.8 |
| 2012 | 16,432.7 |
| 2016 | 19,976.8 |

*Source:* US Dept. of the Treasury

**EXAMPLE 8** Let $D(t)$ be the US national debt at time $t$. The table in the margin gives approximate values of this function by providing end of year estimates, in billions of dollars, from 2000 to 2016. Interpret and estimate the value of $D'(2008)$.

**SOLUTION** The derivative $D'(2008)$ means the rate of change of $D$ with respect to $t$ when $t = 2008$, that is, the rate of increase of the national debt in 2008.

According to Equation 5,

$$D'(2008) = \lim_{t \to 2008} \frac{D(t) - D(2008)}{t - 2008}$$

One way we can estimate this value is to compare average rates of change over different time intervals by computing difference quotients, as compiled in the following table.

| $t$ | Time interval | Average rate of change $= \dfrac{D(t) - D(2008)}{t - 2008}$ |
|---|---|---|
| 2000 | [2000, 2008] | 629.7 |
| 2004 | [2004, 2008] | 775.93 |
| 2012 | [2008, 2012] | 1433.23 |
| 2016 | [2008, 2016] | 1159.63 |

**A Note on Units**

The units for the average rate of change $\Delta D/\Delta t$ are the units for $\Delta D$ divided by the units for $\Delta t$, namely, billions of dollars per year. The instantaneous rate of change is the limit of the average rates of change, so it is measured in the same units: billions of dollars per year.

From this table we see that $D'(2008)$ lies somewhere between 775.93 and 1433.23 billion dollars per year. [Here we are making the reasonable assumption that the debt didn't fluctuate wildly between 2004 and 2012.] A good estimate for the rate of increase of the US national debt in 2008 would be the average of these two numbers, namely

$$D'(2008) \approx 1105 \text{ billion dollars per year}$$

Another method would be to plot the debt function and estimate the slope of the tangent line when $t = 2008$. ■

In Examples 3, 7, and 8 we saw three specific examples of rates of change: the velocity of an object is the rate of change of displacement with respect to time; marginal cost is the rate of change of production cost with respect to the number of items produced; the rate of change of the debt with respect to time is of interest in economics. Here is a small sample of other rates of change: In physics, the rate of change of work with respect to time is called *power*. Chemists who study a chemical reaction are interested in the rate of change in the concentration of a reactant with respect to time (called the *rate of reaction*). A biologist is interested in the rate of change of the population of a colony of bacteria with respect to time. In fact, the computation of rates of change is important in all of the natural sciences, in engineering, and even in the social sciences. Further examples will be given in Section 2.7.

All these rates of change are derivatives and can therefore be interpreted as slopes of tangents. This gives added significance to the solution of the tangent problem. Whenever we solve a problem involving tangent lines, we are not just solving a problem in geometry. We are also implicitly solving a great variety of problems involving rates of change in science and engineering.

## 2.1 Exercises

**1.** A curve has equation $y = f(x)$.
(a) Write an expression for the slope of the secant line through the points $P(3, f(3))$ and $Q(x, f(x))$.
(b) Write an expression for the slope of the tangent line at $P$.

**2.** Graph the curve $y = \sin x$ in the viewing rectangles $[-2, 2]$ by $[-2, 2]$, $[-1, 1]$ by $[-1, 1]$, and $[-0.5, 0.5]$ by $[-0.5, 0.5]$. What do you notice about the curve as you zoom in toward the origin?

**3.** (a) Find the slope of the tangent line to the parabola $y = x^2 + 3x$ at the point $(-1, -2)$
(i) using Definition 1 (ii) using Equation 2
(b) Find an equation of the tangent line in part (a).
(c) Graph the parabola and the tangent line. As a check on your work, zoom in toward the point $(-1, -2)$ until the parabola and the tangent line are indistinguishable.

**4.** (a) Find the slope of the tangent line to the curve $y = x^3 + 1$ at the point $(1, 2)$
(i) using Definition 1 (ii) using Equation 2
(b) Find an equation of the tangent line in part (a).
(c) Graph the curve and the tangent line in successively smaller viewing rectangles centered at $(1, 2)$ until the curve and the line appear to coincide.

**5–8** Find an equation of the tangent line to the curve at the given point.

**5.** $y = 2x^2 - 5x + 1$, $(3, 4)$

**6.** $y = x^2 - 2x^3$, $(1, -1)$

**7.** $y = \dfrac{x + 2}{x - 3}$, $(2, -4)$

**8.** $y = \sqrt{1 - 3x}$, $(-1, 2)$

---

**9.** (a) Find the slope of the tangent to the curve $y = 3 + 4x^2 - 2x^3$ at the point where $x = a$.
(b) Find equations of the tangent lines at the points $(1, 5)$ and $(2, 3)$.
(c) Graph the curve and both tangents on a common screen.

**10.** (a) Find the slope of the tangent to the curve $y = 2\sqrt{x}$ at the point where $x = a$.
(b) Find equations of the tangent lines at the points $(1, 2)$ and $(9, 6)$.
(c) Graph the curve and both tangents on a common screen.

**11.** A cliff diver plunges from a height of 100 ft above the water surface. The distance the diver falls in $t$ seconds is given by the function $d(t) = 16t^2$ ft.
(a) After how many seconds will the diver hit the water?
(b) With what velocity does the diver hit the water?

**12.** If a rock is thrown upward on the planet Mars with a velocity of 10 m/s, its height (in meters) after $t$ seconds is given by $H = 10t - 1.86t^2$.
(a) Find the velocity of the rock after one second.
(b) Find the velocity of the rock when $t = a$.
(c) When will the rock hit the surface?
(d) With what velocity will the rock hit the surface?

**13.** The displacement (in meters) of a particle moving in a straight line is given by the equation of motion $s = 1/t^2$, where $t$ is measured in seconds. Find the velocity of the particle at times $t = a$, $t = 1$, $t = 2$, and $t = 3$.

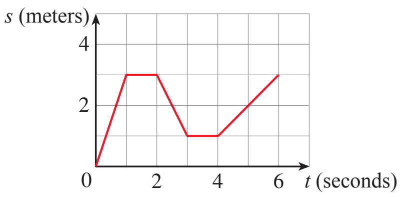
**14.** The displacement (in feet) of a particle moving in a straight line is given by $s = \frac{1}{2}t^2 - 6t + 23$, where $t$ is measured in seconds.
(a) Find the average velocity over each time interval:
(i) $[4, 8]$ (ii) $[6, 8]$
(iii) $[8, 10]$ (iv) $[8, 12]$
(b) Find the instantaneous velocity when $t = 8$.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(c) Draw the graph of $s$ as a function of $t$ and draw the secant lines whose slopes are the average velocities in part (a). Then draw the tangent line whose slope is the instantaneous velocity in part (b).

**15.** (a) A particle starts by moving to the right along a horizontal line; the graph of its position function is shown in the figure. When is the particle moving to the right? Moving to the left? Standing still?

(b) Draw a graph of the velocity function.

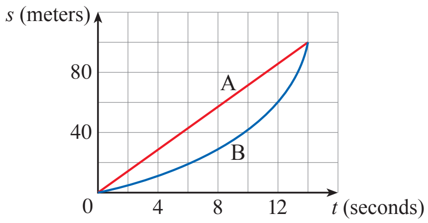


**16.** Shown are graphs of the position functions of two runners, A and B, who run a 100-meter race and finish in a tie.

(a) Describe and compare how the runners run the race.

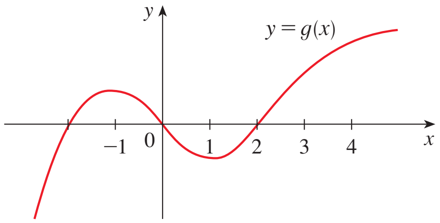
(b) At what time is the distance between the runners the greatest?

(c) At what time do they have the same velocity?



**17.** For the function $g$ whose graph is given, arrange the following numbers in increasing order and explain your reasoning:

$$0 \qquad g'(-2) \qquad g'(0) \qquad g'(2) \qquad g'(4)$$



**18.** The graph of a function $f$ is shown.

(a) Find the average rate of change of $f$ on the interval $[20, 60]$.

(b) Identify an interval on which the average rate of change of $f$ is 0.

(c) Compute

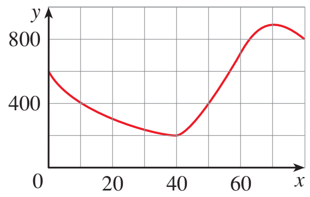
$$\frac{f(40) - f(10)}{40 - 10}$$

What does this value represent geometrically?

(d) Estimate the value of $f'(50)$.

(e) Is $f'(10) > f'(30)$?

(f) Is $f'(60) > \dfrac{f(80) - f(40)}{80 - 40}$? Explain.



**19–20** Use Definition 4 to find $f'(a)$ at the given number $a$.

**19.** $f(x) = \sqrt{4x + 1}, \quad a = 6$

**20.** $f(x) = 5x^4, \quad a = -1$

**21–22** Use Equation 5 to find $f'(a)$ at the given number $a$.

**21.** $f(x) = \dfrac{x^2}{x + 6}, \quad a = 3$

**22.** $f(x) = \dfrac{1}{\sqrt{2x + 2}}, \quad a = 1$

**23–26** Find $f'(a)$.

**23.** $f(x) = 2x^2 - 5x + 3$

**24.** $f(t) = t^3 - 3t$

**25.** $f(t) = \dfrac{1}{t^2 + 1}$

**26.** $f(x) = \dfrac{x}{1 - 4x}$

**27.** Find an equation of the tangent line to the graph of $y = B(x)$ at $x = 6$ if $B(6) = 0$ and $B'(6) = -\frac{1}{2}$.

**28.** Find an equation of the tangent line to the graph of $y = g(x)$ at $x = 5$ if $g(5) = -3$ and $g'(5) = 4$.

**29.** If $f(x) = 3x^2 - x^3$, find $f'(1)$ and use it to find an equation of the tangent line to the curve $y = 3x^2 - x^3$ at the point $(1, 2)$.

**30.** If $g(x) = x^4 - 2$, find $g'(1)$ and use it to find an equation of the tangent line to the curve $y = x^4 - 2$ at the point $(1, -1)$.

**31.** (a) If $F(x) = 5x/(1 + x^2)$, find $F'(2)$ and use it to find an equation of the tangent line to the curve $y = 5x/(1 + x^2)$ at the point $(2, 2)$.

(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**32.** (a) If $G(x) = 4x^2 - x^3$, find $G'(a)$ and use it to find equations of the tangent lines to the curve $y = 4x^2 - x^3$ at the points $(2, 8)$ and $(3, 9)$.

(b) Illustrate part (a) by graphing the curve and the tangent lines on the same screen.

**33.** If an equation of the tangent line to the curve $y = f(x)$ at the point where $a = 2$ is $y = 4x - 5$, find $f(2)$ and $f'(2)$.

**56.** The number $N$ of locations of a popular coffeehouse chain is given in the table. (The numbers of locations as of October 1 are given.)

| Year | $N$ |
|---|---|
| 2008 | 16,680 |
| 2010 | 16,858 |
| 2012 | 18,066 |
| 2014 | 21,366 |
| 2016 | 25,085 |

(a) Find the average rate of growth

(i) from 2008 to 2010

(ii) from 2010 to 2012

In each case, include the units. What can you conclude?

(b) Estimate the instantaneous rate of growth in 2010 by taking the average of two average rates of change. What are its units?

(c) Estimate the instantaneous rate of growth in 2010 by measuring the slope of a tangent.

**57–58** Determine whether $f'(0)$ exists.

**57.** $$f(x) = \begin{cases} x \sin \dfrac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

**58.** $$f(x) = \begin{cases} x^2 \sin \dfrac{1}{x} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

---

**59.** (a) Graph the function

$$f(x) = \sin x - \tfrac{1}{1000}\sin(1000x)$$

in the viewing rectangle $[-2\pi, 2\pi]$ by $[-4, 4]$. What slope does the graph appear to have at the origin?

(b) Zoom in to the viewing window $[-0.4, 0.4]$ by $[-0.25, 0.25]$ and estimate the value of $f'(0)$. Does this agree with your answer from part (a)?

(c) Now zoom in to the viewing window $[-0.008, 0.008]$ by $[-0.005, 0.005]$. Do you wish to revise your estimate for $f'(0)$?

**60. Symmetric Difference Quotients** In Example 8 we approximated an instantaneous rate of change by averaging two average rates of change. An alternative method is to use a single average rate of change over an interval *centered* at the desired value. We define the *symmetric difference quotient* of a function $f$ at $x = a$ on the interval $[a - d, a + d]$ as

$$\frac{f(a + d) - f(a - d)}{(a + d) - (a - d)} = \frac{f(a + d) - f(a - d)}{2d}$$

(a) Compute the symmetric difference quotient for the function $D$ in Example 8 on the interval $[2004, 2012]$ and verify that your result agrees with the estimate for $D'(2008)$ computed in the example.

(b) Show that the symmetric difference quotient of a function $f$ at $x = a$ is equivalent to averaging the average rates of change of $f$ over the intervals $[a - d, a]$ and $[a, a + d]$.

(c) Use a symmetric difference quotient to estimate $f'(1)$ for $f(x) = x^3 - 2x^2 + 2$ with $d = 0.4$. Draw a graph of $f$ along with secant lines corresponding to average rates of change over the intervals $[1 - d, 1]$, $[1, 1 + d]$, and $[1 - d, 1 + d]$. Which of these secant lines appears to have slope closest to that of the tangent line at $x = 1$?

## WRITING PROJECT | EARLY METHODS FOR FINDING TANGENTS

The first person to explicitly formulate the ideas of limits and derivatives was Sir Isaac Newton in the 1660s. But Newton acknowledged that "If I have seen further than other men, it is because I have stood on the shoulders of giants." Two of those giants were Pierre Fermat (1601–1665) and Newton's mentor at Cambridge, Isaac Barrow (1630–1677). Newton was familiar with the methods that these men used to find tangent lines, and their methods played a role in Newton's eventual formulation of calculus.

Learn about these methods by researching on the Internet or reading one of the references listed here. Write an essay comparing the methods of either Fermat or Barrow to modern methods. In particular, use the method of Section 2.1 to find an equation of the tangent line to the curve $y = x^3 + 2x$ at the point $(1, 3)$ and show how either Fermat or Barrow would have solved the same problem. Although you used derivatives and they did not, point out similarities between the methods.

## 2.2 The Derivative as a Function

### The Derivative Function

In Section 2.1 we considered the derivative of a function $f$ at a fixed number $a$:

$$\boxed{1} \qquad f'(a) = \lim_{h \to 0} \frac{f(a + h) - f(a)}{h}$$

Here we change our point of view and let the number $a$ vary. If we replace $a$ in Equation 1 by a variable $x$, we obtain

$$\boxed{2} \qquad \boxed{f'(x) = \lim_{h \to 0} \frac{f(x + h) - f(x)}{h}}$$

Given any number $x$ for which this limit exists, we assign to $x$ the number $f'(x)$. So we can regard $f'$ as a new function, called the **derivative of $f$** and defined by Equation 2. We know that the value of $f'$ at $x$, $f'(x)$, can be interpreted geometrically as the slope of the tangent line to the graph of $f$ at the point $(x, f(x))$.

The function $f'$ is called the derivative of $f$ because it has been "derived" from $f$ by the limiting operation in Equation 2. The domain of $f'$ is the set $\{x \mid f'(x) \text{ exists}\}$ and may be smaller than the domain of $f$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 1** The graph of a function $f$ is given in Figure 1. Use it to sketch the graph of the derivative $f'$.

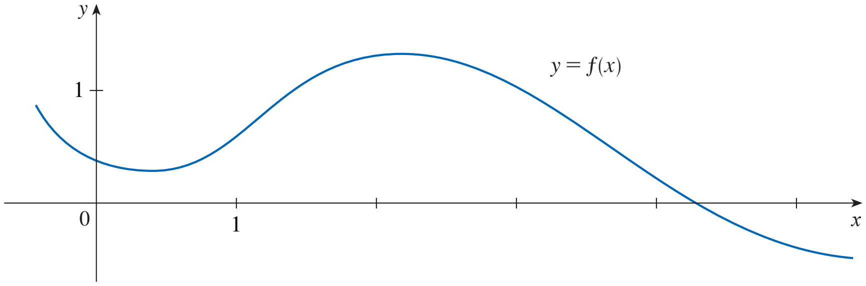

**FIGURE 1**

**SOLUTION** We can estimate the value of the derivative at any value of $x$ by drawing the tangent at the point $(x, f(x))$ and estimating its slope. For instance, for $x = 3$ we draw a tangent at $P$ in Figure 2 and estimate its slope to be about $-\frac{2}{3}$. (We have drawn a triangle to help estimate the slope.) Thus $f'(3) \approx -\frac{2}{3} \approx -0.67$ and this allows us to plot the point $P'(3, -0.67)$ on the graph of $f'$ directly beneath $P$. (The slope of the graph of $f$ becomes the $y$-value on the graph of $f'$.)

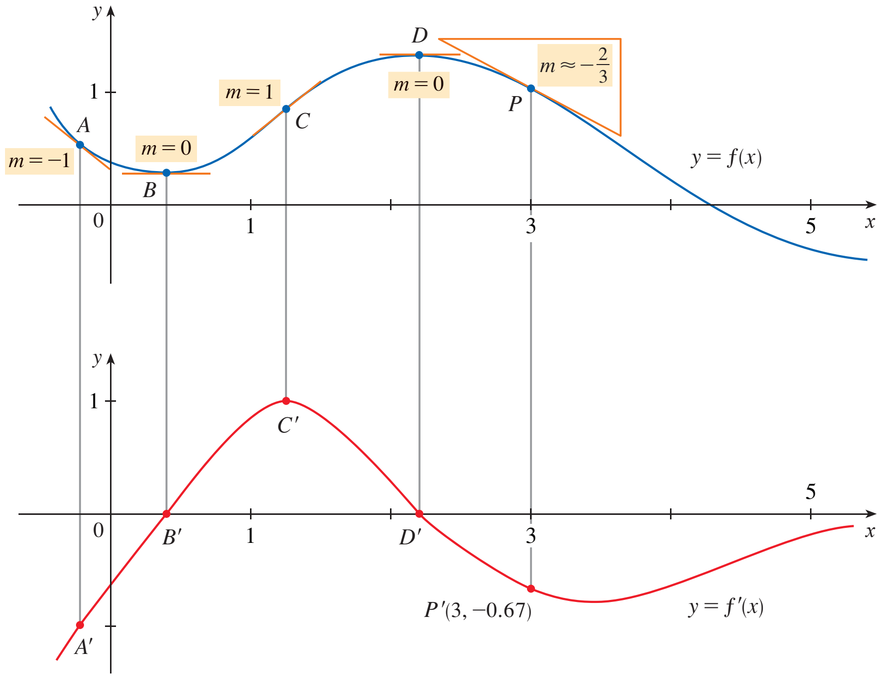

**FIGURE 2**

The slope of the tangent drawn at $A$ appears to be about $-1$, so we plot the point $A'$ with a $y$-value of $-1$ on the graph of $f'$ (directly beneath $A$). The tangents at $B$ and $D$ are horizontal, so the derivative is 0 there and the graph of $f'$ crosses the $x$-axis (where $y = 0$) at the points $B'$ and $D'$, directly beneath $B$ and $D$. Between $B$ and $D$, the graph of $f$ is steepest at $C$ and the tangent line there appears to have slope 1, so the largest value of $f'(x)$ between $B'$ and $D'$ is 1 (at $C'$).

Notice that between $B$ and $D$ the tangents have positive slope, so $f'(x)$ is positive there. (The graph of $f'$ is above the $x$-axis.) But to the right of $D$ the tangents have negative slope, so $f'(x)$ is negative there. (The graph of $f'$ is below the $x$-axis.) ■

## EXAMPLE 2

(a) If $f(x) = x^3 - x$, find a formula for $f'(x)$.
(b) Illustrate this formula by comparing the graphs of $f$ and $f'$.

### SOLUTION

(a) When using Equation 2 to compute a derivative, we must remember that the variable is $h$ and that $x$ is temporarily regarded as a constant during the calculation of the limit.

$$\begin{aligned} f'(x) &= \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{[(x+h)^3 - (x+h)] - [x^3 - x]}{h} \\ &= \lim_{h\to 0} \frac{x^3 + 3x^2h + 3xh^2 + h^3 - x - h - x^3 + x}{h} \\ &= \lim_{h\to 0} \frac{3x^2h + 3xh^2 + h^3 - h}{h} \\ &= \lim_{h\to 0} (3x^2 + 3xh + h^2 - 1) = 3x^2 - 1 \end{aligned}$$

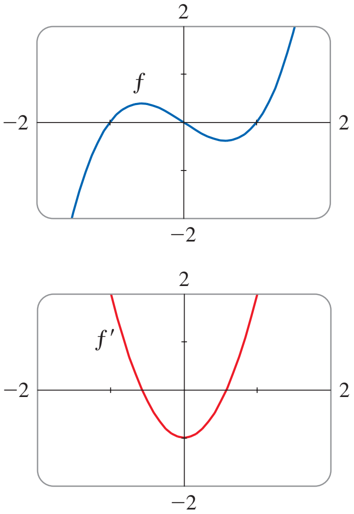

**FIGURE 3**

(b) We use a calculator to graph $f$ and $f'$ in Figure 3. Notice that $f'(x) = 0$ when $f$ has horizontal tangents and $f'(x)$ is positive when the tangents have positive slope. So these graphs serve as a check on our work in part (a). ■

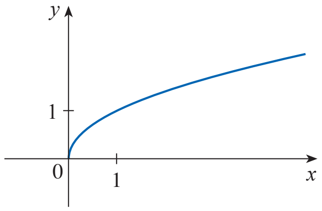
## EXAMPLE 3

If $f(x) = \sqrt{x}$, find the derivative of $f$. State the domain of $f'$.

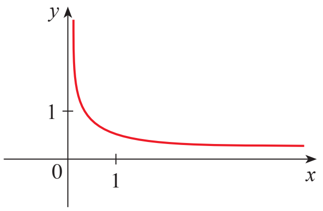
### SOLUTION

$$\begin{aligned} f'(x) &= \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{\sqrt{x+h} - \sqrt{x}}{h} \\ &= \lim_{h\to 0} \left( \frac{\sqrt{x+h} - \sqrt{x}}{h} \cdot \frac{\sqrt{x+h} + \sqrt{x}}{\sqrt{x+h} + \sqrt{x}} \right) \qquad \text{(Rationalize the numerator.)} \\ &= \lim_{h\to 0} \frac{(x+h) - x}{h\left(\sqrt{x+h} + \sqrt{x}\right)} = \lim_{h\to 0} \frac{h}{h\left(\sqrt{x+h} + \sqrt{x}\right)} \\ &= \lim_{h\to 0} \frac{1}{\sqrt{x+h} + \sqrt{x}} = \frac{1}{\sqrt{x} + \sqrt{x}} = \frac{1}{2\sqrt{x}} \end{aligned}$$

We see that $f'(x)$ exists if $x > 0$, so the domain of $f'$ is $(0, \infty)$. This is slightly smaller than the domain of $f$, which is $[0, \infty)$. ■



(a) $f(x) = \sqrt{x}$



(b) $f'(x) = \dfrac{1}{2\sqrt{x}}$

**FIGURE 4**

Let's check to see that the result of Example 3 is reasonable by looking at the graphs of $f$ and $f'$ in Figure 4. When $x$ is close to 0, $\sqrt{x}$ is also close to 0, so $f'(x) = 1/\left(2\sqrt{x}\right)$ is very large and this corresponds to the steep tangent lines near $(0, 0)$ in Figure 4(a) and the large values of $f'(x)$ just to the right of 0 in Figure 4(b). When $x$ is large, $f'(x)$ is very small and this corresponds to the flatter tangent lines at the far right of the graph of $f$ and the horizontal asymptote of the graph of $f'$.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 4** Find $f'$ if $f(x) = \dfrac{1 - x}{2 + x}$.

**SOLUTION**

$$\frac{\dfrac{a}{b} - \dfrac{c}{d}}{e} = \frac{ad - bc}{bd} \cdot \frac{1}{e}$$

$$\begin{aligned}
f'(x) &= \lim_{h \to 0} \frac{f(x + h) - f(x)}{h} \\
&= \lim_{h \to 0} \frac{\dfrac{1 - (x + h)}{2 + (x + h)} - \dfrac{1 - x}{2 + x}}{h} \\
&= \lim_{h \to 0} \frac{(1 - x - h)(2 + x) - (1 - x)(2 + x + h)}{h(2 + x + h)(2 + x)} \\
&= \lim_{h \to 0} \frac{(2 - x - 2h - x^2 - xh) - (2 - x + h - x^2 - xh)}{h(2 + x + h)(2 + x)} \\
&= \lim_{h \to 0} \frac{-3h}{h(2 + x + h)(2 + x)} \\
&= \lim_{h \to 0} \frac{-3}{(2 + x + h)(2 + x)} = -\frac{3}{(2 + x)^2}
\end{aligned}$$

■

**Leibniz**

Gottfried Wilhelm Leibniz was born in Leipzig in 1646 and studied law, theology, philosophy, and mathematics at the university there, graduating with a bachelor's degree at age 17. After earning his doctorate in law at age 20, Leibniz entered the diplomatic service and spent most of his life traveling to the capitals of Europe on political missions. In particular, he worked to avert a French military threat against Germany and attempted to reconcile the Catholic and Protestant churches.

His serious study of mathematics did not begin until 1672 while he was on a diplomatic mission in Paris. There he built a calculating machine and met scientists, like Huygens, who directed his attention to the latest developments in mathematics and science. Leibniz sought to develop a symbolic logic and system of notation that would simplify logical reasoning. In particular, the version of calculus that he published in 1684 established the notation and the rules for finding derivatives that we use today.

Unfortunately, a dreadful priority dispute arose in the 1690s between the followers of Newton and those of Leibniz as to who had invented calculus first. Leibniz was even accused of plagiarism by members of the Royal Society in England. The truth is that each man invented calculus independently. Newton arrived at his version of calculus first but, because of his fear of controversy, did not publish it immediately. So Leibniz's 1684 account of calculus was the first to be published.

## Other Notations

If we use the traditional notation $y = f(x)$ to indicate that the independent variable is $x$ and the dependent variable is $y$, then some common alternative notations for the derivative are as follows:

$$f'(x) = y' = \frac{dy}{dx} = \frac{df}{dx} = \frac{d}{dx} f(x) = Df(x) = D_x f(x)$$

The symbols $D$ and $d/dx$ are called **differentiation operators** because they indicate the operation of **differentiation**, which is the process of calculating a derivative.

The symbol $dy/dx$, which was introduced by Leibniz, should not be regarded as a ratio (for the time being); it is simply a synonym for $f'(x)$. Nonetheless, it is a very useful and suggestive notation, especially when used in conjunction with increment notation. Referring to Equation 2.1.6, we can rewrite the definition of derivative in Leibniz notation in the form

$$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x}$$

If we want to indicate the value of a derivative $dy/dx$ in Leibniz notation at a specific number $a$, we use the notation

$$\left.\frac{dy}{dx}\right|_{x=a} \qquad \text{or} \qquad \left.\frac{dy}{dx}\right]_{x=a}$$

which is a synonym for $f'(a)$. The vertical bar means "evaluate at."

**3 Definitio** A function $f$ is **differentiable at $a$** if $f'(a)$ exists. It is **differentiable on an open interval** $(a, b)$ [or $(a, \infty)$ or $(-\infty, a)$ or $(-\infty, \infty)$] if it is differentiable at every number in the interval.

**EXAMPLE 5** Where is the function $f(x) = |x|$ differentiable?

**SOLUTION** If $x > 0$, then $|x| = x$ and we can choose $h$ small enough that $x + h > 0$ and hence $|x + h| = x + h$. Therefore, for $x > 0$, we have

$$f'(x) = \lim_{h \to 0} \frac{|x + h| - |x|}{h} = \lim_{h \to 0} \frac{(x + h) - x}{h}$$

$$= \lim_{h \to 0} \frac{h}{h} = \lim_{h \to 0} 1 = 1$$

and so $f$ is differentiable for any $x > 0$.

Similarly, for $x < 0$ we have $|x| = -x$ and $h$ can be chosen small enough that $x + h < 0$ and so $|x + h| = -(x + h)$. Therefore, for $x < 0$,

$$f'(x) = \lim_{h \to 0} \frac{|x + h| - |x|}{h} = \lim_{h \to 0} \frac{-(x + h) - (-x)}{h}$$

$$= \lim_{h \to 0} \frac{-h}{h} = \lim_{h \to 0} (-1) = -1$$

and so $f$ is differentiable for any $x < 0$.

For $x = 0$ we have to investigate

$$f'(0) = \lim_{h \to 0} \frac{f(0 + h) - f(0)}{h}$$

$$= \lim_{h \to 0} \frac{|0 + h| - |0|}{h} = \lim_{h \to 0} \frac{|h|}{h} \qquad \text{(if it exists)}$$

Let's compute the left and right limits separately:

$$\lim_{h \to 0^+} \frac{|h|}{h} = \lim_{h \to 0^+} \frac{h}{h} = \lim_{h \to 0^+} 1 = 1$$

and

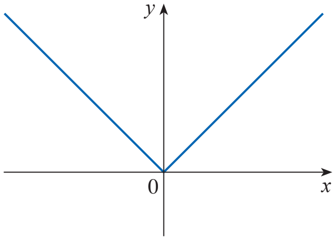
$$\lim_{h \to 0^-} \frac{|h|}{h} = \lim_{h \to 0^-} \frac{-h}{h} = \lim_{h \to 0^-} (-1) = -1$$

Since these limits are different, $f'(0)$ does not exist. Thus $f$ is differentiable at all $x$ except 0.

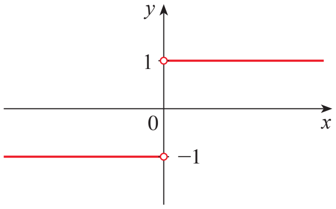
A formula for $f'$ is given by

$$f'(x) = \begin{cases} 1 & \text{if } x > 0 \\ -1 & \text{if } x < 0 \end{cases}$$

and its graph is shown in Figure 5(b). The fact that $f'(0)$ does not exist is reflected geometrically in the fact that the curve $y = |x|$ does not have a tangent line at (0, 0). [See Figure 5(a).] ■



(a) $y = f(x) = |x|$



(b) $y = f'(x)$

**FIGURE 5**

Both continuity and differentiability are desirable properties for a function to have. The following theorem shows how these properties are related.

**4** **Theorem** If $f$ is differentiable at $a$, then $f$ is continuous at $a$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PROOF** To prove that $f$ is continuous at $a$, we have to show that $\lim_{x\to a} f(x) = f(a)$. We will do this by showing that the difference $f(x) - f(a)$ approaches 0.

The given information is that $f$ is differentiable at $a$, that is,

$$f'(a) = \lim_{x\to a} \frac{f(x) - f(a)}{x - a}$$

**PS** An important aspect of problem solving is trying to find a connection between the given and the unknown. See Step 2 (Think of a Plan) in Principles of Problem Solving following Chapter 1.

exists (see Equation 2.1.5). To connect the given and the unknown, we divide and multiply $f(x) - f(a)$ by $x - a$ (which we can do when $x \neq a$):

$$f(x) - f(a) = \frac{f(x) - f(a)}{x - a}(x - a)$$

Thus, using Limit Law 4 (Section 1.6), we can write

$$\begin{aligned}\lim_{x\to a}[f(x) - f(a)] &= \lim_{x\to a} \frac{f(x) - f(a)}{x - a}(x - a) \\ &= \lim_{x\to a} \frac{f(x) - f(a)}{x - a} \cdot \lim_{x\to a}(x - a) \\ &= f'(a) \cdot 0 = 0\end{aligned}$$

To use what we have just proved, we start with $f(x)$ and add and subtract $f(a)$:

$$\begin{aligned}\lim_{x\to a} f(x) &= \lim_{x\to a}[f(a) + (f(x) - f(a))] \\ &= \lim_{x\to a} f(a) + \lim_{x\to a}[f(x) - f(a)] \\ &= f(a) + 0 = f(a)\end{aligned}$$

Therefore $f$ is continuous at $a$. ■

⊘ **NOTE** The converse of Theorem 4 is false; that is, there are functions that are continuous but not differentiable. For instance, the function $f(x) = |x|$ is continuous at 0 because

$$\lim_{x\to 0} f(x) = \lim_{x\to 0} |x| = 0 = f(0)$$

(See Example 1.6.7.) But in Example 5 we showed that $f$ is not differentiable at 0.

## How Can a Function Fail To Be Differentiable?

We saw that the function $y = |x|$ in Example 5 is not differentiable at 0 and Figure 5(a) shows that its graph changes direction abruptly when $x = 0$. In general, if the graph of a function $f$ has a "corner" or "kink" in it, then the graph of $f$ has no tangent at this point and $f$ is not differentiable there. [In trying to compute $f'(a)$, we find that the left and right limits are different.]

Theorem 4 gives another way for a function not to have a derivative. It says that if $f$ is not continuous at $a$, then $f$ is not differentiable at $a$. So at any discontinuity (for instance, a jump discontinuity) $f$ fails to be differentiable.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

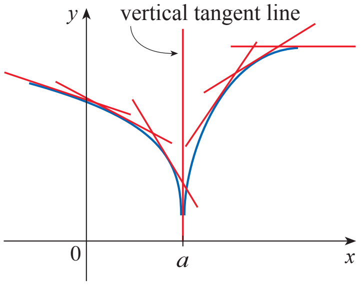


**FIGURE 6**

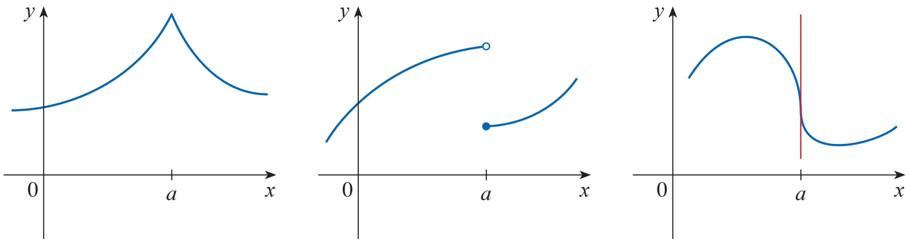
A third possibility is that the curve has a **vertical tangent line** when $x = a$; that is, $f$ is continuous at $a$ and

$$\lim_{x \to a} |f'(x)| = \infty$$

This means that the tangent lines become steeper and steeper as $x \to a$. Figure 6 shows one way that this can happen; Figure 7(c) shows another. Figure 7 illustrates the three possibilities that we have discussed.



(a) A corner

(b) A discontinuity

(c) A vertical tangent

**FIGURE 7**
Three ways for $f$ not to be differentiable at $a$

A graphing calculator or computer provides another way of looking at differentiability. If $f$ is differentiable at $a$, then when we zoom in toward the point $(a, f(a))$ the graph straightens out and appears more and more like a line. (See Figure 8. We saw a specific example of this in Figure 2.1.2.) But no matter how much we zoom in toward a point like the ones in Figures 6 and 7(a), we can't eliminate the sharp point or corner (see Figure 9).

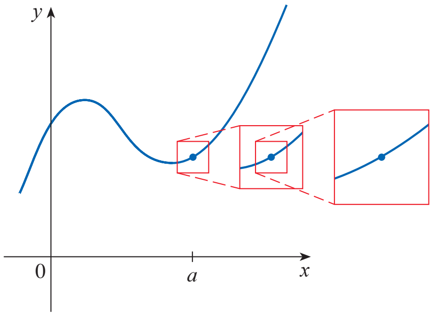


**FIGURE 8**
$f$ is differentiable at $a$.

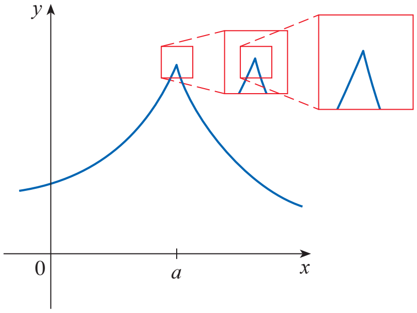

**FIGURE 9**
$f$ is not differentiable at $a$.

## Higher Derivatives

If $f$ is a differentiable function, then its derivative $f'$ is also a function, so $f'$ may have a derivative of its own, denoted by $(f')' = f''$. This new function $f''$ is called the **second derivative** of $f$ because it is the derivative of the derivative of $f$. Using Leibniz notation, we write the second derivative of $y = f(x)$ as

$$\underbrace{\frac{d}{dx}}_{\text{derivative of}}\underbrace{\left(\frac{dy}{dx}\right)}_{\text{first derivative}} = \underbrace{\frac{d^2y}{dx^2}}_{\text{second derivative}}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 6** If $f(x) = x^3 - x$, find and interpret $f''(x)$.

**SOLUTION** In Example 2 we found that the first derivative is $f'(x) = 3x^2 - 1$. So the second derivative is

$$\begin{aligned} f''(x) = (f')'(x) &= \lim_{h \to 0} \frac{f'(x+h) - f'(x)}{h} \\ &= \lim_{h \to 0} \frac{[3(x+h)^2 - 1] - [3x^2 - 1]}{h} \\ &= \lim_{h \to 0} \frac{3x^2 + 6xh + 3h^2 - 1 - 3x^2 + 1}{h} \\ &= \lim_{h \to 0} (6x + 3h) = 6x \end{aligned}$$

The graphs of $f$, $f'$, and $f''$ are shown in Figure 10.

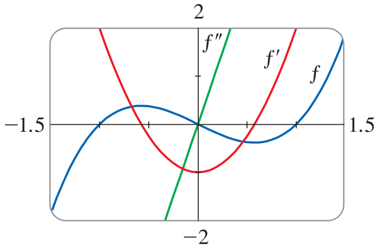

**FIGURE 10**

We can interpret $f''(x)$ as the slope of the curve $y = f'(x)$ at the point $(x, f'(x))$. In other words, it is the rate of change of the slope of the original curve $y = f(x)$.

Notice from Figure 10 that $f''(x)$ is negative when $y = f'(x)$ has negative slope and positive when $y = f'(x)$ has positive slope. So the graphs serve as a check on our calculations. ■

In general, we can interpret a second derivative as a rate of change of a rate of change. The most familiar example of this is *acceleration*, which we define as follows.

If $s = s(t)$ is the position function of an object that moves in a straight line, we know that its first derivative represents the velocity $v(t)$ of the object as a function of time:

$$v(t) = s'(t) = \frac{ds}{dt}$$

The instantaneous rate of change of velocity with respect to time is called the **acceleration** $a(t)$ of the object. Thus the acceleration function is the derivative of the velocity function and is therefore the second derivative of the position function:

$$a(t) = v'(t) = s''(t)$$

or, in Leibniz notation,

$$a = \frac{dv}{dt} = \frac{d^2s}{dt^2}$$

Acceleration is the change in velocity you feel when speeding up or slowing down in a car.

The **third derivative** $f'''$ is the derivative of the second derivative: $f''' = (f'')'$. So $f'''(x)$ can be interpreted as the slope of the curve $y = f''(x)$ or as the rate of change of $f''(x)$. If $y = f(x)$, then alternative notations for the third derivative are

$$y''' = f'''(x) = \frac{d}{dx}\left(\frac{d^2y}{dx^2}\right) = \frac{d^3y}{dx^3}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We can also interpret the third derivative physically in the case where the function is the position function $s = s(t)$ of an object that moves along a straight line. Because $s''' = (s'')' = a'$, the third derivative of the position function is the derivative of the acceleration function and is called the **jerk**:

$$j = \frac{da}{dt} = \frac{d^3s}{dt^3}$$

Thus the jerk $j$ is the rate of change of acceleration. It is aptly named because a large jerk means a sudden change in acceleration, which causes an abrupt movement.

The differentiation process can be continued. The fourth derivative $f''''$ is usually denoted by $f^{(4)}$. In general, the $n$th derivative of $f$ is denoted by $f^{(n)}$ and is obtained from $f$ by differentiating $n$ times. If $y = f(x)$, we write

$$y^{(n)} = f^{(n)}(x) = \frac{d^n y}{dx^n}$$

**EXAMPLE 7** If $f(x) = x^3 - x$, find $f'''(x)$ and $f^{(4)}(x)$.

**SOLUTION** In Example 6 we found that $f''(x) = 6x$. The graph of the second derivative has equation $y = 6x$ and so it is a straight line with slope 6. Since the derivative $f'''(x)$ is the slope of $f''(x)$, we have

$$f'''(x) = 6$$

for all values of $x$. So $f'''$ is a constant function and its graph is a horizontal line. Therefore, for all values of $x$,

$$f^{(4)}(x) = 0$$

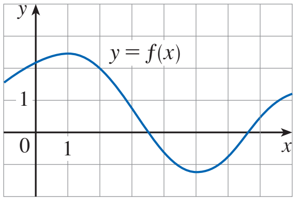
■

We have seen that one application of second and third derivatives occurs in analyzing the motion of objects using acceleration and jerk. We will investigate another application of second derivatives in Section 3.3, where we show how knowledge of $f''$ gives us information about the shape of the graph of $f$. In Chapter 11 we will see how second and higher derivatives enable us to represent functions as sums of infinite series.

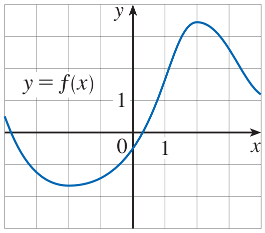
## 2.2 Exercises

**1–2** Use the given graph to estimate the value of each derivative. Then sketch the graph of $f'$.

**1.** (a) $f'(0)$ (b) $f'(1)$ (c) $f'(2)$ (d) $f'(3)$
(e) $f'(4)$ (f) $f'(5)$ (g) $f'(6)$ (h) $f'(7)$

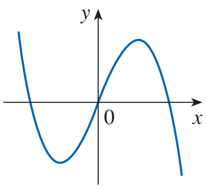


**2.** (a) $f'(-3)$ (b) $f'(-2)$ (c) $f'(-1)$
(d) $f'(0)$ (e) $f'(1)$ (f) $f'(2)$
(g) $f'(3)$

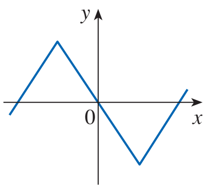


**3.** Match the graph of each function in (a)–(d) with the graph of its derivative in I–IV. Give reasons for your choices.

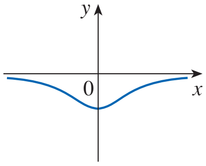
(a)



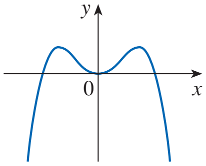
(b)



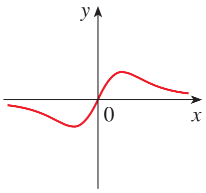
(c)



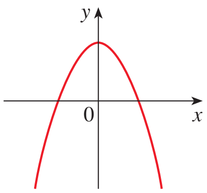
(d)



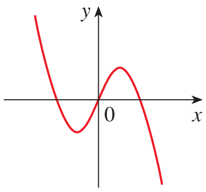
I



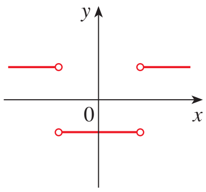
II



III

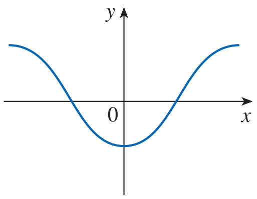


IV

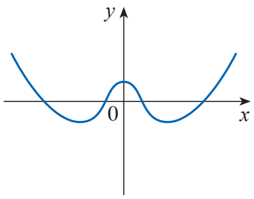


**4–11** Trace or copy the graph of the given function *f*. (Assume that the axes have equal scales.) Then use the method of Example 1 to sketch the graph of $f'$ below it.

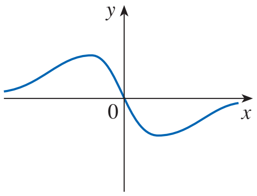
**4.**



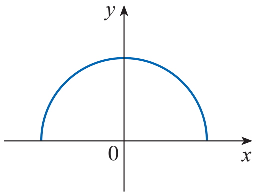
**5.**



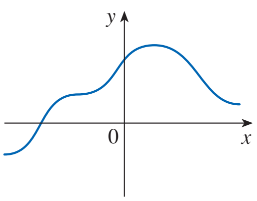
**6.**



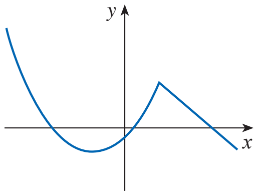
**7.**



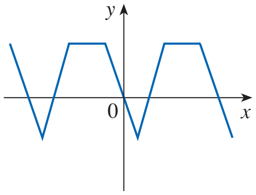
**8.**



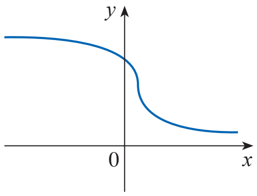
**9.**



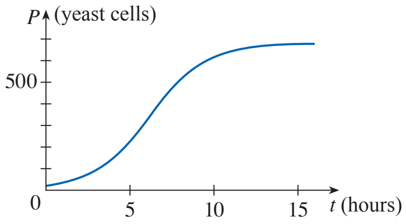
**10.**



**11.**



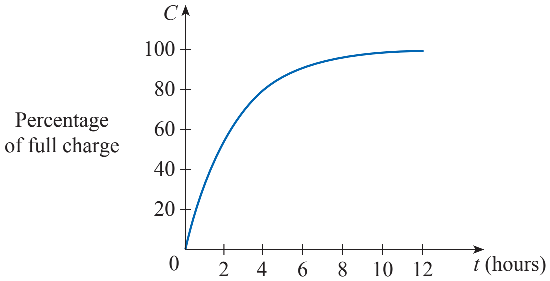
**12.** Shown is the graph of the population function $P(t)$ for yeast cells in a laboratory culture. Use the method of Example 1 to graph the derivative $P'(t)$. What does the graph of $P'$ tell us about the yeast population?



**13.** A rechargeable battery is plugged into a charger. The graph shows $C(t)$, the percentage of full capacity that the battery reaches as a function of time $t$ elapsed (in hours).

(a) What is the meaning of the derivative $C'(t)$?

(b) Sketch the graph of $C'(t)$. What does the graph tell you?



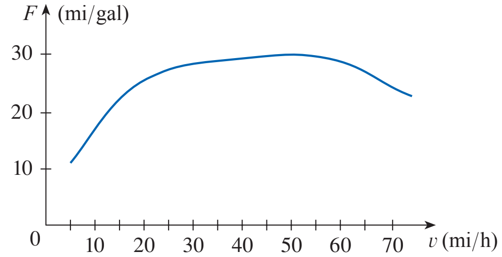
**14.** The graph on page 130 (from the US Department of Energy) shows how driving speed affects gas mileage. Fuel economy $F$ is measured in miles per gallon and speed $v$ is measured in miles per hour.

(a) What is the meaning of the derivative $F'(v)$?

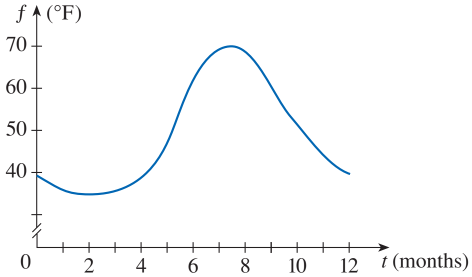
(b) Sketch the graph of $F'(v)$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(c) At what speed should you drive if you want to save on gas?



**15.** The graph shows how the average surface water temperature $f$ of Lake Michigan varies over the course of a year (where $t$ is measured in months with $t = 0$ corresponding to January 1). The average was calculated from data obtained over a 20-year period ending in 2011. Sketch the graph of the derivative function $f'$. When is $f'(t)$ largest?



**16.** Make a careful sketch of the graph of the sine function and below it sketch the graph of its derivative in the same manner as in Example 1. Can you guess what the derivative of the sine function is from its graph?

**17.** Let $f(x) = x^2$.

(a) Estimate the values of $f'(0)$, $f'(\frac{1}{2})$, $f'(1)$, and $f'(2)$ by zooming in on the graph of $f$.

(b) Use symmetry to deduce the values of $f'(-\frac{1}{2})$, $f'(-1)$, and $f'(-2)$.

(c) Use the results from parts (a) and (b) to guess a formula for $f'(x)$.

(d) Use the definition of derivative to prove that your guess in part (c) is correct.

**18.** Let $f(x) = x^3$.

(a) Estimate the values of $f'(0)$, $f'(\frac{1}{2})$, $f'(1)$, $f'(2)$, and $f'(3)$ by zooming in on the graph of $f$.

(b) Use symmetry to deduce the values of $f'(-\frac{1}{2})$, $f'(-1)$, $f'(-2)$, and $f'(-3)$.

(c) Use the values from parts (a) and (b) to graph $f'$.

(d) Guess a formula for $f'(x)$.

(e) Use the definition of a derivative to prove that your guess in part (d) is correct.

**19–30** Find the derivative of the function using the definition of derivative. State the domain of the function and the domain of its derivative.

**19.** $f(x) = 3x - 8$

**20.** $f(x) = mx + b$

**21.** $f(t) = 2.5t^2 + 6t$

**22.** $f(x) = 4 + 8x - 5x^2$

**23.** $A(p) = 4p^3 + 3p$

**24.** $F(t) = t^3 - 5t + 1$

**25.** $f(x) = \dfrac{1}{x^2 - 4}$

**26.** $F(v) = \dfrac{v}{v + 2}$

**27.** $g(u) = \dfrac{u + 1}{4u - 1}$

**28.** $f(x) = x^4$

**29.** $f(x) = \dfrac{1}{\sqrt{1 + x}}$

**30.** $g(x) = \dfrac{1}{1 + \sqrt{x}}$

---

**31.** (a) Sketch the graph of $f(x) = 1 + \sqrt{x + 3}$ by starting with the graph of $y = \sqrt{x}$ and using the transformations of Section 1.3.

(b) Use the graph from part (a) to sketch the graph of $f'$.

(c) Use the definition of a derivative to find $f'(x)$. What are the domains of $f$ and $f'$?

(d) Graph $f'$ and compare with your sketch in part (b).

**32.** (a) If $f(x) = x + 1/x$, find $f'(x)$.

(b) Check to see that your answer to part (a) is reasonable by comparing the graphs of $f$ and $f'$.

**33.** (a) If $f(x) = x^4 + 2x$, find $f'(x)$.

(b) Check to see that your answer to part (a) is reasonable by comparing the graphs of $f$ and $f'$.

**34.** The table gives the number $N(t)$, measured in thousands, of minimally invasive cosmetic surgery procedures performed in the United States for various years $t$.

| $t$ | $N(t)$ (thousands) |
|---|---|
| 2000 | 5,500 |
| 2002 | 4,897 |
| 2004 | 7,470 |
| 2006 | 9,138 |
| 2008 | 10,897 |
| 2010 | 11,561 |
| 2012 | 13,035 |
| 2014 | 13,945 |

*Source:* American Society of Plastic Surgeons

(a) What is the meaning of $N'(t)$? What are its units?

(b) Construct a table of estimated values for $N'(t)$.

(c) Graph $N$ and $N'$.

(d) How would it be possible to get more accurate values for $N'(t)$?

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**35.** The table gives the height as time passes of a typical pine tree grown for lumber at a managed site.

| Tree age (years) | 14 | 21 | 28 | 35 | 42 | 49 |
|---|---|---|---|---|---|---|
| Height (feet) | 41 | 54 | 64 | 72 | 78 | 83 |

*Source:* Arkansas Forestry Commission

If $H(t)$ is the height of the tree after $t$ years, construct a table of estimated values for $H'$ and sketch its graph.

**36.** Water temperature affects the growth rate of brook trout. The table shows the amount of weight gained by brook trout after 24 days in various water temperatures.

| Temperature (°C) | 15.5 | 17.7 | 20.0 | 22.4 | 24.4 |
|---|---|---|---|---|---|
| Weight gained (g) | 37.2 | 31.0 | 19.8 | 9.7 | −9.8 |

If $W(x)$ is the weight gain at temperature $x$, construct a table of estimated values for $W'$ and sketch its graph. What are the units for $W'(x)$?

*Source:* Adapted from J. Chadwick Jr., "Temperature Effects on Growth and Stress Physiology of Brook Trout: Implications for Climate Change Impacts on an Iconic Cold-Water Fish." *Masters Theses*. Paper 897. 2012. scholarworks.umass.edu/theses/897.

**37.** Let $P$ represent the percentage of a city's electrical power that is produced by solar panels $t$ years after January 1, 2020.

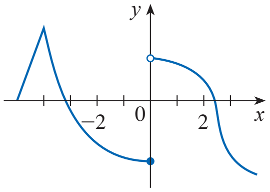
(a) What does $dP/dt$ represent in this context?
(b) Interpret the statement

$$\left.\frac{dP}{dt}\right|_{t=2} = 3.5$$

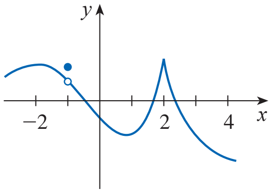
**38.** Suppose $N$ is the number of people in the United States who travel by car to another state for a vacation in a year when the average price of gasoline is $p$ dollars per gallon. Do you expect $dN/dp$ to be positive or negative? Explain.

**39–42** The graph of $f$ is given. State, with reasons, the numbers at which $f$ is *not* differentiable.

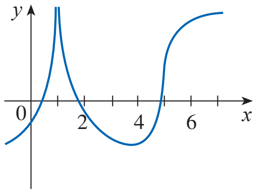
**39.**



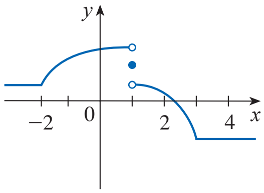
**40.**



**41.**



**42.**

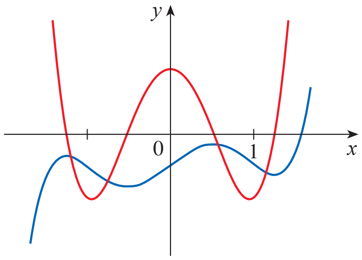


**43.** Graph the function $f(x) = x + \sqrt{|x|}$. Zoom in repeatedly, first toward the point $(-1, 0)$ and then toward the origin. What is different about the behavior of $f$ in the vicinity of these two points? What do you conclude about the differentiability of $f$?

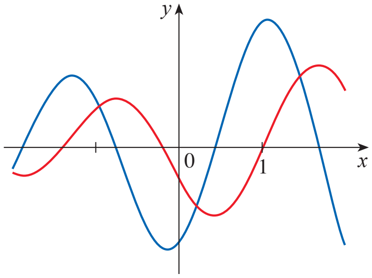
**44.** Zoom in toward the points $(1, 0)$, $(0, 1)$, and $(-1, 0)$ on the graph of the function $g(x) = (x^2 - 1)^{2/3}$. What do you notice? Account for what you see in terms of the differentiability of $g$.

**45–46** The graphs of a function $f$ and its derivative $f'$ are shown. Which is bigger, $f'(-1)$ or $f''(1)$?

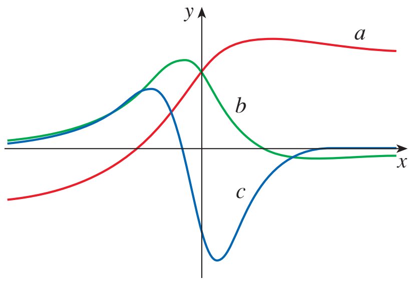
**45.**



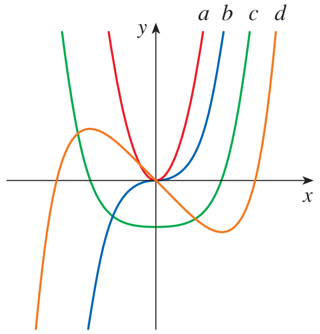
**46.**



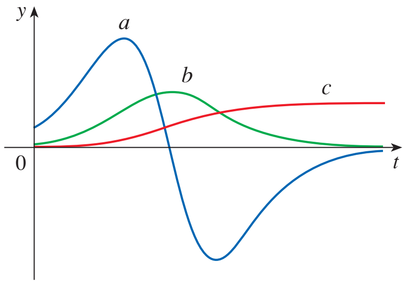
**47.** The figure shows the graphs of $f$, $f'$, and $f''$. Identify each curve, and explain your choices.



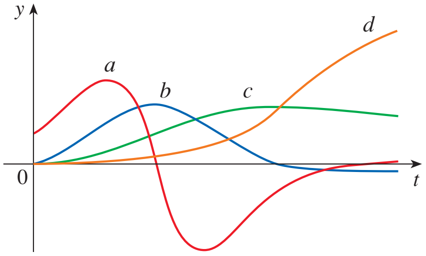
**48.** The figure shows graphs of $f$, $f'$, $f''$, and $f'''$. Identify each curve, and explain your choices.



**49.** The figure shows the graphs of three functions. One is the position function of a car, one is the velocity of the car, and one is its acceleration. Identify each curve, and explain your choices.



**50.** The figure shows the graphs of four functions. One is the position function of a car, one is the velocity of the car, one is its acceleration, and one is its jerk. Identify each curve, and explain your choices.



**51–52** Use the definition of a derivative to find $f'(x)$ and $f''(x)$. Then graph $f$, $f'$, and $f''$ on a common screen and check to see if your answers are reasonable.

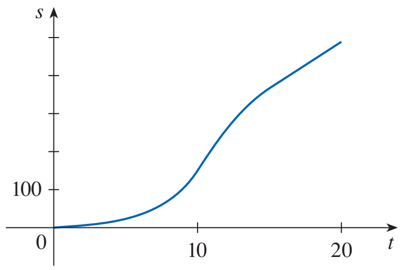
**51.** $f(x) = 3x^2 + 2x + 1$ **52.** $f(x) = x^3 - 3x$

---

**53.** If $f(x) = 2x^2 - x^3$, find $f'(x)$, $f''(x)$, $f'''(x)$, and $f^{(4)}(x)$. Graph $f$, $f'$, $f''$, and $f'''$ on a common screen. Are the graphs consistent with the geometric interpretations of these derivatives?

**54.** (a) The graph of a position function of a car is shown, where $s$ is measured in feet and $t$ in seconds. Use it to graph the velocity and acceleration of the car. What is the acceleration at $t = 10$ seconds?

(b) Use the acceleration curve from part (a) to estimate the jerk at $t = 10$ seconds. What are the units for jerk?



**55.** Let $f(x) = \sqrt[3]{x}$.

(a) If $a \neq 0$, use Equation 2.1.5 to find $f'(a)$.

(b) Show that $f'(0)$ does not exist.

(c) Show that $y = \sqrt[3]{x}$ has a vertical tangent line at (0, 0). (Recall the shape of the graph of $f$. See Figure 1.2.13.)

**56.** (a) If $g(x) = x^{2/3}$, show that $g'(0)$ does not exist.

(b) If $a \neq 0$, find $g'(a)$.

(c) Show that $y = x^{2/3}$ has a vertical tangent line at (0, 0).

(d) Illustrate part (c) by graphing $y = x^{2/3}$.

**57.** Show that the function $f(x) = |x - 6|$ is not differentiable at 6. Find a formula for $f'$ and sketch its graph.

**58.** Where is the greatest integer function $f(x) = [\![ x ]\!]$ not differentiable? Find a formula for $f'$ and sketch its graph.

**59.** (a) Sketch the graph of the function $f(x) = x|x|$.

(b) For what values of $x$ is $f$ differentiable?

(c) Find a formula for $f'$.

**60.** (a) Sketch the graph of the function $g(x) = x + |x|$.

(b) For what values of $x$ is $g$ differentiable?

(c) Find a formula for $g'$.

**61. Derivatives of Even and Odd Functions** Recall that a function $f$ is called *even* if $f(-x) = f(x)$ for all $x$ in its domain and *odd* if $f(-x) = -f(x)$ for all such $x$. Prove each of the following.

(a) The derivative of an even function is an odd function.

(b) The derivative of an odd function is an even function.

**62–63 Left- and Right-Hand Derivatives** The *left-hand* and *right-hand derivatives* of $f$ at $a$ are defined by

$$f'_{-}(a) = \lim_{h \to 0^-} \frac{f(a + h) - f(a)}{h}$$

and

$$f'_{+}(a) = \lim_{h \to 0^+} \frac{f(a + h) - f(a)}{h}$$

if these limits exist. Then $f'(a)$ exists if and only if these one-sided derivatives exist and are equal.

**62.** Find $f'_-(0)$ and $f'_+(0)$ for the given function $f$. Is $f$ differentiable at 0?

(a) $f(x) = \begin{cases} 0 & \text{if } x \leqslant 0 \\ x & \text{if } x > 0 \end{cases}$ (b) $f(x) = \begin{cases} 0 & \text{if } x \leqslant 0 \\ x^2 & \text{if } x > 0 \end{cases}$

**63.** Let

$$f(x) = \begin{cases} 0 & \text{if } x \leqslant 0 \\ 5 - x & \text{if } 0 < x < 4 \\ \dfrac{1}{5-x} & \text{if } x \geqslant 4 \end{cases}$$

(a) Find $f'_-(4)$ and $f'_+(4)$.
(b) Sketch the graph of $f$.
(c) Where is $f$ discontinuous?
(d) Where is $f$ not differentiable?

---

**64.** When you turn on a hot-water faucet, the temperature $T$ of the water depends on how long the water has been running. In Example 1.1.4 we sketched a possible graph of $T$ as a function of the time $t$ that has elapsed since the faucet was turned on.
(a) Describe how the rate of change of $T$ with respect to $t$ varies as $t$ increases.
(b) Sketch a graph of the derivative of $T$.

**65.** Nick starts jogging and runs faster and faster for 3 mintues, then he walks for 5 minutes. He stops at an intersection for 2 minutes, runs fairly quickly for 5 minutes, then walks for 4 minutes.
(a) Sketch a possible graph of the distance $s$ Nick has covered after $t$ minutes.
(b) Sketch a graph of $ds/dt$.

**66.** Let $\ell$ be the tangent line to the parabola $y = x^2$ at the point (1, 1). The *angle of inclination* of $\ell$ is the angle $\phi$ that $\ell$ makes with the positive direction of the $x$-axis. Calculate $\phi$ correct to the nearest degree.

# 2.3 Differentiation Formulas

If it were always necessary to compute derivatives directly from the definition, as we did in the preceding section, such computations would be tedious and the evaluation of some limits would require ingenuity. Fortunately, several rules have been developed for finding derivatives without having to use the definition directly. These formulas greatly simplify the task of differentiation.

## Constant Functions

Let's start with the simplest of all functions, the constant function $f(x) = c$. The graph of this function is the horizontal line $y = c$, which has slope 0, so we must have $f'(x) = 0$. (See Figure 1.) A formal proof, from the definition of a derivative, is also easy:

$$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{c - c}{h} = \lim_{h \to 0} 0 = 0$$

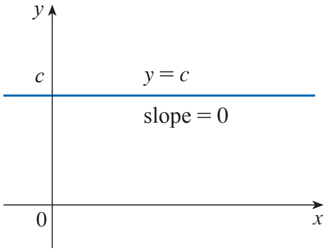

**FIGURE 1**
The graph of $f(x) = c$ is the line $y = c$, so $f'(x) = 0$.

In Leibniz notation, we write this rule as follows.

**Derivative of a Constant Function**

$$\frac{d}{dx}(c) = 0$$

## Power Functions

We next look at the functions $f(x) = x^n$, where $n$ is a positive integer. If $n = 1$, the graph of $f(x) = x$ is the line $y = x$, which has slope 1. (See Figure 2.) So

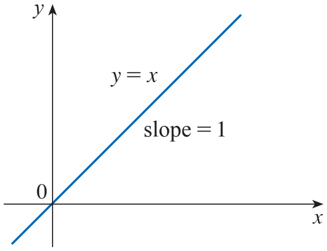

**FIGURE 2**
The graph of $f(x) = x$ is the line $y = x$, so $f'(x) = 1$.

**1** $$\boxed{\frac{d}{dx}(x) = 1}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(You can also verify Equation 1 from the definition of a derivative.) We have already investigated the cases $n = 2$ and $n = 3$. In fact, in Section 2.2 (Exercises 17 and 18) we found that

$$\boxed{2} \qquad \frac{d}{dx}(x^2) = 2x \qquad \frac{d}{dx}(x^3) = 3x^2$$

For $n = 4$ we find the derivative of $f(x) = x^4$ as follows:

$$\begin{aligned} f'(x) &= \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{(x+h)^4 - x^4}{h} \\ &= \lim_{h\to 0} \frac{x^4 + 4x^3h + 6x^2h^2 + 4xh^3 + h^4 - x^4}{h} \\ &= \lim_{h\to 0} \frac{4x^3h + 6x^2h^2 + 4xh^3 + h^4}{h} \\ &= \lim_{h\to 0} (4x^3 + 6x^2h + 4xh^2 + h^3) = 4x^3 \end{aligned}$$

Thus

$$\boxed{3} \qquad \frac{d}{dx}(x^4) = 4x^3$$

Comparing the equations in (1), (2), and (3), we see a pattern emerging. It seems to be a reasonable guess that, when $n$ is a positive integer, $(d/dx)(x^n) = nx^{n-1}$. This turns out to be true. We prove it in two ways; the second proof uses the Binomial Theorem.

**The Power Rule** If $n$ is a positive integer, then

$$\frac{d}{dx}(x^n) = nx^{n-1}$$

**FIRST PROOF** The formula

$$x^n - a^n = (x - a)(x^{n-1} + x^{n-2}a + \cdots + xa^{n-2} + a^{n-1})$$

can be verified simply by multiplying out the right-hand side (or by summing the second factor as a geometric series). If $f(x) = x^n$, we can use Equation 2.1.5 for $f'(a)$ and the equation above to write

$$\begin{aligned} f'(a) &= \lim_{x\to a} \frac{f(x) - f(a)}{x - a} = \lim_{x\to a} \frac{x^n - a^n}{x - a} \\ &= \lim_{x\to a} (x^{n-1} + x^{n-2}a + \cdots + xa^{n-2} + a^{n-1}) \\ &= a^{n-1} + a^{n-2}a + \cdots + aa^{n-2} + a^{n-1} \\ &= na^{n-1} \end{aligned}$$

**SECOND PROOF**

$$f'(x) = \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h\to 0} \frac{(x+h)^n - x^n}{h}$$

The Binomial Theorem is given on Reference Page 1.

In finding the derivative of $x^4$ we had to expand $(x+h)^4$. Here we need to expand $(x+h)^n$ and we use the Binomial Theorem to do so:

$$\begin{aligned} f'(x) &= \lim_{h\to 0} \frac{\left[x^n + nx^{n-1}h + \dfrac{n(n-1)}{2}x^{n-2}h^2 + \cdots + nxh^{n-1} + h^n\right] - x^n}{h} \\ &= \lim_{h\to 0} \frac{nx^{n-1}h + \dfrac{n(n-1)}{2}x^{n-2}h^2 + \cdots + nxh^{n-1} + h^n}{h} \\ &= \lim_{h\to 0} \left[nx^{n-1} + \frac{n(n-1)}{2}x^{n-2}h + \cdots + nxh^{n-2} + h^{n-1}\right] \\ &= nx^{n-1} \end{aligned}$$

because every term except the first has $h$ as a factor and therefore approaches 0. ■

We illustrate the Power Rule using various notations in Example 1.

**EXAMPLE 1**

(a) If $f(x) = x^6$, then $f'(x) = 6x^5$.

(b) If $y = x^{1000}$, then $y' = 1000x^{999}$.

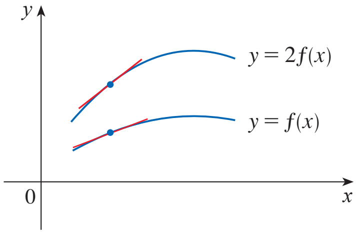
(c) If $y = t^4$, then $\dfrac{dy}{dt} = 4t^3$.

(d) $\dfrac{d}{dr}(r^3) = 3r^2$ ■

## ■ New Derivatives from Old

When new functions are formed from old functions by addition, subtraction, or multiplication by a constant, their derivatives can be calculated in terms of derivatives of the old functions. In particular, the following formula says that *the derivative of a constant times a function is the constant times the derivative of the function.*

**Geometric Interpretation of the Constant Multiple Rule**



Multiplying by $c = 2$ stretches the graph vertically by a factor of 2. All the rises have been doubled but the runs stay the same. So the slopes are also doubled.

**The Constant Multiple Rule** If $c$ is a constant and $f$ is a differentiable function, then

$$\frac{d}{dx}[cf(x)] = c\frac{d}{dx}f(x)$$

**PROOF** Let $g(x) = cf(x)$. Then

$$\begin{aligned} g'(x) &= \lim_{h\to 0}\frac{g(x+h)-g(x)}{h} = \lim_{h\to 0}\frac{cf(x+h)-cf(x)}{h} \\ &= \lim_{h\to 0} c\left[\frac{f(x+h)-f(x)}{h}\right] \\ &= c\lim_{h\to 0}\frac{f(x+h)-f(x)}{h} \qquad \text{(by Limit Law 3)} \\ &= cf'(x) \end{aligned}$$

■

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 2**

(a) $\dfrac{d}{dx}(3x^4) = 3\dfrac{d}{dx}(x^4) = 3(4x^3) = 12x^3$

(b) $\dfrac{d}{dx}(-x) = \dfrac{d}{dx}[(-1)x] = (-1)\dfrac{d}{dx}(x) = -1(1) = -1$ ■

The next rule tells us that *the derivative of a sum (or difference) of functions is the sum (or difference) of the derivatives.*

Using prime notation, we can write the Sum and Difference Rules as

$$(f + g)' = f' + g'$$
$$(f - g)' = f' - g'$$

**The Sum and Difference Rules** If $f$ and $g$ are both differentiable, then

$$\frac{d}{dx}[f(x) + g(x)] = \frac{d}{dx}f(x) + \frac{d}{dx}g(x)$$

$$\frac{d}{dx}[f(x) - g(x)] = \frac{d}{dx}f(x) - \frac{d}{dx}g(x)$$

**PROOF** To prove the Sum Rule, we let $F(x) = f(x) + g(x)$. Then

$$\begin{aligned}
F'(x) &= \lim_{h\to 0}\frac{F(x+h) - F(x)}{h} \\
&= \lim_{h\to 0}\frac{[f(x+h) + g(x+h)] - [f(x) + g(x)]}{h} \\
&= \lim_{h\to 0}\left[\frac{f(x+h) - f(x)}{h} + \frac{g(x+h) - g(x)}{h}\right] \\
&= \lim_{h\to 0}\frac{f(x+h) - f(x)}{h} + \lim_{h\to 0}\frac{g(x+h) - g(x)}{h} \qquad \text{(by Limit Law 1)} \\
&= f'(x) + g'(x)
\end{aligned}$$

To prove the Difference Rule, we write $f - g$ as $f + (-1)g$ and apply the Sum Rule and the Constant Multiple Rule. ■

The Sum Rule can be extended to the sum of any number of functions. For instance, using this theorem twice, we get

$$(f + g + h)' = [(f + g) + h]' = (f + g)' + h' = f' + g' + h'$$

The Constant Multiple Rule, the Sum Rule, and the Difference Rule can be combined with the Power Rule to differentiate any polynomial, as the following three examples demonstrate.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 3**

$$\frac{d}{dx}(x^8 + 12x^5 - 4x^4 + 10x^3 - 6x + 5)$$

$$\begin{aligned} &= \frac{d}{dx}(x^8) + 12\frac{d}{dx}(x^5) - 4\frac{d}{dx}(x^4) + 10\frac{d}{dx}(x^3) - 6\frac{d}{dx}(x) + \frac{d}{dx}(5) \\ &= 8x^7 + 12(5x^4) - 4(4x^3) + 10(3x^2) - 6(1) + 0 \\ &= 8x^7 + 60x^4 - 16x^3 + 30x^2 - 6 \end{aligned}$$

■

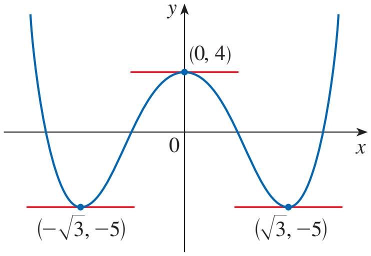


**FIGURE 3**
The curve $y = x^4 - 6x^2 + 4$ and its horizontal tangents

**EXAMPLE 4** Find the points on the curve $y = x^4 - 6x^2 + 4$ where the tangent line is horizontal.

**SOLUTION** Horizontal tangents occur where the derivative is zero. We have

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx}(x^4) - 6\frac{d}{dx}(x^2) + \frac{d}{dx}(4) \\ &= 4x^3 - 12x + 0 = 4x(x^2 - 3) \end{aligned}$$

Thus $dy/dx = 0$ if $x = 0$ or $x^2 - 3 = 0$, that is, $x = \pm\sqrt{3}$. So the given curve has horizontal tangents when $x = 0$, $\sqrt{3}$, and $-\sqrt{3}$. The corresponding points are $(0, 4)$, $(\sqrt{3}, -5)$, and $(-\sqrt{3}, -5)$. (See Figure 3.) ■

**EXAMPLE 5** The equation of motion of a particle is $s = 2t^3 - 5t^2 + 3t + 4$, where $s$ is measured in centimeters and $t$ in seconds. Find the acceleration as a function of time. What is the acceleration after 2 seconds?

**SOLUTION** The velocity and acceleration are

$$v(t) = \frac{ds}{dt} = 6t^2 - 10t + 3$$

$$a(t) = \frac{dv}{dt} = 12t - 10$$

The acceleration after 2 seconds is $a(2) = 12(2) - 10 = 14 \text{ cm/s}^2$. ■

Next we need a formula for the derivative of a product of two functions.

## The Product Rule

By analogy with the Sum and Difference Rules, we might be tempted to guess, as Leibniz did three centuries ago, that the derivative of a product is the product of the derivatives. We can see, however, that this guess is wrong by looking at a particular example. Let $f(x) = x$ and $g(x) = x^2$. Then the Power Rule gives $f'(x) = 1$ and $g'(x) = 2x$. But $(fg)(x) = x^3$, so $(fg)'(x) = 3x^2$. Thus $(fg)' \neq f'g'$. The correct formula was discovered by Leibniz (soon after his false start) and is called the Product Rule.

**The Product Rule** If $f$ and $g$ are both differentiable, then

$$\frac{d}{dx}[f(x)g(x)] = f(x)\frac{d}{dx}[g(x)] + g(x)\frac{d}{dx}[f(x)]$$

In prime notation the Product Rule is written as

$$(fg)' = fg' + gf'$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PROOF** Let $F(x) = f(x)g(x)$. Then

$$\begin{aligned} F'(x) &= \lim_{h\to 0} \frac{F(x+h) - F(x)}{h} \\ &= \lim_{h\to 0} \frac{f(x+h)g(x+h) - f(x)g(x)}{h} \end{aligned}$$

In order to evaluate this limit, we would like to separate the functions $f$ and $g$ as in the proof of the Sum Rule. We can achieve this separation by subtracting and adding the term $f(x+h)g(x)$ in the numerator:

$$\begin{aligned} F'(x) &= \lim_{h\to 0} \frac{f(x+h)g(x+h) - f(x+h)g(x) + f(x+h)g(x) - f(x)g(x)}{h} \\ &= \lim_{h\to 0} \left[ f(x+h)\,\frac{g(x+h) - g(x)}{h} + g(x)\,\frac{f(x+h) - f(x)}{h} \right] \\ &= \lim_{h\to 0} f(x+h) \cdot \lim_{h\to 0} \frac{g(x+h) - g(x)}{h} + \lim_{h\to 0} g(x) \cdot \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} \\ &= f(x)g'(x) + g(x)f'(x) \end{aligned}$$

Note that $\lim_{h\to 0} g(x) = g(x)$ because $g(x)$ is a constant with respect to the variable $h$. Also, since $f$ is differentiable at $x$, it is continuous at $x$ by Theorem 2.2.4, and so $\lim_{h\to 0} f(x+h) = f(x)$. (See Exercise 1.8.65.) ■

In words, the Product Rule says that the *derivative of a product of two functions is the first function times the derivative of the second function plus the second function times the derivative of the first function.*

**EXAMPLE 6** Find $F'(x)$ if $F(x) = (6x^3)(7x^4)$.

**SOLUTION** By the Product Rule, we have

$$\begin{aligned} F'(x) &= (6x^3)\frac{d}{dx}(7x^4) + (7x^4)\frac{d}{dx}(6x^3) \\ &= (6x^3)(28x^3) + (7x^4)(18x^2) = 168x^6 + 126x^6 = 294x^6 \end{aligned}$$ ■

Notice that we could verify the answer to Example 6 directly by first multiplying the factors:

$$F(x) = (6x^3)(7x^4) = 42x^7 \qquad \Rightarrow \qquad F'(x) = 42(7x^6) = 294x^6$$

But later we will meet functions, such as $y = x^2 \sin x$, for which the Product Rule is the only possible method.

**EXAMPLE 7** If $h(x) = xg(x)$ and it is known that $g(3) = 5$ and $g'(3) = 2$, find $h'(3)$.

**SOLUTION** Applying the Product Rule, we get

$$\begin{aligned} h'(x) &= \frac{d}{dx}[xg(x)] = x\frac{d}{dx}[g(x)] + g(x)\frac{d}{dx}[x] \\ &= x \cdot g'(x) + g(x) \cdot (1) \end{aligned}$$

Therefore $$h'(3) = 3g'(3) + g(3) = 3 \cdot 2 + 5 = 11$$ ■

## The Quotient Rule

The following formula tells us how to differentiate the quotient of two functions.

In prime notation the Quotient Rule is written as

$$\left(\frac{f}{g}\right)' = \frac{gf' - fg'}{g^2}$$

**The Quotient Rule** If $f$ and $g$ are differentiable, then

$$\frac{d}{dx}\left[\frac{f(x)}{g(x)}\right] = \frac{g(x)\dfrac{d}{dx}[f(x)] - f(x)\dfrac{d}{dx}[g(x)]}{[g(x)]^2}$$

**PROOF** Let $F(x) = f(x)/g(x)$. Then

$$F'(x) = \lim_{h\to 0}\frac{F(x+h) - F(x)}{h} = \lim_{h\to 0}\frac{\dfrac{f(x+h)}{g(x+h)} - \dfrac{f(x)}{g(x)}}{h}$$

$$= \lim_{h\to 0}\frac{f(x+h)g(x) - f(x)g(x+h)}{hg(x+h)g(x)}$$

We can separate $f$ and $g$ in this expression by subtracting and adding the term $f(x)g(x)$ in the numerator:

$$F'(x) = \lim_{h\to 0}\frac{f(x+h)g(x) - f(x)g(x) + f(x)g(x) - f(x)g(x+h)}{hg(x+h)g(x)}$$

$$= \lim_{h\to 0}\frac{g(x)\dfrac{f(x+h) - f(x)}{h} - f(x)\dfrac{g(x+h) - g(x)}{h}}{g(x+h)g(x)}$$

$$= \frac{\lim\limits_{h\to 0} g(x)\cdot\lim\limits_{h\to 0}\dfrac{f(x+h) - f(x)}{h} - \lim\limits_{h\to 0} f(x)\cdot\lim\limits_{h\to 0}\dfrac{g(x+h) - g(x)}{h}}{\lim\limits_{h\to 0} g(x+h)\cdot\lim\limits_{h\to 0} g(x)}$$

$$= \frac{g(x)f'(x) - f(x)g'(x)}{[g(x)]^2}$$

Again $g$ is continuous by Theorem 2.2.4, so $\lim_{h\to 0} g(x+h) = g(x)$. ■

In words, the Quotient Rule says that the *derivative of a quotient is the denominator times the derivative of the numerator minus the numerator times the derivative of the denominator, all divided by the square of the denominator.*

The theorems of this section show that any polynomial is differentiable on $\mathbb{R}$ and any rational function is differentiable on its domain. Furthermore, the Quotient Rule and the other differentiation formulas enable us to compute the derivative of any rational function, as the next example illustrates.

Figure 4 shows the graphs of the function of Example 8 and its derivative. Notice that when $y$ grows rapidly (near $-\sqrt[3]{6} \approx -1.8$), $y'$ is large. And when $y$ grows slowly, $y'$ is near $0$.

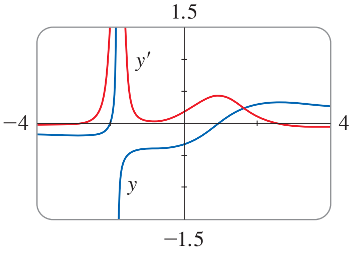

**FIGURE 4**

**EXAMPLE 8** Let $y = \dfrac{x^2 + x - 2}{x^3 + 6}$. Then

$$\begin{aligned} y' &= \frac{(x^3 + 6)\dfrac{d}{dx}(x^2 + x - 2) - (x^2 + x - 2)\dfrac{d}{dx}(x^3 + 6)}{(x^3 + 6)^2} \\ &= \frac{(x^3 + 6)(2x + 1) - (x^2 + x - 2)(3x^2)}{(x^3 + 6)^2} \\ &= \frac{(2x^4 + x^3 + 12x + 6) - (3x^4 + 3x^3 - 6x^2)}{(x^3 + 6)^2} \\ &= \frac{-x^4 - 2x^3 + 6x^2 + 12x + 6}{(x^3 + 6)^2} \end{aligned}$$

■

**NOTE** Don't use the Quotient Rule *every* time you see a quotient. Sometimes it's easier to rewrite a quotient first to put it in a form that is simpler for the purpose of differentiation. For instance, although it is possible to differentiate the function

$$F(x) = \frac{3x^2 + 2\sqrt{x}}{x}$$

using the Quotient Rule, it is much easier to perform the division first and write the function as

$$F(x) = 3x + 2x^{-1/2}$$

before differentiating.

## ■ General Power Functions

The Quotient Rule can be used to extend the Power Rule to the case where the exponent is a negative integer.

If $n$ is a positive integer, then

$$\frac{d}{dx}(x^{-n}) = -nx^{-n-1}$$

**PROOF**
$$\begin{aligned} \frac{d}{dx}(x^{-n}) &= \frac{d}{dx}\left(\frac{1}{x^n}\right) \\ &= \frac{x^n \dfrac{d}{dx}(1) - 1 \cdot \dfrac{d}{dx}(x^n)}{(x^n)^2} = \frac{x^n \cdot 0 - 1 \cdot nx^{n-1}}{x^{2n}} \\ &= \frac{-nx^{n-1}}{x^{2n}} = -nx^{n-1-2n} = -nx^{-n-1} \end{aligned}$$

■

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

### EXAMPLE 9

(a) If $y = \dfrac{1}{x}$, then $\dfrac{dy}{dx} = \dfrac{d}{dx}(x^{-1}) = -x^{-2} = -\dfrac{1}{x^2}$

(b) $\dfrac{d}{dt}\left(\dfrac{6}{t^3}\right) = 6\dfrac{d}{dt}(t^{-3}) = 6(-3)t^{-4} = -\dfrac{18}{t^4}$ ■

So far we know that the Power Rule holds if the exponent $n$ is a positive or negative integer. If $n = 0$, then $x^0 = 1$, which we know has a derivative of 0. Thus the Power Rule holds for any integer $n$. What if the exponent is a fraction? In Example 2.2.3 we found that

$$\frac{d}{dx}\sqrt{x} = \frac{1}{2\sqrt{x}}$$

which can be written as

$$\frac{d}{dx}(x^{1/2}) = \tfrac{1}{2}x^{-1/2}$$

This shows that the Power Rule is true even when $n = \frac{1}{2}$. In fact, it also holds for *any real number n*, as we will prove in Chapter 6. (A proof for rational values of $n$ is indicated in Exercise 2.6.50.) In the meantime we state the general version and use it in the examples and exercises.

**The Power Rule (General Version)** If $n$ is any real number, then

$$\frac{d}{dx}(x^n) = nx^{n-1}$$

### EXAMPLE 10

(a) If $f(x) = x^{\pi}$, then $f'(x) = \pi x^{\pi - 1}$.

(b) Let
$$y = \frac{1}{\sqrt[3]{x^2}}$$

Then
$$\frac{dy}{dx} = \frac{d}{dx}(x^{-2/3}) = -\tfrac{2}{3}x^{-(2/3)-1}$$
$$= -\tfrac{2}{3}x^{-5/3}$$ ■

In Example 11, $a$ and $b$ are constants. It is customary in mathematics to use letters near the beginning of the alphabet to represent constants and letters near the end of the alphabet to represent variables.

### EXAMPLE 11 Differentiate the function $f(t) = \sqrt{t}\,(a + bt)$.

**SOLUTION 1** Using the Product Rule, we have

$$\begin{aligned} f'(t) &= \sqrt{t}\,\frac{d}{dt}(a + bt) + (a + bt)\frac{d}{dt}\left(\sqrt{t}\,\right) \\ &= \sqrt{t}\cdot b + (a + bt)\cdot \tfrac{1}{2}t^{-1/2} \\ &= b\sqrt{t} + \frac{a + bt}{2\sqrt{t}} = \frac{a + 3bt}{2\sqrt{t}} \end{aligned}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**SOLUTION 2** If we first use the laws of exponents to rewrite $f(t)$, then we can proceed directly without using the Product Rule.

$$f(t) = a\sqrt{t} + bt\sqrt{t} = at^{1/2} + bt^{3/2}$$

$$f'(t) = \tfrac{1}{2}at^{-1/2} + \tfrac{3}{2}bt^{1/2}$$

which is equivalent to the answer given in Solution 1. ■

The differentiation rules enable us to find tangent lines without having to resort to the definition of a derivative. It also enables us to find *normal lines*. The **normal line** to a curve $C$ at a point $P$ is the line through $P$ that is perpendicular to the tangent line at $P$. (In the study of optics, one needs to consider the angle between a light ray and the normal line to a lens.)

**EXAMPLE 12** Find equations of the tangent line and normal line to the curve $y = \sqrt{x}/(1 + x^2)$ at the point $\left(1, \tfrac{1}{2}\right)$.

**SOLUTION** According to the Quotient Rule, we have

$$\frac{dy}{dx} = \frac{(1 + x^2)\dfrac{d}{dx}\left(\sqrt{x}\right) - \sqrt{x}\,\dfrac{d}{dx}(1 + x^2)}{(1 + x^2)^2}$$

$$= \frac{(1 + x^2)\dfrac{1}{2\sqrt{x}} - \sqrt{x}\,(2x)}{(1 + x^2)^2}$$

$$= \frac{(1 + x^2) - 4x^2}{2\sqrt{x}\,(1 + x^2)^2} = \frac{1 - 3x^2}{2\sqrt{x}\,(1 + x^2)^2}$$

So the slope of the tangent line at $\left(1, \tfrac{1}{2}\right)$ is

$$\left.\frac{dy}{dx}\right|_{x=1} = \frac{1 - 3 \cdot 1^2}{2\sqrt{1}\,(1 + 1^2)^2} = -\frac{1}{4}$$

We use the point-slope form to write an equation of the tangent line at $\left(1, \tfrac{1}{2}\right)$:

$$y - \tfrac{1}{2} = -\tfrac{1}{4}(x - 1) \qquad \text{or} \qquad y = -\tfrac{1}{4}x + \tfrac{3}{4}$$

The slope of the normal line at $\left(1, \tfrac{1}{2}\right)$ is the negative reciprocal of $-\tfrac{1}{4}$, namely 4, so an equation is

$$y - \tfrac{1}{2} = 4(x - 1) \qquad \text{or} \qquad y = 4x - \tfrac{7}{2}$$

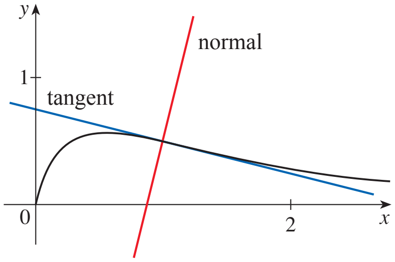

**FIGURE 5**

The curve and its tangent and normal lines are graphed in Figure 5. ■

**EXAMPLE 13** At what points on the hyperbola $xy = 12$ is the tangent line parallel to the line $3x + y = 0$?

**SOLUTION** Since $xy = 12$ can be written as $y = 12/x$, we have

$$\frac{dy}{dx} = 12\frac{d}{dx}(x^{-1}) = 12(-x^{-2}) = -\frac{12}{x^2}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

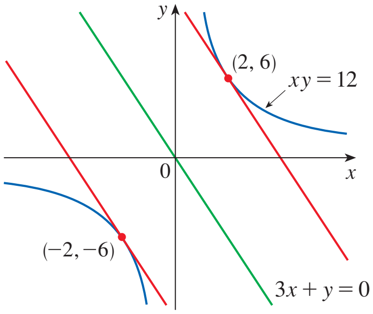

**FIGURE 6**

Let the $x$-coordinate of one of the points in question be $a$. Then the slope of the tangent line at that point is $-12/a^2$. This tangent line will be parallel to the line $3x + y = 0$, or $y = -3x$, if it has the same slope, that is, $-3$. Equating slopes, we get

$$-\frac{12}{a^2} = -3 \qquad \text{or} \qquad a^2 = 4 \qquad \text{or} \qquad a = \pm 2$$

Therefore the required points are $(2, 6)$ and $(-2, -6)$. The hyperbola and the tangents are shown in Figure 6. ■

We summarize the differentiation formulas we have learned so far as follows.

**Table of Differentiation Formulas**

$$\frac{d}{dx}(c) = 0 \qquad \frac{d}{dx}(x^n) = nx^{n-1}$$

$$(cf)' = cf' \qquad (f + g)' = f' + g' \qquad (f - g)' = f' - g'$$

$$(fg)' = fg' + gf' \qquad \left(\frac{f}{g}\right)' = \frac{gf' - fg'}{g^2}$$

## 2.3 Exercises

**1–14** Differentiate the function.

**1.** $g(x) = 4x + 7$

**2.** $g(t) = 5t + 4t^2$

**3.** $f(x) = x^{75} - x + 3$

**4.** $g(x) = \frac{7}{4}x^2 - 3x + 12$

**5.** $W(v) = 1.8v^{-3}$

**6.** $r(z) = z^{-5} - z^{1/2}$

**7.** $f(x) = x^{3/2} + x^{-3}$

**8.** $V(t) = t^{-3/5} + t^4$

**9.** $s(t) = \dfrac{1}{t} + \dfrac{1}{t^2}$

**10.** $r(t) = \dfrac{a}{t^2} + \dfrac{b}{t^4}$

**11.** $y = 2x + \sqrt{x}$

**12.** $h(w) = \sqrt{2}\,w - \sqrt{2}$

**13.** $g(x) = \dfrac{1}{\sqrt{x}} + \sqrt[4]{x}$

**14.** $S(R) = 4\pi R^2$

**15–24** Differentiate the function after first rewriting the function in a different form. (Do not use the Product or Quotient Rules.)

**15.** $f(x) = x^3(x + 3)$

**16.** $F(t) = (2t - 3)^2$

**17.** $f(x) = \dfrac{3x^2 + x^3}{x}$

**18.** $y = \dfrac{\sqrt{x} + x}{x^2}$

**19.** $G(q) = (1 + q^{-1})^2$

**20.** $G(t) = \sqrt{5t} + \dfrac{\sqrt{7}}{t}$

**21.** $G(r) = \dfrac{3r^{3/2} + r^{5/2}}{r}$

**22.** $F(z) = \dfrac{A + Bz + Cz^2}{z^2}$

**23.** $P(w) = \dfrac{2w^2 - w + 4}{\sqrt{w}}$

**24.** $D(t) = \dfrac{1 + 16t^2}{(4t)^3}$

**25–26** Find $dy/dx$ and $dy/dt$.

**25.** $y = tx^2 + t^3x$

**26.** $y = \dfrac{t}{x^2} + \dfrac{x}{t}$

**27.** Find the derivative of $f(x) = (1 + 2x^2)(x - x^2)$ in two ways: by using the Product Rule and by performing the multiplication first. Do your answers agree?

**28.** Find the derivative of the function

$$F(x) = \frac{x^4 - 5x^3 + \sqrt{x}}{x^2}$$

in two ways: by using the Quotient Rule and by simplifying first. Show that your answers are equivalent. Which method do you prefer?

**29–32** Use the Product Rule to find the derivative of the function.

**29.** $f(x) = (3x^2 - 5x)x^2$

**30.** $y = (10x^2 + 7x - 2)(2 - x^2)$

**31.** $y = (4x^2 + 3)(2x + 5)$

**32.** $g(x) = \sqrt{x}\,(x + 2\sqrt{x})$

**33–36** Use the Quotient Rule to find the derivative of the function.

**33.** $y = \dfrac{5x}{1 + x}$

**34.** $y = \dfrac{x^2}{1 - x}$

**35.** $g(t) = \dfrac{3 - 2t}{5t + 1}$

**36.** $G(u) = \dfrac{6u^4 - 5u}{u + 1}$

---

**37–52** Differentiate.

**37.** $f(t) = \dfrac{5t}{t^3 - t - 1}$

**38.** $F(x) = \dfrac{1}{2x^3 - 6x^2 + 5}$

**39.** $y = \dfrac{s - \sqrt{s}}{s^2}$

**40.** $y = \dfrac{\sqrt{x}}{\sqrt{x} + 1}$

**41.** $F(x) = \dfrac{2x^5 + x^4 - 6x}{x^3}$

**42.** $y = \dfrac{(u + 2)^2}{1 - u}$

**43.** $H(u) = (u - \sqrt{u})(u + \sqrt{u})$

**44.** $A(v) = v^{2/3}(2v^2 + 1 - v^{-2})$

**45.** $J(u) = \left(\dfrac{1}{u} + \dfrac{1}{u^2}\right)\left(u + \dfrac{1}{u}\right)$

**46.** $h(w) = (w^2 + 3w)(w^{-1} - w^{-4})$

**47.** $f(t) = \dfrac{\sqrt[3]{t}}{t - 3}$

**48.** $y = \dfrac{cx}{1 + cx}$

**49.** $G(y) = \dfrac{B}{Ay^3 + B}$

**50.** $F(t) = \dfrac{At}{Bt^2 + Ct^3}$

**51.** $f(x) = \dfrac{x}{x + \dfrac{c}{x}}$

**52.** $f(x) = \dfrac{ax + b}{cx + d}$

---

**53.** The general polynomial of degree $n$ has the form

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_2 x^2 + a_1 x + a_0$$

where $a_n \neq 0$. Find the derivative of $P$.

**54–56** Find $f'(x)$. Compare the graphs of $f$ and $f'$ and use them to explain why your answer is reasonable.

**54.** $f(x) = x^4 - 2x^3 + x^2$

**55.** $f(x) = 3x^{15} - 5x^3 + 3$

**56.** $f(x) = x + \dfrac{1}{x}$

---

**57.** (a) Graph the function

$$f(x) = x^4 - 3x^3 - 6x^2 + 7x + 30$$

in the viewing rectangle $[-3, 5]$ by $[-10, 50]$.

(b) Using the graph in part (a) to estimate slopes, make a rough sketch, by hand, of the graph of $f'$. (See Example 2.2.1.)

(c) Calculate $f'(x)$ and use this expression to graph $f'$. Compare with your sketch in part (b).

**58.** (a) Graph the function $g(x) = x^2/(x^2 + 1)$ in the viewing rectangle $[-4, 4]$ by $[-1, 1.5]$.

(b) Using the graph in part (a) to estimate slopes, make a rough sketch, by hand, of the graph of $g'$. (See Example 2.2.1.)

(c) Calculate $g'(x)$ and use this expression to graph $g'$. Compare with your sketch in part (b).

**59–60** Find an equation of the tangent line to the curve at the given point.

**59.** $y = \dfrac{2x}{x + 1}$, $(1, 1)$

**60.** $y = 2x^3 - x^2 + 2$, $(1, 3)$

---

**61–64** Find equations of the tangent line and normal line to the curve at the specified point.

**61.** $y = x + \sqrt{x}$, $(1, 2)$

**62.** $y = x^{3/2}$, $(1, 1)$

**63.** $y = \dfrac{3x}{1 + 5x^2}$, $\left(1, \tfrac{1}{2}\right)$

**64.** $y = \dfrac{\sqrt{x}}{x + 1}$, $(4, 0.4)$

---

**65.** (a) The curve $y = 1/(1 + x^2)$ is called a **witch of Maria Agnesi**. Find an equation of the tangent line to this curve at the point $\left(-1, \tfrac{1}{2}\right)$.

(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**66.** (a) The curve $y = x/(1 + x^2)$ is called a **serpentine**. Find an equation of the tangent line to this curve at the point $(3, 0.3)$.

(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**67–70** Find the first and second derivatives of the function.

**67.** $f(x) = 0.001x^5 - 0.02x^3$

**68.** $G(r) = \sqrt{r} + \sqrt[3]{r}$

**69.** $f(x) = \dfrac{x^2}{1 + 2x}$

**70.** $f(x) = \dfrac{1}{3 - x}$

---

**71–72** Find the first and second derivatives of the function. Check to see that your answers are reasonable by comparing the graphs of $f$, $f'$, and $f''$.

**71.** $f(x) = 2x - 5x^{3/4}$

**72.** $f(x) = \dfrac{x^2 - 1}{x^2 + 1}$

---

**73.** The equation of motion of a particle is $s = t^3 - 3t$, where $s$ is in meters and $t$ is in seconds. Find

(a) the velocity and acceleration as functions of $t$,

(b) the acceleration after 2 s, and

(c) the acceleration when the velocity is 0.

**74.** The equation of motion of a particle is $s = t^4 - 2t^3 + t^2 - t$, where $s$ is in meters and $t$ is in seconds.
(a) Find the velocity and acceleration as functions of $t$.
(b) Find the acceleration after 1 s.
(c) Graph the position, velocity, and acceleration functions on the same screen.

**75.** Biologists have proposed a cubic polynomial to model the length $L$ of Alaskan rockfish at age $A$:

$$L = 0.0155A^3 - 0.372A^2 + 3.95A + 1.21$$

where $L$ is measured in inches and $A$ in years. Calculate

$$\left.\frac{dL}{dA}\right|_{A=12}$$

and interpret your answer.

**76.** The number of tree species $S$ in a given area $A$ in a forest reserve has been modeled by the power function

$$S(A) = 0.882A^{0.842}$$

where $A$ is measured in square meters. Find $S'(100)$ and interpret your answer.

**77.** Boyle's Law states that when a sample of gas is compressed at a constant temperature, the pressure $P$ of the gas is inversely proportional to the volume $V$ of the gas.
(a) Suppose that the pressure of a sample of air that occupies 0.106 $\text{m}^3$ at 25°C is 50 kPa. Write $V$ as a function of $P$.
(b) Calculate $dV/dP$ when $P = 50$ kPa. What is the meaning of the derivative? What are its units?

T **78.** Car tires need to be inflated properly because overinflation or underinflation can cause premature tread wear. The data in the table show tire life $L$ (in thousands of miles) for a certain type of tire at various pressures $P$ (in $\text{lb/in}^2$).

| $P$ | 26 | 28 | 31 | 35 | 38 | 42 | 45 |
|---|---|---|---|---|---|---|---|
| $L$ | 50 | 66 | 78 | 81 | 74 | 70 | 59 |

(a) Use a calculator or computer to model tire life with a quadratic function of the pressure.
(b) Use the model to estimate $dL/dP$ when $P = 30$ and when $P = 40$. What is the meaning of the derivative? What are the units? What is the significance of the signs of the derivatives?

**79.** Suppose that $f(5) = 1$, $f'(5) = 6$, $g(5) = -3$, and $g'(5) = 2$. Find the following values.
(a) $(fg)'(5)$ (b) $(f/g)'(5)$ (c) $(g/f)'(5)$

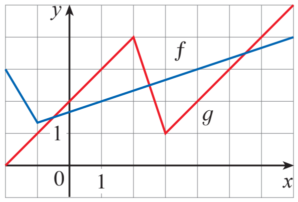
**80.** Suppose that $f(4) = 2$, $g(4) = 5$, $f'(4) = 6$, and $g'(4) = -3$. Find $h'(4)$.
(a) $h(x) = 3f(x) + 8g(x)$ (b) $h(x) = f(x)g(x)$
(c) $h(x) = \dfrac{f(x)}{g(x)}$ (d) $h(x) = \dfrac{g(x)}{f(x) + g(x)}$

**81.** If $f(x) = \sqrt{x}\, g(x)$, where $g(4) = 8$ and $g'(4) = 7$, find $f'(4)$.

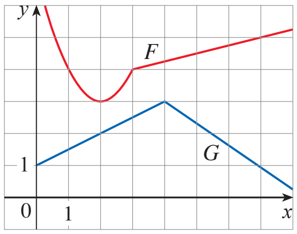
**82.** If $h(2) = 4$ and $h'(2) = -3$, find

$$\left.\frac{d}{dx}\left(\frac{h(x)}{x}\right)\right|_{x=2}$$

**83.** If $f$ and $g$ are the functions whose graphs are shown, let $u(x) = f(x)g(x)$ and $v(x) = f(x)/g(x)$.
(a) Find $u'(1)$. (b) Find $v'(4)$.



**84.** Let $P(x) = F(x)G(x)$ and $Q(x) = F(x)/G(x)$, where $F$ and $G$ are the functions whose graphs are shown.
(a) Find $P'(2)$. (b) Find $Q'(7)$.



**85.** If $g$ is a differentiable function, find an expression for the derivative of each of the following functions.
(a) $y = xg(x)$ (b) $y = \dfrac{x}{g(x)}$ (c) $y = \dfrac{g(x)}{x}$

**86.** If $f$ is a differentiable function, find an expression for the derivative of each of the following functions.
(a) $y = x^2 f(x)$ (b) $y = \dfrac{f(x)}{x^2}$
(c) $y = \dfrac{x^2}{f(x)}$ (d) $y = \dfrac{1 + xf(x)}{\sqrt{x}}$

**87.** Find the points on the curve $y = x^3 + 3x^2 - 9x + 10$ where the tangent is horizontal.

**88.** For what values of $x$ does the graph of

$$f(x) = x^3 + 3x^2 + x + 3$$

have a horizontal tangent?

**89.** Show that the curve $y = 6x^3 + 5x - 3$ has no tangent line with slope 4.

**90.** Find an equation of the line that is both tangent to the curve $y = x^4 + 1$ and parallel to the line $32x - y = 15$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**91.** Find equations for two lines that are both tangent to the curve $y = x^3 - 3x^2 + 3x - 3$ and parallel to the line $3x - y = 15$.

**92.** Find equations of the tangent lines to the curve

$$y = \frac{x - 1}{x + 1}$$

that are parallel to the line $x - 2y = 2$.

**93.** Find an equation of the normal line to the curve $y = \sqrt{x}$ that is parallel to the line $2x + y = 1$.

**94.** Where does the normal line to the parabola $y = x^2 - 1$ at the point $(-1, 0)$ intersect the parabola a second time? Illustrate with a sketch.

**95.** Draw a diagram to show that there are two tangent lines to the parabola $y = x^2$ that pass through the point $(0, -4)$. Find the coordinates of the points where these tangent lines intersect the parabola.

**96.** (a) Find equations of both lines through the point $(2, -3)$ that are tangent to the parabola $y = x^2 + x$.
(b) Show that there is no line through the point $(2, 7)$ that is tangent to the parabola. Then draw a diagram to see why.

**97.** For what values of $a$ and $b$ is the line $2x + y = b$ tangent to the parabola $y = ax^2$ when $x = 2$?

**98.** Find the $n$th derivative of each function by calculating the first few derivatives and observing the pattern that occurs.
(a) $f(x) = x^n$ (b) $f(x) = 1/x$

**99.** Find a second-degree polynomial $P$ such that $P(2) = 5$, $P'(2) = 3$, and $P''(2) = 2$.

**100.** The equation $y'' + y' - 2y = x^2$ is called a **differential equation** because it involves an unknown function $y$ and its derivatives $y'$ and $y''$. Find constants $A$, $B$, and $C$ such that the function $y = Ax^2 + Bx + C$ satisfies this equation. (Differential equations will be studied in detail in Chapter 9.)

**101.** Find a cubic function $y = ax^3 + bx^2 + cx + d$ whose graph has horizontal tangents at the points $(-2, 6)$ and $(2, 0)$.

**102.** Find a parabola with equation $y = ax^2 + bx + c$ that has slope 4 at $x = 1$, slope $-8$ at $x = -1$, and passes through the point $(2, 15)$.

**103.** In this exercise we estimate the rate at which the total personal income is rising in Boulder, Colorado. In 2015, the population of this city was 107,350 and the population was increasing by roughly 1960 people per year. The average annual income was \$60,220 per capita, and this average was increasing at about \$2250 per year (a little above the national average of about \$1810 yearly). Use the Product Rule and these figures to estimate the rate at which total personal income was rising in Boulder in 2015. Explain the meaning of each term in the Product Rule.

**104.** A manufacturer produces bolts of a fabric with a fixed width. The quantity $q$ of this fabric (measured in yards) that is sold is a function of the selling price $p$ (in dollars per yard), so we can write $q = f(p)$. Then the total revenue earned with selling price $p$ is $R(p) = pf(p)$.
(a) What does it mean to say that $f(20) = 10{,}000$ and $f'(20) = -350$?
(b) Assuming the values in part (a), find $R'(20)$ and interpret your answer.

**105.** The Michaelis-Menten equation for the enzyme chymotrypsin is

$$v = \frac{0.14[\text{S}]}{0.015 + [\text{S}]}$$

where $v$ is the rate of an enzymatic reaction and [S] is the concentration of a substrate S. Calculate $dv/d[\text{S}]$ and interpret it.

**106.** The *biomass* $B(t)$ of a fish population is the total mass of the members of the population at time $t$. It is the product of the number of individuals $N(t)$ in the population and the average mass $M(t)$ of a fish at time $t$. In the case of guppies, breeding occurs continually. Suppose that at time $t = 4$ weeks the population is 820 guppies and is growing at a rate of 50 guppies per week, while the average mass is 1.2 g and is increasing at a rate of 0.14 g/week. At what rate is the biomass increasing when $t = 4$?

**107.** **Extended Product Rule** The Product Rule can be extended to the product of three functions.
(a) Use the Product Rule twice to prove that if $f$, $g$, and $h$ are differentiable, then $(fgh)' = f'gh + fg'h + fgh'$.
(b) Taking $f = g = h$ in part (a), show that

$$\frac{d}{dx}[f(x)]^3 = 3[f(x)]^2 f'(x)$$

(c) Use part (b) to differentiate

$$y = (x^4 + 3x^3 + 17x + 82)^3$$

**108.** **Reciprocal Rule** If $g$ is differentiable, the *Reciprocal Rule* says that

$$\frac{d}{dx}\left[\frac{1}{g(x)}\right] = -\frac{g'(x)}{[g(x)]^2}$$

(a) Use the Quotient Rule to prove the Reciprocal Rule.
(b) Use the Reciprocal Rule to differentiate the function in Exercise 38.

**109.** An easy proof of the Quotient Rule can be given if we make the prior assumption that $F'(x)$ exists, where $F = f/g$. Write $f = Fg$; then differentiate using the Product Rule and solve the resulting equation for $F'$.

**110.** (a) If $F(x) = f(x)\,g(x)$, where $f$ and $g$ have derivatives of all orders, show that $F'' = f''g + 2f'g' + fg''$.
(b) Find similar formulas for $F'''$ and $F^{(4)}$.
(c) Guess a formula for $F^{(n)}$.

**111.** Let

$$f(x) = \begin{cases} x^2 + 1 & \text{if } x < 1 \\ x + 1 & \text{if } x \geqslant 1 \end{cases}$$

Is $f$ differentiable at 1? Sketch the graphs of $f$ and $f'$.

**112.** At what numbers is the following function $g$ differentiable?

$$g(x) = \begin{cases} 2x & \text{if } x \leqslant 0 \\ 2x - x^2 & \text{if } 0 < x < 2 \\ 2 - x & \text{if } x \geqslant 2 \end{cases}$$

Give a formula for $g'$ and sketch the graphs of $g$ and $g'$.

**113.** (a) For what values of $x$ is the function $f(x) = |x^2 - 9|$ differentiable? Find a formula for $f'$.

(b) Sketch the graphs of $f$ and $f'$.

**114.** Where is the function $h(x) = |x - 1| + |x + 2|$ differentiable? Give a formula for $h'$ and sketch the graphs of $h$ and $h'$.

**115.** Let

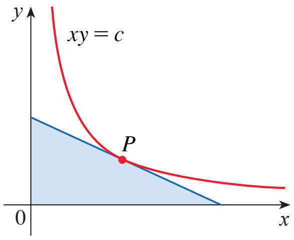
$$f(x) = \begin{cases} x^2 & \text{if } x \leqslant 2 \\ mx + b & \text{if } x > 2 \end{cases}$$

Find the values of $m$ and $b$ that make $f$ differentiable everywhere.

**116.** A tangent line is drawn to the hyperbola $xy = c$ at a point $P$ as shown in the figure.

(a) Show that the midpoint of the line segment cut from this tangent line by the coordinate axes is $P$.

(b) Show that the triangle formed by the tangent line and the coordinate axes always has the same area, no matter where $P$ is located on the hyperbola.

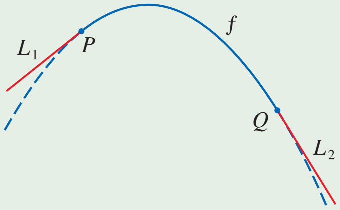


**117.** If $c > \frac{1}{2}$, how many lines through the point $(0, c)$ are normal lines to the parabola $y = x^2$? What if $c \leqslant \frac{1}{2}$?

**118.** Sketch the parabolas $y = x^2$ and $y = x^2 - 2x + 2$. Do you think there is a line that is tangent to both curves? If so, find its equation. If not, why not?

**119.** Evaluate $\lim\limits_{x \to 1} \dfrac{x^{1000} - 1}{x - 1}$.

## APPLIED PROJECT | BUILDING A BETTER ROLLER COASTER



Suppose you are asked to design the first ascent and drop for a new roller coaster. By studying photographs of your favorite coasters, you decide to make the slope of the ascent 0.8 and the slope of the drop $-1.6$. You decide to connect these two straight stretches $y = L_1(x)$ and $y = L_2(x)$ with part of a parabola $y = f(x) = ax^2 + bx + c$, where $x$ and $f(x)$ are measured in feet. For the track to be smooth there can't be abrupt changes in direction, so you want the linear segments $L_1$ and $L_2$ to be tangent to the parabola at the transition points $P$ and $Q$. (See the figure.) To simplify the equations, you decide to place the origin at $P$.

**1.** (a) Suppose the horizontal distance between $P$ and $Q$ is 100 ft. Write equations in $a$, $b$, and $c$ that will ensure that the track is smooth at the transition points.

(b) Solve the equations in part (a) for $a$, $b$, and $c$ to find a formula for $f(x)$.

(c) Plot $L_1$, $f$, and $L_2$ to verify graphically that the transitions are smooth.

(d) Find the difference in elevation between $P$ and $Q$.

Susana Ortega / Shutterstock.com

**2.** The solution in Problem 1 might *look* smooth, but it might not *feel* smooth because the piecewise defined function [consisting of $L_1(x)$ for $x < 0$, $f(x)$ for $0 \leqslant x \leqslant 100$, and $L_2(x)$ for $x > 100$] doesn't have a continuous second derivative. So you decide to improve the design by using a quadratic function $q(x) = ax^2 + bx + c$ only on the interval $10 \leqslant x \leqslant 90$ and connecting it to the linear functions by means of two cubic functions:

$$g(x) = kx^3 + lx^2 + mx + n \qquad 0 \leqslant x < 10$$
$$h(x) = px^3 + qx^2 + rx + s \qquad 90 < x \leqslant 100$$

(a) Write a system of equations in 11 unknowns that ensures that the functions and their first two derivatives agree at the transition points.

(b) Solve the system of equations in part (a) to find formulas for $q(x)$, $g(x)$, and $h(x)$.

(c) Plot $L_1$, $g$, $q$, $h$, and $L_2$, and compare with the plot in Problem 1(c).

## 2.4 Derivatives of Trigonometric Functions

A review of the trigonometric functions is given in Appendix D.

Before starting this section, you might need to review the trigonometric functions. In particular, it is important to remember that when we talk about the function $f$ defined for all real numbers $x$ by

$$f(x) = \sin x$$

it is understood that $\sin x$ means the sine of the angle whose *radian* measure is $x$. A similar convention holds for the other trigonometric functions cos, tan, csc, sec, and cot. Recall from Section 1.8 that all of the trigonometric functions are continuous at every number in their domains.

### Derivatives of the Trigonometric Functions

If we sketch the graph of the function $f(x) = \sin x$ and use the interpretation of $f'(x)$ as the slope of the tangent to the sine curve in order to sketch the graph of $f'$ (see Exercise 2.2.16), then it looks as if the graph of $f'$ may be the same as the cosine curve (see Figure 1).

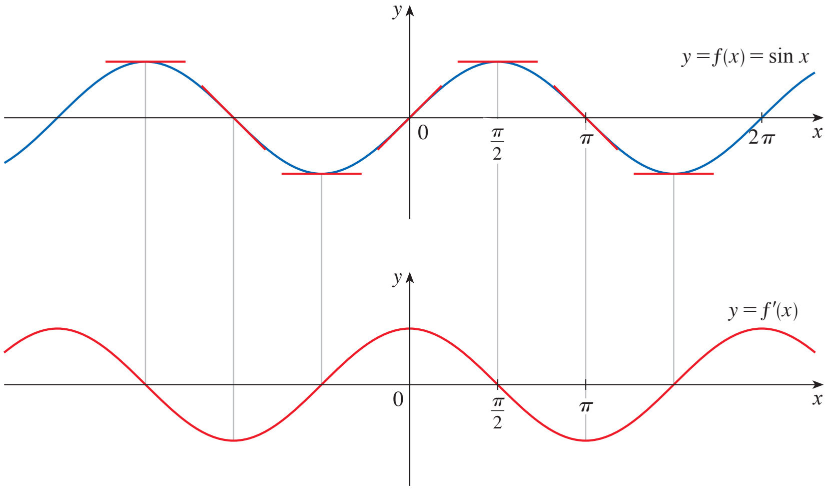

**FIGURE 1**

Let's try to confirm our guess that if $f(x) = \sin x$, then $f'(x) = \cos x$. From the definition of a derivative, we have

$$\begin{aligned}
f'(x) &= \lim_{h\to 0} \frac{f(x+h) - f(x)}{h} \\
&= \lim_{h\to 0} \frac{\sin(x+h) - \sin x}{h} \\
&= \lim_{h\to 0} \frac{\sin x \cos h + \cos x \sin h - \sin x}{h} \qquad \text{(using the addition formula for sine; see Appendix D)} \\
&= \lim_{h\to 0} \left[ \frac{\sin x \cos h - \sin x}{h} + \frac{\cos x \sin h}{h} \right] \\
&= \lim_{h\to 0} \left[ \sin x \left( \frac{\cos h - 1}{h} \right) + \cos x \left( \frac{\sin h}{h} \right) \right]
\end{aligned}$$

$$\boxed{1} \qquad = \lim_{h\to 0} \sin x \cdot \lim_{h\to 0} \frac{\cos h - 1}{h} + \lim_{h\to 0} \cos x \cdot \lim_{h\to 0} \frac{\sin h}{h}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Two of these four limits are easy to evaluate. Because we regard $x$ as a constant when computing a limit as $h \to 0$, we have

$$\lim_{h \to 0} \sin x = \sin x \qquad \text{and} \qquad \lim_{h \to 0} \cos x = \cos x$$

Later in this section we will prove that

$$\lim_{h \to 0} \frac{\sin h}{h} = 1 \qquad \text{and} \qquad \lim_{h \to 0} \frac{\cos h - 1}{h} = 0$$

Putting these limits into (1), we get

$$\begin{aligned} f'(x) &= \lim_{h \to 0} \sin x \cdot \lim_{h \to 0} \frac{\cos h - 1}{h} + \lim_{h \to 0} \cos x \cdot \lim_{h \to 0} \frac{\sin h}{h} \\ &= (\sin x) \cdot 0 + (\cos x) \cdot 1 = \cos x \end{aligned}$$

So we have proved the formula for the derivative of the sine function:

**2**

$$\boxed{\frac{d}{dx}(\sin x) = \cos x}$$

**EXAMPLE 1** Differentiate $y = x^2 \sin x$.

**SOLUTION** Using the Product Rule and Formula 2, we have

$$\begin{aligned} \frac{dy}{dx} &= x^2 \frac{d}{dx}(\sin x) + \sin x \frac{d}{dx}(x^2) \\ &= x^2 \cos x + 2x \sin x \end{aligned}$$

■

Figure 2 shows the graphs of the function of Example 1 and its derivative. Notice that $y' = 0$ whenever $y$ has a horizontal tangent.

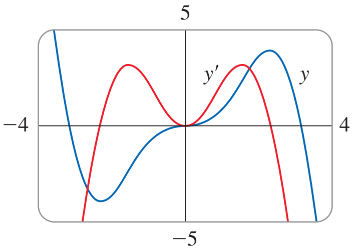

**FIGURE 2**

Using the same methods as in the proof of Formula 2, we can prove (see Exercise 26) that

**3**

$$\boxed{\frac{d}{dx}(\cos x) = -\sin x}$$

The tangent function can also be differentiated by using the definition of a derivative, but it is easier to use the Quotient Rule together with Formulas 2 and 3:

$$\begin{aligned} \frac{d}{dx}(\tan x) &= \frac{d}{dx}\left(\frac{\sin x}{\cos x}\right) \\ &= \frac{\cos x \dfrac{d}{dx}(\sin x) - \sin x \dfrac{d}{dx}(\cos x)}{\cos^2 x} \\ &= \frac{\cos x \cdot \cos x - \sin x\,(-\sin x)}{\cos^2 x} \\ &= \frac{\cos^2 x + \sin^2 x}{\cos^2 x} \\ &= \frac{1}{\cos^2 x} = \sec^2 x \qquad (\cos^2 x + \sin^2 x = 1) \end{aligned}$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**4**

$$\boxed{\frac{d}{dx}(\tan x) = \sec^2 x}$$

The derivatives of the remaining trigonometric functions, csc, sec, and cot, can also be found easily using the Quotient Rule (see Exercises 23–25). We collect all the differentiation formulas for trigonometric functions in the following table. Remember that they are valid only when $x$ is measured in radians.

**Table of Derivatives of Trigonometric Functions**

$$\frac{d}{dx}(\sin x) = \cos x \qquad \frac{d}{dx}(\csc x) = -\csc x \cot x$$

$$\frac{d}{dx}(\cos x) = -\sin x \qquad \frac{d}{dx}(\sec x) = \sec x \tan x$$

$$\frac{d}{dx}(\tan x) = \sec^2 x \qquad \frac{d}{dx}(\cot x) = -\csc^2 x$$

When you memorize this table, it is helpful to notice that the minus signs go with the derivatives of the "cofunctions," that is, cosine, cosecant, and cotangent.

**EXAMPLE 2** Differentiate $f(x) = \dfrac{\sec x}{1 + \tan x}$. For what values of $x$ does the graph of $f$ have a horizontal tangent?

**SOLUTION** The Quotient Rule gives

$$\begin{aligned} f'(x) &= \frac{(1 + \tan x)\dfrac{d}{dx}(\sec x) - \sec x \dfrac{d}{dx}(1 + \tan x)}{(1 + \tan x)^2} \\ &= \frac{(1 + \tan x)\sec x \tan x - \sec x \cdot \sec^2 x}{(1 + \tan x)^2} \\ &= \frac{\sec x\,(\tan x + \tan^2 x - \sec^2 x)}{(1 + \tan x)^2} \\ &= \frac{\sec x\,(\tan x - 1)}{(1 + \tan x)^2} \qquad (\sec^2 x = \tan^2 x + 1) \end{aligned}$$

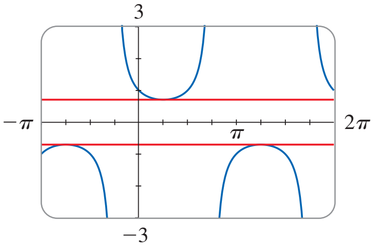

**FIGURE 3**
The horizontal tangents in Example 2

The graph of $f$ has horizontal tangents when $f'(x) = 0$. Because sec $x$ is never 0, we see that $f'(x) = 0$ when $\tan x = 1$, and this occurs when $x = \pi/4 + n\pi$, where $n$ is an integer (see Figure 3). ■

Trigonometric functions are often used in modeling real-world phenomena. In particular, vibrations, waves, elastic motions, and other quantities that vary in a periodic manner can be described using trigonometric functions. In the following example we discuss an instance of simple harmonic motion.

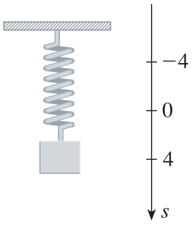

**FIGURE 4**

**EXAMPLE 3** An object fastened to the end of a vertical spring is stretched 4 cm beyond its rest position and released at time $t = 0$. (See Figure 4 and note that the downward direction is positive.) Its position at time $t$ is

$$s = f(t) = 4 \cos t$$

Find the velocity and acceleration at time $t$ and use them to analyze the motion of the object.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

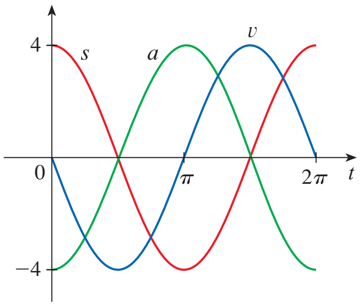

**FIGURE 5**

**SOLUTION** The velocity and acceleration are

$$v = \frac{ds}{dt} = \frac{d}{dt}(4\cos t) = 4\frac{d}{dt}(\cos t) = -4\sin t$$

$$a = \frac{dv}{dt} = \frac{d}{dt}(-4\sin t) = -4\frac{d}{dt}(\sin t) = -4\cos t$$

The object oscillates from the lowest point ($s = 4$ cm) to the highest point ($s = -4$ cm). The period of the oscillation is $2\pi$, the period of $\cos t$.

The speed is $|v| = 4|\sin t|$, which is greatest when $|\sin t| = 1$, that is, when $\cos t = 0$. So the object moves fastest as it passes through its equilibrium position ($s = 0$). Its speed is 0 when $\sin t = 0$, that is, at the highest and lowest points.

The acceleration $a = -4\cos t = 0$ when $s = 0$. It has greatest magnitude at the highest and lowest points. See the graphs in Figure 5. ■

**EXAMPLE 4** Find the 27th derivative of $\cos x$.

**SOLUTION** The first few derivatives of $f(x) = \cos x$ are as follows:

$$f'(x) = -\sin x$$

$$f''(x) = -\cos x$$

$$f'''(x) = \sin x$$

$$f^{(4)}(x) = \cos x$$

$$f^{(5)}(x) = -\sin x$$

PS Look for a pattern.

We see that the successive derivatives occur in a cycle of length 4 and, in particular, $f^{(n)}(x) = \cos x$ whenever $n$ is a multiple of 4. Therefore

$$f^{(24)}(x) = \cos x$$

and, differentiating three more times, we have

$$f^{(27)}(x) = \sin x$$ ■

## Two Special Trigonometric Limits

In proving the formula for the derivative of sine we used two special limits, which we now prove.

$$\boxed{5} \qquad \boxed{\lim_{\theta \to 0} \frac{\sin\theta}{\theta} = 1}$$

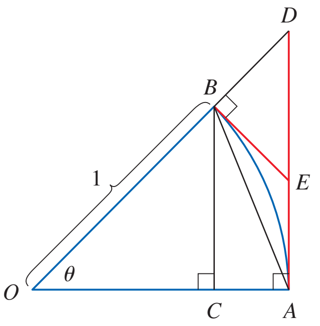

**FIGURE 6**

**PROOF** Assume first that $\theta$ lies between 0 and $\pi/2$. Figure 6 shows a sector of a circle with center $O$, central angle $\theta$, and radius 1. $BC$ is drawn perpendicular to $OA$. By the definition of radian measure, we have arc $AB = \theta$. Also $|BC| = |OB|\sin\theta = \sin\theta$. From the diagram we see that

$$|BC| < |AB| < \text{arc } AB$$

Therefore
$$\sin\theta < \theta \qquad \text{so} \qquad \frac{\sin\theta}{\theta} < 1$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

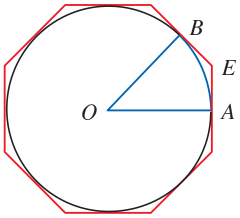

**FIGURE 7**

Let the tangent lines at $A$ and $B$ intersect at $E$. You can see from Figure 7 that the circumference of a circle is smaller than the length of a circumscribed polygon, and so arc $AB < |AE| + |EB|$. Thus

$$\begin{aligned}\theta = \text{arc } AB &< |AE| + |EB| \\ &< |AE| + |ED| \\ &= |AD| = |OA| \tan\theta \\ &= \tan\theta\end{aligned}$$

(In Appendix F the inequality $\theta \leqslant \tan\theta$ is proved directly from the definition of the length of an arc without resorting to geometric intuition as we did here.) Therefore we have

$$\theta < \frac{\sin\theta}{\cos\theta}$$

so

$$\cos\theta < \frac{\sin\theta}{\theta} < 1$$

We know that $\lim_{\theta\to 0} 1 = 1$ and $\lim_{\theta\to 0} \cos\theta = 1$, so by the Squeeze Theorem, we have

$$\lim_{\theta\to 0^+} \frac{\sin\theta}{\theta} = 1 \qquad (0 < \theta < \pi/2)$$

But the function $(\sin\theta)/\theta$ is an even function, so its right and left limits must be equal. Hence, we have

$$\lim_{\theta\to 0} \frac{\sin\theta}{\theta} = 1$$

so we have proved Equation 5. ■

The first special limit we considered concerned the sine function. The following special limit involves cosine.

**6**

$$\boxed{\lim_{\theta\to 0} \frac{\cos\theta - 1}{\theta} = 0}$$

**PROOF** We multiply numerator and denominator by $\cos\theta + 1$ in order to put the function in a form in which we can use limits that we know.

$$\begin{aligned}\lim_{\theta\to 0} \frac{\cos\theta - 1}{\theta} &= \lim_{\theta\to 0} \left(\frac{\cos\theta - 1}{\theta} \cdot \frac{\cos\theta + 1}{\cos\theta + 1}\right) = \lim_{\theta\to 0} \frac{\cos^2\theta - 1}{\theta(\cos\theta + 1)} \\ &= \lim_{\theta\to 0} \frac{-\sin^2\theta}{\theta(\cos\theta + 1)} = -\lim_{\theta\to 0} \left(\frac{\sin\theta}{\theta} \cdot \frac{\sin\theta}{\cos\theta + 1}\right) \\ &= -\lim_{\theta\to 0} \frac{\sin\theta}{\theta} \cdot \lim_{\theta\to 0} \frac{\sin\theta}{\cos\theta + 1} \\ &= -1 \cdot \left(\frac{0}{1 + 1}\right) = 0 \qquad \text{(by Equation 5)}\end{aligned}$$

■

**EXAMPLE 5** Find $\lim_{x \to 0} \dfrac{\sin 7x}{4x}$.

**SOLUTION** In order to apply Equation 5, we first rewrite the function by multiplying and dividing by 7:

Note that $\sin 7x \neq 7 \sin x$.

$$\frac{\sin 7x}{4x} = \frac{7}{4}\left(\frac{\sin 7x}{7x}\right)$$

If we let $\theta = 7x$, then $\theta \to 0$ as $x \to 0$, so by Equation 5 we have

$$\begin{aligned}\lim_{x \to 0} \frac{\sin 7x}{4x} &= \frac{7}{4} \lim_{x \to 0}\left(\frac{\sin 7x}{7x}\right)\\ &= \frac{7}{4} \lim_{\theta \to 0} \frac{\sin \theta}{\theta} = \frac{7}{4} \cdot 1 = \frac{7}{4}\end{aligned}$$

■

**EXAMPLE 6** Calculate $\lim_{x \to 0} x \cot x$.

**SOLUTION** Here we divide numerator and denominator by $x$:

$$\begin{aligned}\lim_{x \to 0} x \cot x &= \lim_{x \to 0} \frac{x \cos x}{\sin x}\\ &= \lim_{x \to 0} \frac{\cos x}{\dfrac{\sin x}{x}} = \frac{\lim_{x \to 0} \cos x}{\lim_{x \to 0} \dfrac{\sin x}{x}}\\ &= \frac{\cos 0}{1} \qquad \text{(by the continuity of cosine and Equation 5)}\\ &= 1\end{aligned}$$

■

**EXAMPLE 7** Find $\lim_{\theta \to 0} \dfrac{\cos \theta - 1}{\sin \theta}$.

**SOLUTION** In order to use Equations 5 and 6 we divide numerator and denominator by $\theta$:

$$\begin{aligned}\lim_{\theta \to 0} \frac{\cos \theta - 1}{\sin \theta} &= \lim_{\theta \to 0} \frac{\dfrac{\cos \theta - 1}{\theta}}{\dfrac{\sin \theta}{\theta}}\\ &= \frac{\lim_{\theta \to 0} \dfrac{\cos \theta - 1}{\theta}}{\lim_{\theta \to 0} \dfrac{\sin \theta}{\theta}} = \frac{0}{1} = 0\end{aligned}$$

## 2.4 Exercises

**1–22** Differentiate.

**1.** $f(x) = 3\sin x - 2\cos x$

**2.** $f(x) = \tan x - 4\sin x$

**3.** $y = x^2 + \cot x$

**4.** $y = 2\sec x - \csc x$

**5.** $h(\theta) = \theta^2 \sin\theta$

**6.** $g(x) = 3x + x^2\cos x$

**7.** $y = \sec\theta\tan\theta$

**8.** $y = \sin\theta\cos\theta$

**9.** $f(\theta) = (\theta - \cos\theta)\sin\theta$

**10.** $f(x) = x\cos x + 2\tan x$

**11.** $H(t) = \cos^2 t$

**12.** $y = u(a\cos u + b\cot u)$

**13.** $f(\theta) = \dfrac{\sin\theta}{1 + \cos\theta}$

**14.** $y = \dfrac{\cos x}{1 - \sin x}$

**15.** $y = \dfrac{x}{2 - \tan x}$

**16.** $f(t) = \dfrac{\cot t}{t^2}$

**17.** $f(w) = \dfrac{1 + \sec w}{1 - \sec w}$

**18.** $y = \dfrac{\sin t}{1 + \tan t}$

**19.** $y = \dfrac{t\sin t}{1 + t}$

**20.** $g(z) = \dfrac{z}{\sec z + \tan z}$

**21.** $f(\theta) = \theta\cos\theta\sin\theta$

**22.** $y = x^2\sin x\tan x$

---

**23.** Show that $\dfrac{d}{dx}(\csc x) = -\csc x\cot x$.

**24.** Show that $\dfrac{d}{dx}(\sec x) = \sec x\tan x$.

**25.** Show that $\dfrac{d}{dx}(\cot x) = -\csc^2 x$.

**26.** Prove, using the definition of a derivative, that if $f(x) = \cos x$, then $f'(x) = -\sin x$.

**27–30** Find an equation of the tangent line to the curve at the given point.

**27.** $y = \sin x + \cos x, \quad (0, 1)$

**28.** $y = x + \sin x, \quad (\pi, \pi)$

**29.** $y = x + \tan x, \quad (\pi, \pi)$

**30.** $y = \dfrac{1 + \sin x}{\cos x}, \quad (\pi, -1)$

---

**31.** (a) Find an equation of the tangent line to the curve $y = 2x\sin x$ at the point $(\pi/2, \pi)$.
(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**32.** (a) Find an equation of the tangent line to the curve $y = 3x + 6\cos x$ at the point $(\pi/3, \pi + 3)$.
(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**33.** (a) If $f(x) = \sec x - x$, find $f'(x)$.
(b) Check to see that your answer to part (a) is reasonable by graphing both $f$ and $f'$ for $|x| < \pi/2$.

**34.** (a) If $f(x) = \sqrt{x}\sin x$, find $f'(x)$.
(b) Check to see that your answer to part (a) is reasonable by graphing both $f$ and $f'$ for $0 \leqslant x \leqslant 2\pi$.

**35.** If $g(\theta) = \dfrac{\sin\theta}{\theta}$, find $g'(\theta)$ and $g''(\theta)$.

**36.** If $f(t) = \sec t$, find $f''(\pi/4)$.

**37.** (a) Use the Quotient Rule to differentiate the function

$$f(x) = \frac{\tan x - 1}{\sec x}$$

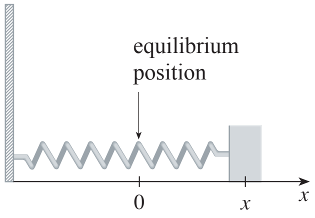
(b) Simplify the expression for $f(x)$ by writing it in terms of $\sin x$ and $\cos x$, and then find $f'(x)$.
(c) Show that your answers to parts (a) and (b) are equivalent.

**38.** Suppose $f(\pi/3) = 4$ and $f'(\pi/3) = -2$, and let $g(x) = f(x)\sin x$ and $h(x) = (\cos x)/f(x)$. Find
(a) $g'(\pi/3)$ (b) $h'(\pi/3)$

**39.** For what values of $x$ does the graph of $f(x) = x + 2\sin x$ have a horizontal tangent?

**40.** Find the points on the curve $y = (\cos x)/(2 + \sin x)$ at which the tangent is horizontal.

**41.** A mass on a spring vibrates horizontally on a smooth level surface (see the figure). Its equation of motion is $x(t) = 8\sin t$, where $t$ is in seconds and $x$ in centimeters.
(a) Find the velocity and acceleration at time $t$.
(b) Find the position, velocity, and acceleration of the mass at time $t = 2\pi/3$. In what direction is it moving at that time?



**42.** An elastic band is hung on a hook and a mass is hung on the lower end of the band. When the mass is pulled downward and then released, it vibrates vertically. The equation of motion is $s = 2\cos t + 3\sin t$, $t \geqslant 0$, where $s$ is measured in centimeters and $t$ in seconds. (Take the positive direction to be downward.)
(a) Find the velocity and acceleration at time $t$.
(b) Graph the velocity and acceleration functions.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(c) When does the mass pass through the equilibrium position for the first time?
(d) How far from its equilibrium position does the mass travel?
(e) When is the speed the greatest?

**43.** A ladder 10 ft long rests against a vertical wall. Let $\theta$ be the angle between the top of the ladder and the wall and let $x$ be the distance from the bottom of the ladder to the wall. If the bottom of the ladder slides away from the wall, how fast does $x$ change with respect to $\theta$ when $\theta = \pi/3$?

**44.** An object with weight $W$ is dragged along a horizontal plane by a force acting along a rope attached to the object. If the rope makes an angle $\theta$ with the plane, then the magnitude of the force is

$$F = \frac{\mu W}{\mu \sin\theta + \cos\theta}$$

where $\mu$ is a constant called the *coefficient of friction*.
(a) Find the rate of change of $F$ with respect to $\theta$.
(b) When is this rate of change equal to 0?
(c) If $W = 50$ lb and $\mu = 0.6$, draw the graph of $F$ as a function of $\theta$ and use it to locate the value of $\theta$ for which $dF/d\theta = 0$. Is the value consistent with your answer to part (b)?

**45–60** Find the limit.

**45.** $\displaystyle\lim_{x \to 0} \frac{\sin 5x}{3x}$

**46.** $\displaystyle\lim_{x \to 0} \frac{\sin x}{\sin \pi x}$

**47.** $\displaystyle\lim_{t \to 0} \frac{\sin 3t}{\sin t}$

**48.** $\displaystyle\lim_{x \to 0} \frac{\sin^2 3x}{x}$

**49.** $\displaystyle\lim_{x \to 0} \frac{\sin x - \sin x \cos x}{x^2}$

**50.** $\displaystyle\lim_{x \to 0} \frac{1 - \sec x}{2x}$

**51.** $\displaystyle\lim_{x \to 0} \frac{\tan 2x}{x}$

**52.** $\displaystyle\lim_{\theta \to 0} \frac{\sin\theta}{\tan 7\theta}$

**53.** $\displaystyle\lim_{x \to 0} \frac{\sin 3x}{5x^3 - 4x}$

**54.** $\displaystyle\lim_{x \to 0} \frac{\sin 3x \sin 5x}{x^2}$

**55.** $\displaystyle\lim_{\theta \to 0} \frac{\sin\theta}{\theta + \tan\theta}$

**56.** $\displaystyle\lim_{x \to 0} \csc x \sin(\sin x)$

**57.** $\displaystyle\lim_{\theta \to 0} \frac{\cos\theta - 1}{2\theta^2}$

**58.** $\displaystyle\lim_{x \to 0} \frac{\sin(x^2)}{x}$

**59.** $\displaystyle\lim_{x \to \pi/4} \frac{1 - \tan x}{\sin x - \cos x}$

**60.** $\displaystyle\lim_{x \to 1} \frac{\sin(x - 1)}{x^2 + x - 2}$

---

**61–62** Find the given derivative by finding the first few derivatives and observing the pattern that occurs.

**61.** $\displaystyle\frac{d^{99}}{dx^{99}}(\sin x)$

**62.** $\displaystyle\frac{d^{35}}{dx^{35}}(x \sin x)$

---

**63.** Find constants $A$ and $B$ such that the function $y = A\sin x + B\cos x$ satisfies the differential equation $y'' + y' - 2y = \sin x$.

**64.** Evaluate $\displaystyle\lim_{x \to 0} x \sin\frac{1}{x}$ and illustrate by graphing

$$y = x\sin(1/x)$$

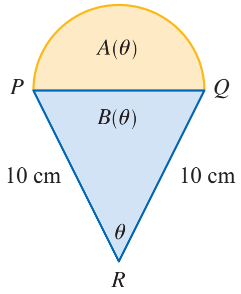
**65.** Differentiate each trigonometric identity to obtain a new (or familiar) identity.

(a) $\displaystyle\tan x = \frac{\sin x}{\cos x}$ (b) $\displaystyle\sec x = \frac{1}{\cos x}$

(c) $\displaystyle\sin x + \cos x = \frac{1 + \cot x}{\csc x}$

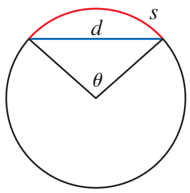
**66.** A semicircle with diameter $PQ$ sits on an isosceles triangle $PQR$ to form a region shaped like a two-dimensional ice-cream cone, as shown in the figure. If $A(\theta)$ is the area of the semicircle and $B(\theta)$ is the area of the triangle, find

$$\lim_{\theta \to 0^+} \frac{A(\theta)}{B(\theta)}$$



**67.** The figure shows a circular arc of length $s$ and a chord of length $d$, both subtended by a central angle $\theta$. Find

$$\lim_{\theta \to 0^+} \frac{s}{d}$$



**68.** Let $\displaystyle f(x) = \frac{x}{\sqrt{1 - \cos 2x}}$.
(a) Graph $f$. What type of discontinuity does it appear to have at 0?
(b) Calculate the left and right limits of $f$ at 0. Do these values confirm your answer to part (a)?

## 2.5 The Chain Rule

Suppose you are asked to differentiate the function

$$F(x) = \sqrt{x^2 + 1}$$

The differentiation formulas you learned in the previous sections of this chapter do not enable you to calculate $F'(x)$.

See Section 1.3 for a review of composite functions.

Observe that $F$ is a composite function. In fact, if we let $y = f(u) = \sqrt{u}$ and let $u = g(x) = x^2 + 1$, then we can write $y = F(x) = f(g(x))$, that is, $F = f \circ g$. We know how to differentiate both $f$ and $g$, so it would be useful to have a rule that tells us how to find the derivative of $F = f \circ g$ in terms of the derivatives of $f$ and $g$.

### The Chain Rule

It turns out that the derivative of the composite function $f \circ g$ is the product of the derivatives of $f$ and $g$. This fact is one of the most important of the differentiation rules and is called the *Chain Rule*. It seems plausible if we interpret derivatives as rates of change. Regard $du/dx$ as the rate of change of $u$ with respect to $x$, $dy/du$ as the rate of change of $y$ with respect to $u$, and $dy/dx$ as the rate of change of $y$ with respect to $x$. If $u$ changes twice as fast as $x$ and $y$ changes three times as fast as $u$, then it seems reasonable that $y$ changes six times as fast as $x$, and so we expect that $dy/dx$ is the product of $dy/du$ and $du/dx$.

**The Chain Rule** If $g$ is differentiable at $x$ and $f$ is differentiable at $g(x)$, then the composite function $F = f \circ g$ defined by $F(x) = f(g(x))$ is differentiable at $x$ and $F'$ is given by the product

$$\boxed{1} \qquad F'(x) = f'(g(x)) \cdot g'(x)$$

In Leibniz notation, if $y = f(u)$ and $u = g(x)$ are both differentiable functions, then

$$\boxed{2} \qquad \frac{dy}{dx} = \frac{dy}{du}\,\frac{du}{dx}$$

**James Gregory**
The first person to formulate the Chain Rule was the Scottish mathematician James Gregory (1638–1675), who also designed the first practical reflecting telescope. Gregory discovered the basic ideas of calculus at about the same time as Newton. He became the first Professor of Mathematics at the University of St. Andrews and later held the same position at the University of Edinburgh. But one year after accepting that position, he died at the age of 36.

Formula 2 is easy to remember because if we think of $dy/du$ and $du/dx$ as quotients, then we could cancel $du$; however, $du$ has not been defined and $du/dx$ should not be considered as an actual quotient.

**COMMENTS ON THE PROOF OF THE CHAIN RULE** Let $\Delta u$ be the change in $u$ corresponding to a change of $\Delta x$ in $x$, that is,

$$\Delta u = g(x + \Delta x) - g(x)$$

Then the corresponding change in $y$ is

$$\Delta y = f(u + \Delta u) - f(u)$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

It is tempting to write

$$
\begin{aligned}
\frac{dy}{dx} &= \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} \\
\boxed{3} \qquad &= \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta u} \cdot \frac{\Delta u}{\Delta x} \\
&= \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta u} \cdot \lim_{\Delta x \to 0} \frac{\Delta u}{\Delta x} \\
&= \lim_{\Delta u \to 0} \frac{\Delta y}{\Delta u} \cdot \lim_{\Delta x \to 0} \frac{\Delta u}{\Delta x} \qquad \text{(Note that } \Delta u \to 0 \text{ as } \Delta x \to 0 \text{ because } g \text{ is continuous.)} \\
&= \frac{dy}{du}\frac{du}{dx}
\end{aligned}
$$

The only flaw in this reasoning is that in (3) it might happen that $\Delta u = 0$ (even when $\Delta x \neq 0$) and, of course, we can't divide by 0. Nonetheless, this reasoning does at least *suggest* that the Chain Rule is true. A full proof of the Chain Rule is given at the end of this section. ■

**EXAMPLE 1** Find $F'(x)$ if $F(x) = \sqrt{x^2 + 1}$.

**SOLUTION 1** (using Formula 1): At the beginning of this section we expressed $F$ as $F(x) = (f \circ g)(x) = f(g(x))$ where $f(u) = \sqrt{u}$ and $g(x) = x^2 + 1$. Since

$$
f'(u) = \tfrac{1}{2}u^{-1/2} = \frac{1}{2\sqrt{u}} \qquad \text{and} \qquad g'(x) = 2x
$$

we have

$$
\begin{aligned}
F'(x) &= f'(g(x)) \cdot g'(x) \\
&= \frac{1}{2\sqrt{x^2+1}} \cdot 2x = \frac{x}{\sqrt{x^2+1}}
\end{aligned}
$$

**SOLUTION 2** (using Formula 2): If we let $u = x^2 + 1$ and $y = \sqrt{u}$, then

$$
F'(x) = \frac{dy}{du}\frac{du}{dx} = \frac{1}{2\sqrt{u}}(2x) = \frac{1}{2\sqrt{x^2+1}}(2x) = \frac{x}{\sqrt{x^2+1}}
$$ ■

When using Formula 2 we should bear in mind that $dy/dx$ refers to the derivative of $y$ when $y$ is considered as a function of $x$ (the derivative of $y$ with respect to $x$), whereas $dy/du$ refers to the derivative of $y$ when considered as a function of $u$ (the derivative of $y$ with respect to $u$). For instance, in Example 1, $y$ can be considered as a function of $x$ $\left(y = \sqrt{x^2+1}\right)$ and also as a function of $u$ $\left(y = \sqrt{u}\right)$. Note that

$$
\frac{dy}{dx} = F'(x) = \frac{x}{\sqrt{x^2+1}} \qquad \text{whereas} \qquad \frac{dy}{du} = f'(u) = \frac{1}{2\sqrt{u}}
$$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**NOTE** In using the Chain Rule we work from the outside to the inside. Formula 1 says that *we differentiate the outer function* $f$ [*at the inner function* $g(x)$] *and then we multiply by the derivative of the inner function.*

$$\frac{d}{dx}\underbrace{f}_{\substack{\text{outer}\\\text{function}}}\ \underbrace{(g(x))}_{\substack{\text{evaluated}\\\text{at inner}\\\text{function}}} = \underbrace{f'}_{\substack{\text{derivative}\\\text{of outer}\\\text{function}}}\ \underbrace{(g(x))}_{\substack{\text{evaluated}\\\text{at inner}\\\text{function}}} \cdot \underbrace{g'(x)}_{\substack{\text{derivative}\\\text{of inner}\\\text{function}}}$$

**EXAMPLE 2** Differentiate (a) $y = \sin(x^2)$ and (b) $y = \sin^2 x$.

**SOLUTION**

(a) If $y = \sin(x^2)$, then the outer function is the sine function and the inner function is the squaring function, so the Chain Rule gives

$$\frac{dy}{dx} = \frac{d}{dx}\underbrace{\sin}_{\substack{\text{outer}\\\text{function}}}\ \underbrace{(x^2)}_{\substack{\text{evaluated}\\\text{at inner}\\\text{function}}} = \underbrace{\cos}_{\substack{\text{derivative}\\\text{of outer}\\\text{function}}}\ \underbrace{(x^2)}_{\substack{\text{evaluated}\\\text{at inner}\\\text{function}}} \cdot \underbrace{2x}_{\substack{\text{derivative}\\\text{of inner}\\\text{function}}}$$

$$= 2x\cos(x^2)$$

(b) Note that $\sin^2 x = (\sin x)^2$. Here the outer function is the squaring function and the inner function is the sine function. So

$$\frac{dy}{dx} = \frac{d}{dx}\underbrace{(\sin x)}_{\substack{\text{inner}\\\text{function}}}{}^2 = \underbrace{2}_{\substack{\text{derivative}\\\text{of outer}\\\text{function}}} \cdot \underbrace{(\sin x)}_{\substack{\text{evaluated}\\\text{at inner}\\\text{function}}} \cdot \underbrace{\cos x}_{\substack{\text{derivative}\\\text{of inner}\\\text{function}}}$$

The answer can be left as $2\sin x\cos x$ or written as $\sin 2x$ (by a trigonometric identity known as the double-angle formula). ■

See Reference Page 2 or Appendix D.

In Example 2(a) we combined the Chain Rule with the rule for differentiating the sine function. In general, if $y = \sin u$, where $u$ is a differentiable function of $x$, then, by the Chain Rule,

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = \cos u\,\frac{du}{dx}$$

Thus

$$\frac{d}{dx}(\sin u) = \cos u\,\frac{du}{dx}$$

In a similar fashion, all of the formulas for differentiating trigonometric functions can be combined with the Chain Rule.

Let's make explicit the special case of the Chain Rule where the outer function $f$ is a power function. If $y = [g(x)]^n$, then we can write $y = f(u) = u^n$ where $u = g(x)$. By using the Chain Rule and then the Power Rule, we get

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = nu^{n-1}\frac{du}{dx} = n[g(x)]^{n-1}g'(x)$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**4 The Power Rule Combined with the Chain Rule** If $n$ is any real number and $u = g(x)$ is differentiable, then

$$\frac{d}{dx}(u^n) = nu^{n-1}\frac{du}{dx}$$

Alternatively,
$$\frac{d}{dx}[g(x)]^n = n[g(x)]^{n-1} \cdot g'(x)$$

Notice that the derivative we found in Example 1 could be calculated by taking $n = \frac{1}{2}$ in Rule 4.

**EXAMPLE 3** Differentiate $y = (x^3 - 1)^{100}$.

**SOLUTION** Taking $u = g(x) = x^3 - 1$ and $n = 100$ in (4), we have

$$\begin{aligned}\frac{dy}{dx} &= \frac{d}{dx}(x^3 - 1)^{100} = 100(x^3 - 1)^{99}\frac{d}{dx}(x^3 - 1)\\ &= 100(x^3 - 1)^{99} \cdot 3x^2 = 300x^2(x^3 - 1)^{99}\end{aligned}$$ ■

**EXAMPLE 4** Find $f'(x)$ if $f(x) = \dfrac{1}{\sqrt[3]{x^2 + x + 1}}$.

**SOLUTION** First rewrite $f$:
$$f(x) = (x^2 + x + 1)^{-1/3}$$

Thus
$$\begin{aligned}f'(x) &= -\tfrac{1}{3}(x^2 + x + 1)^{-4/3}\frac{d}{dx}(x^2 + x + 1)\\ &= -\tfrac{1}{3}(x^2 + x + 1)^{-4/3}(2x + 1)\end{aligned}$$ ■

**EXAMPLE 5** Find the derivative of the function

$$g(t) = \left(\frac{t - 2}{2t + 1}\right)^9$$

**SOLUTION** Combining the Power Rule, Chain Rule, and Quotient Rule, we get

$$\begin{aligned}g'(t) &= 9\left(\frac{t - 2}{2t + 1}\right)^8 \frac{d}{dt}\left(\frac{t - 2}{2t + 1}\right)\\ &= 9\left(\frac{t - 2}{2t + 1}\right)^8 \frac{(2t + 1) \cdot 1 - 2(t - 2)}{(2t + 1)^2} = \frac{45(t - 2)^8}{(2t + 1)^{10}}\end{aligned}$$ ■

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 6** Differentiate $y = (2x + 1)^5(x^3 - x + 1)^4$.

**SOLUTION** In this example we must use the Product Rule before using the Chain Rule:

$$\begin{aligned}\frac{dy}{dx} &= (2x+1)^5 \frac{d}{dx}(x^3 - x + 1)^4 + (x^3 - x + 1)^4 \frac{d}{dx}(2x+1)^5 \\ &= (2x+1)^5 \cdot 4(x^3 - x + 1)^3 \frac{d}{dx}(x^3 - x + 1) \\ &\quad + (x^3 - x + 1)^4 \cdot 5(2x+1)^4 \frac{d}{dx}(2x+1) \\ &= 4(2x+1)^5(x^3 - x + 1)^3(3x^2 - 1) + 5(x^3 - x + 1)^4(2x+1)^4 \cdot 2\end{aligned}$$

The graphs of the functions $y$ and $y'$ in Example 6 are shown in Figure 1. Notice that $y'$ is large when $y$ increases rapidly and $y' = 0$ when $y$ has a horizontal tangent. So our answer appears to be reasonable.

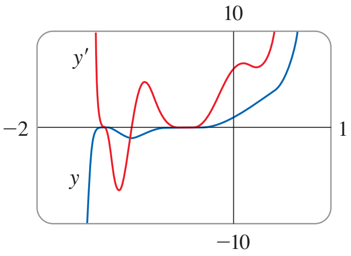

**FIGURE 1**

Noticing that each term has the common factor $2(2x + 1)^4(x^3 - x + 1)^3$, we could factor it out and write the answer as

$$\frac{dy}{dx} = 2(2x+1)^4(x^3 - x + 1)^3(17x^3 + 6x^2 - 9x + 3)$$ ■

The reason for the name "Chain Rule" becomes clear when we make a longer chain by adding another link. Suppose that $y = f(u)$, $u = g(x)$, and $x = h(t)$ where $f$, $g$, and $h$ are differentiable functions. Then, to compute the derivative of $y$ with respect to $t$, we use the Chain Rule twice:

$$\frac{dy}{dt} = \frac{dy}{dx}\frac{dx}{dt} = \frac{dy}{du}\frac{du}{dx}\frac{dx}{dt}$$

**EXAMPLE 7** If $f(x) = \sin(\cos(\tan x))$, then

$$\begin{aligned}f'(x) &= \cos(\cos(\tan x)) \frac{d}{dx}\cos(\tan x) \\ &= \cos(\cos(\tan x))[-\sin(\tan x)] \frac{d}{dx}(\tan x) \\ &= -\cos(\cos(\tan x)) \sin(\tan x) \sec^2 x\end{aligned}$$

Notice that we used the Chain Rule twice. ■

**EXAMPLE 8** Differentiate $y = \sqrt{\sec x^3}$.

**SOLUTION** Here the outer function is the square root function, the middle function is the secant function, and the inner function is the cubing function. So we have

$$\begin{aligned}\frac{dy}{dx} &= \frac{1}{2\sqrt{\sec x^3}} \frac{d}{dx}(\sec x^3) \\ &= \frac{1}{2\sqrt{\sec x^3}} \sec x^3 \tan x^3 \frac{d}{dx}(x^3) \\ &= \frac{3x^2 \sec x^3 \tan x^3}{2\sqrt{\sec x^3}}\end{aligned}$$ ■

## How to Prove the Chain Rule

Recall that if $y = f(x)$ and $x$ changes from $a$ to $a + \Delta x$, we define the increment of $y$ as

$$\Delta y = f(a + \Delta x) - f(a)$$

According to the definition of a derivative, we have

$$\lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = f'(a)$$

So if we denote by $\varepsilon$ the difference between $\Delta y/\Delta x$ and $f'(a)$, we obtain

$$\lim_{\Delta x \to 0} \varepsilon = \lim_{\Delta x \to 0} \left( \frac{\Delta y}{\Delta x} - f'(a) \right) = f'(a) - f'(a) = 0$$

But $$\varepsilon = \frac{\Delta y}{\Delta x} - f'(a) \quad \Rightarrow \quad \Delta y = f'(a)\,\Delta x + \varepsilon\,\Delta x$$

If we define $\varepsilon$ to be 0 when $\Delta x = 0$, then $\varepsilon$ becomes a continuous function of $\Delta x$. Thus, for a differentiable function $f$, we can write

$$\boxed{5} \qquad \Delta y = f'(a)\,\Delta x + \varepsilon\,\Delta x \qquad \text{where} \qquad \varepsilon \to 0 \text{ as } \Delta x \to 0$$

and $\varepsilon$ is a continuous function of $\Delta x$. This property of differentiable functions is what enables us to prove the Chain Rule.

**PROOF OF THE CHAIN RULE** Suppose $u = g(x)$ is differentiable at $a$ and $y = f(u)$ is differentiable at $b = g(a)$. If $\Delta x$ is an increment in $x$ and $\Delta u$ and $\Delta y$ are the corresponding increments in $u$ and $y$, then we can use Equation 5 to write

$$\boxed{6} \qquad \Delta u = g'(a)\,\Delta x + \varepsilon_1\,\Delta x = [g'(a) + \varepsilon_1]\,\Delta x$$

where $\varepsilon_1 \to 0$ as $\Delta x \to 0$. Similarly

$$\boxed{7} \qquad \Delta y = f'(b)\,\Delta u + \varepsilon_2\,\Delta u = [f'(b) + \varepsilon_2]\,\Delta u$$

where $\varepsilon_2 \to 0$ as $\Delta u \to 0$. If we now substitute the expression for $\Delta u$ from Equation 6 into Equation 7, we get

$$\Delta y = [f'(b) + \varepsilon_2][g'(a) + \varepsilon_1]\,\Delta x$$

so $$\frac{\Delta y}{\Delta x} = [f'(b) + \varepsilon_2][g'(a) + \varepsilon_1]$$

As $\Delta x \to 0$, Equation 6 shows that $\Delta u \to 0$. Taking the limit as $\Delta x \to 0$, we get

$$\begin{aligned} \frac{dy}{dx} &= \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} [f'(b) + \varepsilon_2][g'(a) + \varepsilon_1] \\ &= f'(b)\,g'(a) = f'(g(a))\,g'(a) \end{aligned}$$

This proves the Chain Rule. ■

## 2.5 Exercises

**1–6** Write the composite function in the form $f(g(x))$. [Identify the inner function $u = g(x)$ and the outer function $y = f(u)$.] Then find the derivative $dy/dx$.

**1.** $y = (5 - x^4)^3$

**2.** $y = \sqrt{x^3 + 2}$

**3.** $y = \sin(\cos x)$

**4.** $y = \tan(x^2)$

**5.** $y = \sqrt{\sin x}$

**6.** $y = \sin \sqrt{x}$

**7–48** Find the derivative of the function.

**7.** $f(x) = (2x^3 - 5x^2 + 4)^5$

**8.** $f(x) = (x^5 + 3x^2 - x)^{50}$

**9.** $f(x) = \sqrt{5x + 1}$

**10.** $f(x) = \dfrac{1}{\sqrt[3]{x^2 - 1}}$

**11.** $g(t) = \dfrac{1}{(2t + 1)^2}$

**12.** $F(t) = \left(\dfrac{1}{2t + 1}\right)^4$

**13.** $A(t) = \dfrac{1}{(\cos t + \tan t)^2}$

**14.** $g(x) = (2 - \sin x)^{3/2}$

**15.** $f(\theta) = \cos(\theta^2)$

**16.** $g(\theta) = \cos^2 \theta$

**17.** $h(v) = v\sqrt[3]{1 + v^2}$

**18.** $f(t) = t \sin \pi t$

**19.** $F(x) = (4x + 5)^3(x^2 - 2x + 5)^4$

**20.** $G(z) = (1 - 4z)^2\sqrt{z^2 + 1}$

**21.** $h(t) = (t + 1)^{2/3}(2t^2 - 1)^3$

**22.** $F(t) = (3t - 1)^4(2t + 1)^{-3}$

**23.** $y = \sqrt{\dfrac{x}{x + 1}}$

**24.** $y = \left(x + \dfrac{1}{x}\right)^5$

**25.** $g(u) = \left(\dfrac{u^3 - 1}{u^3 + 1}\right)^8$

**26.** $s(t) = \sqrt{\dfrac{1 + \sin t}{1 + \cos t}}$

**27.** $H(r) = \dfrac{(r^2 - 1)^3}{(2r + 1)^5}$

**28.** $F(t) = \dfrac{t^2}{\sqrt{t^3 + 1}}$

**29.** $y = \cos(\sec 4x)$

**30.** $J(\theta) = \tan^2(n\theta)$

**31.** $y = \dfrac{\cos x}{\sqrt{1 + \sin x}}$

**32.** $h(\theta) = \tan(\theta^2 \sin \theta)$

**33.** $y = \left(\dfrac{1 - \cos 2x}{1 + \cos 2x}\right)^4$

**34.** $y = x \sin \dfrac{1}{x}$

**35.** $f(x) = \sin x \cos(1 - x^2)$

**36.** $y = \sin\left(t + \cos \sqrt{t}\right)$

**37.** $F(t) = \tan \sqrt{1 + t^2}$

**38.** $G(z) = (1 + \cos^2 z)^3$

**39.** $y = \sin^2(x^2 + 1)$

**40.** $g(u) = [(u^2 - 1)^6 - 3u]^4$

**41.** $y = \cos^4(\sin^3 x)$

**42.** $y = \sin^3(\cos(x^2))$

**43.** $f(t) = \tan(\sec(\cos t))$

**44.** $y = \sqrt{x + \sqrt{x + \sqrt{x}}}$

**45.** $g(x) = (2r \sin rx + n)^p$

**46.** $y = \sin(\theta + \tan(\theta + \cos \theta))$

**47.** $y = \cos\sqrt{\sin(\tan \pi x)}$

**48.** $y = [x + (x + \sin^2 x)^3]^4$

**49–52** Find $y'$ and $y''$.

**49.** $y = \cos(\sin 3\theta)$

**50.** $y = \left(1 + \sqrt{x}\right)^3$

**51.** $y = \sqrt{\cos x}$

**52.** $y = \dfrac{4x}{\sqrt{x + 1}}$

**53–56** Find an equation of the tangent line to the curve at the given point.

**53.** $y = (3x - 1)^{-6}$, $(0, 1)$

**54.** $y = \sqrt{1 + x^3}$, $(2, 3)$

**55.** $y = \sin(\sin x)$, $(\pi, 0)$

**56.** $y = \sin^2 x \cos x$, $(\pi/2, 0)$

**57.** (a) Find an equation of the tangent line to the curve $y = \tan(\pi x^2/4)$ at the point $(1, 1)$.
(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**58.** (a) The curve $y = |x|/\sqrt{2 - x^2}$ is called a *bullet-nose curve*. Find an equation of the tangent line to this curve at the point $(1, 1)$.
(b) Illustrate part (a) by graphing the curve and the tangent line on the same screen.

**59.** (a) If $f(x) = x\sqrt{2 - x^2}$, find $f'(x)$.
(b) Check to see that your answer to part (a) is reasonable by comparing the graphs of $f$ and $f'$.

**60.** The function $f(x) = \sin(x + \sin 2x)$, $0 \leqslant x \leqslant \pi$, arises in applications to frequency modulation (FM) synthesis.
(a) Use a graph of $f$ produced by a calculator or computer to make a rough sketch of the graph of $f'$.
(b) Calculate $f'(x)$ and use this expression, with a calculator or computer, to graph $f'$. Compare with your sketch in part (a).

**61.** Find all points on the graph of the function $f(x) = 2 \sin x + \sin^2 x$ at which the tangent line is horizontal.

**62.** At what point on the curve $y = \sqrt{1 + 2x}$ is the tangent line perpendicular to the line $6x + 2y = 1$?

**63.** If $F(x) = f(g(x))$, where $f(-2) = 8$, $f'(-2) = 4$, $f'(5) = 3$, $g(5) = -2$, and $g'(5) = 6$, find $F'(5)$.

**64.** If $h(x) = \sqrt{4 + 3f(x)}$, where $f(1) = 7$ and $f'(1) = 4$, find $h'(1)$.

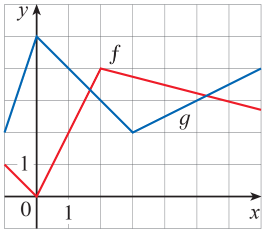
**65.** A table of values for $f$, $g$, $f'$, and $g'$ is given.

| $x$ | $f(x)$ | $g(x)$ | $f'(x)$ | $g'(x)$ |
|---|---|---|---|---|
| 1 | 3 | 2 | 4 | 6 |
| 2 | 1 | 8 | 5 | 7 |
| 3 | 7 | 2 | 7 | 9 |

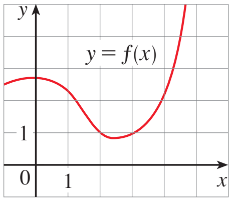
(a) If $h(x) = f(g(x))$, find $h'(1)$.
(b) If $H(x) = g(f(x))$, find $H'(1)$.

**66.** Let $f$ and $g$ be the functions in Exercise 65.
(a) If $F(x) = f(f(x))$, find $F'(2)$.
(b) If $G(x) = g(g(x))$, find $G'(3)$.

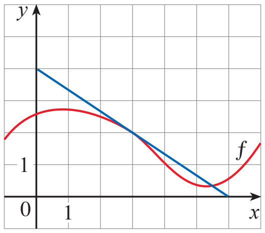
**67.** If $f$ and $g$ are the functions whose graphs are shown, let $u(x) = f(g(x))$, $v(x) = g(f(x))$, and $w(x) = g(g(x))$. Find each derivative, if it exists. If it does not exist, explain why.
(a) $u'(1)$ (b) $v'(1)$ (c) $w'(1)$



**68.** If $f$ is the function whose graph is shown, let $h(x) = f(f(x))$ and $g(x) = f(x^2)$. Use the graph of $f$ to estimate the value of each derivative.
(a) $h'(2)$ (b) $g'(2)$



**69.** If $g(x) = \sqrt{f(x)}$, where the graph of $f$ is shown, evaluate $g'(3)$.



**70.** Suppose $f$ is differentiable on $\mathbb{R}$ and $\alpha$ is a real number. Let $F(x) = f(x^\alpha)$ and $G(x) = [f(x)]^\alpha$. Find expressions for (a) $F'(x)$ and (b) $G'(x)$.

**71.** Let $r(x) = f(g(h(x)))$, where $h(1) = 2$, $g(2) = 3$, $h'(1) = 4$, $g'(2) = 5$, and $f'(3) = 6$. Find $r'(1)$.

**72.** If $g$ is a twice differentiable function and $f(x) = xg(x^2)$, find $f''$ in terms of $g$, $g'$, and $g''$.

**73.** If $F(x) = f(3f(4f(x)))$, where $f(0) = 0$ and $f'(0) = 2$, find $F'(0)$.

**74.** If $F(x) = f(xf(xf(x)))$, where $f(1) = 2$, $f(2) = 3$, $f'(1) = 4$, $f'(2) = 5$, and $f'(3) = 6$, find $F'(1)$.

**75–76** Find the given derivative by finding the first few derivatives and observing the pattern that occurs.

**75.** $D^{103} \cos 2x$ **76.** $D^{35} x \sin \pi x$

**77.** The displacement of a particle on a vibrating string is given by the equation

$$s(t) = 10 + \tfrac{1}{4}\sin(10\pi t)$$

where $s$ is measured in centimeters and $t$ in seconds. Find the velocity of the particle after $t$ seconds.

**78.** If the equation of motion of a particle is given by $s = A\cos(\omega t + \delta)$, the particle is said to undergo *simple harmonic motion.*
(a) Find the velocity of the particle at time $t$.
(b) When is the velocity 0?

**79.** A Cepheid variable star is a star whose brightness alternately increases and decreases. The most easily visible such star is Delta Cephei, for which the interval between times of maximum brightness is 5.4 days. The average brightness of this star is 4.0 and its brightness changes by ±0.35. In view of these data, the brightness of Delta Cephei at time $t$, where $t$ is measured in days, has been modeled by the function

$$B(t) = 4.0 + 0.35\sin\left(\frac{2\pi t}{5.4}\right)$$

(a) Find the rate of change of the brightness after $t$ days.
(b) Find, correct to two decimal places, the rate of increase after one day.

**80.** In Example 1.3.4 we arrived at a model for the length of daylight (in hours) in Philadelphia on the $t$th day of the year:

$$L(t) = 12 + 2.8\sin\left[\frac{2\pi}{365}(t - 80)\right]$$

Use this model to compare how the number of hours of daylight is increasing in Philadelphia on March 21 ($t = 80$) and May 21 ($t = 141$).

**81.** A particle moves along a straight line with displacement $s(t)$, velocity $v(t)$, and acceleration $a(t)$. Show that

$$a(t) = v(t)\,\frac{dv}{ds}$$

Explain the difference between the meanings of the derivatives $dv/dt$ and $dv/ds$.

**82.** Air is being pumped into a spherical weather balloon. At any time $t$, the volume of the balloon is $V(t)$ and its radius is $r(t)$.
- (a) What do the derivatives $dV/dr$ and $dV/dt$ represent?
- (b) Express $dV/dt$ in terms of $dr/dt$.

**83.** Use the Chain Rule to prove the following.
- (a) The derivative of an even function is an odd function.
- (b) The derivative of an odd function is an even function.

**84.** Use the Chain Rule and the Product Rule to give an alternative proof of the Quotient Rule. [*Hint:* Write $f(x)/g(x) = f(x)[g(x)]^{-1}$.]

**85.** Use the Chain Rule to show that if $\theta$ is measured in degrees, then

$$\frac{d}{d\theta}(\sin\theta) = \frac{\pi}{180}\cos\theta$$

(This gives one reason for the convention that radian measure is always used when dealing with trigonometric functions in calculus: the differentiation formulas would not be as simple if we used degree measure.)

**86.** (a) Write $|x| = \sqrt{x^2}$ and use the Chain Rule to show that

$$\frac{d}{dx}|x| = \frac{x}{|x|}$$

- (b) If $f(x) = |\sin x|$, find $f'(x)$ and sketch the graphs of $f$ and $f'$. Where is $f$ not differentiable?
- (c) If $g(x) = \sin|x|$, find $g'(x)$ and sketch the graphs of $g$ and $g'$. Where is $g$ not differentiable?

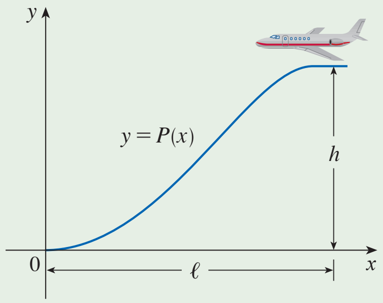
**87.** If $F = f \circ g \circ h$, where $f$, $g$, and $h$ are differentiable functions, use the Chain Rule to show that

$$F'(x) = f'(g(h(x))) \cdot g'(h(x)) \cdot h'(x)$$

**88.** If $F = f \circ g$, where $f$ and $g$ are twice differentiable functions, use the Chain Rule and the Product Rule to show that the second derivative of $F$ is given by

$$F''(x) = f''(g(x)) \cdot [g'(x)]^2 + f'(g(x)) \cdot g''(x)$$

## APPLIED PROJECT | WHERE SHOULD A PILOT START DESCENT?



An approach path for an aircraft landing is shown in the figure and satisfies the following conditions:

(i) The cruising altitude is $h$ when descent starts at a horizontal distance $\ell$ from touchdown at the origin.

(ii) The pilot must maintain a constant horizontal speed $v$ throughout descent.

(iii) The absolute value of the vertical acceleration should not exceed a constant $k$ (which is much less than the acceleration due to gravity).

**1.** Find a cubic polynomial $P(x) = ax^3 + bx^2 + cx + d$ that satisfies condition (i) by imposing suitable conditions on $P(x)$ and $P'(x)$ at the start of descent and at touchdown.

**2.** Use conditions (ii) and (iii) to show that

$$\frac{6hv^2}{\ell^2} \leqslant k$$

**3.** Suppose that an airline decides not to allow vertical acceleration of a plane to exceed $k = 860$ mi/h². If the cruising altitude of a plane is 35,000 ft and the speed is 300 mi/h, how far away from the airport should the pilot start descent?

**4.** Graph the approach path if the conditions stated in Problem 3 are satisfied.

# 2.6 Implicit Differentiation

## Implicitly Defined Functions

The functions that we have met so far can be described by expressing one variable explicitly in terms of another variable—for example,

$$y = \sqrt{x^3 + 1} \qquad \text{or} \qquad y = x\sin x$$

or, in general, $y = f(x)$. Some functions, however, are defined implicitly by a relation between $x$ and $y$ such as

$$x^2 + y^2 = 25 \tag{1}$$

or

$$x^3 + y^3 = 6xy \tag{2}$$

In some cases it is possible to solve such an equation for $y$ as an explicit function (or several functions) of $x$. For instance, if we solve Equation 1 for $y$, we get $y = \pm\sqrt{25 - x^2}$, so two of the functions determined by the implicit Equation 1 are $f(x) = \sqrt{25 - x^2}$ and $g(x) = -\sqrt{25 - x^2}$. The graphs of $f$ and $g$ are the upper and lower semicircles of the circle $x^2 + y^2 = 25$. (See Figure 1.)

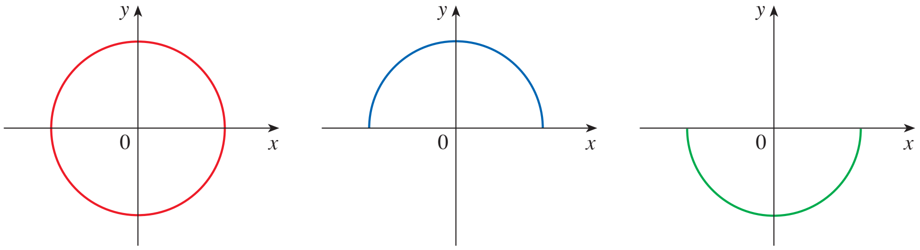

**FIGURE 1** (a) $x^2 + y^2 = 25$ (b) $f(x) = \sqrt{25 - x^2}$ (c) $g(x) = -\sqrt{25 - x^2}$

It's not easy to solve Equation 2 for $y$ explicitly as a function of $x$ by hand. (Even if we use technology, the resulting expressions are very complicated.) Nonetheless, (2) is the equation of a curve called the **folium of Descartes** shown in Figure 2 and it implicitly defines $y$ as several functions of $x$. The graphs of three such functions are shown in Figure 3. When we say that $f$ is a function defined implicitly by Equation 2, we mean that the equation

$$x^3 + [f(x)]^3 = 6xf(x)$$

is true for all values of $x$ in the domain of $f$.

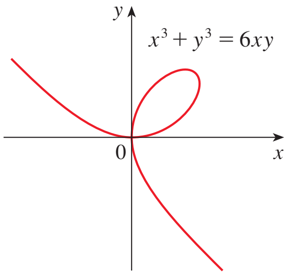

**FIGURE 2** The folium of Descartes

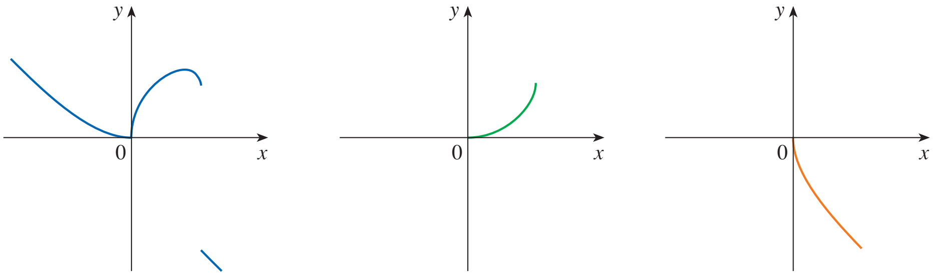

**FIGURE 3** Graphs of three functions defined implicitly by the folium of Descartes

## Implicit Differentiation

Fortunately, we don't need to solve an equation for $y$ in terms of $x$ in order to find the derivative of $y$. Instead we can use the method of **implicit differentiation**. This consists of differentiating both sides of the equation with respect to $x$ and then solving the resulting equation for $dy/dx$. In the examples and exercises of this section it is always assumed that the given equation determines $y$ implicitly as a differentiable function of $x$ so that the method of implicit differentiation can be applied.

### EXAMPLE 1

If $x^2 + y^2 = 25$, find $\dfrac{dy}{dx}$. Then find an equation of the tangent to the circle $x^2 + y^2 = 25$ at the point $(3, 4)$.

### SOLUTION 1

Differentiate both sides of the equation $x^2 + y^2 = 25$:

$$\frac{d}{dx}(x^2 + y^2) = \frac{d}{dx}(25)$$

$$\frac{d}{dx}(x^2) + \frac{d}{dx}(y^2) = 0$$

Remembering that $y$ is a function of $x$ and using the Chain Rule, we have

$$\frac{d}{dx}(y^2) = \frac{d}{dy}(y^2)\frac{dy}{dx} = 2y\frac{dy}{dx}$$

Thus
$$2x + 2y\frac{dy}{dx} = 0$$

Now we solve this equation for $dy/dx$:

$$\frac{dy}{dx} = -\frac{x}{y}$$

At the point $(3, 4)$ we have $x = 3$ and $y = 4$, so

$$\frac{dy}{dx} = -\frac{3}{4}$$

An equation of the tangent to the circle at $(3, 4)$ is therefore

$$y - 4 = -\tfrac{3}{4}(x - 3) \qquad \text{or} \qquad 3x + 4y = 25$$

### SOLUTION 2

Solving the equation $x^2 + y^2 = 25$ for $y$, we get $y = \pm\sqrt{25 - x^2}$. The point $(3, 4)$ lies on the upper semicircle $y = \sqrt{25 - x^2}$ and so we consider the function $f(x) = \sqrt{25 - x^2}$. Differentiating $f$ using the Chain Rule, we have

$$\begin{aligned} f'(x) &= \tfrac{1}{2}(25 - x^2)^{-1/2}\frac{d}{dx}(25 - x^2) \\ &= \tfrac{1}{2}(25 - x^2)^{-1/2}(-2x) = -\frac{x}{\sqrt{25 - x^2}} \end{aligned}$$

At the point $(3, 4)$ we have

$$f'(3) = -\frac{3}{\sqrt{25 - 3^2}} = -\frac{3}{4}$$

and, as in Solution 1, an equation of the tangent is $3x + 4y = 25$. ■

Example 1 illustrates that even when it is possible to solve an equation explicitly for $y$ in terms of $x$, it may be easier to use implicit differentiation.

**NOTE 1** The expression $dy/dx = -x/y$ in Solution 1 gives the derivative in terms of both $x$ and $y$. It is correct no matter which function $y$ is determined by the given equation. For instance, for $y = f(x) = \sqrt{25 - x^2}$ we have

$$\frac{dy}{dx} = -\frac{x}{y} = -\frac{x}{\sqrt{25 - x^2}}$$

whereas for $y = g(x) = -\sqrt{25 - x^2}$ we have

$$\frac{dy}{dx} = -\frac{x}{y} = -\frac{x}{-\sqrt{25 - x^2}} = \frac{x}{\sqrt{25 - x^2}}$$

## EXAMPLE 2

(a) Find $y'$ if $x^3 + y^3 = 6xy$.

(b) Find the tangent to the folium of Descartes $x^3 + y^3 = 6xy$ at the point (3, 3).

(c) At what point in the first quadrant is the tangent line horizontal?

### SOLUTION

(a) Differentiating both sides of $x^3 + y^3 = 6xy$ with respect to $x$, regarding $y$ as a function of $x$, and using the Chain Rule on the term $y^3$ and the Product Rule on the term $6xy$, we get

We can use either of the notations $dy/dx$ or $y'$ for the derivative of $y$ with respect to $x$.

$$3x^2 + 3y^2y' = 6xy' + 6y$$

or

$$x^2 + y^2y' = 2xy' + 2y$$

We now solve for $y'$:

$$y^2y' - 2xy' = 2y - x^2$$

$$(y^2 - 2x)y' = 2y - x^2$$

$$y' = \frac{2y - x^2}{y^2 - 2x}$$

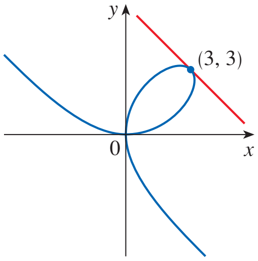

**FIGURE 4**

(b) When $x = y = 3$,

$$y' = \frac{2 \cdot 3 - 3^2}{3^2 - 2 \cdot 3} = -1$$

and a glance at Figure 4 confirms that this is a reasonable value for the slope at (3, 3). So an equation of the tangent to the folium at (3, 3) is

$$y - 3 = -1(x - 3) \qquad \text{or} \qquad x + y = 6$$

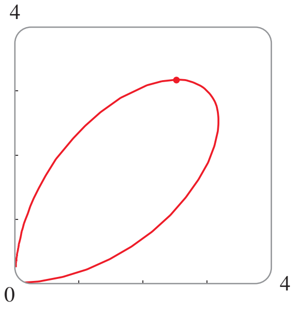

**FIGURE 5**

(c) The tangent line is horizontal if $y' = 0$. Using the expression for $y'$ from part (a), we see that $y' = 0$ when $2y - x^2 = 0$ (provided that $y^2 - 2x \neq 0$). Substituting $y = \frac{1}{2}x^2$ in the equation of the curve, we get

$$x^3 + \left(\tfrac{1}{2}x^2\right)^3 = 6x\left(\tfrac{1}{2}x^2\right)$$

which simplifies to $x^6 = 16x^3$. Since $x \neq 0$ in the first quadrant, we have $x^3 = 16$. If $x = 16^{1/3} = 2^{4/3}$, then $y = \frac{1}{2}(2^{8/3}) = 2^{5/3}$. Thus the tangent is horizontal at $(2^{4/3}, 2^{5/3})$, which is approximately (2.5198, 3.1748). Looking at Figure 5, we see that our answer is reasonable. ■

**NOTE 2** There is a formula for the three solutions of a cubic equation that is like the quadratic formula but much more complicated. If we use this formula (or a computer) to solve the equation $x^3 + y^3 = 6xy$ for $y$ in terms of $x$, we get three functions determined by the equations:

$$y = f(x) = \sqrt[3]{-\tfrac{1}{2}x^3 + \sqrt{\tfrac{1}{4}x^6 - 8x^3}} + \sqrt[3]{-\tfrac{1}{2}x^3 - \sqrt{\tfrac{1}{4}x^6 - 8x^3}}$$

and

$$y = \tfrac{1}{2}\left[-f(x) \pm \sqrt{-3}\left(\sqrt[3]{-\tfrac{1}{2}x^3 + \sqrt{\tfrac{1}{4}x^6 - 8x^3}} - \sqrt[3]{-\tfrac{1}{2}x^3 - \sqrt{\tfrac{1}{4}x^6 - 8x^3}}\right)\right]$$

**Abel and Galois**

The Norwegian mathematician Niels Abel proved in 1824 that no general formula in terms of radicals can be given for the solutions of the equation $p(x) = 0$, where $p$ is a polynomial of degree 5 with integer coefficients. Later the French mathematician Evariste Galois proved that it is impossible to find a general formula in terms of radicals for the solutions of an equation $p(x) = 0$, where $p$ is a polynomial of degree $n \geqslant 5$.

(These are the three functions whose graphs are shown in Figure 3.) You can see that the method of implicit differentiation saves an enormous amount of work in cases such as this. Moreover, implicit differentiation works just as easily for equations such as

$$y^5 + 3x^2y^2 + 5x^4 = 12$$

for which it is *impossible* to find an expression for $y$ in terms of $x$.

**EXAMPLE 3** Find $y'$ if $\sin(x + y) = y^2 \cos x$.

**SOLUTION** Differentiating implicitly with respect to $x$ and remembering that $y$ is a function of $x$, we get

$$\cos(x + y) \cdot (1 + y') = y^2(-\sin x) + (\cos x)(2yy')$$

(Note that we have used the Chain Rule on the left side and the Product Rule and Chain Rule on the right side.) If we collect the terms that involve $y'$, we get

$$\cos(x + y) + y^2 \sin x = (2y \cos x)y' - \cos(x + y) \cdot y'$$

So

$$y' = \frac{y^2 \sin x + \cos(x + y)}{2y \cos x - \cos(x + y)}$$

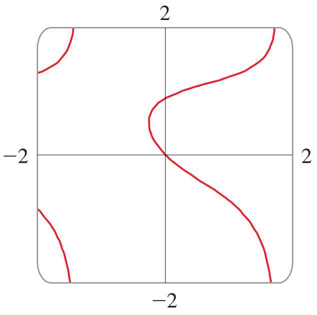

**FIGURE 6**

Figure 6, drawn by a computer, shows part of the curve $\sin(x + y) = y^2 \cos x$. As a check on our calculation, notice that $y' = -1$ when $x = y = 0$ and it appears from the graph that the slope is approximately $-1$ at the origin. ■

Figures 7, 8, and 9 show three more curves produced by a computer. In Exercises 43–44 you will have an opportunity to create and examine unusual curves of this nature.

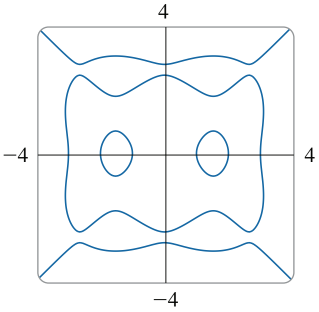

**FIGURE 7**
$(x^2 - 1)(x^2 - 4)(x^2 - 9)$
$= y^2(y^2 - 4)(y^2 - 9)$

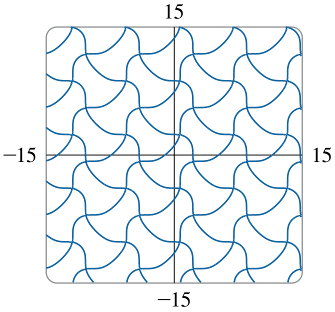

**FIGURE 8**
$\cos(x - \sin y) = \sin(y - \sin x)$

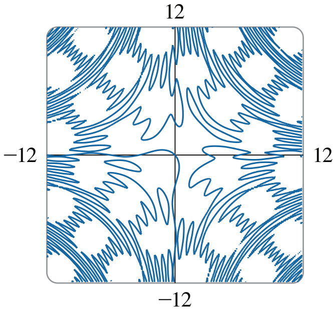

**FIGURE 9**
$\sin(xy) = \sin x + \sin y$

## ■ Second Derivatives of Implicit Functions

The following example shows how to find the second derivative of a function that is defined implicitly.

**EXAMPLE 4** Find $y''$ if $x^4 + y^4 = 16$.

**SOLUTION** Differentiating the equation implicitly with respect to $x$, we get

$$4x^3 + 4y^3y' = 0$$

Solving for $y'$ gives

$$\boxed{3} \qquad y' = -\frac{x^3}{y^3}$$

To find $y''$ we differentiate this expression for $y'$ using the Quotient Rule and remembering that $y$ is a function of $x$:

$$\begin{aligned} y'' &= \frac{d}{dx}\left(-\frac{x^3}{y^3}\right) = -\frac{y^3\,(d/dx)(x^3) - x^3\,(d/dx)(y^3)}{(y^3)^2} \\ &= -\frac{y^3 \cdot 3x^2 - x^3(3y^2y')}{y^6} \end{aligned}$$

If we now substitute Equation 3 into this expression, we get

$$\begin{aligned} y'' &= -\frac{3x^2y^3 - 3x^3y^2\left(-\dfrac{x^3}{y^3}\right)}{y^6} \\ &= -\frac{3(x^2y^4 + x^6)}{y^7} = -\frac{3x^2(y^4 + x^4)}{y^7} \end{aligned}$$

But the values of $x$ and $y$ must satisfy the original equation $x^4 + y^4 = 16$. So the answer simplifies to

$$y'' = -\frac{3x^2(16)}{y^7} = -48\,\frac{x^2}{y^7}$$ ■

Figure 10 shows the graph of the curve $x^4 + y^4 = 16$ of Example 4. Notice that it's a stretched and flattened version of the circle $x^2 + y^2 = 4$. For this reason it's sometimes called a *fat circle*. It starts out very steep on the left but quickly becomes very flat. This can be seen from the expression

$$y' = -\frac{x^3}{y^3} = -\left(\frac{x}{y}\right)^3$$

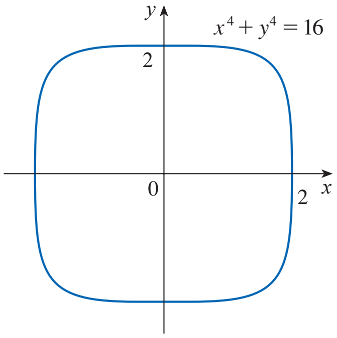

**FIGURE 10**

## 2.6 Exercises

**1–4**

(a) Find $y'$ by implicit differentiation.

(b) Solve the equation explicitly for $y$ and differentiate to get $y'$ in terms of $x$.

(c) Check that your solutions to parts (a) and (b) are consistent by substituting the expression for $y$ into your solution for part (a).

**1.** $5x^2 - y^3 = 7$

**2.** $6x^4 + y^5 = 2x$

**3.** $\sqrt{x} + \sqrt{y} = 1$

**4.** $\dfrac{2}{x} - \dfrac{1}{y} = 4$

**5–20** Find $dy/dx$ by implicit differentiation.

**5.** $x^2 - 4xy + y^2 = 4$

**6.** $2x^2 + xy - y^2 = 2$

**7.** $x^4 + x^2y^2 + y^3 = 5$

**8.** $x^3 - xy^2 + y^3 = 1$

**9.** $\dfrac{x^2}{x + y} = y^2 + 1$

**10.** $y^5 + x^2y^3 = 1 + x^4y$

**11.** $\sin x + \cos y = 2x - 3y$

**12.** $y \sin(x^2) = x \sin(y^2)$

**13.** $\sin(x + y) = \cos x + \cos y$

**14.** $\tan(x - y) = 2xy^3 + 1$

**15.** $\tan(x/y) = x + y$

**16.** $\sin(xy) = \cos(x + y)$

**17.** $\sqrt{x + y} = x^4 + y^4$

**18.** $\sin x \cos y = x^2 - 5y$

**19.** $\sqrt{xy} = 1 + x^2y$

**20.** $xy = \sqrt{x^2 + y^2}$

**21.** If $f(x) + x^2[f(x)]^3 = 10$ and $f(1) = 2$, find $f'(1)$.

**22.** If $g(x) + x \sin g(x) = x^2$, find $g'(0)$.

**35.** (a) The curve with equation $y^2 = 5x^4 - x^2$ is called a **kampyle of Eudoxus**. Find an equation of the tangent line to this curve at the point $(1, 2)$.

(b) Illustrate part (a) by graphing the curve and the tangent line on a common screen. (Graph the implicitly defined curve if possible, or you can graph the upper and lower halves separately.)

**36.** (a) The curve with equation $y^2 = x^3 + 3x^2$ is called the **Tschirnhausen cubic**. Find an equation of the tangent line to this curve at the point $(1, -2)$.

(b) At what points does this curve have horizontal tangents?

(c) Illustrate parts (a) and (b) by graphing the curve and the tangent lines on a common screen.

**37–40** Find $y''$ by implicit differentiation. Simplify where possible.

**37.** $x^2 + 4y^2 = 4$ **38.** $x^2 + xy + y^2 = 3$

**39.** $\sin y + \cos x = 1$ **40.** $x^3 - y^3 = 7$

---

**41.** If $xy + y^3 = 1$, find the value of $y''$ at the point where $x = 0$.

**42.** If $x^2 + xy + y^3 = 1$, find the value of $y'''$ at the point where $x = 1$.

**43.** Fanciful shapes can be created by using software that can graph implicitly defined curves.

(a) Graph the curve with equation

$$y(y^2 - 1)(y - 2) = x(x - 1)(x - 2)$$

At how many points does this curve have horizontal tangents? Estimate the $x$-coordinates of these points.

(b) Find equations of the tangent lines at the points $(0, 1)$ and $(0, 2)$.

(c) Find the exact $x$-coordinates of the points in part (a).

(d) Create even more fanciful curves by modifying the equation in part (a).

**44.** (a) The curve with equation

$$2y^3 + y^2 - y^5 = x^4 - 2x^3 + x^2$$

has been likened to a bouncing wagon. Graph this curve and discover why.

(b) At how many points does this curve have horizontal tangent lines? Find the $x$-coordinates of these points.

**45.** Find the points on the lemniscate in Exercise 33 where the tangent is horizontal.

**46.** Show by implicit differentiation that the tangent line to the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

at the point $(x_0, y_0)$ has equation

$$\frac{x_0x}{a^2} + \frac{y_0y}{b^2} = 1$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**47.** Find an equation of the tangent line to the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$$

at the point $(x_0, y_0)$.

**48.** Show that the sum of the $x$- and $y$-intercepts of any tangent line to the curve $\sqrt{x} + \sqrt{y} = \sqrt{c}$ is equal to $c$.

**49.** Show, using implicit differentiation, that any tangent line at a point $P$ to a circle with center $O$ is perpendicular to the radius $OP$.

**50.** The Power Rule can be proved using implicit differentiation for the case where $n$ is a rational number, $n = p/q$, and $y = f(x) = x^n$ is assumed beforehand to be a differentiable function. If $y = x^{p/q}$, then $y^q = x^p$. Use implicit differentiation to show that

$$y' = \frac{p}{q} x^{(p/q)-1}$$

**51–54 Orthogonal Trajectories** Two curves are *orthogonal* if their tangent lines are perpendicular at each point of intersection. Show that the given families of curves are *orthogonal trajectories* of each other; that is, every curve in one family is orthogonal to every curve in the other family. Sketch both families of curves on the same axes.

**51.** $x^2 + y^2 = r^2, \quad ax + by = 0$

**52.** $x^2 + y^2 = ax, \quad x^2 + y^2 = by$

**53.** $y = cx^2, \quad x^2 + 2y^2 = k$

**54.** $y = ax^3, \quad x^2 + 3y^2 = b$

**55.** Show that the ellipse $x^2/a^2 + y^2/b^2 = 1$ and the hyperbola $x^2/A^2 - y^2/B^2 = 1$ are orthogonal trajectories if $A^2 < a^2$ and $a^2 - b^2 = A^2 + B^2$ (so the ellipse and hyperbola have the same foci).

**56.** Find the value of the number $a$ such that the families of curves $y = (x + c)^{-1}$ and $y = a(x + k)^{1/3}$ are orthogonal trajectories.

**57.** The *van der Waals equation* for $n$ moles of a gas is

$$\left(P + \frac{n^2 a}{V^2}\right)(V - nb) = nRT$$

where $P$ is the pressure, $V$ is the volume, and $T$ is the temperature of the gas. The constant $R$ is the universal gas constant and $a$ and $b$ are positive constants that are characteristic of a particular gas.

(a) If $T$ remains constant, use implicit differentiation to find $dV/dP$.

(b) Find the rate of change of volume with respect to pressure of 1 mole of carbon dioxide at a volume of $V = 10$ L and a pressure of $P = 2.5$ atm. Use $a = 3.592$ L$^2$-atm/mole$^2$ and $b = 0.04267$ L/mole.

**58.** (a) Use implicit differentiation to find $y'$ if

$$x^2 + xy + y^2 + 1 = 0$$

(b) Plot the curve in part (a). What do you see? Prove that what you see is correct.

(c) In view of part (b), what can you say about the expression for $y'$ that you found in part (a)?

**59.** The equation $x^2 - xy + y^2 = 3$ represents a "rotated ellipse," that is, an ellipse whose axes are not parallel to the coordinate axes. Find the points at which this ellipse crosses the $x$-axis and show that the tangent lines at these points are parallel.

**60.** (a) Where does the normal line to the ellipse $x^2 - xy + y^2 = 3$ at the point $(-1, 1)$ intersect the ellipse a second time?

(b) Illustrate part (a) by graphing the ellipse and the normal line.

**61.** Find all points on the curve $x^2y^2 + xy = 2$ where the slope of the tangent line is $-1$.

**62.** Find equations of both the tangent lines to the ellipse $x^2 + 4y^2 = 36$ that pass through the point $(12, 3)$.

**63.** Use implicit differentiation to find $dy/dx$ for the equation

$$\frac{x}{y} = y^2 + 1 \qquad y \neq 0$$

and for the equivalent equation

$$x = y^3 + y \qquad y \neq 0$$

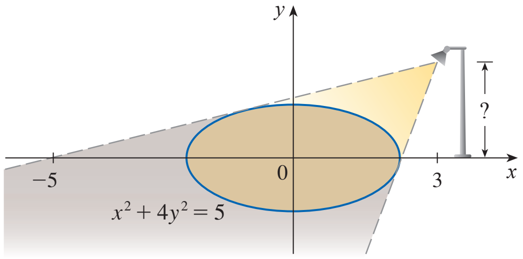
Show that although the expressions you get for $dy/dx$ look different, they agree for all points that satisfy the given equation.

**64.** The *Bessel function* of order 0, $y = J(x)$, satisfies the differential equation $xy'' + y' + xy = 0$ for all values of $x$ and its value at 0 is $J(0) = 1$.

(a) Find $J'(0)$.

(b) Use implicit differentiation to find $J''(0)$.

**65.** The figure shows a lamp located three units to the right of the $y$-axis and a shadow created by the elliptical region $x^2 + 4y^2 \leqslant 5$. If the point $(-5, 0)$ is on the edge of the shadow, how far above the $x$-axis is the lamp located?



## DISCOVERY PROJECT FAMILIES OF IMPLICIT CURVES

In this project you will explore the changing shapes of implicitly defined curves as you vary the constants in a family, and determine which features are common to all members of the family.

**1.** Consider the family of curves

$$y^2 - 2x^2(x + 8) = c[(y + 1)^2(y + 9) - x^2]$$

(a) By graphing the curves with $c = 0$ and $c = 2$, determine how many points of intersection there are. (You might have to zoom in to find all of them.)
(b) Now add the curves with $c = 5$ and $c = 10$ to your graphs in part (a). What do you notice? What about other values of $c$?

**2.** (a) Graph several members of the family of curves

$$x^2 + y^2 + cx^2y^2 = 1$$

Describe how the graph changes as you change the value of $c$.
(b) What happens to the curve when $c = -1$? Describe what appears on the screen. Can you prove it algebraically?
(c) Find $y'$ by implicit differentiation. For the case $c = -1$, is your expression for $y'$ consistent with what you discovered in part (b)?

## 2.7 Rates of Change in the Natural and Social Sciences

We know that if $y = f(x)$, then the derivative $dy/dx$ can be interpreted as the rate of change of $y$ with respect to $x$. In this section we examine some of the applications of this idea to physics, chemistry, biology, economics, and other sciences.

Let's recall from Section 2.1 the basic idea behind rates of change. If $x$ changes from $x_1$ to $x_2$, then the change in $x$ is

$$\Delta x = x_2 - x_1$$

and the corresponding change in $y$ is

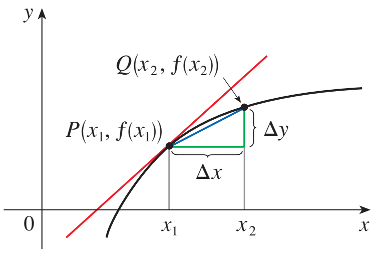
$$\Delta y = f(x_2) - f(x_1)$$

The difference quotient

$$\frac{\Delta y}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

is **the average rate of change of $y$ with respect to $x$** over the interval $[x_1, x_2]$ and can be interpreted as the slope of the secant line $PQ$ in Figure 1. Its limit as $\Delta x \to 0$ is the derivative $f'(x_1)$, which can therefore be interpreted as the **instantaneous rate of change of $y$ with respect to $x$** or the slope of the tangent line at $P(x_1, f(x_1))$. Using Leibniz notation, we write the process in the form

$$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x}$$



$m_{PQ}$ = average rate of change
$m = f'(x_1)$ = instantaneous rate of change

**FIGURE 1**

Whenever the function $y = f(x)$ has a specific interpretation in one of the sciences, its derivative will have a specific interpretation as a rate of change. (As we discussed in

Section 2.1, the units for $dy/dx$ are the units for $y$ divided by the units for $x$.) We now look at some of these interpretations in the natural and social sciences.

## Physics

If $s = f(t)$ is the position function of a particle that is moving in a straight line, then $\Delta s/\Delta t$ represents the average velocity over a time period $\Delta t$, and $v = ds/dt$ represents the instantaneous **velocity** (the rate of change of displacement with respect to time). The instantaneous rate of change of velocity with respect to time is **acceleration**: $a(t) = v'(t) = s''(t)$. This was discussed in Sections 2.1 and 2.2, but now that we know the differentiation formulas, we are able to more easily solve problems involving the motion of objects.

**EXAMPLE 1** The position of a particle is given by the equation

$$s = f(t) = t^3 - 6t^2 + 9t$$

where $t$ is measured in seconds and $s$ in meters.

(a) Find the velocity at time $t$.
(b) What is the velocity after 2 s? After 4 s?
(c) When is the particle at rest?
(d) When is the particle moving forward (that is, in the positive direction)?
(e) Draw a diagram to represent the motion of the particle.
(f) Find the total distance traveled by the particle during the first five seconds.
(g) Find the acceleration at time $t$ and after 4 s.
(h) Graph the position, velocity, and acceleration functions for $0 \leqslant t \leqslant 5$.
(i) When is the particle speeding up? When is it slowing down?

**SOLUTION**

(a) The velocity function is the derivative of the position function:

$$s = f(t) = t^3 - 6t^2 + 9t$$

$$v(t) = \frac{ds}{dt} = 3t^2 - 12t + 9$$

(b) The velocity after 2 s means the instantaneous velocity when $t = 2$, that is,

$$v(2) = \left.\frac{ds}{dt}\right|_{t=2} = 3(2)^2 - 12(2) + 9 = -3 \text{ m/s}$$

The velocity after 4 s is

$$v(4) = 3(4)^2 - 12(4) + 9 = 9 \text{ m/s}$$

(c) The particle is at rest when $v(t) = 0$, that is,

$$3t^2 - 12t + 9 = 3(t^2 - 4t + 3) = 3(t - 1)(t - 3) = 0$$

and this is true when $t = 1$ or $t = 3$. Thus the particle is at rest after 1 s and after 3 s.

(d) The particle moves in the positive direction when $v(t) > 0$, that is,

$$3t^2 - 12t + 9 = 3(t - 1)(t - 3) > 0$$

This inequality is true when both factors are positive ($t > 3$) or when both factors are

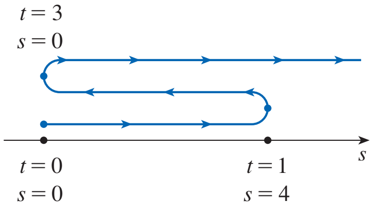

**FIGURE 2**

negative ($t < 1$). Thus the particle moves in the positive direction in the time intervals $t < 1$ and $t > 3$. It moves backward (in the negative direction) when $1 < t < 3$.

(e) Using the information from part (d) we make a schematic sketch in Figure 2 of the motion of the particle back and forth along a line (the $s$-axis).

(f) Because of what we learned in parts (d) and (e), we need to calculate the distances traveled during the time intervals [0, 1], [1, 3], and [3, 5] separately.

The distance traveled in the first second is

$$|f(1) - f(0)| = |4 - 0| = 4 \text{ m}$$

From $t = 1$ to $t = 3$ the distance traveled is

$$|f(3) - f(1)| = |0 - 4| = 4 \text{ m}$$

From $t = 3$ to $t = 5$ the distance traveled is

$$|f(5) - f(3)| = |20 - 0| = 20 \text{ m}$$

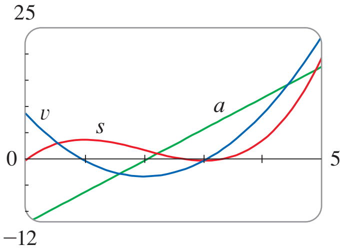

**FIGURE 3**

The total distance is $4 + 4 + 20 = 28$ m.

(g) The acceleration is the derivative of the velocity function:

$$a(t) = \frac{d^2s}{dt^2} = \frac{dv}{dt} = 6t - 12$$

$$a(4) = 6(4) - 12 = 12 \text{ m/s}^2$$

(h) Figure 3 shows the graphs of $s$, $v$, and $a$.

(i) The particle speeds up when the velocity is positive and increasing ($v$ and $a$ are both positive) and also when the velocity is negative and decreasing ($v$ and $a$ are both negative). In other words, the particle speeds up when the velocity and acceleration have the same sign. (The particle is pushed in the same direction it is moving.) From Figure 3 we see that this happens when $1 < t < 2$ and when $t > 3$. The particle slows down when $v$ and $a$ have opposite signs, that is, when $0 \leqslant t < 1$ and when $2 < t < 3$. Figure 4 summarizes the motion of the particle.

**EXAMPLE 2** If a rod or piece of wire is homogeneous, then its *linear density* is uniform and is defined as the mass per unit length ($\rho = m/l$) and measured in kilograms per meter. Suppose, however, that the rod is not homogeneous but that its mass measured from its left end to a point $x$ is $m = f(x)$, as shown in Figure 5.

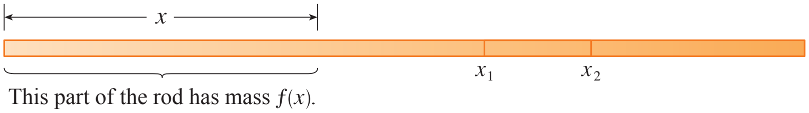

**FIGURE 5**

The mass of the part of the rod that lies between $x = x_1$ and $x = x_2$ is given by $\Delta m = f(x_2) - f(x_1)$, so the average density of that part of the rod is

$$\text{average density} = \frac{\Delta m}{\Delta x} = \frac{f(x_2) - f(x_1)}{x_2 - x_1}$$

If we now let $\Delta x \to 0$ (that is, $x_2 \to x_1$), we are computing the average density over smaller and smaller intervals. The **linear density** $\rho$ at $x_1$ is the limit of these average densities as $\Delta x \to 0$; that is, the linear density is the rate of change of mass with respect to length. Symbolically,

$$\rho = \lim_{\Delta x \to 0} \frac{\Delta m}{\Delta x} = \frac{dm}{dx}$$

Thus the linear density of the rod is the derivative of mass with respect to length.

For instance, if $m = f(x) = \sqrt{x}$, where $x$ is measured in meters and $m$ in kilograms, then the average density of the part of the rod given by $1 \leqslant x \leqslant 1.2$ is

$$\frac{\Delta m}{\Delta x} = \frac{f(1.2) - f(1)}{1.2 - 1} = \frac{\sqrt{1.2} - 1}{0.2} \approx 0.48 \text{ kg/m}$$

while the density right at $x = 1$ is

$$\rho = \left.\frac{dm}{dx}\right|_{x=1} = \left.\frac{1}{2\sqrt{x}}\right|_{x=1} = 0.50 \text{ kg/m}$$ ■

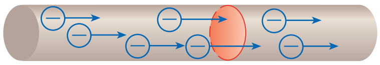

**FIGURE 6**

**EXAMPLE 3** A current exists whenever electric charges move. Figure 6 shows part of a wire and electrons moving through a plane surface, shaded red. If $\Delta Q$ is the net charge that passes through this surface during a time period $\Delta t$, then the average current during this time interval is defined as

$$\text{average current} = \frac{\Delta Q}{\Delta t} = \frac{Q_2 - Q_1}{t_2 - t_1}$$

If we take the limit of this average current over smaller and smaller time intervals, we get what is called the **current** $I$ at a given time $t_1$:

$$I = \lim_{\Delta t \to 0} \frac{\Delta Q}{\Delta t} = \frac{dQ}{dt}$$

Thus the current is the rate at which charge flows through a surface. It is measured in units of charge per unit time (often coulombs per second, called amperes). ■

Velocity, density, and current are not the only rates of change that are important in physics. Others include power (the rate at which work is done), the rate of heat flow, temperature gradient (the rate of change of temperature with respect to position), and the rate of decay of a radioactive substance in nuclear physics.

## ■ Chemistry

**EXAMPLE 4** A chemical reaction results in the formation of one or more substances (called *products*) from one or more starting materials (called *reactants*). For instance, the "equation"

$$2H_2 + O_2 \rightarrow 2H_2O$$

indicates that two molecules of hydrogen and one molecule of oxygen form two molecules of water. Let's consider the reaction

$$\mathrm{A} + \mathrm{B} \rightarrow \mathrm{C}$$

where A and B are the reactants and C is the product. The **concentration** of a reactant A is the number of moles (1 mole $= 6.022 \times 10^{23}$ molecules) per liter and is denoted by $[\mathrm{A}]$. The concentration varies during a reaction, so $[\mathrm{A}]$, $[\mathrm{B}]$, and $[\mathrm{C}]$ are all functions of time ($t$). The average rate of reaction of the product C over a time interval $t_1 \leqslant t \leqslant t_2$ is

$$\frac{\Delta[\mathrm{C}]}{\Delta t} = \frac{[\mathrm{C}](t_2) - [\mathrm{C}](t_1)}{t_2 - t_1}$$

But chemists are interested in the **instantaneous rate of reaction** because it gives information about the mechanism of the chemical reaction. The instantaneous rate of reaction is obtained by taking the limit of the average rate of reaction as the time interval $\Delta t$ approaches 0:

$$\text{rate of reaction} = \lim_{\Delta t \to 0} \frac{\Delta[\mathrm{C}]}{\Delta t} = \frac{d[\mathrm{C}]}{dt}$$

Since the concentration of the product increases as the reaction proceeds, the derivative $d[\mathrm{C}]/dt$ will be positive, and so the rate of reaction of C is positive. The concentrations of the reactants, however, decrease during the reaction, so, to make the rates of reaction of A and B positive numbers, we put minus signs in front of the derivatives $d[\mathrm{A}]/dt$ and $d[\mathrm{B}]/dt$. Since $[\mathrm{A}]$ and $[\mathrm{B}]$ each decrease at the same rate that $[\mathrm{C}]$ increases, we have

$$\text{rate of reaction} = \frac{d[\mathrm{C}]}{dt} = -\frac{d[\mathrm{A}]}{dt} = -\frac{d[\mathrm{B}]}{dt}$$

More generally, it turns out that for a reaction of the form

$$a\mathrm{A} + b\mathrm{B} \rightarrow c\mathrm{C} + d\mathrm{D}$$

we have

$$-\frac{1}{a}\frac{d[\mathrm{A}]}{dt} = -\frac{1}{b}\frac{d[\mathrm{B}]}{dt} = \frac{1}{c}\frac{d[\mathrm{C}]}{dt} = \frac{1}{d}\frac{d[\mathrm{D}]}{dt}$$

The rate of reaction can be determined from data and graphical methods. In some cases there are explicit formulas for the concentrations as functions of time that enable us to compute the rate of reaction (see Exercise 26). ■

**EXAMPLE 5** One of the quantities of interest in thermodynamics is compressibility. If a given substance is kept at a constant temperature, then its volume $V$ depends on its pressure $P$. We can consider the rate of change of volume with respect to pressure—namely, the derivative $dV/dP$. As $P$ increases, $V$ decreases, so $dV/dP < 0$. The **compressibility** is defined by introducing a minus sign and dividing this derivative by the volume $V$:

$$\text{isothermal compressibility} = \beta = -\frac{1}{V}\frac{dV}{dP}$$

Thus $\beta$ measures how fast, per unit volume, the volume of a substance decreases as the pressure on it increases at constant temperature.

For instance, the volume $V$ (in cubic meters) of a sample of air at 25°C was found to be related to the pressure $P$ (in kilopascals) by the equation

$$V = \frac{5.3}{P}$$

The rate of change of $V$ with respect to $P$ when $P = 50$ kPa is

$$\begin{aligned}\left.\frac{dV}{dP}\right|_{P=50} &= -\left.\frac{5.3}{P^2}\right|_{P=50}\\ &= -\frac{5.3}{2500} = -0.00212 \text{ m}^3/\text{kPa}\end{aligned}$$

The compressibility at that pressure is

$$\beta = -\frac{1}{V}\left.\frac{dV}{dP}\right|_{P=50} = \frac{0.00212}{\dfrac{5.3}{50}} = 0.02 \text{ (m}^3/\text{kPa)/m}^3$$ ■

## ■ Biology

**EXAMPLE 6** Let $n = f(t)$ be the number of individuals in an animal or plant population at time $t$. The change in the population size between the times $t = t_1$ and $t = t_2$ is $\Delta n = f(t_2) - f(t_1)$, and so the average rate of growth during the time period $t_1 \leqslant t \leqslant t_2$ is

$$\text{average rate of growth} = \frac{\Delta n}{\Delta t} = \frac{f(t_2) - f(t_1)}{t_2 - t_1}$$

The **instantaneous rate of growth** is obtained from this average rate of growth by letting the time period $\Delta t$ approach 0:

$$\text{growth rate} = \lim_{\Delta t \to 0}\frac{\Delta n}{\Delta t} = \frac{dn}{dt}$$

Strictly speaking, this is not quite accurate because the actual graph of a population function $n = f(t)$ would be a step function that is discontinuous whenever a birth or death occurs and therefore not differentiable. However, for a large animal

or plant population, we can replace the graph by a smooth approximating curve as in Figure 7.

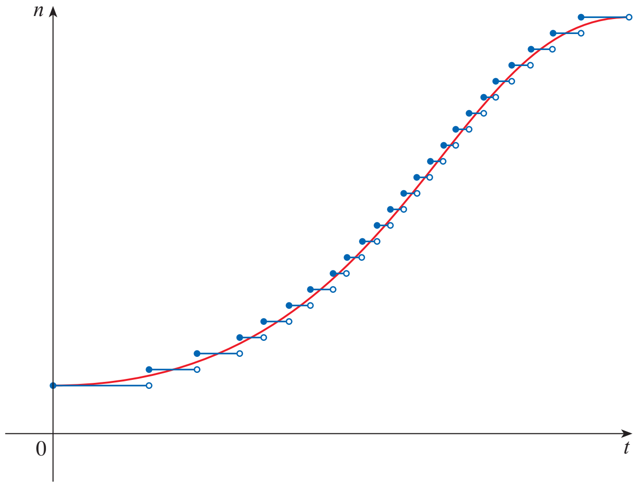

**FIGURE 7**
A smooth curve approximating a growth function

Science Photo Library / Alamy Stock Photo

*E. coli* bacteria measure about 2 micrometers (μm) long and 0.75 μm wide. The image was produced with a scanning electron microscope.

To be more specific, consider a population of bacteria in a homogeneous nutrient medium. Suppose that by sampling the population at certain intervals it is determined that the population doubles every hour. If the initial population is $n_0$ and the time $t$ is measured in hours, then

$$f(1) = 2f(0) = 2n_0$$
$$f(2) = 2f(1) = 2^2 n_0$$
$$f(3) = 2f(2) = 2^3 n_0$$

and, in general,

$$f(t) = 2^t n_0$$

The population function is $n = n_0 2^t$.

This an example of an exponential function. In Chapter 6 we will discuss exponential functions in general; at that time we will be able to compute their derivatives and thereby determine the rate of growth of the bacteria population. ■

**EXAMPLE 7** When we consider the flow of blood through a blood vessel, such as a vein or artery, we can model the shape of the blood vessel by a cylindrical tube with radius $R$ and length $l$ as illustrated in Figure 8.

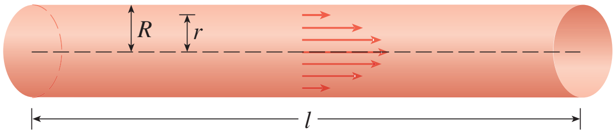

**FIGURE 8**
Blood flow in an artery

Because of friction at the walls of the tube, the velocity $v$ of the blood is greatest along the central axis of the tube and decreases as the distance $r$ from the axis increases until $v$ becomes 0 at the wall. The relationship between $v$ and $r$ is given by the **law of laminar flow**, which was experimentally derived by the French physicist Jean Léonard

Marie Poiseuille in 1838. This law states that

$$\boxed{1} \qquad v = \frac{P}{4\eta l}(R^2 - r^2)$$

where $\eta$ is the viscosity of the blood and $P$ is the pressure difference between the ends of the tube. If $P$ and $l$ are constant, then $v$ is a function of $r$ with domain $[0, R]$.

For more detailed information, see W. Nichols, M. O'Rourke, and C. Vlachopoulos (eds.), *McDonald's Blood Flow in Arteries: Theoretical, Experimental, and Clinical Principles*, 6th ed. (Boca Raton, FL, 2011).

The average rate of change of the velocity as we move from $r = r_1$ outward to $r = r_2$ is given by

$$\frac{\Delta v}{\Delta r} = \frac{v(r_2) - v(r_1)}{r_2 - r_1}$$

and if we let $\Delta r \to 0$, we obtain the **velocity gradient**, that is, the instantaneous rate of change of velocity with respect to $r$:

$$\text{velocity gradient} = \lim_{\Delta r \to 0} \frac{\Delta v}{\Delta r} = \frac{dv}{dr}$$

Using Equation 1, we obtain

$$\frac{dv}{dr} = \frac{P}{4\eta l}(0 - 2r) = -\frac{Pr}{2\eta l}$$

For one of the smaller human arteries we can take $\eta = 0.027$, $R = 0.008$ cm, $l = 2$ cm, and $P = 4000$ dynes/cm$^2$, which gives

$$\begin{aligned} v &= \frac{4000}{4(0.027)2}(0.000064 - r^2) \\ &\approx 1.85 \times 10^4(6.4 \times 10^{-5} - r^2) \end{aligned}$$

At $r = 0.002$ cm the blood is flowing at a speed of

$$v(0.002) \approx 1.85 \times 10^4(64 \times 10^{-6} - 4 \times 10^{-6}) = 1.11 \text{ cm/s}$$

and the velocity gradient at that point is

$$\left.\frac{dv}{dr}\right|_{r=0.002} = -\frac{4000(0.002)}{2(0.027)2} \approx -74 \text{ (cm/s)/cm}$$

To get a feeling for what this statement means, let's change our units from centimeters to micrometers (1 cm = 10,000 μm). Then the radius of the artery is 80 μm. The velocity at the central axis is 11,850 μm/s, which decreases to 11,110 μm/s at a distance of $r = 20$ μm. The fact that $dv/dr = -74$ (μm/s)/μm means that, when $r = 20$ μm, the velocity is decreasing at a rate of about 74 μm/s for each micrometer that we proceed away from the center. ■

## ■ Economics

**EXAMPLE 8** Suppose $C(x)$ is the total cost that a company incurs in producing $x$ units of a certain commodity. The function $C$ is called a **cost function**. If the number of items produced is increased from $x_1$ to $x_2$, then the additional cost is $\Delta C = C(x_2) - C(x_1)$, and the average rate of change of the cost is

$$\frac{\Delta C}{\Delta x} = \frac{C(x_2) - C(x_1)}{x_2 - x_1} = \frac{C(x_1 + \Delta x) - C(x_1)}{\Delta x}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The limit of this quantity as $\Delta x \to 0$, that is, the instantaneous rate of change of cost with respect to the number of items produced, is called the **marginal cost** by economists:

$$\text{marginal cost} = \lim_{\Delta x \to 0} \frac{\Delta C}{\Delta x} = \frac{dC}{dx}$$

[Since $x$ often takes on only integer values, it may not make literal sense to let $\Delta x$ approach 0, but we can always replace $C(x)$ by a smooth approximating function as in Example 6.]

Taking $\Delta x = 1$ and $n$ large (so that $\Delta x$ is small compared to $n$), we have

$$C'(n) \approx C(n + 1) - C(n)$$

Thus the marginal cost of producing $n$ units is approximately equal to the cost of producing one more unit [the $(n + 1)$st unit].

It is often appropriate to represent a total cost function by a polynomial

$$C(x) = a + bx + cx^2 + dx^3$$

where $a$ represents the overhead cost (rent, heat, maintenance) and the other terms represent the cost of raw materials, labor, and so on. (The cost of raw materials may be proportional to $x$, but labor costs might depend partly on higher powers of $x$ because of overtime costs and inefficiencies involved in large-scale operations.)

For instance, suppose a company has estimated that the cost (in dollars) of producing $x$ items is

$$C(x) = 10{,}000 + 5x + 0.01x^2$$

Then the marginal cost function is

$$C'(x) = 5 + 0.02x$$

The marginal cost at the production level of 500 items is

$$C'(500) = 5 + 0.02(500) = \$15/\text{item}$$

This gives the rate at which costs are increasing with respect to the production level when $x = 500$ and predicts the cost of the 501st item.

The actual cost of producing the 501st item is

$$\begin{aligned} C(501) - C(500) &= [10{,}000 + 5(501) + 0.01(501)^2] \\ &\qquad - [10{,}000 + 5(500) + 0.01(500)^2] \\ &= \$15.01 \end{aligned}$$

Notice that $C'(500) \approx C(501) - C(500)$. ■

Economists also study marginal demand, marginal revenue, and marginal profit, the derivatives of the demand, revenue, and profit functions. These will be considered in Chapter 3 after we have developed techniques for finding the maximum and minimum values of functions.

## Other Sciences

Rates of change occur in all the sciences. A geologist is interested in knowing the rate at which an intruded body of molten rock cools by conduction of heat into surrounding rocks. An engineer wants to know the rate at which water flows out of a reservoir. An urban geographer is interested in the rate of change of the population density in a city as the distance from the city center increases. A meteorologist is concerned with the rate of change of atmospheric pressure with respect to height (see Exercise 6.5.19).

In psychology, those interested in learning theory study the learning curve, which graphs the performance $P(t)$ of someone learning a skill as a function of the training time $t$. Of particular interest is the rate at which performance improves as time passes, that is, $dP/dt$. Psychologists have also studied the phenomenon of memory and have developed models for the rate of memory retention (see Exercise 38). They also study the difficulty involved in performing certain tasks and the rate at which difficulty increases when a given parameter is changed (see Exercise 6.4.98).

In sociology, differential calculus is used in analyzing the spread of rumors (or innovations or fads or fashions). If $p(t)$ denotes the proportion of a population that knows a rumor by time $t$, then the derivative $dp/dt$ represents the rate of spread of the rumor (see Exercise 6.2.65).

## A Single Idea, Many Interpretations

Velocity, density, current, power, and temperature gradient in physics; rate of reaction and compressibility in chemistry; rate of growth and blood velocity gradient in biology; marginal cost and marginal profit in economics; rate of heat flow in geology; rate of improvement of performance in psychology; rate of spread of a rumor in sociology—these are all special cases of a single mathematical concept, the derivative.

All of these different applications of the derivative illustrate the fact that part of the power of mathematics lies in its abstractness. A single abstract mathematical concept (such as the derivative) can have different interpretations in each of the sciences. When we develop the properties of the mathematical concept once and for all, we can then turn around and apply these results to all of the sciences. This is much more efficient than developing properties of special concepts in each separate science. The French mathematician Joseph Fourier (1768–1830) put it succinctly: “Mathematics compares the most diverse phenomena and discovers the secret analogies that unite them.”

## 2.7 Exercises

**1–4** A particle moves according to a law of motion $s = f(t)$, $t \geqslant 0$, where $t$ is measured in seconds and $s$ in feet.

(a) Find the velocity at time $t$.

(b) What is the velocity after 1 second?

(c) When is the particle at rest?

(d) When is the particle moving in the positive direction?

(e) Find the total distance traveled during the first 6 seconds.

(f) Draw a diagram like Figure 2 to illustrate the motion of the particle.

(g) Find the acceleration at time $t$ and after 1 second.

(h) Graph the position, velocity, and acceleration functions for $0 \leqslant t \leqslant 6$.

(i) When is the particle speeding up? When is it slowing down?

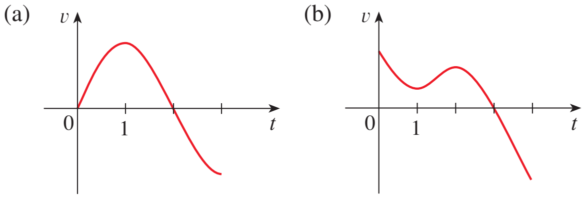
**1.** $f(t) = t^3 - 9t^2 + 24t$

**2.** $f(t) = 0.01t^4 - 0.04t^3$

**3.** $f(t) = \sin(\pi t/2)$

**4.** $f(t) = 9t/(t^2 + 9)$

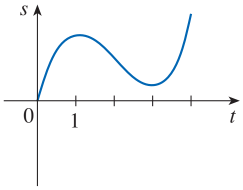
**5.** Graphs of the *velocity* functions of two particles are shown, where $t$ is measured in seconds. When is each particle speeding up? When is it slowing down? Explain.



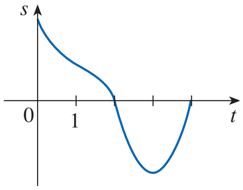
Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**6.** Graphs of the *position* functions of two particles are shown, where $t$ is measured in seconds. When is the velocity of each particle positive? When is it negative? When is each particle speeding up? When is it slowing down? Explain.

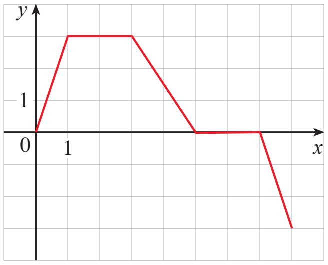
(a)



(b)



**7.** Suppose that the graph of the velocity function of a particle is as shown in the figure, where $t$ is measured in seconds. When is the particle traveling forward (in the positive direction)? When is it traveling backward? What is happening when $5 < t < 7$?



**8.** For the particle described in Exercise 7, sketch a graph of the acceleration function. When is the particle speeding up? When is it slowing down? When is it traveling at a constant speed?

**9.** The height (in meters) of a projectile shot vertically upward from a point 2 m above ground level with an initial velocity of 24.5 m/s is $h = 2 + 24.5t - 4.9t^2$ after $t$ seconds.

(a) Find the velocity after 2 s and after 4 s.
(b) When does the projectile reach its maximum height?
(c) What is the maximum height?
(d) When does it hit the ground?
(e) With what velocity does it hit the ground?

**10.** If a ball is thrown vertically upward with a velocity of 80 ft/s, then its height after $t$ seconds is $s = 80t - 16t^2$.

(a) What is the maximum height reached by the ball?
(b) What is the velocity of the ball when it is 96 ft above the ground on its way up? On its way down?

**11.** If a rock is thrown vertically upward from the surface of Mars with velocity 15 m/s, its height after $t$ seconds is $h = 15t - 1.86t^2$.

(a) What is the velocity of the rock after 2 s?
(b) What is the velocity of the rock when its height is 25 m on its way up? On its way down?

**12.** A particle moves with position function

$$s = t^4 - 4t^3 - 20t^2 + 20t \qquad t \geqslant 0$$

(a) At what time does the particle have a velocity of 20 m/s?
(b) At what time is the acceleration 0? What is the significance of this value of $t$?

**13.** (a) A company makes computer chips from square wafers of silicon. A process engineer wants to keep the side length of a wafer very close to 15 mm and needs to know how the area $A(x)$ of a wafer changes when the side length $x$ changes. Find $A'(15)$ and explain its meaning in this situation.

(b) Show that the rate of change of the area of a square with respect to its side length is half its perimeter. Try to explain geometrically why this is true by drawing a square whose side length $x$ is increased by an amount $\Delta x$. How can you approximate the resulting change in area $\Delta A$ if $\Delta x$ is small?

**14.** (a) Sodium chlorate crystals are easy to grow in the shape of cubes by allowing a solution of water and sodium chlorate to evaporate slowly. If $V$ is the volume of such a cube with side length $x$, calculate $dV/dx$ when $x = 3$ mm and explain its meaning.

(b) Show that the rate of change of the volume of a cube with respect to its edge length is equal to half the surface area of the cube. Explain geometrically why this result is true by arguing by analogy with Exercise 13(b).

**15.** (a) Find the average rate of change of the area of a circle with respect to its radius $r$ as $r$ changes from

(i) 2 to 3  (ii) 2 to 2.5  (iii) 2 to 2.1

(b) Find the instantaneous rate of change when $r = 2$.

(c) Show that the rate of change of the area of a circle with respect to its radius (at any $r$) is equal to the circumference of the circle. Try to explain geometrically why this is true by drawing a circle whose radius is increased by an amount $\Delta r$. How can you approximate the resulting change in area $\Delta A$ if $\Delta r$ is small?

**16.** A stone is dropped into a lake, creating a circular ripple that travels outward at a speed of 60 cm/s. Find the rate at which the area within the circle is increasing after (a) 1 s, (b) 3 s, and (c) 5 s. What can you conclude?

**17.** A spherical balloon is being inflated. Find the rate of increase of the surface area ($S = 4\pi r^2$) with respect to the radius $r$ when $r$ is (a) 1 ft, (b) 2 ft, and (c) 3 ft. What conclusion can you make?

**18.** (a) The volume of a growing spherical cell is $V = \frac{4}{3}\pi r^3$, where the radius $r$ is measured in micrometers ($1\ \mu\text{m} = 10^{-6}$ m). Find the average rate of change of $V$ with respect to $r$ when $r$ changes from

(i) 5 to 8 μm  (ii) 5 to 6 μm  (iii) 5 to 5.1 μm

(b) Find the instantaneous rate of change of $V$ with respect to $r$ when $r = 5$ μm.

(c) Show that the rate of change of the volume of a sphere with respect to its radius is equal to its surface area. Explain geometrically why this result is true. Argue by analogy with Exercise 15(c).

**19.** The mass of the part of a metal rod that lies between its left end and a point $x$ meters to the right is $3x^2$ kg. Find the linear density (see Example 2) when $x$ is (a) 1 m, (b) 2 m, and (c) 3 m. Where is the density the highest? The lowest?

**20.** If a cylindrical water tank holds 5000 gallons, and the water drains from the bottom of the tank in 40 minutes, then Torricelli's Law gives the volume $V$ of water remaining in the tank after $t$ minutes as

$$V = 5000\left(1 - \tfrac{1}{40}t\right)^2 \qquad 0 \leqslant t \leqslant 40$$

Find the rate at which water is draining from the tank after (a) 5 min, (b) 10 min, (c) 20 min, and (d) 40 min. At what time is the water flowing out the fastest? The slowest? Summarize your findings.

**21.** The quantity of charge $Q$ in coulombs (C) that has passed through a point in a wire up to time $t$ (measured in seconds) is given by $Q(t) = t^3 - 2t^2 + 6t + 2$. Find the current when (a) $t = 0.5$ s and (b) $t = 1$ s. (See Example 3. The unit of current is an ampere [1 A = 1 C/s].) At what time is the current lowest?

**22.** Newton's Law of Gravitation says that the magnitude $F$ of the force exerted by a body of mass $m$ on a body of mass $M$ is

$$F = \frac{GmM}{r^2}$$

where $G$ is the gravitational constant and $r$ is the distance between the bodies.

(a) Find $dF/dr$ and explain its meaning. What does the minus sign indicate?

(b) Suppose it is known that the earth attracts an object with a force that decreases at the rate of 2 N/km when $r = 20{,}000$ km. How fast does this force change when $r = 10{,}000$ km?

**23.** The force $F$ acting on a body with mass $m$ and velocity $v$ is the rate of change of momentum: $F = (d/dt)(mv)$. If $m$ is constant, this becomes $F = ma$, where $a = dv/dt$ is the acceleration. But in the theory of relativity, the mass of a particle varies with $v$ as follows: $m = m_0/\sqrt{1 - v^2/c^2}$ where $m_0$ is the mass of the particle at rest and $c$ is the speed of light. Show that

$$F = \frac{m_0 a}{(1 - v^2/c^2)^{3/2}}$$

**24.** Some of the highest tides in the world occur in the Bay of Fundy on the Atlantic Coast of Canada. At Hopewell Cape the water depth at low tide is about 2.0 m and at high tide it is about 12.0 m. The natural period of oscillation is a little more than 12 hours and on a day in June, high tide occurred at 6:45 AM. This helps explain the following model for the water depth $D$ (in meters) as a function of the time $t$ (in hours after midnight) on that day:

$$D(t) = 7 + 5\cos[0.503(t - 6.75)]$$

How fast was the tide rising (or falling) at the following times?

(a) 3:00 AM (b) 6:00 AM

(c) 9:00 AM (d) Noon

**25.** Boyle's Law states that when a sample of gas is compressed at a constant temperature, the product of the pressure and the volume remains constant: $PV = C$.

(a) Find the rate of change of volume with respect to pressure.

(b) A sample of gas is in a container at low pressure and is steadily compressed at constant temperature for 10 minutes. Is the volume decreasing more rapidly at the beginning or the end of the 10 minutes? Explain.

(c) Prove that the isothermal compressibility (see Example 5) is given by $\beta = 1/P$.

**26.** If, in Example 4, one molecule of the product C is formed from one molecule of the reactant A and one molecule of the reactant B, and the initial concentrations of A and B have a common value $[A] = [B] = a$ moles/L, then

$$[C] = a^2kt/(akt + 1)$$

where $k$ is a constant.

(a) Find the rate of reaction at time $t$.

(b) Show that if $x = [C]$, then

$$\frac{dx}{dt} = k(a - x)^2$$

T **27.** The table gives the world population $P(t)$, in millions, where $t$ is measured in years and $t = 0$ corresponds to the year 1900.

| $t$ | Population (millions) | $t$ | Population (millions) |
|---|---|---|---|
| 0 | 1650 | 60 | 3040 |
| 10 | 1750 | 70 | 3710 |
| 20 | 1860 | 80 | 4450 |
| 30 | 2070 | 90 | 5280 |
| 40 | 2300 | 100 | 6080 |
| 50 | 2560 | 110 | 6870 |

(a) Estimate the rate of population growth in 1920 and in 1980 by averaging the slopes of two secant lines.

(b) Use a graphing calculator or computer to find a cubic function (a third-degree polynomial) that models the data.

(c) Use your model in part (b) to find a model for the rate of population growth.

(d) Use part (c) to estimate the rates of growth in 1920 and 1980. Compare with your estimates in part (a).

(e) Estimate the rate of growth in 1985.

T **28.** The table shows how the average age of first marriage of Japanese women has varied since 1950.

| $t$ | $A(t)$ | $t$ | $A(t)$ |
|---|---|---|---|
| 1950 | 23.0 | 1985 | 25.5 |
| 1955 | 23.8 | 1990 | 25.9 |
| 1960 | 24.4 | 1995 | 26.3 |
| 1965 | 24.5 | 2000 | 27.0 |
| 1970 | 24.2 | 2005 | 28.0 |
| 1975 | 24.7 | 2010 | 28.8 |
| 1980 | 25.2 | 2015 | 29.4 |

(a) Use a graphing calculator or computer to model these data with a fourth-degree polynomial.
(b) Use part (a) to find a model for $A'(t)$.
(c) Estimate the rate of change of marriage age for women in 1990.
(d) Graph the data points and the models for $A$ and $A'$.

**29.** Refer to the law of laminar flow given in Example 7. Consider a blood vessel with radius 0.01 cm, length 3 cm, pressure difference 3000 dynes/cm$^2$, and viscosity $\eta = 0.027$.
(a) Find the velocity of the blood along the centerline $r = 0$, at radius $r = 0.005$ cm, and at the wall $r = R = 0.01$ cm.
(b) Find the velocity gradient at $r = 0$, $r = 0.005$, and $r = 0.01$.
(c) Where is the velocity the greatest? Where is the velocity changing most?

**30.** The frequency of vibrations of a vibrating violin string is given by

$$f = \frac{1}{2L}\sqrt{\frac{T}{\rho}}$$

where $L$ is the length of the string, $T$ is its tension, and $\rho$ is its linear density. [See Chapter 11 in D. E. Hall, *Musical Acoustics*, 3rd ed. (Pacific Grove, CA, 2002).]
(a) Find the rate of change of the frequency with respect to
  (i) the length (when $T$ and $\rho$ are constant),
  (ii) the tension (when $L$ and $\rho$ are constant), and
  (iii) the linear density (when $L$ and $T$ are constant).
(b) The pitch of a note (how high or low the note sounds) is determined by the frequency $f$. (The higher the frequency, the higher the pitch.) Use the signs of the derivatives in part (a) to determine what happens to the pitch of a note
  (i) when the effective length of a string is decreased by placing a finger on the string so a shorter portion of the string vibrates,
  (ii) when the tension is increased by turning a tuning peg,
  (iii) when the linear density is increased by switching to another string.

**31.** Suppose that the cost (in dollars) for a company to produce $x$ pairs of a new line of jeans is

$$C(x) = 2000 + 3x + 0.01x^2 + 0.0002x^3$$

(a) Find the marginal cost function.
(b) Find $C'(100)$ and explain its meaning. What does it predict?
(c) Compare $C'(100)$ with the cost of manufacturing the 101st pair of jeans.

**32.** The cost function for a certain commodity is

$$C(q) = 84 + 0.16q - 0.0006q^2 + 0.000003q^3$$

(a) Find and interpret $C'(100)$.
(b) Compare $C'(100)$ with the cost of producing the 101st item.

**33.** If $p(x)$ is the total value of the production when there are $x$ workers in a plant, then the *average productivity* of the workforce at the plant is

$$A(x) = \frac{p(x)}{x}$$

(a) Find $A'(x)$. Why does the company want to hire more workers if $A'(x) > 0$?
(b) Show that $A'(x) > 0$ if $p'(x)$ is greater than the average productivity.

**34.** If $R$ denotes the reaction of the body to some stimulus of strength $x$, the *sensitivity* $S$ is defined to be the rate of change of the reaction with respect to $x$. A particular example is that when the brightness $x$ of a light source is increased, the eye reacts by decreasing the area $R$ of the pupil. The experimental formula

$$R = \frac{40 + 24x^{0.4}}{1 + 4x^{0.4}}$$

has been used to model the dependence of $R$ on $x$ when $R$ is measured in square millimeters and $x$ is measured in appropriate units of brightness.
(a) Find the sensitivity.
(b) Illustrate part (a) by graphing both $R$ and $S$ as functions of $x$. Comment on the values of $R$ and $S$ at low levels of brightness. Is this what you would expect?

**35.** The gas law for an ideal gas at absolute temperature $T$ (in kelvins), pressure $P$ (in atmospheres), and volume $V$ (in liters) is $PV = nRT$, where $n$ is the number of moles of the gas and $R = 0.0821$ is the gas constant. Suppose that, at a certain instant, $P = 8.0$ atm and is increasing at a rate of 0.10 atm/min and $V = 10$ L and is decreasing at a rate of 0.15 L/min. Find the rate of change of $T$ with respect to time at that instant if $n = 10$ mol.

**36.** Invasive species often display a wave of advance as they colonize new areas. Mathematical models based on random dispersal and reproduction have demonstrated that the speed with which such waves move is given by the

function $f(r) = 2\sqrt{Dr}$, where $r$ is the reproductive rate of individuals and $D$ is a parameter quantifying dispersal. Calculate the derivative of the wave speed with respect to the reproductive rate $r$ and explain its meaning.

**37.** In the study of ecosystems, *predator-prey models* are often used to study the interaction between species. Consider populations of tundra wolves, given by $W(t)$, and caribou, given by $C(t)$, in northern Canada. The interaction has been modeled by the equations

$$\frac{dC}{dt} = aC - bCW \qquad \frac{dW}{dt} = -cW + dCW$$

(a) What values of $dC/dt$ and $dW/dt$ correspond to stable populations?

(b) How would the statement "The caribou go extinct" be represented mathematically?

(c) Suppose that $a = 0.05$, $b = 0.001$, $c = 0.05$, and $d = 0.0001$. Find all population pairs $(C, W)$ that lead to stable populations. According to this model, is it possible for the two species to live in balance or will one or both species become extinct?

**38.** Hermann Ebbinghaus (1850–1909) pioneered the study of memory. A 2011 article in the *Journal of Mathematical Psychology* presents the mathematical model

$$R(t) = a + b(1 + ct)^{-\beta}$$

for the *Ebbinghaus forgetting curve*, where $R(t)$ is the fraction of memory retained $t$ days after learning a task; $a$, $b$, and $c$ are experimentally determined constants between 0 and 1; $\beta$ is a positive constant; and $R(0) = 1$. The constants depend on the type of task being learned.

(a) What is the rate of change of retention $t$ days after a task is learned?

(b) Do you forget how to perform a task faster soon after learning it or a long time after you have learned it?

(c) What fraction of memory is permanent?

## 2.8 Related Rates

If we are pumping air into a balloon, both the volume and the radius of the balloon are increasing and their rates of increase are related to each other. But it is much easier to measure directly the rate of increase of the volume than the rate of increase of the radius.

In a related rates problem the idea is to compute the rate of change of one quantity in terms of the rate of change of another quantity (which may be more easily measured). The procedure is to find an equation that relates the two quantities and then use the Chain Rule to differentiate both sides with respect to time.

**EXAMPLE 1** Air is being pumped into a spherical balloon so that its volume increases at a rate of 100 $\text{cm}^3/\text{s}$. How fast is the radius of the balloon increasing when the diameter is 50 cm?

**PS** According to the Principles of Problem Solving discussed following Chapter 1, the first step is to understand the problem. This includes reading the problem carefully, identifying the given and the unknown, and introducing suitable notation.

**SOLUTION** We start by identifying two things:

the *given information:*

the rate of increase of the volume of air is 100 $\text{cm}^3/\text{s}$

and the *unknown:*

the rate of increase of the radius when the diameter is 50 cm

In order to express these quantities mathematically, we introduce some suggestive *notation:*

Let $V$ be the volume of the balloon and let $r$ be its radius.

The key thing to remember is that rates of change are derivatives. In this problem, the volume and the radius are both functions of the time $t$. The rate of increase of the volume with respect to time is the derivative $dV/dt$, and the rate of increase of the radius is $dr/dt$. We can therefore restate the given and the unknown as follows:

$$\textit{Given:} \qquad \frac{dV}{dt} = 100 \text{ cm}^3/\text{s}$$

$$\textit{Unknown:} \qquad \frac{dr}{dt} \quad \text{when } r = 25 \text{ cm}$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PS** The second stage of problem solving is to think of a plan for connecting the given and the unknown.

In order to connect $dV/dt$ and $dr/dt$, we first relate $V$ and $r$ by a formula—in this case, the formula for the volume of a sphere:

$$V = \tfrac{4}{3}\pi r^3$$

In order to use the given information, we differentiate each side of this equation with respect to $t$. To differentiate the right side, we need to use the Chain Rule:

$$\frac{dV}{dt} = \frac{dV}{dr}\frac{dr}{dt} = 4\pi r^2 \frac{dr}{dt}$$

Now we solve for the unknown quantity:

Notice that, although $dV/dt$ is constant, $dr/dt$ is *not* constant.

$$\frac{dr}{dt} = \frac{1}{4\pi r^2}\frac{dV}{dt}$$

If we put $r = 25$ and $dV/dt = 100$ in this equation, we obtain

$$\frac{dr}{dt} = \frac{1}{4\pi(25)^2}100 = \frac{1}{25\pi}$$

The radius of the balloon is increasing at the rate of $1/(25\pi) \approx 0.0127$ cm/s when the diameter is 50 cm. ■

**EXAMPLE 2** A ladder 10 ft long rests against a vertical wall. If the bottom of the ladder slides away from the wall at a rate of 4 ft/s, how fast is the top of the ladder sliding down the wall when the bottom of the ladder is 6 ft from the wall?

**SOLUTION** We first draw a diagram and label it as in Figure 1. Let $x$ feet be the distance from the bottom of the ladder to the wall and $y$ feet the distance from the top of the ladder to the ground. Note that $x$ and $y$ are both functions of $t$ (time, measured in seconds).

We are given that $dx/dt = 4$ ft/s and we are asked to find $dy/dt$ when $x = 6$ ft (see Figure 2). In this problem, the relationship between $x$ and $y$ is given by the Pythagorean Theorem:

$$x^2 + y^2 = 100$$

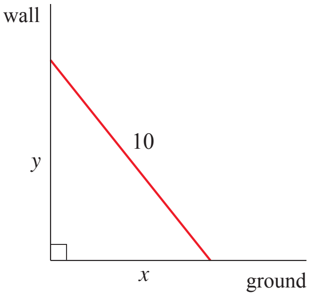

**FIGURE 1**

Differentiating each side with respect to $t$ using the Chain Rule, we have

$$2x\frac{dx}{dt} + 2y\frac{dy}{dt} = 0$$

Solving this equation for the desired rate, we obtain

$$\frac{dy}{dt} = -\frac{x}{y}\frac{dx}{dt}$$

When $x = 6$, the Pythagorean Theorem gives $y = 8$ and so, substituting these values and $dx/dt = 4$, we have

$$\frac{dy}{dt} = -\frac{6}{8}(4) = -3 \text{ ft/s}$$

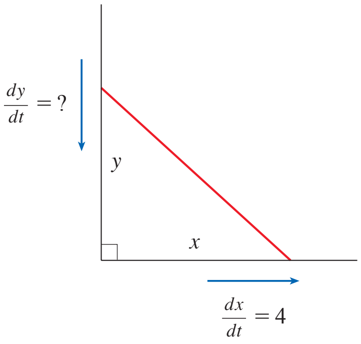

**FIGURE 2**

The fact that $dy/dt$ is negative means that the distance from the top of the ladder to the ground is *decreasing* at a rate of 3 ft/s. In other words, the top of the ladder is sliding down the wall at a rate of 3 ft/s. ■

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PS** Look back: What have we learned from Examples 1 and 2 that will help us solve future problems?

**WARNING** A common error is to substitute the given numerical information (for quantities that vary with time) too early. This should be done only *after* the differentiation. (Step 7 follows Step 6.) For instance, in Example 1 we dealt with general values of $r$ until we finally substituted $r = 25$ at the last step. (If we had put $r = 25$ earlier, we would have gotten $dV/dt = 0$, which is clearly wrong.)

**Problem Solving Strategy**

It is useful to recall some of the problem-solving principles and adapt them to related rates in light of our experience in Examples 1 and 2:

1. Read the problem carefully.
2. Draw a diagram if possible.
3. Introduce notation. Assign symbols to all quantities that are functions of time.
4. Express the given information and the required rate in terms of derivatives.
5. Write an equation that relates the various quantities of the problem. If necessary, use the geometry of the situation to eliminate one of the variables by substitution (see Example 3 below).
6. Use the Chain Rule to differentiate both sides of the equation with respect to $t$.
7. Substitute the given information into the resulting equation and solve for the unknown rate.

See also Principles of Problem Solving following Chapter 1.

The following examples further illustrate this strategy.

**EXAMPLE 3** A water tank has the shape of an inverted circular cone with base radius 2 m and height 4 m. If water is being pumped into the tank at a rate of 2 m$^3$/min, find the rate at which the water level is rising when the water is 3 m deep.

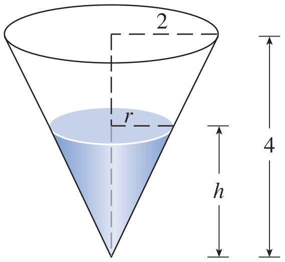

**FIGURE 3**

**SOLUTION** We first sketch the cone and label it as in Figure 3. Let $V$, $r$, and $h$ be the volume of the water, the radius of the surface, and the height of the water at time $t$, where $t$ is measured in minutes.

We are given that $dV/dt = 2$ m$^3$/min and we are asked to find $dh/dt$ when $h$ is 3 m. The quantities $V$ and $h$ are related by the equation

$$V = \tfrac{1}{3}\pi r^2 h$$

but it is very useful to express $V$ as a function of $h$ alone. In order to eliminate $r$, we use the similar triangles in Figure 3 to write

$$\frac{r}{h} = \frac{2}{4} \qquad r = \frac{h}{2}$$

and the expression for $V$ becomes

$$V = \frac{1}{3}\pi\left(\frac{h}{2}\right)^2 h = \frac{\pi}{12}h^3$$

Now we can differentiate each side with respect to $t$:

$$\frac{dV}{dt} = \frac{\pi}{4}h^2\frac{dh}{dt}$$

so

$$\frac{dh}{dt} = \frac{4}{\pi h^2}\frac{dV}{dt}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Substituting $h = 3$ m and $dV/dt = 2$ m$^3$/min, we have

$$\frac{dh}{dt} = \frac{4}{\pi(3)^2} \cdot 2 = \frac{8}{9\pi}$$

The water level is rising at a rate of $8/(9\pi) \approx 0.28$ m/min. ■

**EXAMPLE 4** Car A is traveling west at 50 mi/h and car B is traveling north at 60 mi/h. Both are headed for the intersection of the two roads. At what rate are the cars approaching each other when car A is 0.3 mi and car B is 0.4 mi from the intersection?

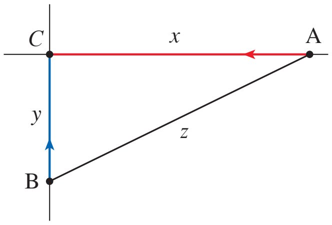

**FIGURE 4**

**SOLUTION** We draw Figure 4, where $C$ is the intersection of the roads. At a given time $t$, let $x$ be the distance from car A to $C$, let $y$ be the distance from car B to $C$, and let $z$ be the distance between the cars, where $x$, $y$, and $z$ are measured in miles.

We are given that $dx/dt = -50$ mi/h and $dy/dt = -60$ mi/h. (The derivatives are negative because $x$ and $y$ are decreasing.) We are asked to find $dz/dt$. The equation that relates $x$, $y$, and $z$ is given by the Pythagorean Theorem:

$$z^2 = x^2 + y^2$$

Differentiating each side with respect to $t$, we have

$$2z \frac{dz}{dt} = 2x \frac{dx}{dt} + 2y \frac{dy}{dt}$$

$$\frac{dz}{dt} = \frac{1}{z}\left(x \frac{dx}{dt} + y \frac{dy}{dt}\right)$$

When $x = 0.3$ mi and $y = 0.4$ mi, the Pythagorean Theorem gives $z = 0.5$ mi, so

$$\frac{dz}{dt} = \frac{1}{0.5}[0.3(-50) + 0.4(-60)] = -78 \text{ mi/h}$$

The cars are approaching each other at a rate of 78 mi/h. ■

**EXAMPLE 5** A man walks along a straight path at a speed of 4 ft/s. A spotlight is located on the ground 20 ft from the path and is kept focused on the man. At what rate is the spotlight rotating when the man is 15 ft from the point on the path closest to the light?

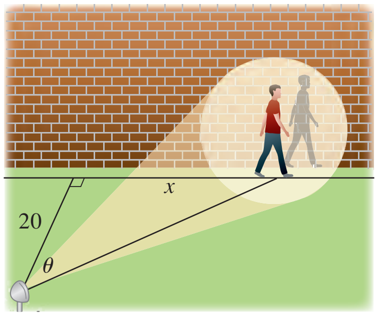

**FIGURE 5**

**SOLUTION** We draw Figure 5 and let $x$ be the distance from the man to the point on the path closest to the spotlight. We let $\theta$ be the angle between the beam of the light and the perpendicular to the path.

We are given that $dx/dt = 4$ ft/s and are asked to find $d\theta/dt$ when $x = 15$. The equation that relates $x$ and $\theta$ can be written from Figure 5:

$$\frac{x}{20} = \tan\theta \qquad x = 20\tan\theta$$

Differentiating each side with respect to $t$, we get

$$\frac{dx}{dt} = 20\sec^2\theta \frac{d\theta}{dt}$$

so

$$\frac{d\theta}{dt} = \frac{1}{20}\cos^2\theta \frac{dx}{dt}$$

$$= \frac{1}{20}\cos^2\theta\,(4) = \frac{1}{5}\cos^2\theta$$

When $x = 15$, the length of the beam is 25, so $\cos\theta = \frac{20}{25} = \frac{4}{5}$ and

$$\frac{d\theta}{dt} = \frac{1}{5}\left(\frac{4}{5}\right)^2 = \frac{16}{125} = 0.128$$

The spotlight is rotating at a rate of 0.128 rad/s. ■

$$0.128\,\frac{\text{rad}}{\text{s}} \times \frac{1\text{ rotation}}{2\pi\text{ rad}} \times \frac{60\text{ s}}{1\text{ min}}$$

$\approx$ 1.22 rotations per min

## 2.8 Exercises

**1.** (a) If $V$ is the volume of a cube with edge length $x$ and the cube expands as time passes, find $dV/dt$ in terms of $dx/dt$.

(b) If the length of the edge of a cube is increasing at a rate of 4 cm/s, how fast is the volume of the cube increasing when the edge length is 15 cm?

**2.** (a) If $A$ is the area of a circle with radius $r$ and the circle expands as time passes, find $dA/dt$ in terms of $dr/dt$.

(b) Suppose oil spills from a ruptured tanker and spreads in a circular pattern. If the radius of the oil spill increases at a constant rate of 2 m/s, how fast is the area of the spill increasing when the radius is 30 m?

**3.** Each side of a square is increasing at a rate of 6 cm/s. At what rate is the area of the square increasing when the area of the square is 16 $\text{cm}^2$?

**4.** The radius of a sphere is increasing at a rate of 4 mm/s. How fast is the volume increasing when the diameter is 80 mm?

**5.** The radius of a spherical ball is increasing at a rate of 2 cm/min. At what rate is the surface area of the ball increasing when the radius is 8 cm?

**6.** The length of a rectangle is increasing at a rate of 8 cm/s and its width is increasing at a rate of 3 cm/s. When the length is 20 cm and the width is 10 cm, how fast is the area of the rectangle increasing?

**7.** A cylindrical tank with radius 5 m is being filled with water at a rate of 3 $\text{m}^3$/min. How fast is the height of the water increasing?

**8.** The area of a triangle with sides of lengths $a$ and $b$ and contained angle $\theta$ is $A = \frac{1}{2}ab\sin\theta$. (See Formula 6 in Appendix D.)

(a) If $a = 2$ cm, $b = 3$ cm, and $\theta$ increases at a rate of 0.2 rad/min, how fast is the area increasing when $\theta = \pi/3$?

(b) If $a = 2$ cm, $b$ increases at a rate of 1.5 cm/min, and $\theta$ increases at a rate of 0.2 rad/min, how fast is the area increasing when $b = 3$ cm and $\theta = \pi/3$?

(c) If $a$ increases at a rate of 2.5 cm/min, $b$ increases at a rate of 1.5 cm/min, and $\theta$ increases at a rate of 0.2 rad/min, how fast is the area increasing when $a = 2$ cm, $b = 3$ cm, and $\theta = \pi/3$?

**9.** Suppose $4x^2 + 9y^2 = 25$, where $x$ and $y$ are functions of $t$.

(a) If $dy/dt = \frac{1}{3}$, find $dx/dt$ when $x = 2$ and $y = 1$.

(b) If $dx/dt = 3$, find $dy/dt$ when $x = -2$ and $y = 1$.

**10.** If $x^2 + y^2 + z^2 = 9$, $dx/dt = 5$, and $dy/dt = 4$, find $dz/dt$ when $(x, y, z) = (2, 2, 1)$.

**11.** The weight $w$ of an astronaut (in pounds) is related to her height $h$ above the surface of the earth (in miles) by

$$w = w_0\left(\frac{3960}{3960 + h}\right)^2$$

where $w_0$ is the weight of the astronaut on the surface of the earth. If the astronaut weighs 130 pounds on earth and is in a rocket, being propelled upward at a speed of 12 mi/s, find the rate at which her weight is changing (in lb/s) when she is 40 miles above the earth's surface.

**12.** A particle is moving along a hyperbola $xy = 8$. As it reaches the point $(4, 2)$, the $y$-coordinate is decreasing at a rate of 3 cm/s. How fast is the $x$-coordinate of the point changing at that instant?

**13–16**

(a) What quantities are given in the problem?
(b) What is the unknown?
(c) Draw a picture of the situation for any time $t$.
(d) Write an equation that relates the quantities.
(e) Finish solving the problem.

**13.** A plane flying horizontally at an altitude of 1 mi and a speed of 500 mi/h passes directly over a radar station. Find the rate at which the distance from the plane to the station is increasing when the plane is 2 mi away from the station.

**14.** If a snowball melts so that its surface area decreases at a rate of 1 $\text{cm}^2$/min, find the rate at which the diameter decreases when the diameter is 10 cm.

**15.** A street light is mounted at the top of a 15-ft-tall pole. A man 6 ft tall walks away from the pole with a speed of 5 ft/s along a straight path. How fast is the tip of his shadow moving when he is 40 ft from the pole?

**16.** At noon, ship A is 150 km west of ship B. Ship A is sailing east at 35 km/h and ship B is sailing north at 25 km/h. How fast is the distance between the ships changing at 4:00 PM?

**17.** Two cars start moving from the same point. One travels south at 60 mi/h and the other travels west at 25 mi/h. At what rate is the distance between the cars increasing two hours later?

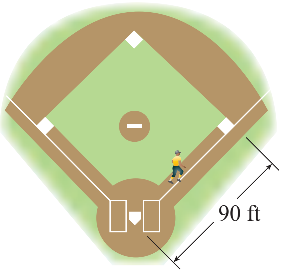
**18.** A spotlight on the ground shines on a wall 12 m away. If a man 2 m tall walks from the spotlight toward the building at a speed of 1.6 m/s, how fast is the length of his shadow on the building decreasing when he is 4 m from the building?

**19.** A man starts walking north at 4 ft/s from a point $P$. Five minutes later a woman starts walking south at 5 ft/s from a point 500 ft due east of $P$. At what rate are the people moving apart 15 min after the woman starts walking?

**20.** A baseball diamond is a square with side 90 ft. A batter hits the ball and runs toward first base with a speed of 24 ft/s.

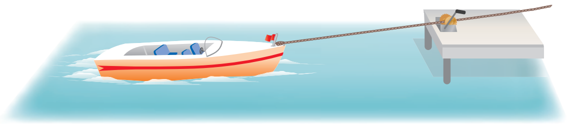
(a) At what rate is his distance from second base decreasing when he is halfway to first base?

(b) At what rate is his distance from third base increasing at the same moment?



**21.** The altitude of a triangle is increasing at a rate of 1 cm/min while the area of the triangle is increasing at a rate of 2 $\text{cm}^2$/min. At what rate is the base of the triangle changing when the altitude is 10 cm and the area is 100 $\text{cm}^2$?

**22.** A boat is pulled into a dock by a rope attached to the bow of the boat and passing through a pulley on the dock that is 1 m higher than the bow of the boat. If the rope is pulled in at a rate of 1 m/s, how fast is the boat approaching the dock when it is 8 m from the dock?



**23–24** Use the fact that the distance (in meters) a dropped stone falls after $t$ seconds is $d = 4.9t^2$.

**23.** A woman stands near the edge of a cliff and drops a stone over the edge. Exactly one second later she drops another stone. One second after that, how fast is the distance between the two stones changing?

**24.** Two men stand 10 m apart on level ground near the edge of a cliff. One man drops a stone and one second later the other man drops a stone. One second after that, how fast is the distance between the two stones changing?

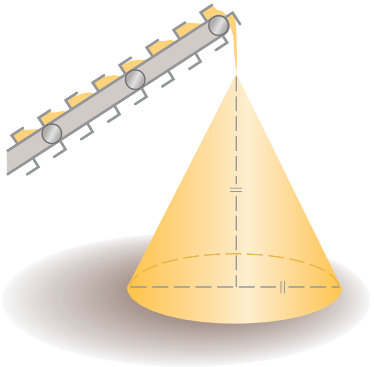
**25.** Water is leaking out of an inverted conical tank at a rate of 10,000 $\text{cm}^3$/min at the same time that water is being pumped into the tank at a constant rate. The tank has height 6 m and the diameter at the top is 4 m. If the water level is rising at a rate of 20 cm/min when the height of the water is 2 m, find the rate at which water is being pumped into the tank.

**26.** A particle moves along the curve $y = 2\sin(\pi x/2)$. As the particle passes through the point $\left(\frac{1}{3}, 1\right)$, its $x$-coordinate increases at a rate of $\sqrt{10}$ cm/s. How fast is the distance from the particle to the origin changing at this instant?

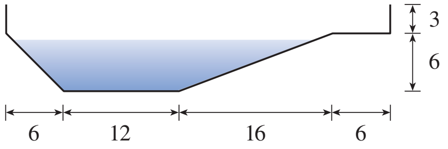
**27.** A water trough is 10 m long and a cross-section has the shape of an isosceles trapezoid that is 30 cm wide at the bottom, 80 cm wide at the top, and has height 50 cm. If the trough is being filled with water at the rate of 0.2 $\text{m}^3$/min, how fast is the water level rising when the water is 30 cm deep?

**28.** A trough is 10 ft long and its ends have the shape of isosceles triangles that are 3 ft across at the top and have a height of 1 ft. If the trough is being filled with water at a rate of 12 $\text{ft}^3$/min, how fast is the water level rising when the water is 6 inches deep?

**29.** Gravel is being dumped from a conveyor belt at a rate of 30 $\text{ft}^3$/min, and its coarseness is such that it forms a pile in the shape of a cone whose base diameter and height are always equal. How fast is the height of the pile increasing when the pile is 10 ft high?



**30.** A swimming pool is 20 ft wide, 40 ft long, 3 ft deep at the shallow end, and 9 ft deep at its deepest point. A cross-section is shown in the figure. If the pool is being filled at a rate of 0.8 $\text{ft}^3$/min, how fast is the water level rising when the depth at the deepest point is 5 ft?



**31.** The sides of an equilateral triangle are increasing at a rate of 10 cm/min. At what rate is the area of the triangle increasing when the sides are 30 cm long?

**32.** A kite 100 ft above the ground moves horizontally at a speed of 8 ft/s. At what rate is the angle between the string and the horizontal decreasing when 200 ft of string has been let out?

**33.** A car is traveling north on a straight road at 20 m/s and a drone is flying east at 6 m/s at an elevation of 25 m. At one instant the drone passes directly over the car. How fast is the distance between the drone and the car changing 5 seconds later?

**34.** If the minute hand of a clock has length $r$ (in centimeters), find the rate at which it sweeps out area as a function of $r$.

**35.** How fast is the angle between the ladder and the ground changing in Example 2 when the bottom of the ladder is 6 ft from the wall?

**36.** According to the model we used to solve Example 2, what happens as the top of the ladder approaches the ground? Is the model appropriate for small values of $y$?

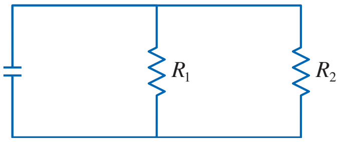
**37.** Boyle's Law states that when a sample of gas is compressed at a constant temperature, the pressure $P$ and volume $V$ satisfy the equation $PV = C$, where $C$ is a constant. Suppose that at a certain instant the volume is 600 $\text{cm}^3$, the pressure is 150 kPa, and the pressure is increasing at a rate of 20 kPa/min. At what rate is the volume decreasing at this instant?

**38.** A faucet is filling a hemispherical basin of diameter 60 cm with water at a rate of 2 L/min. Find the rate at which the water is rising in the basin when it is half full. [Use the following facts: 1 L is 1000 $\text{cm}^3$. The volume of the portion of a sphere with radius $r$ from the bottom to a height $h$ is $V = \pi\left(rh^2 - \frac{1}{3}h^3\right)$, as we will show in Chapter 5.]

**39.** If two resistors with resistances $R_1$ and $R_2$ are connected in parallel, as shown in the figure, then the total resistance $R$, measured in ohms ($\Omega$), is given by

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}$$

If $R_1$ and $R_2$ are increasing at rates of 0.3 $\Omega$/s and 0.2 $\Omega$/s, respectively, how fast is $R$ changing when $R_1 = 80\ \Omega$ and $R_2 = 100\ \Omega$?



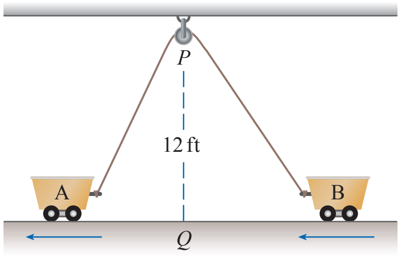
**40.** When air expands adiabatically (without gaining or losing heat), its pressure $P$ and volume $V$ are related by the equation $PV^{1.4} = C$, where $C$ is a constant. Suppose that at a certain instant the volume is 400 $\text{cm}^3$ and the pressure is 80 kPa and is decreasing at a rate of 10 kPa/min. At what rate is the volume increasing at this instant?

**41.** Two straight roads diverge from an intersection at an angle of 60°. Two cars leave the intersection at the same time, the first traveling down one road at 40 mi/h and the second traveling down the other road at 60 mi/h. How fast is the distance between the cars changing after half an hour? [*Hint:* Use the Law of Cosines (Formula 21 in Appendix D).]

**42.** Brain weight $B$ as a function of body weight $W$ in fish has been modeled by the power function $B = 0.007W^{2/3}$, where $B$ and $W$ are measured in grams. A model for body weight as a function of body length $L$ (measured in centimeters) is $W = 0.12L^{2.53}$. If, over 10 million years, the average length of a certain species of fish evolved from 15 cm to 20 cm at a constant rate, how fast was this species' brain growing when its average length was 18 cm?

**43.** Two sides of a triangle have lengths 12 m and 15 m. The angle between them is increasing at a rate of 2°/min. How fast is the length of the third side increasing when the angle between the sides of fixed length is 60°? [*Hint:* Use the Law of Cosines (Formula 21 in Appendix D).]

**44.** Two carts, A and B, are connected by a rope 39 ft long that passes over a pulley $P$. (See the figure.) The point $Q$ is on the floor 12 ft directly beneath $P$ and between the carts. Cart A is being pulled away from $Q$ at a speed of 2 ft/s. How fast is cart B moving toward $Q$ at the instant when cart A is 5 ft from $Q$?



**45.** A television camera is positioned 4000 ft from the base of a rocket launching pad. The angle of elevation of the camera has to change at the correct rate in order to keep the rocket in sight. Also, the mechanism for focusing the camera has to take into account the increasing distance from the camera to the rising rocket. Let's assume the rocket rises vertically and its speed is 600 ft/s when it has risen 3000 ft.

(a) How fast is the distance from the television camera to the rocket changing at that moment?

(b) If the television camera is always kept aimed at the rocket, how fast is the camera's angle of elevation changing at that same moment?

**46.** A lighthouse is located on a small island 3 km away from the nearest point $P$ on a straight shoreline and its light makes four revolutions per minute. How fast is the beam of light moving along the shoreline when it is 1 km from $P$?

**47.** A plane flies horizontally at an altitude of 5 km and passes directly over a tracking telescope on the ground. When the angle of elevation is $\pi/3$, this angle is decreasing at a rate of $\pi/6$ rad/min. How fast is the plane traveling at that time?

**48.** A Ferris wheel with a radius of 10 m is rotating at a rate of one revolution every 2 minutes. How fast is a rider rising when his seat is 16 m above ground level?

**49.** A plane flying with a constant speed of 300 km/h passes over a ground radar station at an altitude of 1 km and climbs at an angle of 30°. At what rate is the distance from the plane to the radar station increasing a minute later?

**50.** Two people start from the same point. One walks east at 3 mi/h and the other walks northeast at 2 mi/h. How fast is the distance between the people changing after 15 minutes?

**51.** A runner sprints around a circular track of radius 100 m at a constant speed of 7 m/s. The runner's friend is standing at a distance 200 m from the center of the track. How fast is the distance between the friends changing when the distance between them is 200 m?

**52.** The minute hand on a watch is 8 mm long and the hour hand is 4 mm long. How fast is the distance between the tips of the hands changing at one o'clock?

**53.** Suppose that the volume $V$ of a rolling snowball increases so that $dV/dt$ is proportional to the surface area of the snowball at time $t$. Show that the radius $r$ increases at a constant rate, that is, $dr/dt$ is constant.

## 2.9 Linear Approximations and Differentials

We have seen that a curve lies very close to its tangent line near the point of tangency. In fact, by zooming in toward a point on the graph of a differentiable function, we noticed that the graph looks more and more like its tangent line. (See Figure 2.1.2.) This observation is the basis for a method of finding approximate values of functions.

### Linearization and Approximation

It might be easy to calculate a value $f(a)$ of a function, but difficult (or even impossible) to compute nearby values of $f$. So we settle for the easily computed values of the linear function $L$ whose graph is the tangent line of $f$ at $(a, f(a))$. (See Figure 1.)

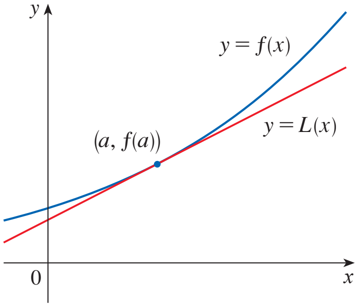


**FIGURE 1**

In other words, we use the tangent line at $(a, f(a))$ as an approximation to the curve $y = f(x)$ when $x$ is near $a$. An equation of this tangent line is

$$y = f(a) + f'(a)(x - a)$$

The linear function whose graph is this tangent line, that is,

$$\boxed{1} \qquad \boxed{L(x) = f(a) + f'(a)(x - a)}$$

is called the **linearization** of $f$ at $a$. The approximation $f(x) \approx L(x)$ or

$$\boxed{2} \qquad \boxed{f(x) \approx f(a) + f'(a)(x - a)}$$

is called the **linear approximation** or **tangent line approximation** of $f$ at $a$.

**EXAMPLE 1** Find the linearization of the function $f(x) = \sqrt{x + 3}$ at $a = 1$ and use it to approximate the numbers $\sqrt{3.98}$ and $\sqrt{4.05}$. Are these approximations overestimates or underestimates?

**SOLUTION** The derivative of $f(x) = (x + 3)^{1/2}$ is

$$f'(x) = \tfrac{1}{2}(x + 3)^{-1/2} = \frac{1}{2\sqrt{x + 3}}$$

and so we have $f(1) = 2$ and $f'(1) = \frac{1}{4}$. Putting these values into Equation 1, we see

that the linearization is

$$L(x) = f(1) + f'(1)(x - 1) = 2 + \tfrac{1}{4}(x - 1) = \frac{7}{4} + \frac{x}{4}$$

The corresponding linear approximation (2) is

$$\sqrt{x + 3} \approx \frac{7}{4} + \frac{x}{4} \qquad \text{(when } x \text{ is near 1)}$$

In particular, we have

$$\sqrt{3.98} \approx \tfrac{7}{4} + \tfrac{0.98}{4} = 1.995 \qquad \text{and} \qquad \sqrt{4.05} \approx \tfrac{7}{4} + \tfrac{1.05}{4} = 2.0125$$

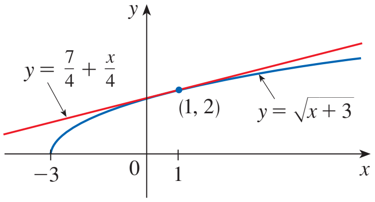

**FIGURE 2**

The linear approximation is illustrated in Figure 2. We see that, indeed, the tangent line approximation is a good approximation to the given function when $x$ is near 1. We also see that our approximations are overestimates because the tangent line lies above the curve.

Of course, a calculator could give us approximations for $\sqrt{3.98}$ and $\sqrt{4.05}$, but the linear approximation gives an approximation *over an entire interval.* ■

In the following table we compare the estimates from the linear approximation in Example 1 with the true values. Notice from this table, and also from Figure 2, that the tangent line approximation gives good estimates when $x$ is close to 1 but the accuracy of the approximation deteriorates when $x$ is farther away from 1.

| | $x$ | From $L(x)$ | Actual value |
|---|---|---|---|
| $\sqrt{3.9}$ | 0.9 | 1.975 | 1.97484176. . . |
| $\sqrt{3.98}$ | 0.98 | 1.995 | 1.99499373. . . |
| $\sqrt{4}$ | 1 | 2 | 2.00000000. . . |
| $\sqrt{4.05}$ | 1.05 | 2.0125 | 2.01246117. . . |
| $\sqrt{4.1}$ | 1.1 | 2.025 | 2.02484567. . . |
| $\sqrt{5}$ | 2 | 2.25 | 2.23606797. . . |
| $\sqrt{6}$ | 3 | 2.5 | 2.44948974. . . |

How good is the approximation that we obtained in Example 1? The next example shows that by using a graphing calculator or computer we can determine an interval throughout which a linear approximation provides a specified accuracy.

**EXAMPLE 2** For what values of $x$ is the linear approximation

$$\sqrt{x + 3} \approx \frac{7}{4} + \frac{x}{4}$$

accurate to within 0.5? What about accuracy to within 0.1?

**SOLUTION** Accuracy to within 0.5 means that the functions should differ by less than 0.5:

$$\left| \sqrt{x + 3} - \left( \frac{7}{4} + \frac{x}{4} \right) \right| < 0.5$$

Equivalently, we could write

$$\sqrt{x + 3} - 0.5 < \frac{7}{4} + \frac{x}{4} < \sqrt{x + 3} + 0.5$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. **FIGURE 3**

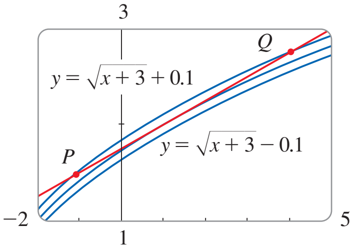

**FIGURE 4**

This says that the linear approximation should lie between the curves obtained by shifting the curve $y = \sqrt{x + 3}$ upward and downward by an amount 0.5. Figure 3 shows the tangent line $y = (7 + x)/4$ intersecting the upper curve $y = \sqrt{x + 3} + 0.5$ at $P$ and $Q$. We estimate that the $x$-coordinate of $P$ is about $-2.66$ and the $x$-coordinate of $Q$ is about 8.66. Thus we see from the graph that the approximation

$$\sqrt{x + 3} \approx \frac{7}{4} + \frac{x}{4}$$

is accurate to within 0.5 when $-2.6 < x < 8.6$. (We have rounded the smaller value up and the larger value down.)

Similarly, from Figure 4 we see that the approximation is accurate to within 0.1 when $-1.1 < x < 3.9$. ■

## Applications to Physics

Linear approximations are often used in physics. In analyzing the consequences of an equation, a physicist sometimes needs to simplify a function by replacing it with its linear approximation. For instance, in deriving a formula for the period of a pendulum, physics textbooks obtain an expression involving $\sin\theta$ and then replace $\sin\theta$ by $\theta$ with the remark that $\sin\theta$ is very close to $\theta$ if $\theta$ is not too large. You can verify that the linearization of the function $f(x) = \sin x$ at $a = 0$ is $L(x) = x$ and so the linear approximation at 0 is

$$\sin x \approx x$$

(see Exercise 48). So, in effect, the derivation of the formula for the period of a pendulum uses the tangent line approximation for the sine function.

Another example occurs in the theory of optics, where light rays that arrive at shallow angles relative to the optical axis are called *paraxial rays.* In paraxial (or Gaussian) optics, both $\sin\theta$ and $\cos\theta$ are replaced by their linearizations. In other words, the linear approximations

$$\sin\theta \approx \theta \qquad \text{and} \qquad \cos\theta \approx 1$$

are used because $\theta$ is close to 0. The results of calculations made with these approximations became the basic theoretical tool used to design lenses. (See *Optics,* 5th ed., by Eugene Hecht [Boston, 2017], p. 164.)

In Section 11.11 we will present several other applications of the idea of linear approximations to physics and engineering.

## Differentials

The ideas behind linear approximations are sometimes formulated in the terminology and notation of *differentials*. If $y = f(x)$, where $f$ is a differentiable function, then the **differential** $dx$ is an independent variable; that is, $dx$ can be given the value of any real number. The **differential** $dy$ is then defined in terms of $dx$ by the equation

$$\boxed{3} \qquad dy = f'(x)\,dx$$

So $dy$ is a dependent variable; it depends on the values of $x$ and $dx$. If $dx$ is given a specific value and $x$ is taken to be some specific number in the domain of $f$, then the numerical value of $dy$ is determined.

If $dx \neq 0$, we can divide both sides of Equation 3 by $dx$ to obtain

$$\frac{dy}{dx} = f'(x)$$

We have seen similar equations before, but now the left side can genuinely be interpreted as a ratio of differentials.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The geometric meaning of differentials is shown in Figure 5. Let $P(x, f(x))$ and $Q(x + \Delta x, f(x + \Delta x))$ be points on the graph of $f$ and let $dx = \Delta x$. The corresponding change in $y$ is

$$\Delta y = f(x + \Delta x) - f(x)$$

The slope of the tangent line $PR$ is the derivative $f'(x)$. Thus the directed distance from $S$ to $R$ is $f'(x)\,dx = dy$. Therefore $dy$ represents the amount that the tangent line rises or falls (the change in the linearization), whereas $\Delta y$ represents the amount that the curve $y = f(x)$ rises or falls when $x$ changes by an amount $dx$.

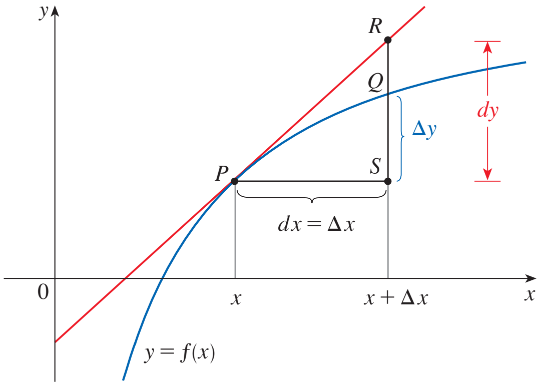

**FIGURE 5**

**EXAMPLE 3** Compare the values of $\Delta y$ and $dy$ if $y = f(x) = x^3 + x^2 - 2x + 1$ and $x$ changes (a) from 2 to 2.05 and (b) from 2 to 2.01.

**SOLUTION**

(a) We have

$$f(2) = 2^3 + 2^2 - 2(2) + 1 = 9$$

$$f(2.05) = (2.05)^3 + (2.05)^2 - 2(2.05) + 1 = 9.717625$$

$$\Delta y = f(2.05) - f(2) = 0.717625$$

Figure 6 shows the function in Example 3 and a comparison of $dy$ and $\Delta y$ when $a = 2$. The viewing rectangle is $[1.8, 2.5]$ by $[6, 18]$.

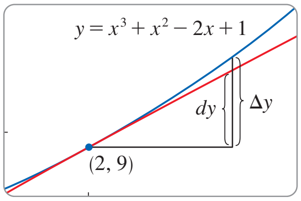

**FIGURE 6**

In general, $$dy = f'(x)\,dx = (3x^2 + 2x - 2)\,dx$$

When $x = 2$ and $dx = \Delta x = 0.05$, this becomes

$$dy = [3(2)^2 + 2(2) - 2]0.05 = 0.7$$

(b) $$f(2.01) = (2.01)^3 + (2.01)^2 - 2(2.01) + 1 = 9.140701$$

$$\Delta y = f(2.01) - f(2) = 0.140701$$

When $dx = \Delta x = 0.01$,

$$dy = [3(2)^2 + 2(2) - 2]0.01 = 0.14$$ ■

Notice that the approximation $\Delta y \approx dy$ becomes better as $\Delta x$ becomes smaller in Example 3. Notice also that $dy$ was easier to compute than $\Delta y$.

In the notation of differentials, the linear approximation $f(x) \approx f(a) + f'(a)(x - a)$ can be written as

$$f(a + dx) \approx f(a) + dy$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. by taking $dx = x - a$, so $x = a + dx$. For instance, for the function $f(x) = \sqrt{x + 3}$ in Example 1, we have

$$dy = f'(x)\,dx = \frac{dx}{2\sqrt{x + 3}}$$

If $a = 1$ and $dx = \Delta x = 0.05$, then

$$dy = \frac{0.05}{2\sqrt{1 + 3}} = 0.0125$$

and $$\sqrt{4.05} = f(1.05) = f(1 + 0.05) \approx f(1) + dy = 2.0125$$

just as we found in Example 1.

Our final example illustrates the use of differentials in estimating the errors that occur because of approximate measurements.

**EXAMPLE 4** The radius of a sphere was measured and found to be 21 cm with a possible error in measurement of at most 0.05 cm. What is the maximum error in using this value of the radius to compute the volume of the sphere?

**SOLUTION** If the radius of the sphere is $r$, then its volume is $V = \frac{4}{3}\pi r^3$. If the error in the measured value of $r$ is denoted by $dr = \Delta r$, then the corresponding error in the calculated value of $V$ is $\Delta V$, which can be approximated by the differential

$$dV = 4\pi r^2\,dr$$

When $r = 21$ and $dr = 0.05$, this becomes

$$dV = 4\pi(21)^2\,0.05 \approx 277$$

The maximum error in the calculated volume is about 277 cm$^3$. ■

**NOTE** Although the possible error in Example 4 may appear to be rather large, a better picture of the error is given by the **relative error**, which is computed by dividing the error by the total volume:

$$\frac{\Delta V}{V} \approx \frac{dV}{V} = \frac{4\pi r^2\,dr}{\frac{4}{3}\pi r^3} = 3\,\frac{dr}{r}$$

Thus the relative error in the volume is about three times the relative error in the radius. In Example 4 the relative error in the radius is approximately $dr/r = 0.05/21 \approx 0.0024$ and it produces a relative error of about 0.007 in the volume. The errors could also be expressed as percentage errors of 0.24% in the radius and 0.7% in the volume.

## 2.9 Exercises

**1–4** Find the linearization $L(x)$ of the function at $a$.

**1.** $f(x) = x^3 - x^2 + 3, \quad a = -2$

**2.** $f(x) = \cos 2x, \quad a = \pi/6$

**3.** $f(x) = \sqrt[3]{x}, \quad a = 8$

**4.** $f(x) = 2/\sqrt{x^2 - 5}, \quad a = 3$

**5.** Find the linear approximation of the function $f(x) = \sqrt{1 - x}$ at $a = 0$ and use it to approximate the numbers $\sqrt{0.9}$ and $\sqrt{0.99}$. Illustrate by graphing $f$ and the tangent line.

**6.** Find the linear approximation of the function $g(x) = \sqrt[3]{1 + x}$ at $a = 0$ and use it to approximate the numbers $\sqrt[3]{0.95}$ and $\sqrt[3]{1.1}$. Illustrate by graphing $g$ and the tangent line.

**7–10** Verify the given linear approximation at $a = 0$. Then determine the values of $x$ for which the linear approximation is accurate to within 0.1.

**7.** $\sqrt[4]{1 + 2x} \approx 1 + \frac{1}{2}x$

**8.** $(1 + x)^{-3} \approx 1 - 3x$

**9.** $1/(1 + 2x)^4 \approx 1 - 8x$

**10.** $\tan x \approx x$

**11–18** Find the differential of the function.

**11.** $y = (x^2 - 3)^{-2}$

**12.** $y = \sqrt{1 - t^4}$

**13.** $y = \dfrac{1 + 2u}{1 + 3u}$

**14.** $y = \theta^2 \sin 2\theta$

**15.** $y = \dfrac{1}{x^2 - 3x}$

**16.** $y = \sqrt{1 + \cos\theta}$

**17.** $y = \sqrt{t - \cos t}$

**18.** $y = \dfrac{1}{x} \sin x$

**19–22** (a) Find the differential $dy$ and (b) evaluate $dy$ for the given values of $x$ and $dx$.

**19.** $y = \tan x, \quad x = \pi/4, \quad dx = -0.1$

**20.** $y = \cos \pi x, \quad x = \frac{1}{3}, \quad dx = -0.02$

**21.** $y = \sqrt{3 + x^2}, \quad x = 1, \quad dx = -0.1$

**22.** $y = \dfrac{x + 1}{x - 1}, \quad x = 2, \quad dx = 0.05$

**23–26** Compute $\Delta y$ and $dy$ for the given values of $x$ and $dx = \Delta x$. Then sketch a diagram like Figure 5 showing the line segments with lengths $dx$, $dy$, and $\Delta y$.

**23.** $y = x^2 - 4x, \quad x = 3, \quad \Delta x = 0.5$

**24.** $y = x - x^3, \quad x = 0, \quad \Delta x = -0.3$

**25.** $y = \sqrt{x - 2}, \quad x = 3, \quad \Delta x = 0.8$

**26.** $y = x^3, \quad x = 1, \quad \Delta x = 0.5$

**27–30** Compare the values of $\Delta y$ and $dy$ if $x$ changes from 1 to 1.05. What if $x$ changes from 1 to 1.01? Does the approximation $\Delta y \approx dy$ become better as $\Delta x$ gets smaller?

**27.** $f(x) = x^4 - x + 1$

**28.** $f(x) = (x^3 + 3)^2$

**29.** $f(x) = \sqrt{5 - x}$

**30.** $f(x) = \dfrac{1}{x^2 + 1}$

**31–36** Use a linear approximation (or differentials) to estimate the given number.

**31.** $(1.999)^4$

**32.** $1/4.002$

**33.** $\sqrt[3]{1001}$

**34.** $\sqrt{100.5}$

**35.** $\tan 2°$

**36.** $\cos 29°$

**37–38** Explain, in terms of linear approximations or differentials, why the approximation is reasonable.

**37.** $\sec 0.08 \approx 1$

**38.** $\sqrt{4.02} \approx 2.005$

**39.** The edge of a cube was found to be 30 cm with a possible error in measurement of 0.1 cm. Use differentials to estimate the maximum possible error, relative error, and percentage error in computing (a) the volume of the cube and (b) the surface area of the cube.

**40.** The radius of a circular disk is given as 24 cm with a maximum error in measurement of 0.2 cm.

(a) Use differentials to estimate the maximum error in the calculated area of the disk.

(b) What is the relative error and the percentage error?

**41.** The circumference of a sphere was measured to be 84 cm with a possible error of 0.5 cm.

(a) Use differentials to estimate the maximum error in the calculated surface area. What is the relative error?

(b) Use differentials to estimate the maximum error in the calculated volume. What is the relative error?

**42.** Use differentials to estimate the amount of paint needed to apply a coat of paint 0.05 cm thick to a hemispherical dome with diameter 50 m.

**43.** (a) Use differentials to find a formula for the approximate volume of a thin cylindrical shell with height $h$, inner radius $r$, and thickness $\Delta r$.

(b) What is the error involved in using the formula from part (a)?

**44.** One side of a right triangle is known to be 20 cm long and the opposite angle is measured as 30°, with a possible error of $\pm 1°$.

(a) Use differentials to estimate the error in computing the length of the hypotenuse.

(b) What is the percentage error?

**45.** If a current $I$ passes through a resistor with resistance $R$, Ohm's Law states that the voltage drop is $V = RI$. If $V$ is constant and $R$ is measured with a certain error, use differentials to show that the relative error in calculating $I$ is approximately the same (in magnitude) as the relative error in $R$.

**46.** When blood flows along a blood vessel, the flux $F$ (the volume of blood per unit time that flows past a given point) is proportional to the fourth power of the radius $R$ of the blood vessel:

$$F = kR^4$$

(This is known as Poiseuille's Law; we will show why it is true in Section 8.4.) A partially clogged artery can be expanded by an operation called angioplasty, in which a balloon-tipped catheter is inflated inside the artery in order to widen it and restore normal blood flow.

Show that the relative change in $F$ is about four times the relative change in $R$. How will a 5% increase in the radius affect the flow of blood?

**47.** Establish the following rules for working with differentials (where $c$ denotes a constant and $u$ and $v$ are functions of $x$).

(a) $dc = 0$

(b) $d(cu) = c\,du$

(c) $d(u + v) = du + dv$

(d) $d(uv) = u\,dv + v\,du$

(e) $d\left(\dfrac{u}{v}\right) = \dfrac{v\,du - u\,dv}{v^2}$

(f) $d(x^n) = nx^{n-1}\,dx$

**48.** In physics textbooks, the period $T$ of a pendulum of length $L$ is often given as $T \approx 2\pi\sqrt{L/g}$, provided that the pendulum swings through a relatively small arc. In the course of deriving this formula, the equation $a_T = -g\sin\theta$ for the tangential acceleration of the bob of the pendulum is obtained, and then $\sin\theta$ is replaced by $\theta$ with the remark that for small angles, $\theta$ (in radians) is very close to $\sin\theta$.

(a) Verify the linear approximation at 0 for the sine function:

$$\sin\theta \approx \theta$$

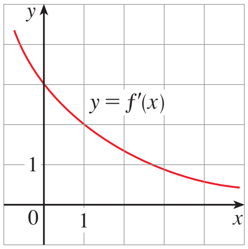
(b) If $\theta = \pi/18$ (equivalent to 10°) and we approximate $\sin\theta$ by $\theta$, what is the percentage error?

(c) Use a graph to determine the values of $\theta$ for which $\sin\theta$ and $\theta$ differ by less than 2%. What are the values in degrees?

**49.** Suppose that the only information we have about a function $f$ is that $f(1) = 5$ and the graph of its *derivative* is as shown.

(a) Use a linear approximation to estimate $f(0.9)$ and $f(1.1)$.

(b) Are your estimates in part (a) too large or too small? Explain.



**50.** Suppose that we don't have a formula for $g(x)$ but we know that $g(2) = -4$ and $g'(x) = \sqrt{x^2 + 5}$ for all $x$.

(a) Use a linear approximation to estimate $g(1.95)$ and $g(2.05)$.

(b) Are your estimates in part (a) too large or too small? Explain.

## DISCOVERY PROJECT | POLYNOMIAL APPROXIMATIONS

The tangent line approximation $L(x)$ is the best first-degree (linear) approximation to $f(x)$ near $x = a$ because $f(x)$ and $L(x)$ have the same rate of change (derivative) at $a$. For a better approximation than a linear one, let's try a second-degree (quadratic) approximation $P(x)$. In other words, we approximate a curve by a parabola instead of by a straight line. To make sure that the approximation is a good one, we stipulate the following:

(i) $P(a) = f(a)$ ($P$ and $f$ should have the same value at $a$.)

(ii) $P'(a) = f'(a)$ ($P$ and $f$ should have the same rate of change at $a$.)

(iii) $P''(a) = f''(a)$ (The slopes of $P$ and $f$ should change at the same rate at $a$.)

**1.** Find the quadratic approximation $P(x) = A + Bx + Cx^2$ to the function $f(x) = \cos x$ that satisfies conditions (i), (ii), and (iii) with $a = 0$. Graph $P$, $f$, and the linear approximation $L(x) = 1$ on a common screen. Comment on how well the functions $P$ and $L$ approximate $f$.

**2.** Determine the values of $x$ for which the quadratic approximation $f(x) \approx P(x)$ in Problem 1 is accurate to within 0.1. [*Hint:* Graph $y = P(x)$, $y = \cos x - 0.1$, and $y = \cos x + 0.1$ on a common screen.]

**3.** To approximate a function $f$ by a quadratic function $P$ near a number $a$, it is best to write $P$ in the form

$$P(x) = A + B(x - a) + C(x - a)^2$$

Show that the quadratic function that satisfies conditions (i), (ii), and (iii) is

$$P(x) = f(a) + f'(a)(x - a) + \tfrac{1}{2}f''(a)(x - a)^2$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**4.** Find the quadratic approximation to $f(x) = \sqrt{x + 3}$ near $a = 1$. Graph $f$, the quadratic approximation, and the linear approximation from Example 2.9.2 on a common screen. What do you conclude?

**5.** Instead of being satisfied with a linear or quadratic approximation to $f(x)$ near $x = a$, let's try to find better approximations with higher-degree polynomials. We look for an $n$th-degree polynomial

$$T_n(x) = c_0 + c_1(x - a) + c_2(x - a)^2 + c_3(x - a)^3 + \cdots + c_n(x - a)^n$$

such that $T_n$ and its first $n$ derivatives have the same values at $x = a$ as $f$ and its first $n$ derivatives. By differentiating repeatedly and setting $x = a$, show that these conditions are satisfied if $c_0 = f(a)$, $c_1 = f'(a)$, $c_2 = \frac{1}{2}f''(a)$, and in general

$$c_k = \frac{f^{(k)}(a)}{k!}$$

where $k! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot \cdots \cdot k$. The resulting polynomial

$$T_n(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n$$

is called the ***n*****th-degree Taylor polynomial of *f* centered at *a***. (We will study Taylor polynomials in more detail in Chapter 11.)

**6.** Find the 8th-degree Taylor polynomial centered at $a = 0$ for the function $f(x) = \cos x$. Graph $f$ together with the Taylor polynomials $T_2$, $T_4$, $T_6$, $T_8$ in the viewing rectangle $[-5, 5]$ by $[-1.4, 1.4]$ and comment on how well they approximate $f$.

# 2 REVIEW

## CONCEPT CHECK

Answers to the Concept Check are available at StewartCalculus.com.

**1.** Write an expression for the slope of the tangent line to the curve $y = f(x)$ at the point $(a, f(a))$.

**2.** Suppose an object moves along a straight line with position $f(t)$ at time $t$. Write an expression for the instantaneous velocity of the object at time $t = a$. How can you interpret this velocity in terms of the graph of $f$?

**3.** If $y = f(x)$ and $x$ changes from $x_1$ to $x_2$, write expressions for the following.
   (a) The average rate of change of $y$ with respect to $x$ over the interval $[x_1, x_2]$
   (b) The instantaneous rate of change of $y$ with respect to $x$ at $x = x_1$

**4.** Define the derivative $f'(a)$. Discuss two ways of interpreting this number.

**5.** (a) What does it mean for $f$ to be differentiable at $a$?
   (b) What is the relation between the differentiability and continuity of a function?
   (c) Sketch the graph of a function that is continuous but not differentiable at $a = 2$.

**6.** Describe several ways in which a function can fail to be differentiable. Illustrate with sketches.

**7.** What are the second and third derivatives of a function $f$? If $f$ is the position function of an object, how can you interpret $f''$ and $f'''$?

**8.** State each differentiation rule both in symbols and in words.
   (a) The Power Rule
   (b) The Constant Multiple Rule
   (c) The Sum Rule
   (d) The Difference Rule
   (e) The Product Rule
   (f) The Quotient Rule
   (g) The Chain Rule

**9.** State the derivative of each function.
   (a) $y = x^n$
   (b) $y = \sin x$
   (c) $y = \cos x$
   (d) $y = \tan x$
   (e) $y = \csc x$
   (f) $y = \sec x$
   (g) $y = \cot x$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**10.** Explain how implicit differentiation works.

**11.** Give several examples of how the derivative can be interpreted as a rate of change in physics, chemistry, biology, economics, or other sciences.

**12.** (a) Write an expression for the linearization of $f$ at $a$.
(b) If $y = f(x)$, write an expression for the differential $dy$.
(c) If $dx = \Delta x$, draw a picture showing the geometric meanings of $\Delta y$ and $dy$.

## TRUE-FALSE QUIZ

Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

**1.** If $f$ is continuous at $a$, then $f$ is differentiable at $a$.

**2.** If $f$ and $g$ are differentiable, then

$$\frac{d}{dx}[f(x) + g(x)] = f'(x) + g'(x)$$

**3.** If $f$ and $g$ are differentiable, then

$$\frac{d}{dx}[f(x)g(x)] = f'(x)g'(x)$$

**4.** If $f$ and $g$ are differentiable, then

$$\frac{d}{dx}\left[f(g(x))\right] = f'(g(x))g'(x)$$

**5.** If $f$ is differentiable, then $\dfrac{d}{dx}\sqrt{f(x)} = \dfrac{f'(x)}{2\sqrt{f(x)}}$.

**6.** If $f$ is differentiable, then $\dfrac{d}{dx}f(\sqrt{x}) = \dfrac{f'(x)}{2\sqrt{x}}$.

**7.** $\dfrac{d}{dx}|x^2 + x| = |2x + 1|$

**8.** If $f'(r)$ exists, then $\lim_{x\to r} f(x) = f(r)$.

**9.** If $g(x) = x^5$, then $\displaystyle\lim_{x\to 2}\frac{g(x) - g(2)}{x - 2} = 80$.

**10.** $\dfrac{d^2y}{dx^2} = \left(\dfrac{dy}{dx}\right)^2$

**11.** An equation of the tangent line to the parabola $y = x^2$ at $(-2, 4)$ is $y - 4 = 2x(x + 2)$.

**12.** $\dfrac{d}{dx}(\tan^2 x) = \dfrac{d}{dx}(\sec^2 x)$

**13.** The derivative of a polynomial is a polynomial.

**14.** The derivative of a rational function is a rational function.

**15.** If $f$ is differentiable at $a$, so is $|f|$.

**16.** If $f(x) = (x^6 - x^4)^5$, then $f^{(31)}(x) = 0$.

## EXERCISES

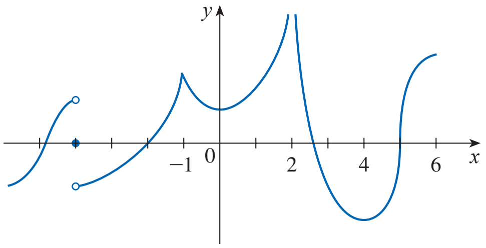
**1.** The displacement (in meters) of an object moving in a straight line is given by $s = 1 + 2t + \frac{1}{4}t^2$, where $t$ is measured in seconds.

(a) Find the average velocity over each time period.

(i) $[1, 3]$ (ii) $[1, 2]$ (iii) $[1, 1.5]$ (iv) $[1, 1.1]$

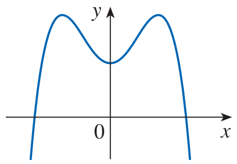
(b) Find the instantaneous velocity when $t = 1$.

**2.** The graph of $f$ is shown. State, with reasons, the numbers at which $f$ is not differentiable.

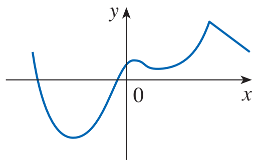


**3–4** Trace or copy the graph of the function. Then sketch a graph of its derivative directly beneath.

**3.**



**4.**



**5.** The figure shows the graphs of $f$, $f'$, and $f''$. Identify each curve, and explain your choices.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**6.** Find a function $f$ and a number $a$ such that

$$\lim_{h \to 0} \frac{(2+h)^6 - 64}{h} = f'(a)$$

**7.** The total cost of repaying a student loan at an interest rate of $r\%$ per year is $C = f(r)$.

(a) What is the meaning of the derivative $f'(r)$? What are its units?

(b) What does the statement $f'(10) = 1200$ mean?

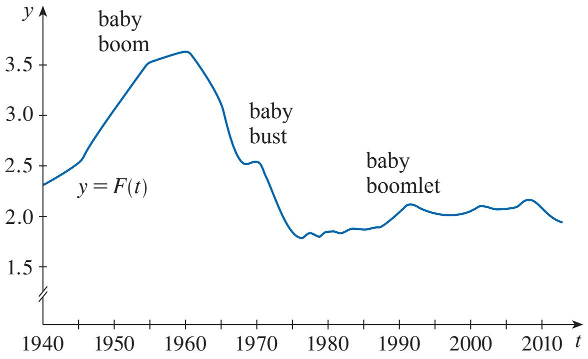
(c) Is $f'(r)$ always positive or does it change sign?

**8.** The *total fertility rate* at time $t$, denoted by $F(t)$, is an estimate of the average number of children born to each woman (assuming that current birth rates remain constant). The graph of the total fertility rate in the United States shows the fluctuations from 1940 to 2010.

(a) Estimate the values of $F'(1950)$, $F'(1965)$, and $F'(1987)$.

(b) What are the meanings of these derivatives?

(c) Can you suggest reasons for the values of these derivatives?



**9.** Let $P(t)$ be the percentage of Americans under the age of 18 at time $t$. The table gives values of this function in census years from 1950 to 2010.

| $t$ | $P(t)$ | $t$ | $P(t)$ |
|---|---|---|---|
| 1950 | 31.1 | 1990 | 25.7 |
| 1960 | 35.7 | 2000 | 25.7 |
| 1970 | 34.0 | 2010 | 24.0 |
| 1980 | 28.0 | | |

(a) What is the meaning of $P'(t)$? What are its units?

(b) Construct a table of estimated values for $P'(t)$.

(c) Graph $P$ and $P'$.

(d) How would it be possible to get more accurate values for $P'(t)$?

**10–11** Find $f'(x)$ from first principles, that is, directly from the definition of a derivative.

**10.** $f(x) = \dfrac{2}{x^2}$

**11.** $f(x) = x^3 + 5x + 4$

---

**12.** (a) If $f(x) = \sqrt{3 - 5x}$, use the definition of a derivative to find $f'(x)$.

(b) Find the domains of $f$ and $f'$.

(c) Graph $f$ and $f'$ on a common screen. Compare the graphs to see whether your answer to part (a) is reasonable.

**13–40** Calculate $y'$.

**13.** $y = (x^2 + x^3)^4$

**14.** $y = \dfrac{1}{\sqrt{x}} - \dfrac{1}{\sqrt[5]{x^3}}$

**15.** $y = \dfrac{x^2 - x + 2}{\sqrt{x}}$

**16.** $y = \dfrac{\tan x}{1 + \cos x}$

**17.** $y = x^2 \sin \pi x$

**18.** $y = \left(x + \dfrac{1}{x^2}\right)^{\sqrt{7}}$

**19.** $y = \dfrac{t^4 - 1}{t^4 + 1}$

**20.** $y = \sin(\cos x)$

**21.** $y = \tan\sqrt{1 - x}$

**22.** $y = \dfrac{1}{\sin(x - \sin x)}$

**23.** $xy^4 + x^2y = x + 3y$

**24.** $y = \sec(1 + x^2)$

**25.** $y = \dfrac{\sec 2\theta}{1 + \tan 2\theta}$

**26.** $y + x\cos y = x^2y$

**27.** $y = (1 - x^{-1})^{-1}$

**28.** $y = 1/\sqrt[3]{x + \sqrt{x}}$

**29.** $\sin(xy) = x^2 - y$

**30.** $y = \sqrt{\sin\sqrt{x}}$

**31.** $y = \cot(3x^2 + 5)$

**32.** $y = \dfrac{(x + \lambda)^4}{x^4 + \lambda^4}$

**33.** $y = \sqrt{x}\cos\sqrt{x}$

**34.** $y = \dfrac{\sin mx}{x}$

**35.** $y = \tan^2(\sin\theta)$

**36.** $x\tan y = y - 1$

**37.** $y = \sqrt[5]{x\tan x}$

**38.** $y = \dfrac{(x - 1)(x - 4)}{(x - 2)(x - 3)}$

**39.** $y = \sin\left(\tan\sqrt{1 + x^3}\right)$

**40.** $y = \sin^2\left(\cos\sqrt{\sin \pi x}\right)$

---

**41.** If $f(t) = \sqrt{4t + 1}$, find $f''(2)$.

**42.** If $g(\theta) = \theta\sin\theta$, find $g''(\pi/6)$.

**43.** Find $y''$ if $x^6 + y^6 = 1$.

**44.** Find $f^{(n)}(x)$ if $f(x) = 1/(2 - x)$.

**45–46** Find the limit.

**45.** $\displaystyle\lim_{x \to 0} \frac{\sec x}{1 - \sin x}$

**46.** $\displaystyle\lim_{t \to 0} \frac{t^3}{\tan^3 2t}$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**47–48** Find an equation of the tangent line to the curve at the given point.

**47.** $y = 4\sin^2 x, \quad (\pi/6, 1)$ **48.** $y = \dfrac{x^2 - 1}{x^2 + 1}, \quad (0, -1)$

---

**49–50** Find equations of the tangent line and normal line to the curve at the given point.

**49.** $y = \sqrt{1 + 4\sin x}, \quad (0, 1)$

**50.** $x^2 + 4xy + y^2 = 13, \quad (2, 1)$

---

**51.** (a) If $f(x) = x\sqrt{5 - x}$, find $f'(x)$.
  (b) Find equations of the tangent lines to the curve $y = x\sqrt{5 - x}$ at the points $(1, 2)$ and $(4, 4)$.
  (c) Illustrate part (b) by graphing the curve and tangent lines on the same screen.
  (d) Check to see that your answer to part (a) is reasonable by comparing the graphs of $f$ and $f'$.

**52.** (a) If $f(x) = 4x - \tan x$, $-\pi/2 < x < \pi/2$, find $f'$ and $f''$.
  (b) Check to see that your answers to part (a) are reasonable by comparing the graphs of $f$, $f'$, and $f''$.

**53.** At what points on the curve $y = \sin x + \cos x$, $0 \leqslant x \leqslant 2\pi$, is the tangent line horizontal?

**54.** Find the points on the ellipse $x^2 + 2y^2 = 1$ where the tangent line has slope 1.

**55.** Find a parabola $y = ax^2 + bx + c$ that passes through the point $(1, 4)$ and whose tangent lines at $x = -1$ and $x = 5$ have slopes 6 and $-2$, respectively.

**56.** How many tangent lines to the curve $y = x/(x + 1)$ pass through the point $(1, 2)$? At which points do these tangent lines touch the curve?

**57.** If $f(x) = (x - a)(x - b)(x - c)$, show that

$$\frac{f'(x)}{f(x)} = \frac{1}{x - a} + \frac{1}{x - b} + \frac{1}{x - c}$$

**58.** (a) By differentiating the double-angle formula

$$\cos 2x = \cos^2 x - \sin^2 x$$

obtain the double-angle formula for the sine function.
  (b) By differentiating the addition formula

$$\sin(x + a) = \sin x \cos a + \cos x \sin a$$

obtain the addition formula for the cosine function.

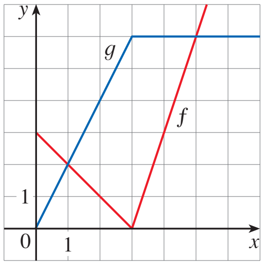
**59.** Suppose that

$f(1) = 2 \qquad f'(1) = 3 \qquad f(2) = 1 \qquad f'(2) = 2$

$g(1) = 3 \qquad g'(1) = 1 \qquad g(2) = 1 \qquad g'(2) = 4$

  (a) If $S(x) = f(x) + g(x)$, find $S'(1)$.
  (b) If $P(x) = f(x)g(x)$, find $P'(2)$.
  (c) If $Q(x) = f(x)/g(x)$, find $Q'(1)$.
  (d) If $C(x) = f(g(x))$, find $C'(2)$.

**60.** If $f$ and $g$ are the functions whose graphs are shown, let $P(x) = f(x)g(x)$, $Q(x) = f(x)/g(x)$, and $C(x) = f(g(x))$. Find (a) $P'(2)$, (b) $Q'(2)$, and (c) $C'(2)$.



**61–68** Find $f'$ in terms of $g'$.

**61.** $f(x) = x^2 g(x)$ **62.** $f(x) = g(x^2)$

**63.** $f(x) = [g(x)]^2$ **64.** $f(x) = x^a g(x^b)$

**65.** $f(x) = g(g(x))$ **66.** $f(x) = \sin(g(x))$

**67.** $f(x) = g(\sin x)$ **68.** $f(x) = g\left(\tan\sqrt{x}\right)$

---

**69–70** Find $h'$ in terms of $f'$ and $g'$.

**69.** $h(x) = \dfrac{f(x)g(x)}{f(x) + g(x)}$ **70.** $h(x) = f(g(\sin 4x))$

---

**71.** (a) Graph the function $f(x) = x - 2\sin x$ in the viewing rectangle $[0, 8]$ by $[-2, 8]$.
  (b) On which interval is the average rate of change larger: $[1, 2]$ or $[2, 3]$?
  (c) At which value of $x$ is the instantaneous rate of change larger: $x = 2$ or $x = 5$?
  (d) Check your visual estimates in part (c) by computing $f'(x)$ and comparing the numerical values of $f'(2)$ and $f'(5)$.

**72.** A particle moves along a horizontal line so that its coordinate at time $t$ is $x = \sqrt{b^2 + c^2t^2}$, $t \geqslant 0$, where $b$ and $c$ are positive constants.
  (a) Find the velocity and acceleration functions.
  (b) Show that the particle always moves in the positive direction.

**73.** A particle moves on a vertical line so that its coordinate at time $t$ is $y = t^3 - 12t + 3$, $t \geqslant 0$.
  (a) Find the velocity and acceleration functions.
  (b) When is the particle moving upward and when is it moving downward?

(c) Find the distance that the particle travels in the time interval $0 \leqslant t \leqslant 3$.

(d) Graph the position, velocity, and acceleration functions for $0 \leqslant t \leqslant 3$.

(e) When is the particle speeding up? When is it slowing down?

**74.** The volume of a right circular cone is $V = \frac{1}{3}\pi r^2 h$, where $r$ is the radius of the base and $h$ is the height.

(a) Find the rate of change of the volume with respect to the height if the radius is constant.

(b) Find the rate of change of the volume with respect to the radius if the height is constant.

**75.** The mass of part of a wire is $x(1 + \sqrt{x})$ kilograms, where $x$ is measured in meters from one end of the wire. Find the linear density of the wire when $x = 4$ m.

**76.** The cost, in dollars, of producing $x$ units of a certain commodity is

$$C(x) = 920 + 2x - 0.02x^2 + 0.00007x^3$$

(a) Find the marginal cost function.

(b) Find $C'(100)$ and explain its meaning.

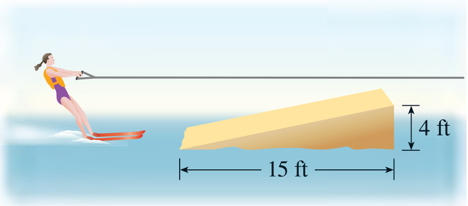
(c) Compare $C'(100)$ with the cost of producing the 101st item.

**77.** The volume of a cube is increasing at a rate of 10 cm$^3$/min. How fast is the surface area increasing when the length of an edge is 30 cm?

**78.** A paper cup has the shape of a cone with height 10 cm and radius 3 cm (at the top). If water is poured into the cup at a rate of 2 cm$^3$/s, how fast is the water level rising when the water is 5 cm deep?

**79.** A balloon is rising at a constant speed of 5 ft/s. A boy is cycling along a straight road at a speed of 15 ft/s. When he passes under the balloon, it is 45 ft above him. How fast is the distance between the boy and the balloon increasing 3 s later?

**80.** A waterskier skis over the ramp shown in the figure at a speed of 30 ft/s. How fast is she rising as she leaves the ramp?



**81.** The angle of elevation of the sun is decreasing at a rate of 0.25 rad/h. How fast is the shadow cast by a 400-ft-tall building increasing when the angle of elevation of the sun is $\pi/6$?

**82.** (a) Find the linear approximation to $f(x) = \sqrt{25 - x^2}$ near 3.

(b) Illustrate part (a) by graphing $f$ and the linear approximation.

(c) For what values of $x$ is the linear approximation accurate to within 0.1?

**83.** (a) Find the linearization of $f(x) = \sqrt[3]{1 + 3x}$ at $a = 0$. State the corresponding linear approximation and use it to give an approximate value for $\sqrt[3]{1.03}$.

(b) Determine the values of $x$ for which the linear approximation given in part (a) is accurate to within 0.1.

**84.** Evaluate $dy$ if $y = x^3 - 2x^2 + 1$, $x = 2$, and $dx = 0.2$.

**85.** A window has the shape of a square surmounted by a semicircle. The base of the window is measured as having width 60 cm with a possible error in measurement of 0.1 cm. Use differentials to estimate the maximum error possible in computing the area of the window.

**86–88** Express the limit as a derivative and evaluate.

**86.** $\displaystyle\lim_{x \to 1} \frac{x^{17} - 1}{x - 1}$

**87.** $\displaystyle\lim_{h \to 0} \frac{\sqrt[4]{16 + h} - 2}{h}$

**88.** $\displaystyle\lim_{\theta \to \pi/3} \frac{\cos\theta - 0.5}{\theta - \pi/3}$

---

**89.** Evaluate $\displaystyle\lim_{x \to 0} \frac{\sqrt{1 + \tan x} - \sqrt{1 + \sin x}}{x^3}$.

**90.** Suppose $f$ is a differentiable function such that $f(g(x)) = x$ and $f'(x) = 1 + [f(x)]^2$. Show that $g'(x) = 1/(1 + x^2)$.

**91.** Find $f'(x)$ if it is known that

$$\frac{d}{dx}[f(2x)] = x^2$$

**92.** Show that the length of the portion of any tangent line to the astroid $x^{2/3} + y^{2/3} = a^{2/3}$ cut off by the coordinate axes is constant.

# Problems Plus

Try to solve the following example yourself before reading the solution.

**EXAMPLE** How many lines are tangent to both of the parabolas $y = -1 - x^2$ and $y = 1 + x^2$? Find the coordinates of the points at which these tangents touch the parabolas.

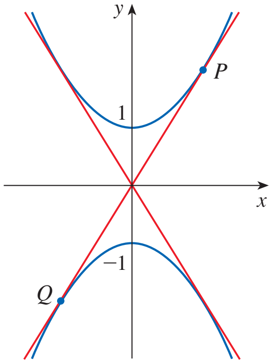

**FIGURE 1**

**SOLUTION** To gain insight into this problem, it is essential to draw a diagram. So we sketch the parabolas $y = 1 + x^2$ (which is the standard parabola $y = x^2$ shifted 1 unit upward) and $y = -1 - x^2$ (which is obtained by reflecting the first parabola about the $x$-axis). If we try to draw a line tangent to both parabolas, we soon discover that there are only two possibilities, as illustrated in Figure 1.

Let $P$ be a point at which one of these tangents touches the upper parabola and let $a$ be its $x$-coordinate. (The choice of notation for the unknown is important. Of course we could have used $b$ or $c$ or $x_0$ or $x_1$ instead of $a$. However, it's not advisable to use $x$ in place of $a$ because that $x$ could be confused with the variable $x$ in the equation of the parabola.) Then, since $P$ lies on the parabola $y = 1 + x^2$, its $y$-coordinate must be $1 + a^2$. Because of the symmetry shown in Figure 1, the coordinates of the point $Q$ where the tangent touches the lower parabola must be $(-a, -(1 + a^2))$.

To use the given information that the line is a tangent, we equate the slope of the line $PQ$ to the slope of the tangent line at $P$. We have

$$m_{PQ} = \frac{1 + a^2 - (-1 - a^2)}{a - (-a)} = \frac{1 + a^2}{a}$$

If $f(x) = 1 + x^2$, then the slope of the tangent line at $P$ is $f'(a) = 2a$. Thus the condition that we need to use is that

$$\frac{1 + a^2}{a} = 2a$$

Solving this equation, we get $1 + a^2 = 2a^2$, so $a^2 = 1$ and $a = \pm 1$. Therefore the points are $(1, 2)$ and $(-1, -2)$. By symmetry, the two remaining points are $(-1, 2)$ and $(1, -2)$. ■

## Problems

**1.** Find points $P$ and $Q$ on the parabola $y = 1 - x^2$ so that the triangle $ABC$ formed by the $x$-axis and the tangent lines at $P$ and $Q$ is an equilateral triangle (see the figure).

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**2.** Find the point where the curves $y = x^3 - 3x + 4$ and $y = 3(x^2 - x)$ are tangent to each other, that is, have a common tangent line. Illustrate by sketching both curves and the common tangent.

**3.** Show that the tangent lines to the parabola $y = ax^2 + bx + c$ at any two points with $x$-coordinates $p$ and $q$ must intersect at a point whose $x$-coordinate is halfway between $p$ and $q$.

**4.** Show that $\dfrac{d}{dx}\left(\dfrac{\sin^2 x}{1 + \cot x} + \dfrac{\cos^2 x}{1 + \tan x}\right) = -\cos 2x$.

**5.** If $f(x) = \lim\limits_{t \to x} \dfrac{\sec t - \sec x}{t - x}$, find the value of $f'(\pi/4)$.

**6.** Find the values of the constants $a$ and $b$ such that

$$\lim_{x \to 0} \frac{\sqrt[3]{ax + b} - 2}{x} = \frac{5}{12}$$

**7.** Prove that $\dfrac{d^n}{dx^n}(\sin^4 x + \cos^4 x) = 4^{n-1} \cos(4x + n\pi/2)$.

**8.** If $f$ is differentiable at $a$, where $a > 0$, evaluate the following limit in terms of $f'(a)$:

$$\lim_{x \to a} \frac{f(x) - f(a)}{\sqrt{x} - \sqrt{a}}$$

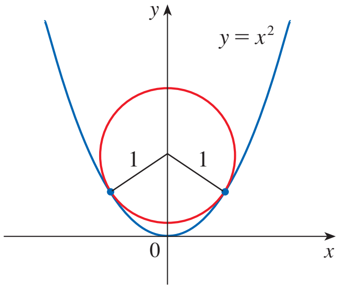

FIGURE FOR PROBLEM 9

**9.** The figure shows a circle with radius 1 inscribed in the parabola $y = x^2$. Find the center of the circle.

**10.** Find all values of $c$ such that the parabolas $y = 4x^2$ and $x = c + 2y^2$ intersect each other at right angles.

**11.** How many lines are tangent to both of the circles $x^2 + y^2 = 4$ and $x^2 + (y - 3)^2 = 1$? At what points do these tangent lines touch the circles?

**12.** If $f(x) = \dfrac{x^{46} + x^{45} + 2}{1 + x}$, calculate $f^{(46)}(3)$. Express your answer using factorial notation:

$$n! = 1 \cdot 2 \cdot 3 \cdot \cdots \cdot (n - 1) \cdot n$$

**13.** The figure shows a rotating wheel with radius 40 cm and a connecting rod $AP$ with length 1.2 m. The pin $P$ slides back and forth along the $x$-axis as the wheel rotates counterclockwise at a rate of 360 revolutions per minute.

(a) Find the angular velocity of the connecting rod, $d\alpha/dt$, in radians per second, when $\theta = \pi/3$.

(b) Express the distance $x = |OP|$ in terms of $\theta$.

(c) Find an expression for the velocity of the pin $P$ in terms of $\theta$.

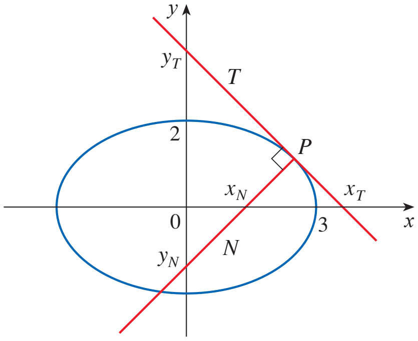
**14.** Tangent lines $T_1$ and $T_2$ are drawn at two points $P_1$ and $P_2$ on the parabola $y = x^2$ and they intersect at a point $P$. Another tangent line $T$ is drawn at a point between $P_1$ and $P_2$; it intersects $T_1$ at $Q_1$ and $T_2$ at $Q_2$. Show that

$$\frac{|PQ_1|}{|PP_1|} + \frac{|PQ_2|}{|PP_2|} = 1$$

**15.** Let $T$ and $N$ be the tangent and normal lines to the ellipse $x^2/9 + y^2/4 = 1$ at any point $P$ on the ellipse in the first quadrant. Let $x_T$ and $y_T$ be the $x$- and $y$-intercepts of $T$ and $x_N$ and $y_N$ be the intercepts of $N$. As $P$ moves along the ellipse in the first quadrant (but not on the axes), what values can $x_T$, $y_T$, $x_N$, and $y_N$ take on? First try to guess the answers just by looking at the figure. Then use calculus to solve the problem and see how good your intuition is.



**16.** Evaluate $\displaystyle\lim_{x \to 0} \frac{\sin(3 + x)^2 - \sin 9}{x}$.

**17.** (a) Use the identity for $\tan(x - y)$ (see Equation 15b in Appendix D) to show that if two lines $L_1$ and $L_2$ intersect at an angle $\alpha$, then

$$\tan \alpha = \frac{m_2 - m_1}{1 + m_1 m_2}$$

where $m_1$ and $m_2$ are the slopes of $L_1$ and $L_2$, respectively.

(b) The **angle between the curves** $C_1$ and $C_2$ at a point of intersection $P$ is defined to be the angle between the tangent lines to $C_1$ and $C_2$ at $P$ (if these tangent lines exist). Use part (a) to find, correct to the nearest degree, the angle between each pair of curves at each point of intersection.

(i) $y = x^2$ and $y = (x - 2)^2$

(ii) $x^2 - y^2 = 3$ and $x^2 - 4x + y^2 + 3 = 0$

**18.** Let $P(x_1, y_1)$ be a point on the parabola $y^2 = 4px$ with focus $F(p, 0)$. Let $\alpha$ be the angle between the parabola and the line segment $FP$, and let $\beta$ be the angle between the horizontal line $y = y_1$ and the parabola as in the figure. Prove that $\alpha = \beta$. (Thus, by a principle

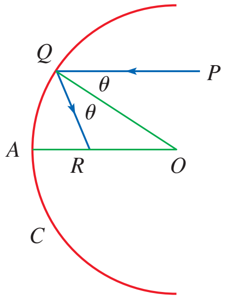
of geometrical optics, light from a source placed at $F$ will be reflected along a line parallel to the $x$-axis. This explains why *paraboloids,* the surfaces obtained by rotating parabolas about their axes, are used as the shape of some automobile headlights and mirrors for telescopes.)

**19.** Suppose that we replace the parabolic mirror of Problem 18 by a spherical mirror. Although the mirror has no focus, we can show the existence of an *approximate* focus. In the figure, $C$ is a semicircle with center $O$. A ray of light coming in toward the mirror parallel to the axis along the line $PQ$ will be reflected to the point $R$ on the axis so that $\angle PQO = \angle OQR$ (the angle of incidence is equal to the angle of reflection). What happens to the point $R$ as $P$ is taken closer and closer to the axis?



**20.** If $f$ and $g$ are differentiable functions with $f(0) = g(0) = 0$ and $g'(0) \neq 0$, show that

$$\lim_{x \to 0} \frac{f(x)}{g(x)} = \frac{f'(0)}{g'(0)}$$

**21.** Evaluate the following limit:

$$\lim_{x \to 0} \frac{\sin(a + 2x) - 2\sin(a + x) + \sin a}{x^2}$$

**22.** Given an ellipse $x^2/a^2 + y^2/b^2 = 1$, where $a \neq b$, find the equation of the set of all points from which there are two tangents to the curve whose slopes are (a) reciprocals and (b) negative reciprocals.

**23.** Find the two points on the curve $y = x^4 - 2x^2 - x$ that have a common tangent line.

**24.** Suppose that three points on the parabola $y = x^2$ have the property that their normal lines intersect at a common point. Show that the sum of their $x$-coordinates is 0.

**25.** A *lattice point* in the plane is a point with integer coordinates. Suppose that circles with radius $r$ are drawn using all lattice points as centers. Find the smallest value of $r$ such that any line with slope $\frac{2}{5}$ intersects some of these circles.

**26.** A cone of radius $r$ centimeters and height $h$ centimeters is lowered point first at a rate of 1 cm/s into a tall cylinder of radius $R$ centimeters that is partially filled with water. How fast is the water level rising at the instant the cone is completely submerged?

**27.** A container in the shape of an inverted cone has height 16 cm and radius 5 cm at the top. It is partially filled with a liquid that oozes through the sides at a rate proportional to the area of the container that is in contact with the liquid. (The surface area of a cone is $\pi r l$, where $r$ is the radius and $l$ is the slant height.) If we pour the liquid into the container at a rate of

2 cm$^3$/min, then the height of the liquid decreases at a rate of 0.3 cm/min when the height is 10 cm. If our goal is to keep the liquid at a constant height of 10 cm, at what rate should we pour the liquid into the container?

T **28.** (a) The cubic function $f(x) = x(x - 2)(x - 6)$ has three distinct zeros: 0, 2, and 6. Graph $f$ and its tangent lines at the *average* of each pair of zeros. What do you notice?

(b) Suppose the cubic function $f(x) = (x - a)(x - b)(x - c)$ has three distinct zeros: $a$, $b$, and $c$. Prove, with the help of a computer algebra system, that a tangent line drawn at the average of the zeros $a$ and $b$ intersects the graph of $f$ at the third zero.

**The great mathematician Leonard Euler observed "… nothing at all takes place in the universe in which some rule of maximum or minimum does not appear." In Exercise 3.7.53 you will use calculus to show that bees construct the cells in their hive in a shape that minimizes surface area.**

Kostiantyn Kravchenko / Shutterstock.com

# Applications of Differentiation

**WE HAVE ALREADY INVESTIGATED SOME** of the applications of derivatives, but now that we know the differentiation rules we are in a better position to pursue the applications of differentiation in greater depth. Here we learn what derivatives tell us about the shape of a graph of a function and, in particular, how they help us locate maximum and minimum values of functions. Many practical problems require us to minimize a cost or maximize an area or somehow find the best possible outcome of a situation. In particular, we will be able to investigate the optimal shape of a can and to explain the location of rainbows in the sky.

## 3.1 Maximum and Minimum Values

Some of the most important applications of differential calculus are *optimization problems*, in which we are required to find the optimal (best) way of doing something. Here are examples of such problems that we will solve in this chapter:

- What is the shape of a can that minimizes manufacturing costs?
- What is the maximum acceleration of a spacecraft? (This is an important question for the astronauts who have to withstand the effects of acceleration.)
- What is the radius of a contracted windpipe that expels air most rapidly during a cough?
- At what angle should blood vessels branch so as to minimize the energy expended by the heart in pumping blood?

These problems can be reduced to finding the maximum or minimum values of a function. Let's first explain exactly what we mean by maximum and minimum values.

### Absolute and Local Extreme Values

We see that the highest point on the graph of the function $f$ shown in Figure 1 is the point $(3, 5)$. In other words, the largest value of $f$ is $f(3) = 5$. Likewise, the smallest value is $f(6) = 2$. We say that $f(3) = 5$ is the *absolute maximum* of $f$ and $f(6) = 2$ is the *absolute minimum*. In general, we use the following definition.

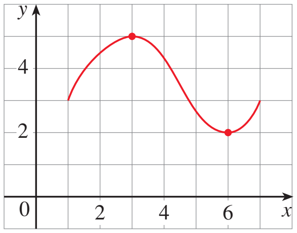

**FIGURE 1**

**1 Definitio** Let $c$ be a number in the domain $D$ of a function $f$. Then $f(c)$ is the

- **absolute maximum** value of $f$ on $D$ if $f(c) \geqslant f(x)$ for all $x$ in $D$.
- **absolute minimum** value of $f$ on $D$ if $f(c) \leqslant f(x)$ for all $x$ in $D$.

An absolute maximum or minimum is sometimes called a **global** maximum or minimum. The maximum and minimum values of $f$ are called **extreme values** of $f$.

Figure 2 shows the graph of a function $f$ with absolute maximum at $d$ and absolute minimum at $a$. Note that $(d, f(d))$ is the highest point on the graph and $(a, f(a))$ is the lowest point. In Figure 2, if we consider only values of $x$ near $b$ [for instance, if we restrict our attention to the interval $(a, c)$], then $f(b)$ is the largest of those values of $f(x)$ and is called a *local maximum value* of $f$. Likewise, $f(c)$ is called a *local minimum value* of $f$ because $f(c) \leqslant f(x)$ for $x$ near $c$ [in the interval $(b, d)$, for instance]. The function $f$ also has a local minimum at $e$. In general, we have the following definition.

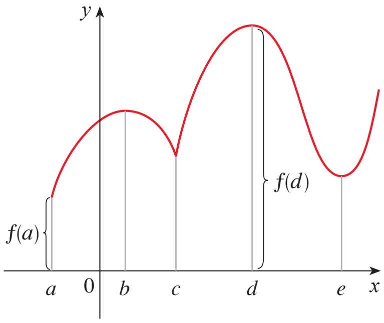

**FIGURE 2**
Abs min $f(a)$, abs max $f(d)$,
loc min $f(c), f(e)$, loc max $f(b), f(d)$

**2 Definitio** The number $f(c)$ is a

- **local maximum** value of $f$ if $f(c) \geqslant f(x)$ when $x$ is near $c$.
- **local minimum** value of $f$ if $f(c) \leqslant f(x)$ when $x$ is near $c$.

In Definition 2 (and elsewhere), if we say that something is true **near** $c$, we mean that it is true on some open interval containing $c$. (Thus a local maximum or minimum can't occur at an endpoint.) For instance, in Figure 3 we see that $f(4) = 5$ is a local minimum because it's the smallest value of $f$ on the interval $I$. It's not the absolute minimum because $f(x)$ takes on smaller values when $x$ is near 12 (in the interval $K$, for instance). In fact $f(12) = 3$ is both a local minimum and the absolute minimum. Similarly, $f(8) = 7$ is a local maximum, but not the absolute maximum because $f$ takes on larger values near 1.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

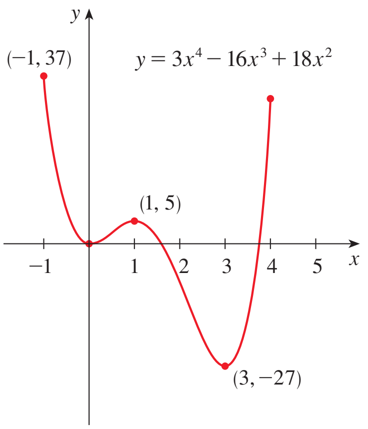

**FIGURE 4**

**EXAMPLE 1** The graph of the function

$$f(x) = 3x^4 - 16x^3 + 18x^2 \qquad -1 \leqslant x \leqslant 4$$

is shown in Figure 4. You can see that $f(1) = 5$ is a local maximum, whereas the absolute maximum is $f(-1) = 37$. (This absolute maximum is not a local maximum because it occurs at an endpoint.) Also, $f(0) = 0$ is a local minimum and $f(3) = -27$ is both a local and an absolute minimum. Note that $f$ has neither a local nor an absolute maximum at $x = 4$. ■

**EXAMPLE 2** The function $f(x) = \cos x$ takes on its (local and absolute) maximum value of 1 infinitely many times, because $\cos 2n\pi = 1$ for any integer $n$ and $-1 \leqslant \cos x \leqslant 1$ for all $x$. (See Figure 5.) Likewise, $\cos(2n + 1)\pi = -1$ is its minimum value, where $n$ is any integer.

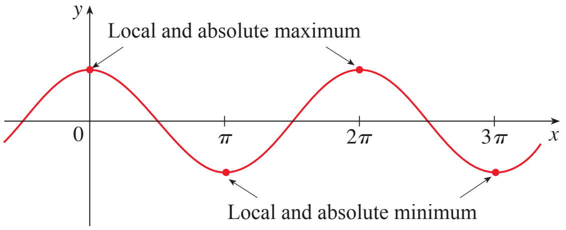

**FIGURE 5**
$y = \cos x$

■

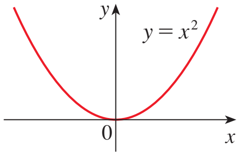

**FIGURE 6**
Mimimum value 0, no maximum

**EXAMPLE 3** If $f(x) = x^2$, then $f(x) \geqslant f(0)$ because $x^2 \geqslant 0$ for all $x$. Therefore $f(0) = 0$ is the absolute (and local) minimum value of $f$. This corresponds to the fact that the origin is the lowest point on the parabola $y = x^2$. (See Figure 6.) However, there is no highest point on the parabola and so this function has no maximum value. ■

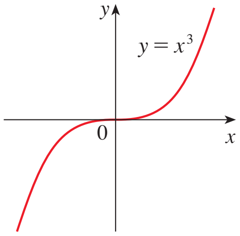

**FIGURE 7**
No mimimum, no maximum

**EXAMPLE 4** From the graph of the function $f(x) = x^3$, shown in Figure 7, we see that this function has neither an absolute maximum value nor an absolute minimum value. In fact, it has no local extreme values either. ■

We have seen that some functions have extreme values, whereas others do not. The following theorem gives conditions under which a function is guaranteed to possess extreme values.

**3 The Extreme Value Theorem** If $f$ is continuous on a closed interval $[a, b]$, then $f$ attains an absolute maximum value $f(c)$ and an absolute minimum value $f(d)$ at some numbers $c$ and $d$ in $[a, b]$.

The Extreme Value Theorem is illustrated in Figure 8. Note that an extreme value can be taken on more than once. Although the Extreme Value Theorem is intuitively very plausible, it is difficult to prove and so we omit the proof.

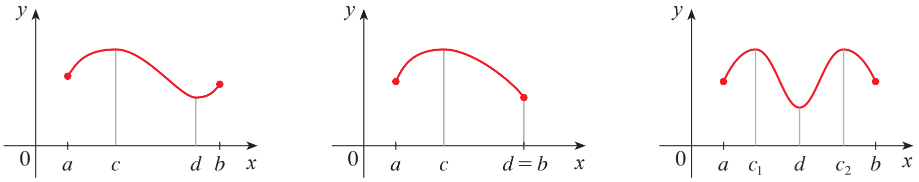

**FIGURE 8**
Functions continuous on a closed interval always attain extreme values.

Figures 9 and 10 show that a function need not possess extreme values if either hypothesis (continuity or closed interval) is omitted from the Extreme Value Theorem.

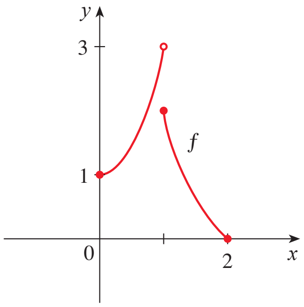

**FIGURE 9**
This function has minimum value $f(2) = 0$, but no maximum value.

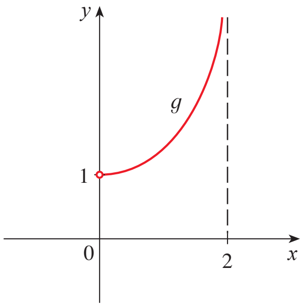

**FIGURE 10**
This continuous function $g$ has no maximum or minimum.

The function $f$ whose graph is shown in Figure 9 is defined on the closed interval $[0, 2]$ but has no maximum value. (Notice that the range of $f$ is $[0, 3)$. The function takes on values arbitrarily close to 3, but never actually attains the value 3.) This does not contradict the Extreme Value Theorem because $f$ is not continuous. [Nonetheless, a discontinuous function *could* have maximum and minimum values. See Exercise 13(b).]

The function $g$ shown in Figure 10 is continuous on the open interval $(0, 2)$ but has neither a maximum nor a minimum value. [The range of $g$ is $(1, \infty)$. The function takes on arbitrarily large values.] This does not contradict the Extreme Value Theorem because the interval $(0, 2)$ is not closed.

## Critical Numbers and the Closed Interval Method

The Extreme Value Theorem says that a continuous function on a closed interval has a maximum value and a minimum value, but it does not tell us how to find these extreme values. Notice in Figure 8 that the absolute maximum and minimum values that are *between* $a$ and $b$ occur at local maximum or minimum values, so we start by looking for local extreme values.

Figure 11 shows the graph of a function $f$ with a local maximum at $c$ and a local minimum at $d$. It appears that at the maximum and minimum points the tangent lines are horizontal and therefore each has slope 0. We know that the derivative is the slope of the tangent line, so it appears that $f'(c) = 0$ and $f'(d) = 0$. The following theorem says that this is always true for differentiable functions.

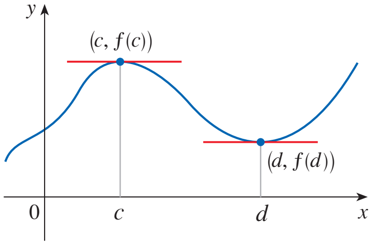

**FIGURE 11**

$\boxed{4}$ **Fermat's Theorem** If $f$ has a local maximum or minimum at $c$, and if $f'(c)$ exists, then $f'(c) = 0$.

**PROOF** Suppose, for the sake of definiteness, that $f$ has a local maximum at $c$. Then, according to Definition 2, $f(c) \geqslant f(x)$ if $x$ is sufficiently close to $c$. This implies that if $h$ is sufficiently close to 0, with $h$ being positive or negative, then

$$f(c) \geqslant f(c + h)$$

and therefore

$$\boxed{5} \qquad f(c + h) - f(c) \leqslant 0$$

**Fermat**

Fermat's Theorem is named after Pierre Fermat (1601–1665), a French lawyer who took up mathematics as a hobby. Despite his amateur status, Fermat was one of the two inventors of analytic geometry (Descartes was the other). His methods for finding tangents to curves and maximum and minimum values (before the invention of limits and derivatives) made him a forerunner of Newton in the creation of differential calculus.

We can divide both sides of an inequality by a positive number. Thus, if $h > 0$ and $h$ is sufficiently small, we have

$$\frac{f(c+h)-f(c)}{h} \leqslant 0$$

Taking the right-hand limit of both sides of this inequality (using Theorem 1.6.2), we get

$$\lim_{h\to 0^+} \frac{f(c+h)-f(c)}{h} \leqslant \lim_{h\to 0^+} 0 = 0$$

But since $f'(c)$ exists, we have

$$f'(c) = \lim_{h\to 0} \frac{f(c+h)-f(c)}{h} = \lim_{h\to 0^+} \frac{f(c+h)-f(c)}{h}$$

and so we have shown that $f'(c) \leqslant 0$.

If $h < 0$, then the direction of the inequality (5) is reversed when we divide by $h$:

$$\frac{f(c+h)-f(c)}{h} \geqslant 0$$

So, taking the left-hand limit, we have

$$f'(c) = \lim_{h\to 0} \frac{f(c+h)-f(c)}{h} = \lim_{h\to 0^-} \frac{f(c+h)-f(c)}{h} \geqslant 0$$

We have shown that $f'(c) \geqslant 0$ and also that $f'(c) \leqslant 0$. Since both of these inequalities must be true, the only possibility is that $f'(c) = 0$.

We have proved Fermat's Theorem for the case of a local maximum. The case of a local minimum can be proved in a similar manner, or see Exercise 73 for an alternate method. ■

The following examples caution us against reading too much into Fermat's Theorem: we can't expect to locate extreme values simply by setting $f'(x) = 0$ and solving for $x$.

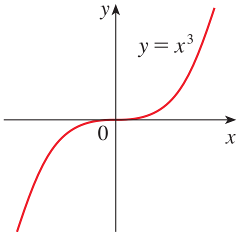

**FIGURE 12**
If $f(x) = x^3$, then $f'(0) = 0$, but $f$ has no maximum or minimum.

**EXAMPLE 5** If $f(x) = x^3$, then $f'(x) = 3x^2$, so $f'(0) = 0$. But $f$ has no maximum or minimum at 0, as you can see from its graph in Figure 12. (Or observe that $x^3 > 0$ for $x > 0$ but $x^3 < 0$ for $x < 0$.) The fact that $f'(0) = 0$ simply means that the curve $y = x^3$ has a horizontal tangent at (0, 0). Instead of having a maximum or minimum at (0, 0), the curve crosses its horizontal tangent there. ■

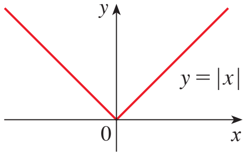

**FIGURE 13**
If $f(x) = |x|$, then $f(0) = 0$ is a minimum value, but $f'(0)$ does not exist.

**EXAMPLE 6** The function $f(x) = |x|$ has its (local and absolute) minimum value at 0, but that value can't be found by setting $f'(x) = 0$ because, as was shown in Example 2.2.5, $f'(0)$ does not exist. (See Figure 13.) ■

⊘ **WARNING** Examples 5 and 6 show that we must be careful when using Fermat's Theorem. Example 5 demonstrates that even when $f'(c) = 0$ there need not be a maximum or minimum at $c$. (In other words, the converse of Fermat's Theorem is false in general.) Furthermore, there may be an extreme value even when $f'(c)$ does not exist (as in Example 6).

Fermat's Theorem does suggest that we should at least *start* looking for extreme values of $f$ at the numbers $c$ where $f'(c) = 0$ or where $f'(c)$ does not exist. Such numbers are given a special name.

**6 Definitio** A **critical number** of a function $f$ is a number $c$ in the domain of $f$ such that either $f'(c) = 0$ or $f'(c)$ does not exist.

**EXAMPLE 7** Find the critical numbers of (a) $f(x) = x^3 - 3x^2 + 1$ and (b) $f(x) = x^{3/5}(4 - x)$.

**SOLUTION**

(a) The derivative of $f$ is $f'(x) = 3x^2 - 6x = 3x(x - 2)$. Since $f'(x)$ exists for all $x$, the only critical numbers of $f$ occur when $f'(x) = 0$, that is, when $x = 0$ or $x = 2$.

(b) First note that the domain of $f$ is $\mathbb{R}$. The Product Rule gives

$$f'(x) = x^{3/5}(-1) + (4 - x)\left(\tfrac{3}{5}x^{-2/5}\right) = -x^{3/5} + \frac{3(4 - x)}{5x^{2/5}}$$

$$= \frac{-5x + 3(4 - x)}{5x^{2/5}} = \frac{12 - 8x}{5x^{2/5}}$$

[The same result could be obtained by first writing $f(x) = 4x^{3/5} - x^{8/5}$.] Therefore $f'(x) = 0$ if $12 - 8x = 0$, that is, $x = \frac{3}{2}$, and $f'(x)$ does not exist when $x = 0$. Thus the critical numbers are $\frac{3}{2}$ and 0. ■

Figure 14 shows a graph of the function $f$ in Example 7(b). It supports our answer because there is a horizontal tangent when $x = 1.5$ [where $f'(x) = 0$] and a vertical tangent when $x = 0$ [where $f'(x)$ is undefined].

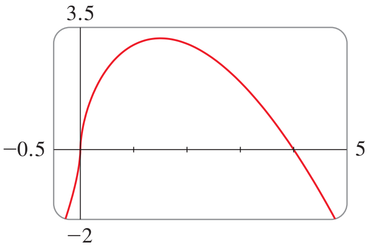

**FIGURE 14**

In terms of critical numbers, Fermat's Theorem can be rephrased as follows (compare Definition 6 with Theorem 4):

**7** If $f$ has a local maximum or minimum at $c$, then $c$ is a critical number of $f$.

To find an absolute maximum or minimum of a continuous function on a closed interval, we note that either it is local [in which case it occurs at a critical number by (7)] or it occurs at an endpoint of the interval, as we see from the examples in Figure 8. Thus the following three-step procedure always works.

**The Closed Interval Method** To find the *absolute* maximum and minimum values of a continuous function $f$ on a closed interval $[a, b]$:

1. Find the values of $f$ at the critical numbers of $f$ in $(a, b)$.
2. Find the values of $f$ at the endpoints of the interval.
3. The largest of the values from Steps 1 and 2 is the absolute maximum value; the smallest of these values is the absolute minimum value.

**EXAMPLE 8** Find the absolute maximum and minimum values of the function

$$f(x) = x^3 - 3x^2 + 1 \qquad -\tfrac{1}{2} \leqslant x \leqslant 4$$

**SOLUTION** Since $f$ is continuous on $\left[-\frac{1}{2}, 4\right]$, we can use the Closed Interval Method.

In Example 7(a) we found the critical numbers $x = 0$ and $x = 2$. Notice that each of these critical numbers lies in the interval $\left(-\frac{1}{2}, 4\right)$. The values of $f$ at these critical numbers are

$$f(0) = 1 \qquad f(2) = -3$$

The values of $f$ at the endpoints of the interval are

$$f\left(-\tfrac{1}{2}\right) = \tfrac{1}{8} \qquad f(4) = 17$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

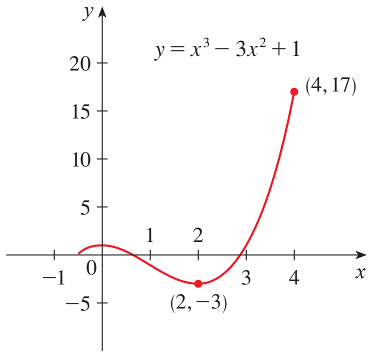

**FIGURE 15**

Comparing these four numbers, we see that the absolute maximum value is $f(4) = 17$ and the absolute minimum value is $f(2) = -3$.

In this example the absolute maximum occurs at an endpoint, whereas the absolute minimum occurs at a critical number. The graph of $f$ is sketched in Figure 15. ■

With graphing software or a graphing calculator it is possible to estimate maximum and minimum values very easily. But, as the next example shows, calculus is needed to find the *exact* values.

## EXAMPLE 9

(a) Use a calculator or computer to estimate the absolute minimum and maximum values of the function $f(x) = x - 2\sin x$, $0 \leqslant x \leqslant 2\pi$.
(b) Use calculus to find the exact minimum and maximum values.

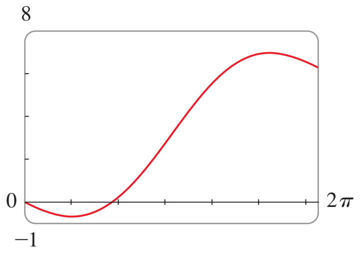

**FIGURE 16**

**SOLUTION**

(a) Figure 16 shows a graph of $f$ in the viewing rectangle $[0, 2\pi]$ by $[-1, 8]$. The absolute maximum value is about 6.97 and it occurs when $x \approx 5.24$. Similarly, the absolute minimum value is about $-0.68$ and it occurs when $x \approx 1.05$. It is possible to get more accurate numerical estimates, but for exact values we must use calculus.

(b) The function $f(x) = x - 2\sin x$ is continuous on $[0, 2\pi]$. Since $f'(x) = 1 - 2\cos x$, we have $f'(x) = 0$ when $\cos x = \frac{1}{2}$ and this occurs when $x = \pi/3$ or $5\pi/3$. The values of $f$ at these critical numbers are

$$f(\pi/3) = \frac{\pi}{3} - 2\sin\frac{\pi}{3} = \frac{\pi}{3} - \sqrt{3} \approx -0.684853$$

and

$$f(5\pi/3) = \frac{5\pi}{3} - 2\sin\frac{5\pi}{3} = \frac{5\pi}{3} + \sqrt{3} \approx 6.968039$$

The values of $f$ at the endpoints are

$$f(0) = 0 \qquad f(2\pi) = 2\pi \approx 6.28$$

Comparing these four numbers and using the Closed Interval Method, we see that the absolute minimum value is $f(\pi/3) = \pi/3 - \sqrt{3}$ and the absolute maximum value is $f(5\pi/3) = 5\pi/3 + \sqrt{3}$. The values from part (a) serve as a check on our work. ■

NASA

**EXAMPLE 10** The Hubble Space Telescope was deployed on April 24, 1990, by the space shuttle *Discovery*. A model for the velocity of the shuttle during this mission, from liftoff at $t = 0$ until the solid rocket boosters were jettisoned at $t = 126$ seconds, is given by

$$v(t) = 0.001302t^3 - 0.09029t^2 + 23.61t - 3.083$$

(in feet per second). Using this model, estimate the absolute maximum and minimum values of the *acceleration* of the shuttle between liftoff and the jettisoning of the boosters.

**SOLUTION** We are asked for the extreme values not of the given velocity function, but rather of the acceleration function. So we first need to differentiate to find the acceleration:

$$\begin{aligned} a(t) = v'(t) &= \frac{d}{dt}(0.001302t^3 - 0.09029t^2 + 23.61t - 3.083) \\ &= 0.003906t^2 - 0.18058t + 23.61 \end{aligned}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We now apply the Closed Interval Method to the continuous function $a$ on the interval $0 \leqslant t \leqslant 126$. Its derivative is

$$a'(t) = 0.007812t - 0.18058$$

The only critical number occurs when $a'(t) = 0$:

$$t_1 = \frac{0.18058}{0.007812} \approx 23.12$$

Evaluating $a(t)$ at the critical number and at the endpoints, we have

$$a(0) = 23.61 \qquad a(t_1) \approx 21.52 \qquad a(126) \approx 62.87$$

So the maximum acceleration is about 62.87 ft/s$^2$ and the minimum acceleration is about 21.52 ft/s$^2$. ■

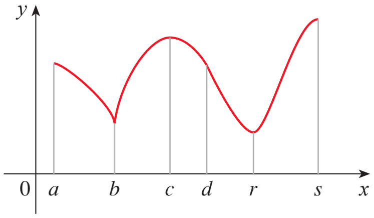
## 3.1 Exercises

**1.** Explain the difference between an absolute minimum and a local minimum.

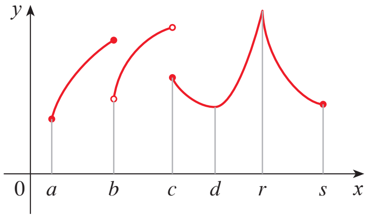
**2.** Suppose $f$ is a continuous function defined on a closed interval $[a, b]$.
  (a) What theorem guarantees the existence of an absolute maximum value and an absolute minimum value for $f$?
  (b) What steps would you take to find those maximum and minimum values?

**3–4** For each of the numbers $a$, $b$, $c$, $d$, $r$, and $s$, state whether the function whose graph is shown has an absolute maximum or minimum, a local maximum or minimum, or neither a maximum nor a minimum.

**3.**

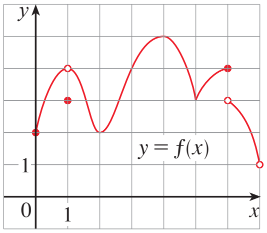


**4.**

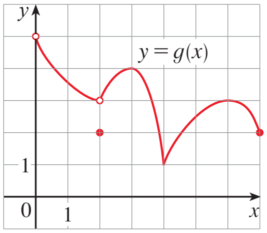


**5–6** Use the graph to state the absolute and local maximum and minimum values of the function.

**5.**



**6.**



**7–10** Sketch the graph of a function $f$ that is continuous on [1, 5] and has the given properties.

**7.** Absolute maximum at 5, absolute minimum at 2, local maximum at 3, local minima at 2 and 4

**8.** Absolute maximum at 4, absolute minimum at 5, local maximum at 2, local minimum at 3

**9.** Absolute minimum at 3, absolute maximum at 4, local maximum at 2

**10.** Absolute maximum at 2, absolute minimum at 5, 4 is a critical number but there is no local maximum or minimum there.

**11.** (a) Sketch the graph of a function that has a local maximum at 2 and is differentiable at 2.
  (b) Sketch the graph of a function that has a local maximum at 2 and is continuous but not differentiable at 2.
  (c) Sketch the graph of a function that has a local maximum at 2 and is not continuous at 2.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**12.** (a) Sketch the graph of a function on $[-1, 2]$ that has an absolute maximum but no local maximum.
(b) Sketch the graph of a function on $[-1, 2]$ that has a local maximum but no absolute maximum.

**13.** (a) Sketch the graph of a function on $[-1, 2]$ that has an absolute maximum but no absolute minimum.
(b) Sketch the graph of a function on $[-1, 2]$ that is discontinuous but has both an absolute maximum and an absolute minimum.

**14.** (a) Sketch the graph of a function that has two local maxima, one local minimum, and no absolute minimum.
(b) Sketch the graph of a function that has three local minima, two local maxima, and seven critical numbers.

**15–28** Sketch the graph of $f$ by hand and use your sketch to find the absolute and local maximum and minimum values of $f$. (Use the graphs and transformations of Sections 1.2 and 1.3.)

**15.** $f(x) = 3 - 2x, \quad x \geqslant -1$

**16.** $f(x) = x^2, \quad -1 \leqslant x < 2$

**17.** $f(x) = 1/x, \quad x \geqslant 1$

**18.** $f(x) = 1/x, \quad 1 < x < 3$

**19.** $f(x) = \sin x, \quad 0 \leqslant x < \pi/2$

**20.** $f(x) = \sin x, \quad 0 < x \leqslant \pi/2$

**21.** $f(x) = \sin x, \quad -\pi/2 \leqslant x \leqslant \pi/2$

**22.** $f(t) = \cos t, \quad -3\pi/2 \leqslant t \leqslant 3\pi/2$

**23.** $f(x) = 1 + (x + 1)^2, \quad -2 \leqslant x < 5$

**24.** $f(x) = |x|$

**25.** $f(x) = 1 - \sqrt{x}$

**26.** $f(x) = 1 - x^3$

**27.** $f(x) = \begin{cases} x^2 & \text{if } -1 \leqslant x \leqslant 0 \\ 2 - 3x & \text{if } 0 < x \leqslant 1 \end{cases}$

**28.** $f(x) = \begin{cases} 2x + 1 & \text{if } 0 \leqslant x < 1 \\ 4 - 2x & \text{if } 1 \leqslant x \leqslant 3 \end{cases}$

**29–46** Find the critical numbers of the function.

**29.** $f(x) = 3x^2 + x - 2$

**30.** $g(v) = v^3 - 12v + 4$

**31.** $f(x) = 3x^4 + 8x^3 - 48x^2$

**32.** $f(x) = 2x^3 + x^2 + 8x$

**33.** $g(t) = t^5 + 5t^3 + 50t$

**34.** $A(x) = |3 - 2x|$

**35.** $g(y) = \dfrac{y - 1}{y^2 - y + 1}$

**36.** $h(p) = \dfrac{p - 1}{p^2 + 4}$

**37.** $p(x) = \dfrac{x^2 + 2}{2x - 1}$

**38.** $q(t) = \dfrac{t^2 + 9}{t^2 - 9}$

**39.** $h(t) = t^{3/4} - 2t^{1/4}$

**40.** $g(x) = \sqrt[3]{4 - x^2}$

**41.** $F(x) = x^{4/5}(x - 4)^2$

**42.** $h(x) = x^{-1/3}(x - 2)$

**43.** $f(x) = x^{1/3}(4 - x)^{2/3}$

**44.** $f(\theta) = \theta + \sqrt{2}\cos\theta$

**45.** $f(\theta) = 2\cos\theta + \sin^2\theta$

**46.** $g(x) = \sqrt{1 - x^2}$

**47–48** A formula for the *derivative* of a function $f$ is given. How many critical numbers does $f$ have?

**47.** $f'(x) = 1 + \dfrac{210 \sin x}{x^2 - 6x + 10}$

**48.** $f'(x) = \dfrac{100 \cos^2 x}{10 + x^2} - 1$

**49–60** Find the absolute maximum and absolute minimum values of $f$ on the given interval.

**49.** $f(x) = 12 + 4x - x^2, \quad [0, 5]$

**50.** $f(x) = 5 + 54x - 2x^3, \quad [0, 4]$

**51.** $f(x) = 2x^3 - 3x^2 - 12x + 1, \quad [-2, 3]$

**52.** $f(x) = x^3 - 6x^2 + 5, \quad [-3, 5]$

**53.** $f(x) = 3x^4 - 4x^3 - 12x^2 + 1, \quad [-2, 3]$

**54.** $f(t) = (t^2 - 4)^3, \quad [-2, 3]$

**55.** $f(x) = x + \dfrac{1}{x}, \quad [0.2, 4]$

**56.** $f(x) = \dfrac{x}{x^2 - x + 1}, \quad [0, 3]$

**57.** $f(t) = t - \sqrt[3]{t}, \quad [-1, 4]$

**58.** $f(t) = \dfrac{\sqrt{t}}{1 + t^2}, \quad [0, 2]$

**59.** $f(t) = 2\cos t + \sin 2t, \quad [0, \pi/2]$

**60.** $f(\theta) = 1 + \cos^2\theta, \quad [\pi/4, \pi]$

**61.** If $a$ and $b$ are positive numbers, find the maximum value of $f(x) = x^a(1 - x)^b$, $0 \leqslant x \leqslant 1$.

**62.** Use a graph to estimate the critical numbers of $f(x) = |1 + 5x - x^3|$ correct to one decimal place.

**63–66**

(a) Use a graph to estimate the absolute maximum and minimum values of the function to two decimal places.
(b) Use calculus to find the exact maximum and minimum values.

**63.** $f(x) = x^5 - x^3 + 2, \quad -1 \leqslant x \leqslant 1$

**64.** $f(x) = x^4 - 3x^3 + 3x^2 - x, \quad 0 \leqslant x \leqslant 2$

**65.** $f(x) = x\sqrt{x - x^2}$

**66.** $f(x) = x - 2\cos x, \quad -2 \leqslant x \leqslant 0$

---

**67.** Between 0°C and 30°C, the volume $V$ (in cubic centimeters) of 1 kg of water at a temperature $T$ is given approximately by the formula

$$V = 999.87 - 0.06426T + 0.0085043T^2 - 0.0000679T^3$$

Find the temperature at which water has its maximum density.

**68.** An object with weight $W$ is dragged along a horizontal plane by a force acting along a rope attached to the object. If the rope makes an angle $\theta$ with the plane, then the magnitude of the force is

$$F = \frac{\mu W}{\mu \sin\theta + \cos\theta}$$

where $\mu$ is a positive constant called the *coefficient of friction* and where $0 \leqslant \theta \leqslant \pi/2$. Show that $F$ is minimized when $\tan\theta = \mu$.

**69.** The water level, measured in feet above mean sea level, of Lake Lanier in Georgia, USA, during 2012 can be modeled by the function

$$L(t) = 0.01441t^3 - 0.4177t^2 + 2.703t + 1060.1$$

where $t$ is measured in months since January 1, 2012. Estimate when the water level was highest during 2012.

T **70.** In 1992 the space shuttle *Endeavour* was launched on mission STS-49 in order to install a new perigee kick motor in an Intelsat communications satellite. The table gives the velocity data for the shuttle between liftoff and the jettisoning of the solid rocket boosters.

| Event | Time (s) | Velocity (ft/s) |
|---|---|---|
| Launch | 0 | 0 |
| Begin roll maneuver | 10 | 185 |
| End roll maneuver | 15 | 319 |
| Throttle to 89% | 20 | 447 |
| Throttle to 67% | 32 | 742 |
| Throttle to 104% | 59 | 1325 |
| Maximum dynamic pressure | 62 | 1445 |
| Solid rocket booster separation | 125 | 4151 |

(a) Use a graphing calculator or computer to find the cubic polynomial that best models the velocity of the shuttle for the time interval $t \in [0, 125]$. Then graph this polynomial.
(b) Find a model for the acceleration of the shuttle and use it to estimate the maximum and minimum values of the acceleration during the first 125 seconds.

**71.** When a foreign object lodged in the trachea forces a person to cough, the diaphragm thrusts upward, causing an increase in pressure in the lungs. This is accompanied by a contraction of the trachea, making a narrower channel for the expelled air to flow through. For a given amount of air to escape in a fixed time, it must move faster through the narrower channel than the wider one. The greater the velocity of the airstream, the greater the force on the foreign object. X-rays show that the radius of the circular tracheal tube contracts to about two-thirds of its normal radius during a cough. According to a mathematical model of coughing, the velocity $v$ of the airstream is related to the radius $r$ of the trachea by the equation

$$v(r) = k(r_0 - r)r^2 \qquad \tfrac{1}{2}r_0 \leqslant r \leqslant r_0$$

where $k$ is a constant and $r_0$ is the normal radius of the trachea. The restriction on $r$ is due to the fact that the tracheal wall stiffens under pressure and a contraction greater than $\frac{1}{2}r_0$ is prevented (otherwise the person would suffocate).

(a) Determine the value of $r$ in the interval $\left[\frac{1}{2}r_0, r_0\right]$ at which $v$ has an absolute maximum. How does this compare with experimental evidence?
(b) What is the absolute maximum value of $v$ on the interval?
(c) Sketch the graph of $v$ on the interval $[0, r_0]$.

**72.** Prove that the function

$$f(x) = x^{101} + x^{51} + x + 1$$

has neither a local maximum nor a local minimum.

**73.** (a) If $f$ has a local minimum value at $c$, show that the function $g(x) = -f(x)$ has a local maximum value at $c$.
(b) Use part (a) to prove Fermat's Theorem for the case in which $f$ has a local minimum at $c$.

**74.** A cubic function is a polynomial of degree 3; that is, it has the form $f(x) = ax^3 + bx^2 + cx + d$, where $a \neq 0$.
(a) Show that a cubic function can have two, one, or no critical number(s). Give examples and sketches to illustrate the three possibilities.
(b) How many local extreme values can a cubic function have?

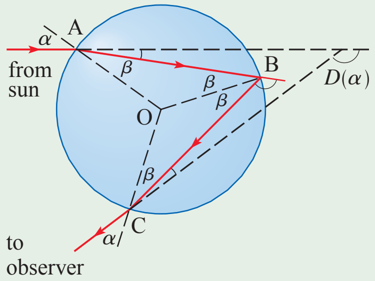
## APPLIED PROJECT | THE CALCULUS OF RAINBOWS

Rainbows are created when raindrops scatter sunlight. They have fascinated mankind since ancient times and have inspired attempts at scientific explanation since the time of Aristotle. In this project we use the ideas of Descartes and Newton to explain the shape, location, and colors of rainbows.

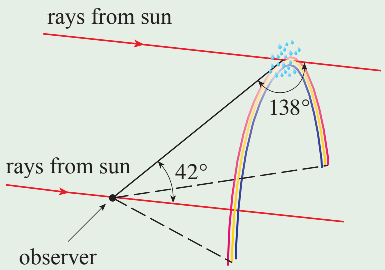


Formation of the primary rainbow

**1.** The figure shows a ray of sunlight entering a spherical raindrop at A. Some of the light is reflected, but the line AB shows the path of the part that enters the drop. Notice that the light is refracted toward the normal line AO and in fact Snell's Law says that $\sin \alpha = k \sin \beta$, where $\alpha$ is the angle of incidence, $\beta$ is the angle of refraction, and $k \approx \frac{4}{3}$ is the index of refraction for water. At B some of the light passes through the drop and is refracted into the air, but the line BC shows the part that is reflected. (The angle of incidence equals the angle of reflection.) When the ray reaches C, part of it is reflected, but for the time being we are more interested in the part that leaves the raindrop at C. (Notice that it is refracted away from the normal line.) The *angle of deviation* $D(\alpha)$ is the amount of clockwise rotation that the ray has undergone during this three-stage process. Thus

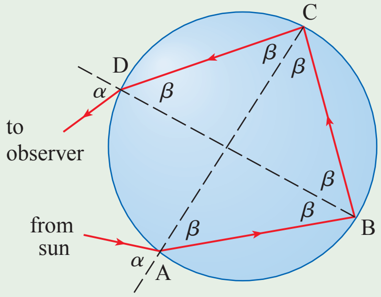
$$D(\alpha) = (\alpha - \beta) + (\pi - 2\beta) + (\alpha - \beta) = \pi + 2\alpha - 4\beta$$

Show that the minimum value of the deviation is $D(\alpha) \approx 138°$ and occurs when $\alpha \approx 59.4°$.



The significance of the minimum deviation is that when $\alpha \approx 59.4°$ we have $D'(\alpha) \approx 0$, so $\Delta D/\Delta\alpha \approx 0$. This means that many rays with $\alpha \approx 59.4°$ become deviated by approximately the same amount. It is the *concentration* of rays coming from near the direction of minimum deviation that creates the brightness of the primary rainbow. The figure at the left shows that the angle of elevation from the observer up to the highest point on the rainbow is $180° - 138° = 42°$. (This angle is called the *rainbow angle.*)

**2.** Problem 1 explains the location of the primary rainbow, but how do we explain the colors? Sunlight comprises a range of wavelengths, from the red range through orange, yellow, green, blue, indigo, and violet. As Newton discovered in his prism experiments of 1666, the index of refraction is different for each color. (The effect is called *dispersion.*) For red light the refractive index is $k \approx 1.3318$, whereas for violet light it is $k \approx 1.3435$. By repeating the calculation of Problem 1 for these values of $k$, show that the rainbow angle is about 42.3° for the red bow and 40.6° for the violet bow. So the rainbow really consists of seven individual bows corresponding to the seven colors.



Formation of the secondary rainbow

**3.** Perhaps you have seen a fainter secondary rainbow above the primary bow. That results from the part of a ray that enters a raindrop and is refracted at A, reflected twice (at B and C), and refracted as it leaves the drop at D (see the figure at the left). This time the deviation angle $D(\alpha)$ is the total amount of counterclockwise rotation that the ray undergoes in this four-stage process. Show that

$$D(\alpha) = 2\alpha - 6\beta + 2\pi$$

and $D(a)$ has a minimum value when

$$\cos \alpha = \sqrt{\frac{k^2 - 1}{8}}$$

Taking $k = \frac{4}{3}$, show that the minimum deviation is about 129° and so the rainbow angle for the secondary rainbow is about 51°, as shown in the figure at the left.

**4.** Show that the colors in the secondary rainbow appear in the opposite order from those in the primary rainbow.

## 3.2 The Mean Value Theorem

We will see that many of the results of this chapter depend on one central fact, which is called the Mean Value Theorem.

### Rolle's Theorem

To arrive at the Mean Value Theorem, we first need the following result.

**Rolle's Theorem** Let $f$ be a function that satisfies the following three hypotheses:

**1.** $f$ is continuous on the closed interval $[a, b]$.

**2.** $f$ is differentiable on the open interval $(a, b)$.

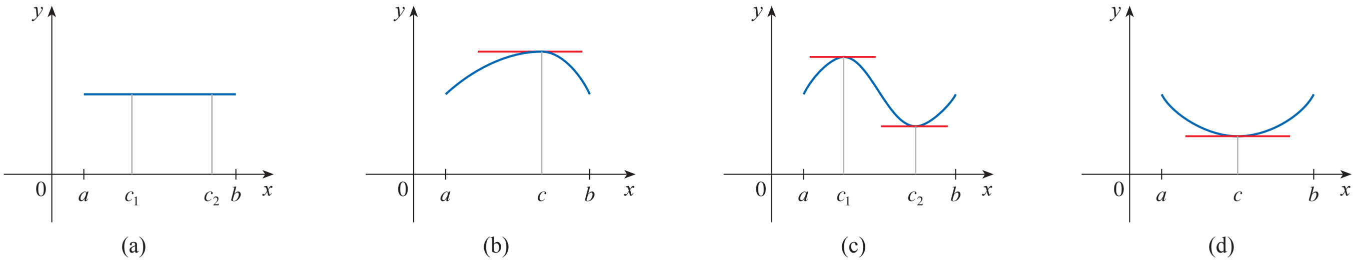
**3.** $f(a) = f(b)$

Then there is a number $c$ in $(a, b)$ such that $f'(c) = 0$.

**Rolle**

Rolle's Theorem was first published in 1691 by the French mathematician Michel Rolle (1652–1719) in a book entitled *Méthode pour resoudre les egalitez*. He was a vocal critic of the methods of his day and attacked calculus as being a "collection of ingenious fallacies." Later, however, he became convinced of the essential correctness of the methods of calculus.

Before giving the proof let's take a look at the graphs of some typical functions that satisfy the three hypotheses. Figure 1 shows the graphs of four such functions. In each case it appears that there is at least one point $(c, f(c))$ on the graph where the tangent is horizontal and therefore $f'(c) = 0$. Thus Rolle's Theorem is plausible.



(a) (b) (c) (d)

**FIGURE 1**

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PROOF** There are three cases:

PS Take cases

**CASE I** $f(x) = k$, **a constant**
Then $f'(x) = 0$, so the number $c$ can be taken to be *any* number in $(a, b)$.

**CASE II** $f(x) > f(a)$ **for some** $x$ **in** $(a, b)$ [as in Figure 1(b) or (c)]
By the Extreme Value Theorem (which we can apply by hypothesis 1), $f$ has a maximum value somewhere in $[a, b]$. Since $f(a) = f(b)$, it must attain this maximum value at a number $c$ in the open interval $(a, b)$. Then $f$ has a *local* maximum at $c$ and, by hypothesis 2, $f$ is differentiable at $c$. Therefore $f'(c) = 0$ by Fermat's Theorem.

**CASE III** $f(x) < f(a)$ **for some** $x$ **in** $(a, b)$ [as in Figure 1(c) or (d)]
By the Extreme Value Theorem, $f$ has a minimum value in $[a, b]$ and, since $f(a) = f(b)$, it attains this minimum value at a number $c$ in $(a, b)$. Again $f'(c) = 0$ by Fermat's Theorem. ■

**EXAMPLE 1** Let's apply Rolle's Theorem to the position function $s = f(t)$ of a moving object. If the object is in the same place at two different instants $t = a$ and $t = b$, then $f(a) = f(b)$. Rolle's Theorem says that there is some instant of time $t = c$ between $a$ and $b$ when $f'(c) = 0$; that is, the velocity is 0. (In particular, you can see that this is true when a ball is thrown directly upward.) ■

Figure 2 shows a graph of the function $f(x) = x^3 + x - 1$ discussed in Example 2. Rolle's Theorem shows that, no matter how much we enlarge the viewing rectangle, we can never find a second $x$-intercept.

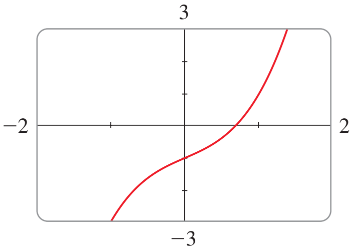


**FIGURE 2**

**EXAMPLE 2** Prove that the equation $x^3 + x - 1 = 0$ has exactly one real solution.

**SOLUTION** First we use the Intermediate Value Theorem (1.8.10) to show that a solution exists. Let $f(x) = x^3 + x - 1$. Then $f(0) = -1 < 0$ and $f(1) = 1 > 0$. Since $f$ is a polynomial, it is continuous, so the Intermediate Value Theorem states that there is a number $c$ between 0 and 1 such that $f(c) = 0$. Thus the given equation has a solution.

To show that the equation has no other real solution, we use Rolle's Theorem and argue by contradiction. Suppose that it had two solutions $a$ and $b$. Then $f(a) = 0 = f(b)$ and, since $f$ is a polynomial, it is differentiable on $(a, b)$ and continuous on $[a, b]$. Thus, by Rolle's Theorem, there is a number $c$ between $a$ and $b$ such that $f'(c) = 0$. But

$$f'(x) = 3x^2 + 1 \geqslant 1 \qquad \text{for all } x$$

(since $x^2 \geqslant 0$) so $f'(x)$ can never be 0. This gives a contradiction. Therefore the equation can't have two real solutions. ■

## The Mean Value Theorem

Our main use of Rolle's Theorem is in proving the following important theorem, which was first stated by another French mathematician, Joseph-Louis Lagrange.

The Mean Value Theorem is an example of what is called an existence theorem. Like the Intermediate Value Theorem, the Extreme Value Theorem, and Rolle's Theorem, it guarantees that there *exists* a number with a certain property, but it doesn't tell us how to find the number.

**The Mean Value Theorem** Let $f$ be a function that satisfies the following hypotheses:

**1.** $f$ is continuous on the closed interval $[a, b]$.

**2.** $f$ is differentiable on the open interval $(a, b)$.

Then there is a number $c$ in $(a, b)$ such that

$$\boxed{1} \qquad f'(c) = \frac{f(b) - f(a)}{b - a}$$

or, equivalently,

$$\boxed{2} \qquad f(b) - f(a) = f'(c)(b - a)$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Before proving this theorem, we can see that it is reasonable by interpreting it geometrically. Figures 3 and 4 show the points $A(a, f(a))$ and $B(b, f(b))$ on the graphs of two differentiable functions. The slope of the secant line $AB$ is

$$\boxed{3} \qquad m_{AB} = \frac{f(b) - f(a)}{b - a}$$

which is the same expression as on the right side of Equation 1. Since $f'(c)$ is the slope of the tangent line at the point $(c, f(c))$, the Mean Value Theorem, in the form given by Equation 1, says that there is at least one point $P(c, f(c))$ on the graph where the slope of the tangent line is the same as the slope of the secant line $AB$. In other words, there is a point $P$ where the tangent line is parallel to the secant line $AB$. (Imagine a line far away that stays parallel to $AB$ while moving toward $AB$ until it touches the graph for the first time.)

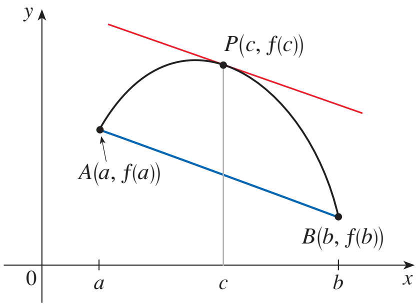

**FIGURE 3**

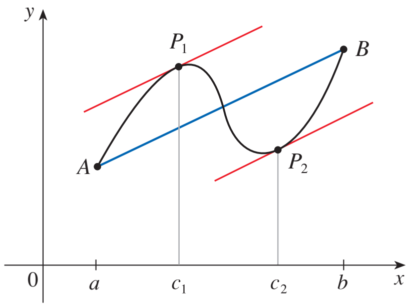

**FIGURE 4**

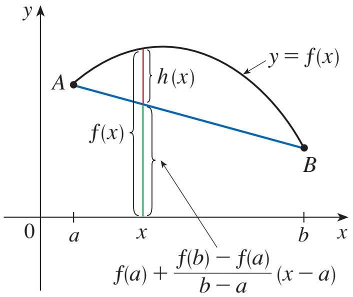

**FIGURE 5**

**PROOF** We apply Rolle's Theorem to a new function $h$ defined as the difference between $f$ and the function whose graph is the secant line $AB$. Using Equation 3 and the point-slope equation of a line, we see that the equation of the line $AB$ can be written as

$$y - f(a) = \frac{f(b) - f(a)}{b - a}(x - a)$$

or as

$$y = f(a) + \frac{f(b) - f(a)}{b - a}(x - a)$$

So, as shown in Figure 5,

$$\boxed{4} \qquad h(x) = f(x) - f(a) - \frac{f(b) - f(a)}{b - a}(x - a)$$

First we must verify that $h$ satisfies the three hypotheses of Rolle's Theorem.

1. The function $h$ is continuous on $[a, b]$ because it is the sum of $f$ and a first-degree polynomial, both of which are continuous.
2. The function $h$ is differentiable on $(a, b)$ because both $f$ and the first-degree polynomial are differentiable. In fact, we can compute $h'$ directly from Equation 4:

$$h'(x) = f'(x) - \frac{f(b) - f(a)}{b - a}$$

(Note that $f(a)$ and $[f(b) - f(a)]/(b - a)$ are constants.)

**3.**

$$h(a) = f(a) - f(a) - \frac{f(b) - f(a)}{b - a}(a - a) = 0$$

$$h(b) = f(b) - f(a) - \frac{f(b) - f(a)}{b - a}(b - a)$$

$$= f(b) - f(a) - [f(b) - f(a)] = 0$$

Therefore $h(a) = h(b)$.

Since $h$ satisfies all the hypotheses of Rolle's Theorem, that theorem says there is a number $c$ in $(a, b)$ such that $h'(c) = 0$. Therefore

$$0 = h'(c) = f'(c) - \frac{f(b) - f(a)}{b - a}$$

and so

$$f'(c) = \frac{f(b) - f(a)}{b - a}$$

■

### Lagrange and the Mean Value Theorem

The Mean Value Theorem was first formulated by Joseph-Louis Lagrange (1736–1813), born in Italy of a French father and an Italian mother. He was a child prodigy and became a professor in Turin at the age of 19. Lagrange made great contributions to number theory, theory of functions, theory of equations, and analytical and celestial mechanics. In particular, he applied calculus to the analysis of the stability of the solar system. At the invitation of Frederick the Great, he succeeded Euler at the Berlin Academy and, when Frederick died, Lagrange accepted King Louis XVI's invitation to Paris, where he was given apartments in the Louvre and became a professor at the Ecole Polytechnique. Despite all the trappings of luxury and fame, he was a kind and quiet man, living only for science.

**EXAMPLE 3** To illustrate the Mean Value Theorem with a specific function, let's consider $f(x) = x^3 - x$, $a = 0$, $b = 2$. Since $f$ is a polynomial, it is continuous and differentiable for all $x$, so it is certainly continuous on $[0, 2]$ and differentiable on $(0, 2)$. Therefore, by the Mean Value Theorem, there is a number $c$ in $(0, 2)$ such that

$$f(2) - f(0) = f'(c)(2 - 0)$$

Now $f(2) = 6$, $f(0) = 0$, and $f'(x) = 3x^2 - 1$, so the above equation becomes

$$6 = (3c^2 - 1)2 = 6c^2 - 2$$

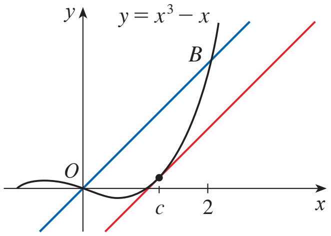

**FIGURE 6**

which gives $c^2 = \frac{4}{3}$, that is, $c = \pm 2/\sqrt{3}$. But $c$ must lie in $(0, 2)$, so $c = 2/\sqrt{3}$. Figure 6 illustrates this calculation: the tangent line at this value of $c$ is parallel to the secant line $OB$. ■

**EXAMPLE 4** If an object moves in a straight line with position function $s = f(t)$, then the average velocity between $t = a$ and $t = b$ is

$$\frac{f(b) - f(a)}{b - a}$$

and the velocity at $t = c$ is $f'(c)$. Thus the Mean Value Theorem (in the form of Equation 1) tells us that at some time $t = c$ between $a$ and $b$ the instantaneous velocity $f'(c)$ is equal to that average velocity. For instance, if a car traveled 180 km in 2 hours, then the speedometer must have read 90 km/h at least once.

In general, the Mean Value Theorem can be interpreted as saying that there is a number at which the instantaneous rate of change is equal to the average rate of change over an interval. ■

The main significance of the Mean Value Theorem is that it enables us to obtain information about a function from information about its derivative. The next example provides an instance of this principle.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 5** Suppose that $f(0) = -3$ and $f'(x) \leqslant 5$ for all values of $x$. How large can $f(2)$ possibly be?

**SOLUTION** We are given that $f$ is differentiable (and therefore continuous) everywhere. In particular, we can apply the Mean Value Theorem on the interval $[0, 2]$. There exists a number $c$ such that

$$f(2) - f(0) = f'(c)(2 - 0)$$

so

$$f(2) = f(0) + 2f'(c) = -3 + 2f'(c)$$

We are given that $f'(x) \leqslant 5$ for all $x$, so in particular we know that $f'(c) \leqslant 5$. Multiplying both sides of this inequality by 2, we have $2f'(c) \leqslant 10$, so

$$f(2) = -3 + 2f'(c) \leqslant -3 + 10 = 7$$

The largest possible value for $f(2)$ is 7. ■

The Mean Value Theorem can be used to establish some of the basic facts of differential calculus. One of these basic facts is the following theorem. Others will be discussed in the following sections.

**5 Theorem** If $f'(x) = 0$ for all $x$ in an interval $(a, b)$, then $f$ is constant on $(a, b)$.

**PROOF** Let $x_1$ and $x_2$ be any two numbers in $(a, b)$ with $x_1 < x_2$. Since $f$ is differentiable on $(a, b)$, it must be differentiable on $(x_1, x_2)$ and continuous on $[x_1, x_2]$. By applying the Mean Value Theorem to $f$ on the interval $[x_1, x_2]$, we get a number $c$ such that $x_1 < c < x_2$ and

**6** $$f(x_2) - f(x_1) = f'(c)(x_2 - x_1)$$

Since $f'(x) = 0$ for all $x$, we have $f'(c) = 0$, and so Equation 6 becomes

$$f(x_2) - f(x_1) = 0 \qquad \text{or} \qquad f(x_2) = f(x_1)$$

Therefore $f$ has the same value at *any* two numbers $x_1$ and $x_2$ in $(a, b)$. This means that $f$ is constant on $(a, b)$. ■

Corollary 7 says that if two functions have the same derivatives on an interval, then their graphs must be vertical translations of each other there. In other words, the graphs have the same shape, but they could be shifted up or down.

**7 Corollary** If $f'(x) = g'(x)$ for all $x$ in an interval $(a, b)$, then $f - g$ is constant on $(a, b)$; that is, $f(x) = g(x) + c$ where $c$ is a constant.

**PROOF** Let $F(x) = f(x) - g(x)$. Then

$$F'(x) = f'(x) - g'(x) = 0$$

for all $x$ in $(a, b)$. Thus, by Theorem 5, $F$ is constant; that is, $f - g$ is constant. ■

**NOTE** Care must be taken in applying Theorem 5. Let

$$f(x) = \frac{x}{|x|} = \begin{cases} 1 & \text{if } x > 0 \\ -1 & \text{if } x < 0 \end{cases}$$

The domain of $f$ is $D = \{x \mid x \neq 0\}$ and $f'(x) = 0$ for all $x$ in $D$. But $f$ is obviously not a constant function. This does not contradict Theorem 5 because $D$ is not an interval.

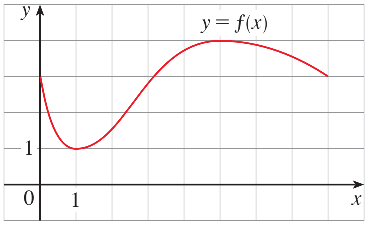
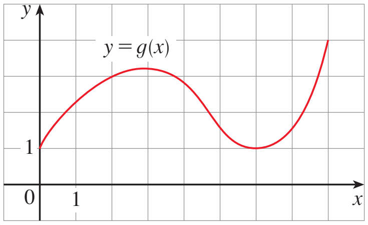
## 3.2 Exercises

**1.** The graph of a function $f$ is shown. Verify that $f$ satisfies the hypotheses of Rolle's Theorem on the interval $[0, 8]$. Then estimate the value(s) of $c$ that satisfy the conclusion of Rolle's Theorem on that interval.



**2.** Draw the graph of a function defined on $[0, 8]$ such that $f(0) = f(8) = 3$ and the function does not satisfy the conclusion of Rolle's Theorem on $[0, 8]$.

**3.** The graph of a function $g$ is shown.

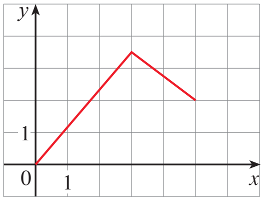


(a) Verify that $g$ satisfies the hypotheses of the Mean Value Theorem on the interval $[0, 8]$.
(b) Estimate the value(s) of $c$ that satisfy the conclusion of the Mean Value Theorem on the interval $[0, 8]$.
(c) Estimate the value(s) of $c$ that satisfy the conclusion of the Mean Value Theorem on the interval $[2, 6]$.

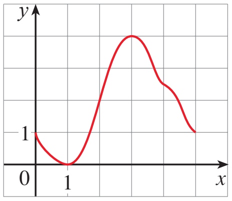
**4.** Draw the graph of a function that is continuous on $[0, 8]$ where $f(0) = 1$ and $f(8) = 4$ and that does not satisfy the conclusion of the Mean Value Theorem on $[0, 8]$.

**5–8** The graph of a function $f$ is shown. Does $f$ satisfy the hypotheses of the Mean Value Theorem on the interval $[0, 5]$? If so, find a value $c$ that satisfies the conclusion of the Mean Value Theorem on that interval.

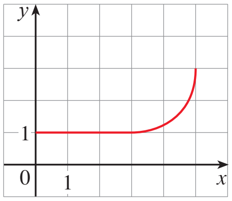
**5.**



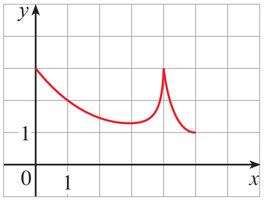
**6.**



**7.**



**8.**



**9–12** Verify that the function satisfies the three hypotheses of Rolle's Theorem on the given interval. Then find all numbers $c$ that satisfy the conclusion of Rolle's Theorem.

**9.** $f(x) = 2x^2 - 4x + 5, \quad [-1, 3]$

**10.** $f(x) = x^3 - 2x^2 - 4x + 2, \quad [-2, 2]$

**11.** $f(x) = \sin(x/2), \quad [\pi/2, 3\pi/2]$

**12.** $f(x) = x + 1/x, \quad \left[\frac{1}{2}, 2\right]$

**13.** Let $f(x) = 1 - x^{2/3}$. Show that $f(-1) = f(1)$ but there is no number $c$ in $(-1, 1)$ such that $f'(c) = 0$. Why does this not contradict Rolle's Theorem?

**14.** Let $f(x) = \tan x$. Show that $f(0) = f(\pi)$ but there is no number $c$ in $(0, \pi)$ such that $f'(c) = 0$. Why does this not contradict Rolle's Theorem?

**15–18** Verify that the function satisfies the hypotheses of the Mean Value Theorem on the given interval. Then find all numbers $c$ that satisfy the conclusion of the Mean Value Theorem.

**15.** $f(x) = 2x^2 - 3x + 1, \quad [0, 2]$

**16.** $f(x) = x^3 - 3x + 2, \quad [-2, 2]$

**17.** $f(x) = \sqrt[3]{x}, \quad [0, 1]$

**18.** $f(x) = 1/x, \quad [1, 3]$

**19–20** Find the number $c$ that satisfies the conclusion of the Mean Value Theorem on the given interval. Graph the function, the secant line through the endpoints, and the tangent line at $(c, f(c))$. Are the secant line and the tangent line parallel?

**19.** $f(x) = \sqrt{x}, \quad [0, 4]$

**20.** $f(x) = x^3 - 2x, \quad [-2, 2]$

**21.** Let $f(x) = (x - 3)^{-2}$. Show that there is no value of $c$ in $(1, 4)$ such that $f(4) - f(1) = f'(c)(4 - 1)$. Why does this not contradict the Mean Value Theorem?

**22.** Let $f(x) = 2 - |2x - 1|$. Show that there is no value of $c$ such that $f(3) - f(0) = f'(c)(3 - 0)$. Why does this not contradict the Mean Value Theorem?

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**23–24** Show that the equation has exactly one real solution.

**23.** $2x + \cos x = 0$

**24.** $2x - 1 - \sin x = 0$

---

**25.** Show that the equation $x^3 - 15x + c = 0$ has at most one solution in the interval $[-2, 2]$.

**26.** Show that the equation $x^4 + 4x + c = 0$ has at most two real solutions.

**27.** (a) Show that a polynomial of degree 3 has at most three real zeros.
(b) Show that a polynomial of degree $n$ has at most $n$ real zeros.

**28.** (a) Suppose that $f$ is differentiable on $\mathbb{R}$ and has two zeros. Show that $f'$ has at least one zero.
(b) Suppose $f$ is twice differentiable on $\mathbb{R}$ and has three zeros. Show that $f''$ has at least one real zero.
(c) Can you generalize parts (a) and (b)?

**29.** If $f(1) = 10$ and $f'(x) \geqslant 2$ for $1 \leqslant x \leqslant 4$, how small can $f(4)$ possibly be?

**30.** Suppose that $3 \leqslant f'(x) \leqslant 5$ for all values of $x$. Show that $18 \leqslant f(8) - f(2) \leqslant 30$.

**31.** Does there exist a function $f$ such that $f(0) = -1$, $f(2) = 4$, and $f'(x) \leqslant 2$ for all $x$?

**32.** Suppose that $f$ and $g$ are continuous on $[a, b]$ and differentiable on $(a, b)$. Suppose also that $f(a) = g(a)$ and $f'(x) < g'(x)$ for $a < x < b$. Prove that $f(b) < g(b)$. [*Hint:* Apply the Mean Value Theorem to the function $h = f - g$.]

**33.** Show that $\sin x < x$ if $0 < x < 2\pi$.

**34.** Suppose $f$ is an odd function and is differentiable everywhere. Prove that for every positive number $b$, there exists a number $c$ in $(-b, b)$ such that $f'(c) = f(b)/b$.

**35.** Use the Mean Value Theorem to prove the inequality

$$|\sin a - \sin b| \leqslant |a - b| \qquad \text{for all } a \text{ and } b$$

**36.** If $f'(x) = c$ ($c$ a constant) for all $x$, use Corollary 7 to show that $f(x) = cx + d$ for some constant $d$.

**37.** Let $f(x) = 1/x$ and

$$g(x) = \begin{cases} \dfrac{1}{x} & \text{if } x > 0 \\[2ex] 1 + \dfrac{1}{x} & \text{if } x < 0 \end{cases}$$

Show that $f'(x) = g'(x)$ for all $x$ in their domains. Can we conclude from Corollary 7 that $f - g$ is constant?

**38.** At 2:00 PM a car's speedometer reads 30 mi/h. At 2:10 PM it reads 50 mi/h. Show that at some time between 2:00 and 2:10 the acceleration is exactly 120 mi/h$^2$.

**39.** Two runners start a race at the same time and finish in a tie. Prove that at some time during the race they have the same speed. [*Hint:* Consider $f(t) = g(t) - h(t)$, where $g$ and $h$ are the position functions of the two runners.]

**40.** **Fixed Points** A number $a$ is called a *fixed point* of a function $f$ if $f(a) = a$. Prove that if $f'(x) \neq 1$ for all real numbers $x$, then $f$ has at most one fixed point.

## 3.3 What Derivatives Tell Us about the Shape of a Graph

Many of the applications of calculus depend on our ability to deduce facts about a function $f$ from information concerning its derivatives. Because $f'(x)$ represents the slope of the curve $y = f(x)$ at the point $(x, f(x))$, it tells us the direction in which the curve proceeds at each point. So it is reasonable to expect that information about $f'(x)$ will provide us with information about $f(x)$.

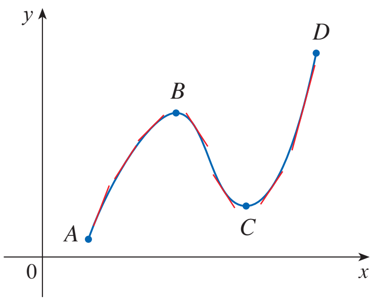


**FIGURE 1**

### What Does $f'$ Say about $f$?

To see how the derivative of $f$ can tell us where a function is increasing or decreasing, look at Figure 1. (Increasing functions and decreasing functions were defined in Section 1.1.) Between $A$ and $B$ and between $C$ and $D$, the tangent lines have positive slope and so $f'(x) > 0$. Between $B$ and $C$, the tangent lines have negative slope and so $f'(x) < 0$. Thus it appears that $f$ increases when $f'(x)$ is positive and decreases when $f'(x)$ is negative. To prove that this is always the case, we use the Mean Value Theorem.

**Notation**
Let's abbreviate the name of this test to the I/D Test.

**Increasing/Decreasing Test**
(a) If $f'(x) > 0$ on an interval, then $f$ is increasing on that interval.
(b) If $f'(x) < 0$ on an interval, then $f$ is decreasing on that interval.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PROOF**

(a) Let $x_1$ and $x_2$ be any two numbers in the interval with $x_1 < x_2$. According to the definition of an increasing function (Section 1.1), we have to show that $f(x_1) < f(x_2)$.

Because we are given that $f'(x) > 0$, we know that $f$ is differentiable on $[x_1, x_2]$. So, by the Mean Value Theorem, there is a number $c$ between $x_1$ and $x_2$ such that

$$\boxed{1} \qquad f(x_2) - f(x_1) = f'(c)(x_2 - x_1)$$

Now $f'(c) > 0$ by assumption and $x_2 - x_1 > 0$ because $x_1 < x_2$. Thus the right side of Equation 1 is positive, and so

$$f(x_2) - f(x_1) > 0 \qquad \text{or} \qquad f(x_1) < f(x_2)$$

This shows that $f$ is increasing.

Part (b) is proved similarly. ■

**EXAMPLE 1** Find where the function $f(x) = 3x^4 - 4x^3 - 12x^2 + 5$ is increasing and where it is decreasing.

**SOLUTION** We start by differentiating $f$:

$$f'(x) = 12x^3 - 12x^2 - 24x = 12x(x - 2)(x + 1)$$

**FIGURE 2**

To use the I/D Test we have to know where $f'(x) > 0$ and where $f'(x) < 0$. To solve these inequalities we first find where $f'(x) = 0$, namely at $x = 0$, 2, and $-1$. These are the critical numbers of $f$, and they divide the domain into four intervals (see the number line in Figure 2). Within each interval, $f'(x)$ must be always positive or always negative. (See Examples 3 and 4 in Appendix A.) We can determine which is the case for each interval from the signs of the three factors of $f'(x)$, namely $12x$, $x - 2$, and $x + 1$, as shown in the following chart. A plus sign indicates that the given expression is positive, and a minus sign indicates that it is negative. The last column of the chart gives the conclusion based on the I/D Test. For instance, $f'(x) < 0$ for $0 < x < 2$, so $f$ is decreasing on $(0, 2)$. (It would also be true to say that $f$ is decreasing on the closed interval $[0, 2]$.)

| Interval | $12x$ | $x - 2$ | $x + 1$ | $f'(x)$ | $f$ |
|---|---|---|---|---|---|
| $x < -1$ | − | − | − | − | decreasing on $(-\infty, -1)$ |
| $-1 < x < 0$ | − | − | + | + | increasing on $(-1, 0)$ |
| $0 < x < 2$ | + | − | + | − | decreasing on $(0, 2)$ |
| $x > 2$ | + | + | + | + | increasing on $(2, \infty)$ |

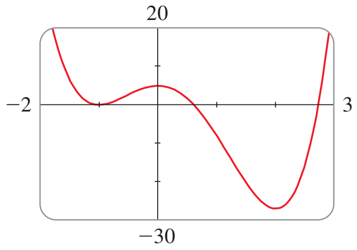

**FIGURE 3**

The graph of $f$ shown in Figure 3 confirms the information in the chart. ■

## The First Derivative Test

Recall from Section 3.1 that if $f$ has a local maximum or minimum at $c$, then $c$ must be a critical number of $f$ (by Fermat's Theorem), but not every critical number gives rise to a maximum or a minimum. We therefore need a test that will tell us whether or not $f$ has a local maximum or minimum at a critical number.

You can see from Figure 3 that for the function $f$ in Example 1, $f(0) = 5$ is a local maximum value of $f$ because $f$ increases on $(-1, 0)$ and decreases on $(0, 2)$. Or, in terms

of derivatives, $f'(x) > 0$ for $-1 < x < 0$ and $f'(x) < 0$ for $0 < x < 2$. In other words, the sign of $f'(x)$ changes from positive to negative at 0. This observation is the basis of the following test.

**The First Derivative Test** Suppose that $c$ is a critical number of a continuous function $f$.

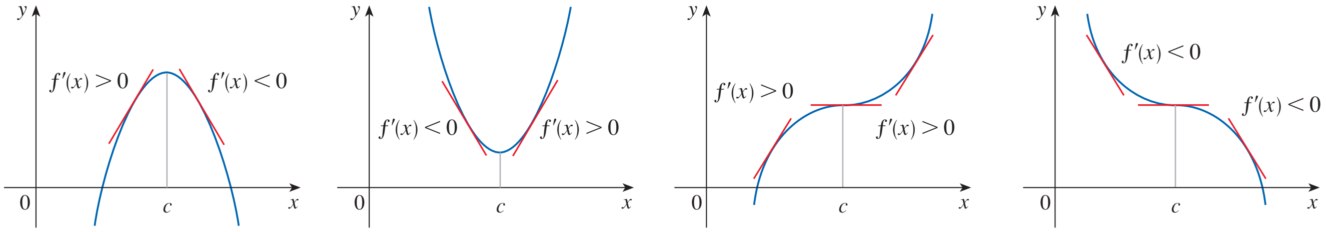
(a) If $f'$ changes from positive to negative at $c$, then $f$ has a local maximum at $c$.

(b) If $f'$ changes from negative to positive at $c$, then $f$ has a local minimum at $c$.

(c) If $f'$ is positive to the left and right of $c$, or negative to the left and right of $c$, then $f$ has no local maximum or minimum at $c$.

The First Derivative Test is a consequence of the I/D Test. In part (a), for instance, because the sign of $f'(x)$ changes from positive to negative at $c$, $f$ is increasing to the left of $c$ and decreasing to the right of $c$. It follows that $f$ has a local maximum at $c$.

It is easy to remember the First Derivative Test by visualizing diagrams such as those in Figure 4.



(a) Local maximum at $c$ (b) Local minimum at $c$ (c) No maximum or minimum at $c$ (d) No maximum or minimum at $c$

**FIGURE 4**

**EXAMPLE 2** Find the local minimum and maximum values of the function $f$ in Example 1.

**SOLUTION** From the chart in the solution to Example 1 we see that $f'(x)$ changes from negative to positive at $-1$, so $f(-1) = 0$ is a local minimum value by the First Derivative Test. Similarly, $f'$ changes from negative to positive at 2, so $f(2) = -27$ is also a local minimum value. As noted previously, $f(0) = 5$ is a local maximum value because $f'(x)$ changes from positive to negative at 0. ■

**EXAMPLE 3** Find the local maximum and minimum values of the function

$$g(x) = x + 2\sin x \qquad 0 \leqslant x \leqslant 2\pi$$

**SOLUTION** As in Example 1, we start by finding the critical numbers. The derivative is

$$g'(x) = 1 + 2\cos x$$

so $g'(x) = 0$ when $\cos x = -\frac{1}{2}$. The solutions of this equation are $2\pi/3$ and $4\pi/3$. Because $g$ is differentiable everywhere, the only critical numbers are $2\pi/3$ and $4\pi/3$. We split the domain into intervals according to the critical numbers. Within each interval, $g'(x)$ is either always positive or always negative and so we analyze $g$ in the following chart.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The + signs in the chart come from the fact that $g'(x) > 0$ when $\cos x > -\frac{1}{2}$. From the graph of $y = \cos x$, this is true in the indicated intervals. Alternatively, we can choose a test value within each interval and check the sign of $g'(x)$ using that value.

| Interval | $g'(x) = 1 + 2\cos x$ | $g$ |
|---|---|---|
| $0 < x < 2\pi/3$ | $+$ | increasing on $(0, 2\pi/3)$ |
| $2\pi/3 < x < 4\pi/3$ | $-$ | decreasing on $(2\pi/3, 4\pi/3)$ |
| $4\pi/3 < x < 2\pi$ | $+$ | increasing on $(4\pi/3, 2\pi)$ |

Because $g'(x)$ changes from positive to negative at $2\pi/3$, the First Derivative Test tells us that there is a local maximum at $2\pi/3$ and the local maximum value is

$$g(2\pi/3) = \frac{2\pi}{3} + 2\sin\frac{2\pi}{3} = \frac{2\pi}{3} + 2\left(\frac{\sqrt{3}}{2}\right) = \frac{2\pi}{3} + \sqrt{3} \approx 3.83$$

Likewise, $g'(x)$ changes from negative to positive at $4\pi/3$ and so

$$g(4\pi/3) = \frac{4\pi}{3} + 2\sin\frac{4\pi}{3} = \frac{4\pi}{3} + 2\left(-\frac{\sqrt{3}}{2}\right) = \frac{4\pi}{3} - \sqrt{3} \approx 2.46$$

is a local minimum value. The graph of $g$ in Figure 5 supports our conclusion. ■

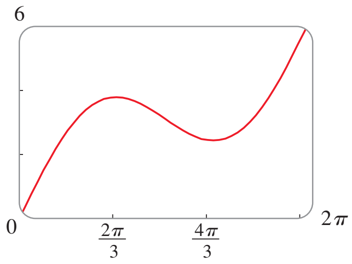


**FIGURE 5**
$g(x) = x + 2\sin x$

## What Does $f''$ Say about $f$?

Figure 6 shows the graphs of two increasing functions on $(a, b)$. Both graphs join point $A$ to point $B$ but they look different because they bend in different directions. How can we distinguish between these two types of behavior?

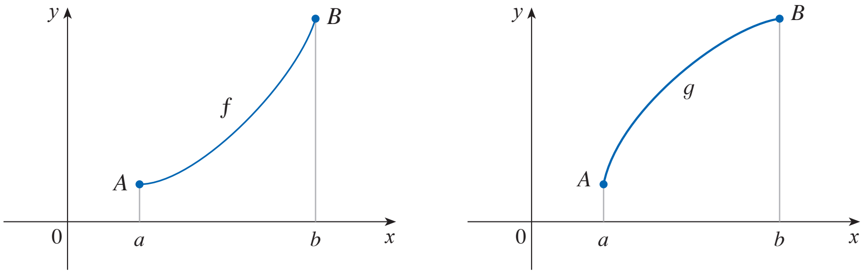

**FIGURE 6**
(a) (b)

In Figure 7 tangents to these curves have been drawn at several points. In part (a) the curve lies above the tangents and $f$ is called *concave upward* on $(a, b)$. In part (b) the curve lies below the tangents and $g$ is called *concave downward* on $(a, b)$.

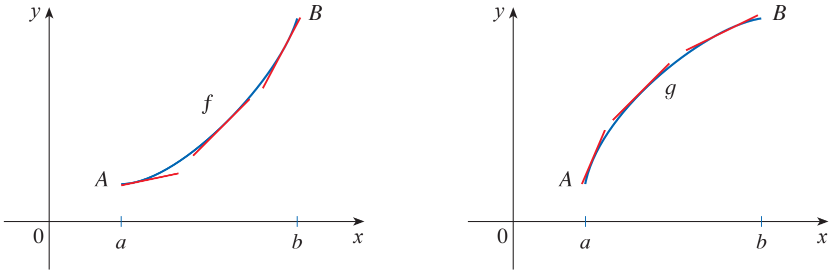

**FIGURE 7**
(a) Concave upward (b) Concave downward

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**Notation**
We use the abbreviation CU for concave upward and CD for concave downward.

**Definitio** If the graph of $f$ lies above all of its tangents on an interval $I$, then $f$ is called **concave upward** on $I$. If the graph of $f$ lies below all of its tangents on $I$, then $f$ is called **concave downward** on $I$.

Figure 8 shows the graph of a function that is concave upward (CU) on the intervals $(b, c)$, $(d, e)$, and $(e, p)$ and concave downward (CD) on the intervals $(a, b)$, $(c, d)$, and $(p, q)$.

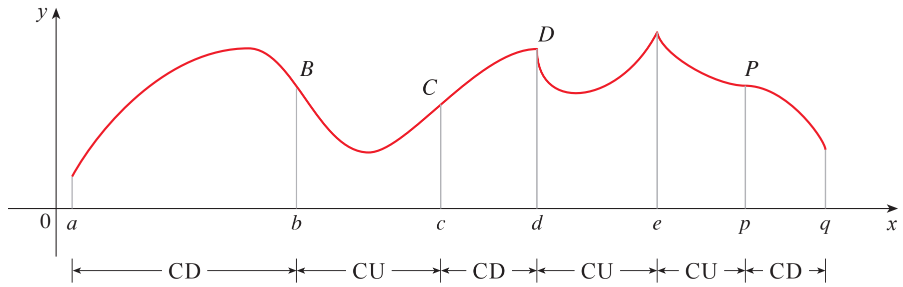

**FIGURE 8**

Let's see how the second derivative helps determine the intervals of concavity. Looking at Figure 7(a), you can see that, going from left to right, the slope of the tangent increases. This means that the derivative $f'$ is an increasing function and therefore its derivative $f''$ is positive. Likewise, in Figure 7(b) the slope of the tangent decreases from left to right, so $f'$ decreases and therefore $f''$ is negative. This reasoning can be reversed and suggests that the following theorem is true. A proof is given in Appendix F with the help of the Mean Value Theorem.

**Concavity Test**

(a) If $f''(x) > 0$ on an interval $I$, then the graph of $f$ is concave upward on $I$.

(b) If $f''(x) < 0$ on an interval $I$, then the graph of $f$ is concave downward on $I$.

**EXAMPLE 4** Figure 9 shows a population graph for honeybees raised in an apiary. How does the rate of population growth change over time? When is this rate highest? Over what intervals is $P$ concave upward or concave downward?

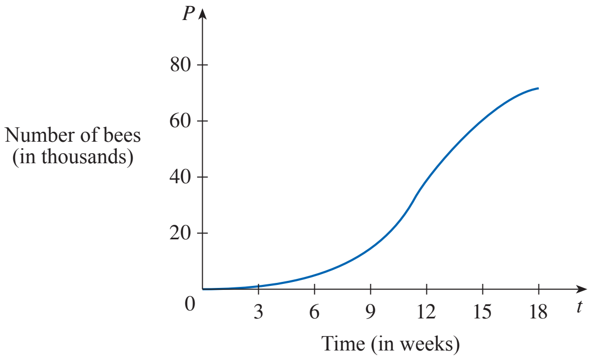

**FIGURE 9**

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**SOLUTION** By looking at the slope of the curve as $t$ increases, we see that the rate of growth of the population is initially very small, then gets larger until it reaches a maximum at about $t = 12$ weeks, and decreases as the population begins to level off. As the population approaches its maximum value of about 75,000 (called the *carrying capacity*), the rate of growth, $P'(t)$, approaches 0. The curve appears to be concave upward on (0, 12) and concave downward on (12, 18). ■

In Example 4, the population curve changed from concave upward to concave downward at approximately the point (12, 38,000). This point is called an *inflection point* of the curve. The significance of this point is that the rate of population increase has its maximum value there. In general, an inflection point is a point where a curve changes its direction of concavity.

**Definitio** A point $P$ on a curve $y = f(x)$ is called an **inflection point** if $f$ is continuous there and the curve changes from concave upward to concave downward or from concave downward to concave upward at $P$.

For instance, in Figure 8, $B$, $C$, $D$, and $P$ are the points of inflection. Notice that if a curve has a tangent at a point of inflection, then the curve crosses its tangent there.

In view of the Concavity Test, there is a point of inflection at any point where the function is continuous and the second derivative changes sign.

**EXAMPLE 5** Sketch a possible graph of a function $f$ that satisfies the following conditions:

(i) $f(0) = 0, \quad f(2) = 3, \quad f(4) = 6, \quad f'(0) = f'(4) = 0$

(ii) $f'(x) > 0$ for $0 < x < 4, \quad f'(x) < 0$ for $x < 0$ and for $x > 4$

(iii) $f''(x) > 0$ for $x < 2, \quad f''(x) < 0$ for $x > 2$

**SOLUTION** Condition (i) tells us that the graph has horizontal tangents at the points (0, 0) and (4, 6). Condition (ii) says that $f$ is increasing on the interval (0, 4) and decreasing on the intervals $(-\infty, 0)$ and $(4, \infty)$. It follows from the I/D Test that $f(0) = 0$ is a local minimum and $f(4) = 6$ is a local maximum.

Condition (iii) says that the graph is concave upward on the interval $(-\infty, 2)$ and concave downward on $(2, \infty)$. Because the curve changes from concave upward to concave downward when $x = 2$, the point (2, 3) is an inflection point.

We use this information to sketch the graph of $f$ in Figure 10. Notice that we made the curve bend upward when $x < 2$ and bend downward when $x > 2$. ■

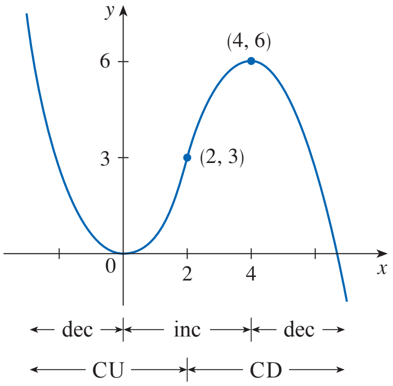

**FIGURE 10**

## The Second Derivative Test

Another application of the second derivative is the following test for identifying local maximum and minimum values. It is a consequence of the Concavity Test, and it serves as an alternative to the First Derivative Test.

**The Second Derivative Test** Suppose $f''$ is continuous near $c$.

(a) If $f'(c) = 0$ and $f''(c) > 0$, then $f$ has a local minimum at $c$.

(b) If $f'(c) = 0$ and $f''(c) < 0$, then $f$ has a local maximum at $c$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

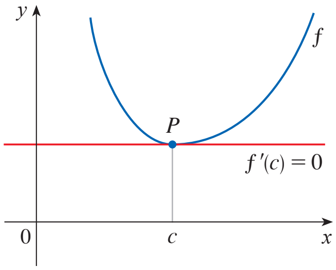

**FIGURE 11**
$f''(c) > 0$, $f$ is concave upward

For instance, part (a) is true because $f''(x) > 0$ near $c$ and so $f$ is concave upward near $c$. This means that the graph of $f$ lies *above* its horizontal tangent at $c$ and so $f$ has a local minimum at $c$. (See Figure 11.)

**NOTE** The Second Derivative Test is inconclusive when $f''(c) = 0$. In other words, at such a point there might be a maximum, there might be a minimum, or there might be neither. This test also fails when $f''(c)$ does not exist. In such cases the First Derivative Test must be used. In fact, even when both tests apply, the First Derivative Test is often the easier one to use.

**EXAMPLE 6** Discuss the curve $y = x^4 - 4x^3$ with respect to concavity, points of inflection, and local maxima and minima.

**SOLUTION** If $f(x) = x^4 - 4x^3$, then

$$f'(x) = 4x^3 - 12x^2 = 4x^2(x - 3)$$

$$f''(x) = 12x^2 - 24x = 12x(x - 2)$$

To find the critical numbers we set $f'(x) = 0$ and obtain $x = 0$ and $x = 3$. (Note that $f'$ is a polynomial and hence defined everywhere.) To use the Second Derivative Test we evaluate $f''$ at these critical numbers:

$$f''(0) = 0 \qquad f''(3) = 36 > 0$$

Since $f'(3) = 0$ and $f''(3) > 0$, the Second Derivative Test tells us that $f(3) = -27$ is a local minimum. Because $f''(0) = 0$, the Second Derivative Test gives no information about the critical number 0. But since $f'(x) < 0$ for $x < 0$ and also for $0 < x < 3$, the First Derivative Test tells us that $f$ does not have a local maximum or minimum at 0.

Since $f''(x) = 0$ when $x = 0$ or 2, we divide the real line into intervals with these numbers as endpoints and complete the following chart.

| Interval | $f''(x) = 12x(x - 2)$ | Concavity |
|---|---|---|
| $(-\infty, 0)$ | $+$ | upward |
| $(0, 2)$ | $-$ | downward |
| $(2, \infty)$ | $+$ | upward |

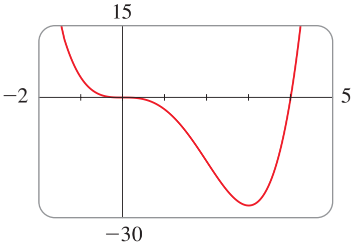

**FIGURE 12**
$y = x^4 - 4x^3$

The point $(0, 0)$ is an inflection point because the curve changes from concave upward to concave downward there. Also $(2, -16)$ is an inflection point because the curve changes from concave downward to concave upward there.

The graph of $y = x^4 - 4x^3$ in Figure 12 supports our conclusions. ■

## ■ Curve Sketching

We now use the information we obtain from the first and second derivatives to sketch the graph of a function.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 7** Sketch the graph of the function $f(x) = x^{2/3}(6 - x)^{1/3}$.

**SOLUTION** First note that the domain of $f$ is $\mathbb{R}$. Calculation of the first two derivatives gives

Use the differentiation rules to check these calculations.

$$f'(x) = \frac{4 - x}{x^{1/3}(6 - x)^{2/3}}$$

$$f''(x) = \frac{-8}{x^{4/3}(6 - x)^{5/3}}$$

Since $f'(x) = 0$ when $x = 4$ and $f'(x)$ does not exist when $x = 0$ or $x = 6$, the critical numbers are 0, 4, and 6.

| Interval | $4 - x$ | $x^{1/3}$ | $(6 - x)^{2/3}$ | $f'(x)$ | $f$ |
|---|---|---|---|---|---|
| $x < 0$ | $+$ | $-$ | $+$ | $-$ | decreasing on $(-\infty, 0)$ |
| $0 < x < 4$ | $+$ | $+$ | $+$ | $+$ | increasing on $(0, 4)$ |
| $4 < x < 6$ | $-$ | $+$ | $+$ | $-$ | decreasing on $(4, 6)$ |
| $x > 6$ | $-$ | $+$ | $+$ | $-$ | decreasing on $(6, \infty)$ |

To find the local extreme values we use the First Derivative Test. Since $f'$ changes from negative to positive at 0, $f(0) = 0$ is a local minimum. Since $f'$ changes from positive to negative at 4, $f(4) = 2^{5/3}$ is a local maximum. The sign of $f'$ does not change at 6, so there is no minimum or maximum there. (The Second Derivative Test could be used at 4 but not at 0 or 6 because $f''$ does not exist at either of these numbers.)

Looking at the expression for $f''(x)$ and noting that $x^{4/3} \geqslant 0$ for all $x$, we have $f''(x) < 0$ for $x < 0$ and for $0 < x < 6$ and $f''(x) > 0$ for $x > 6$. So $f$ is concave downward on $(-\infty, 0)$ and $(0, 6)$ and concave upward on $(6, \infty)$, and the only inflection point is $(6, 0)$. Using all of the information we gathered about $f$ from its first and second derivatives, we sketch the graph in Figure 13. Note that the curve has vertical tangents at $(0, 0)$ and $(6, 0)$ because $|f'(x)| \to \infty$ as $x \to 0$ and as $x \to 6$.

Try reproducing the graph in Figure 13 with a graphing calculator or computer. Some machines produce the complete graph, some produce only the portion to the right of the $y$-axis, and some produce only the portion between $x = 0$ and $x = 6$. For an explanation, see Example 7 in Graphing Calculators and Computers at www.StewartCalculus.com.

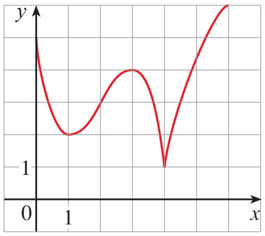
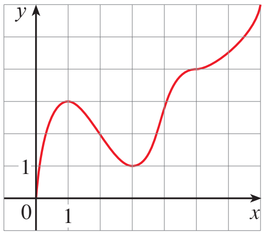
## 3.3 Exercises

**1–2** Use the given graph of $f$ to find the following.
(a) The open intervals on which $f$ is increasing.
(b) The open intervals on which $f$ is decreasing.
(c) The open intervals on which $f$ is concave upward.
(d) The open intervals on which $f$ is concave downward.
(e) The coordinates of the points of inflection.

**1.**



**2.**

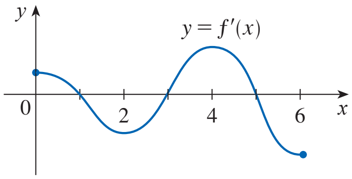


**3.** Suppose you are given a formula for a function $f$.
(a) How do you determine where $f$ is increasing or decreasing?
(b) How do you determine where the graph of $f$ is concave upward or concave downward?
(c) How do you locate inflection points?

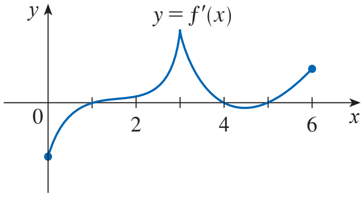
**4.** (a) State the First Derivative Test.
(b) State the Second Derivative Test. Under what circumstances is it inconclusive? What do you do if it fails?

**5–6** The graph of the *derivative* $f'$ of a function $f$ is shown.
(a) On what intervals is $f$ increasing? Decreasing?
(b) At what values of $x$ does $f$ have a local maximum? Local minimum?

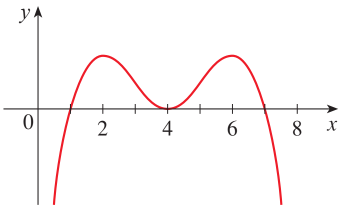
**5.**



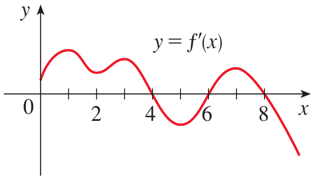
**6.**



**7.** In each part use the given graph to state the $x$-coordinates of the inflection points of $f$. Give reasons for your answers.
(a) The curve is the graph of $f$.
(b) The curve is the graph of $f'$.
(c) The curve is the graph of $f''$.



**8.** The graph of the first derivative $f'$ of a function $f$ is shown.
(a) On what intervals is $f$ increasing? Explain.
(b) At what values of $x$ does $f$ have a local maximum or minimum? Explain.
(c) On what intervals is $f$ concave upward or concave downward? Explain.
(d) What are the $x$-coordinates of the inflection points of $f$? Why?



**9–14** Find the intervals on which $f$ is increasing or decreasing, and find the local maximum and minimum values of $f$.

**9.** $f(x) = 2x^3 - 15x^2 + 24x - 5$

**10.** $f(x) = x^3 - 6x^2 - 135x$

**11.** $f(x) = 6x^4 - 16x^3 + 1$

**12.** $f(x) = x^{2/3}(x - 3)$

**13.** $f(x) = \dfrac{x^2 - 24}{x - 5}$

**14.** $f(x) = x + \dfrac{4}{x^2}$

**15–18** Find the intervals on which $f$ is concave upward or concave downward, and find the inflection points of $f$.

**15.** $f(x) = x^3 - 3x^2 - 9x + 4$

**16.** $f(x) = 2x^3 - 9x^2 + 12x - 3$

**17.** $f(x) = \sin^2 x - \cos 2x, \quad 0 \leqslant x \leqslant \pi$

**18.** $f(x) = x\sqrt[3]{x - 4}$

**19–22**
(a) Find the intervals on which $f$ is increasing or decreasing.
(b) Find the local maximum and minimum values of $f$.
(c) Find the intervals of concavity and the inflection points.

**19.** $f(x) = x^4 - 2x^2 + 3$

**20.** $f(x) = \dfrac{x}{x^2 + 1}$

**21.** $f(x) = \sin x + \cos x, \quad 0 \leqslant x \leqslant 2\pi$

**22.** $f(x) = \cos^2 x - 2\sin x, \quad 0 \leqslant x \leqslant 2\pi$

**23–24** Find the local maximum and minimum values of $f$ using both the First and Second Derivative Tests. Which method do you prefer?

**23.** $f(x) = 1 + 3x^2 - 2x^3$ **24.** $f(x) = \dfrac{x^2}{x - 1}$

---

**25.** Suppose the derivative of a function $f$ is

$$f'(x) = (x - 4)^2(x + 3)^7(x - 5)^8$$

On what interval(s) is $f$ increasing?

**26.** (a) Find the critical numbers of $f(x) = x^4(x - 1)^3$.
(b) What does the Second Derivative Test tell you about the behavior of $f$ at these critical numbers?
(c) What does the First Derivative Test tell you?

**27.** Suppose $f''$ is continuous on $(-\infty, \infty)$.
(a) If $f'(2) = 0$ and $f''(2) = -5$, what can you say about $f$?
(b) If $f'(6) = 0$ and $f''(6) = 0$, what can you say about $f$?

**28–35** Sketch the graph of a function that satisfies all of the given conditions.

**28.** (a) $f'(x) < 0$ and $f''(x) < 0$ for all $x$
(b) $f'(x) > 0$ and $f''(x) > 0$ for all $x$

**29.** (a) $f'(x) > 0$ and $f''(x) < 0$ for all $x$
(b) $f'(x) < 0$ and $f''(x) > 0$ for all $x$

**30.** Vertical asymptote $x = 0$, $f'(x) > 0$ if $x < -2$,
$f'(x) < 0$ if $x > -2$ $(x \neq 0)$,
$f''(x) < 0$ if $x < 0$, $f''(x) > 0$ if $x > 0$

**31.** $f'(0) = f'(2) = f'(4) = 0$,
$f'(x) > 0$ if $x < 0$ or $2 < x < 4$,
$f'(x) < 0$ if $0 < x < 2$ or $x > 4$,
$f''(x) > 0$ if $1 < x < 3$, $f''(x) < 0$ if $x < 1$ or $x > 3$

**32.** $f'(x) > 0$ for all $x \neq 1$, vertical asymptote $x = 1$,
$f''(x) > 0$ if $x < 1$ or $x > 3$, $f''(x) < 0$ if $1 < x < 3$

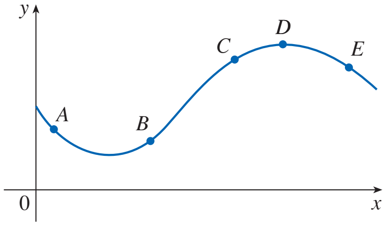
**33.** $f'(5) = 0$, $f'(x) < 0$ when $x < 5$,
$f'(x) > 0$ when $x > 5$, $f''(2) = 0$, $f''(8) = 0$,
$f''(x) < 0$ when $x < 2$ or $x > 8$,
$f''(x) > 0$ for $2 < x < 8$

**34.** $f'(0) = f'(4) = 0$, $f'(x) = 1$ if $x < -1$,
$f'(x) > 0$ if $0 < x < 2$,
$f'(x) < 0$ if $-1 < x < 0$ or $2 < x < 4$ or $x > 4$,
$\lim_{x \to 2^-} f'(x) = \infty$, $\lim_{x \to 2^+} f'(x) = -\infty$,
$f''(x) > 0$ if $-1 < x < 2$ or $2 < x < 4$,
$f''(x) < 0$ if $x > 4$

**35.** $f(0) = f'(0) = f'(2) = f'(4) = f'(6) = 0$,
$f'(x) > 0$ if $0 < x < 2$ or $4 < x < 6$,
$f'(x) < 0$ if $2 < x < 4$ or $x > 6$,
$f''(x) > 0$ if $0 < x < 1$ or $3 < x < 5$,
$f''(x) < 0$ if $1 < x < 3$ or $x > 5$, $f(-x) = f(x)$

---

**36.** The graph of a function $y = f(x)$ is shown. At which point(s) are the following true?
(a) $\dfrac{dy}{dx}$ and $\dfrac{d^2y}{dx^2}$ are both positive.
(b) $\dfrac{dy}{dx}$ and $\dfrac{d^2y}{dx^2}$ are both negative.
(c) $\dfrac{dy}{dx}$ is negative but $\dfrac{d^2y}{dx^2}$ is positive.



**37–38** The graph of the derivative $f'$ of a continuous function $f$ is shown.
(a) On what intervals is $f$ increasing? Decreasing?
(b) At what values of $x$ does $f$ have a local maximum? Local minimum?
(c) On what intervals is $f$ concave upward? Concave downward?
(d) State the $x$-coordinate(s) of the point(s) of inflection.
(e) Assuming that $f(0) = 0$, sketch a graph of $f$.

**68.** Show that the curve $y = (1 + x)/(1 + x^2)$ has three points of inflection and they all lie on one straight line.

**69.** Show that the inflection points of the curve $y = x\sin x$ lie on the curve $y^2(x^2 + 4) = 4x^2$.

**70–72** Assume that all of the functions are twice differentiable and the second derivatives are never 0.

**70.** (a) If $f$ and $g$ are concave upward on an interval $I$, show that $f + g$ is concave upward on $I$.

(b) If $f$ is positive and concave upward on $I$, show that the function $g(x) = [f(x)]^2$ is concave upward on $I$.

**71.** (a) If $f$ and $g$ are positive, increasing, concave upward functions on an interval $I$, show that the product function $fg$ is concave upward on $I$.

(b) Show that part (a) remains true if $f$ and $g$ are both decreasing.

(c) Suppose $f$ is increasing and $g$ is decreasing. Show, by giving three examples, that $fg$ may be concave upward, concave downward, or linear. Why doesn't the argument in parts (a) and (b) work in this case?

**72.** Suppose $f$ and $g$ are both concave upward on $(-\infty, \infty)$. Under what condition on $f$ will the composite function $h(x) = f(g(x))$ be concave upward?

---

**73.** Show that a cubic function (a third-degree polynomial) always has exactly one point of inflection. If its graph has three $x$-intercepts $x_1$, $x_2$, and $x_3$, show that the $x$-coordinate of the inflection point is $(x_1 + x_2 + x_3)/3$.

**74.** For what values of $c$ does the polynomial $P(x) = x^4 + cx^3 + x^2$ have two inflection points? One inflection point? None? Illustrate by graphing $P$ for several values of $c$. How does the graph change as $c$ decreases?

**75.** Prove that if $(c, f(c))$ is a point of inflection of the graph of $f$ and $f''$ exists in an open interval that contains $c$, then $f''(c) = 0$. [*Hint:* Apply the First Derivative Test and Fermat's Theorem to the function $g = f'$.]

**76.** Show that if $f(x) = x^4$, then $f''(0) = 0$, but $(0, 0)$ is not an inflection point of the graph of $f$.

**77.** Show that the function $g(x) = x|x|$ has an inflection point at $(0, 0)$ but $g''(0)$ does not exist.

**78.** Suppose that $f'''$ is continuous and $f'(c) = f''(c) = 0$, but $f'''(c) > 0$. Does $f$ have a local maximum or minimum at $c$? Does $f$ have a point of inflection at $c$?

**79.** Suppose $f$ is differentiable on an interval $I$ and $f'(x) > 0$ for all numbers $x$ in $I$ except for a single number $c$. Prove that $f$ is increasing on the entire interval $I$.

**80.** For what values of $c$ is the function

$$f(x) = cx + \frac{1}{x^2 + 3}$$

increasing on $(-\infty, \infty)$?

**81.** The three cases in the First Derivative Test cover the situations commonly encountered but do not exhaust all possibilities. Consider the functions $f$, $g$, and $h$ whose values at 0 are all 0 and, for $x \neq 0$,

$$f(x) = x^4 \sin \frac{1}{x} \qquad g(x) = x^4\left(2 + \sin \frac{1}{x}\right)$$

$$h(x) = x^4\left(-2 + \sin \frac{1}{x}\right)$$

(a) Show that 0 is a critical number of all three functions but their derivatives change sign infinitely often on both sides of 0.

(b) Show that $f$ has neither a local maximum nor a local minimum at 0, $g$ has a local minimum, and $h$ has a local maximum.

## 3.4 Limits at Infinity; Horizontal Asymptotes

In Sections 1.5 and 1.7 we investigated infinite limits and vertical asymptotes of a curve $y = f(x)$. There we let $x$ approach a number and the result was that the values of $y$ became arbitrarily large (positive or negative). In this section we let $x$ become arbitrarily large (positive or negative) and see what happens to $y$. We will find it very useful to consider this so-called *end behavior* when sketching graphs.

### Limits at Infinity and Horizontal Asymptotes

Let's begin by investigating the behavior of the function $f$ defined by

$$f(x) = \frac{x^2 - 1}{x^2 + 1}$$

as $x$ becomes large. The table at the left gives values of this function correct to six decimal places, and the graph of $f$ has been drawn by a computer in Figure 1.

| $x$ | $f(x)$ |
|---|---|
| 0 | $-1$ |
| $\pm 1$ | 0 |
| $\pm 2$ | 0.600000 |
| $\pm 3$ | 0.800000 |
| $\pm 4$ | 0.882353 |
| $\pm 5$ | 0.923077 |
| $\pm 10$ | 0.980198 |
| $\pm 50$ | 0.999200 |
| $\pm 100$ | 0.999800 |
| $\pm 1000$ | 0.999998 |

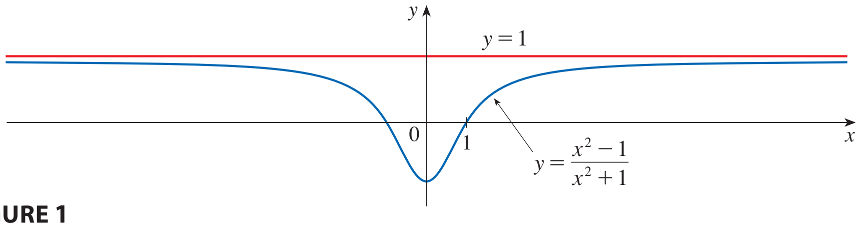

**FIGURE 1**

You can see that as $x$ grows larger and larger, the values of $f(x)$ get closer and closer to 1. (The graph of $f$ approaches the horizontal line $y = 1$ as we look to the right.) In fact, it seems that we can make the values of $f(x)$ as close as we like to 1 by taking $x$ sufficiently large. This situation is expressed symbolically by writing

$$\lim_{x \to \infty} \frac{x^2 - 1}{x^2 + 1} = 1$$

In general, we use the notation

$$\lim_{x \to \infty} f(x) = L$$

to indicate that the values of $f(x)$ approach $L$ as $x$ becomes larger and larger.

**1 Intuitive Definition of a Limit at Infinity** Let $f$ be a function defined on some interval $(a, \infty)$. Then

$$\lim_{x \to \infty} f(x) = L$$

means that the values of $f(x)$ can be made arbitrarily close to $L$ by requiring $x$ to be sufficiently large.

Another notation for $\lim_{x \to \infty} f(x) = L$ is

$$f(x) \to L \quad \text{as} \quad x \to \infty$$

The symbol $\infty$ does not represent a number. Nonetheless, the expression $\lim\limits_{x \to \infty} f(x) = L$ is often read as

"the limit of $f(x)$, as $x$ approaches infinity, is $L$"

or "the limit of $f(x)$, as $x$ becomes infinite, is $L$"

or "the limit of $f(x)$, as $x$ increases without bound, is $L$"

The meaning of such phrases is given by Definition 1. A more precise definition, similar to the $\varepsilon$, $\delta$ definition of Section 1.7, is given at the end of this section.

Geometric illustrations of Definition 1 are shown in Figure 2. Notice that there are many ways for the graph of $f$ to approach the line $y = L$ (which is called a *horizontal asymptote*) as we look to the far right of each graph.

Referring back to Figure 1, we see that for numerically large negative values of $x$, the values of $f(x)$ are close to 1. By letting $x$ decrease through negative values without bound, we can make $f(x)$ as close to 1 as we like. This is expressed by writing

$$\lim_{x \to -\infty} \frac{x^2 - 1}{x^2 + 1} = 1$$

The general definition is as follows.

**2 Definition** Let $f$ be a function defined on some interval $(-\infty, a)$. Then

$$\lim_{x \to -\infty} f(x) = L$$

means that the values of $f(x)$ can be made arbitrarily close to $L$ by requiring $x$ to be sufficiently large negative.

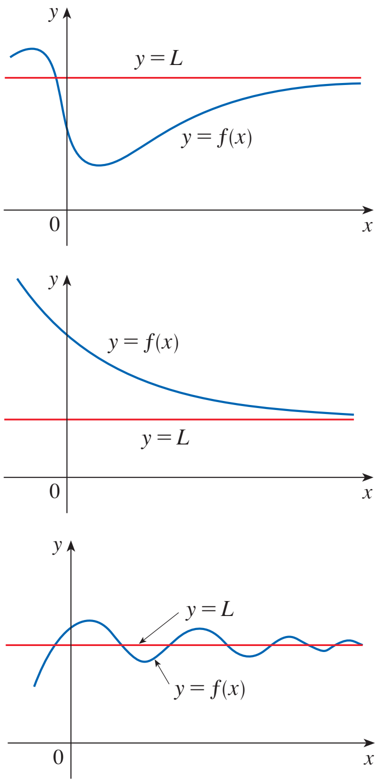

**FIGURE 2**

Examples illustrating $\lim\limits_{x \to \infty} f(x) = L$

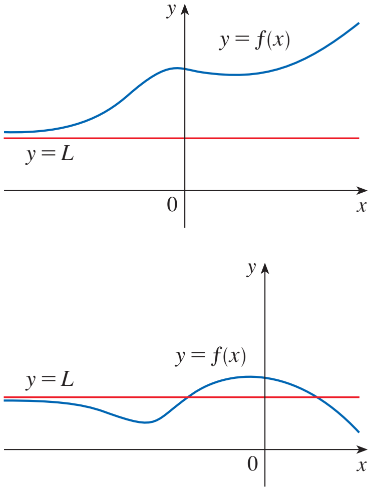

**FIGURE 3**
Examples illustrating $\lim_{x \to -\infty} f(x) = L$

Again, the symbol $-\infty$ does not represent a number, but the expression $\lim_{x \to -\infty} f(x) = L$ is often read as

"the limit of $f(x)$, as $x$ approaches negative infinity, is $L$"

Definition 2 is illustrated in Figure 3. Notice that the graph approaches the line $y = L$ as we look to the far left of each graph.

**3 Definitio** The line $y = L$ is called a **horizontal asymptote** of the curve $y = f(x)$ if either

$$\lim_{x \to \infty} f(x) = L \qquad \text{or} \qquad \lim_{x \to -\infty} f(x) = L$$

For instance, the curve illustrated in Figure 1 has the line $y = 1$ as a horizontal asymptote because

$$\lim_{x \to \infty} \frac{x^2 - 1}{x^2 + 1} = 1$$

The curve $y = f(x)$ sketched in Figure 4 has both $y = -1$ and $y = 2$ as horizontal asymptotes because

$$\lim_{x \to \infty} f(x) = -1 \qquad \text{and} \qquad \lim_{x \to -\infty} f(x) = 2$$

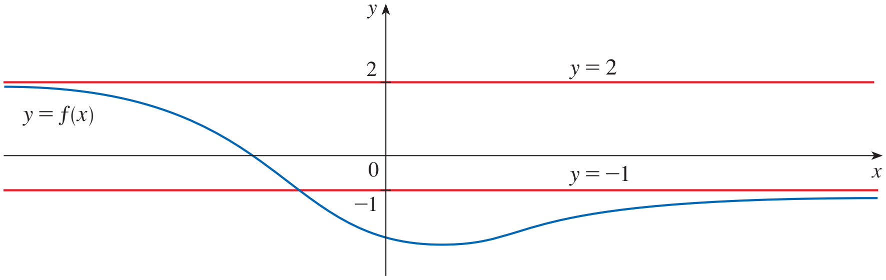

**FIGURE 4**

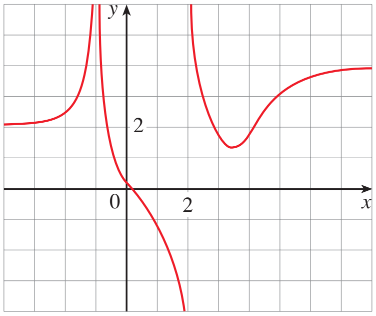

**FIGURE 5**

**EXAMPLE 1** Find the infinite limits, limits at infinity, and asymptotes for the function $f$ whose graph is shown in Figure 5.

**SOLUTION** We see that the values of $f(x)$ become large as $x \to -1$ from both sides, so

$$\lim_{x \to -1} f(x) = \infty$$

Notice that $f(x)$ becomes large negative as $x$ approaches 2 from the left, but large positive as $x$ approaches 2 from the right. So

$$\lim_{x \to 2^-} f(x) = -\infty \qquad \text{and} \qquad \lim_{x \to 2^+} f(x) = \infty$$

Thus both of the lines $x = -1$ and $x = 2$ are vertical asymptotes.

As $x$ becomes large, it appears that $f(x)$ approaches 4. But as $x$ decreases through negative values, $f(x)$ approaches 2. So

$$\lim_{x \to \infty} f(x) = 4 \qquad \text{and} \qquad \lim_{x \to -\infty} f(x) = 2$$

This means that both $y = 4$ and $y = 2$ are horizontal asymptotes. ■

**EXAMPLE 2** Find $\lim_{x\to\infty} \frac{1}{x}$ and $\lim_{x\to-\infty} \frac{1}{x}$.

**SOLUTION** Observe that when $x$ is large, $1/x$ is small. For instance,

$$\frac{1}{100} = 0.01 \qquad \frac{1}{10{,}000} = 0.0001 \qquad \frac{1}{1{,}000{,}000} = 0.000001$$

In fact, by taking $x$ large enough, we can make $1/x$ as close to 0 as we please. Therefore, according to Definition 1, we have

$$\lim_{x\to\infty} \frac{1}{x} = 0$$

Similar reasoning shows that when $x$ is large negative, $1/x$ is small negative, so we also have

$$\lim_{x\to-\infty} \frac{1}{x} = 0$$

It follows that the line $y = 0$ (the $x$-axis) is a horizontal asymptote of the curve $y = 1/x$. (This is a hyperbola; see Figure 6.) ■

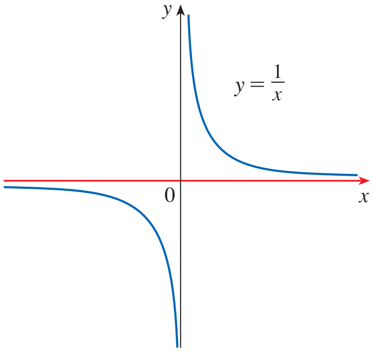

**FIGURE 6**

$\lim_{x\to\infty} \frac{1}{x} = 0, \quad \lim_{x\to-\infty} \frac{1}{x} = 0$

## ■ Evaluating Limits at Infinity

Most of the Limit Laws that were given in Section 1.6 also hold for limits at infinity. It can be proved that *the Limit Laws listed in Section 1.6 (with the exception of Laws 10 and 11) are also valid if "$x \to a$" is replaced by "$x \to \infty$" or "$x \to -\infty$."* In particular, if we combine Laws 6 and 7 with the results of Example 2, we obtain the following important rule for calculating limits.

**4** **Theorem** If $r > 0$ is a rational number, then

$$\lim_{x\to\infty} \frac{1}{x^r} = 0$$

If $r > 0$ is a rational number such that $x^r$ is defined for all $x$, then

$$\lim_{x\to-\infty} \frac{1}{x^r} = 0$$

**EXAMPLE 3** Evaluate the following limit and indicate which properties of limits are used at each stage.

$$\lim_{x\to\infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1}$$

**SOLUTION** As $x$ becomes large, both numerator and denominator become large, so it isn't obvious what happens to their ratio. We need to do some preliminary algebra.

To evaluate the limit at infinity of any rational function, we first divide both the numerator and denominator by the highest power of $x$ that occurs in the denominator. (We may assume that $x \neq 0$, since we are interested only in large values of $x$.) In this case the highest power of $x$ in the denominator is $x^2$, so we have

$$\lim_{x\to\infty}\frac{3x^2-x-2}{5x^2+4x+1}=\lim_{x\to\infty}\frac{\dfrac{3x^2-x-2}{x^2}}{\dfrac{5x^2+4x+1}{x^2}}=\lim_{x\to\infty}\frac{3-\dfrac{1}{x}-\dfrac{2}{x^2}}{5+\dfrac{4}{x}+\dfrac{1}{x^2}}$$

$$=\frac{\lim\limits_{x\to\infty}\left(3-\dfrac{1}{x}-\dfrac{2}{x^2}\right)}{\lim\limits_{x\to\infty}\left(5+\dfrac{4}{x}+\dfrac{1}{x^2}\right)} \qquad \text{(by Limit Law 5)}$$

$$=\frac{\lim\limits_{x\to\infty}3-\lim\limits_{x\to\infty}\dfrac{1}{x}-2\lim\limits_{x\to\infty}\dfrac{1}{x^2}}{\lim\limits_{x\to\infty}5+4\lim\limits_{x\to\infty}\dfrac{1}{x}+\lim\limits_{x\to\infty}\dfrac{1}{x^2}} \qquad \text{(by 1, 2, and 3)}$$

$$=\frac{3-0-0}{5+0+0} \qquad \text{(by 8 and Theorem 4)}$$

$$=\frac{3}{5}$$

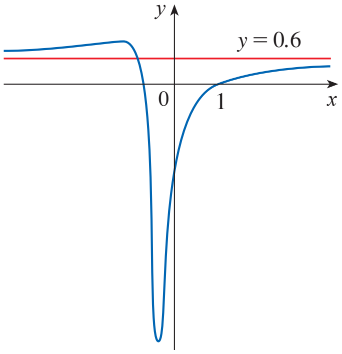

**FIGURE 7**
$y=\dfrac{3x^2-x-2}{5x^2+4x+1}$

A similar calculation shows that the limit as $x\to-\infty$ is also $\frac{3}{5}$. Figure 7 illustrates the results of these calculations by showing how the graph of the given rational function approaches the horizontal asymptote $y=\frac{3}{5}=0.6$. ■

**EXAMPLE 4** Find the horizontal asymptotes of the graph of the function

$$f(x)=\frac{\sqrt{2x^2+1}}{3x-5}$$

**SOLUTION** Dividing both numerator and denominator by $x$ (which is the highest power of $x$ in the denominator) and using the properties of limits, we have

$$\lim_{x\to\infty}\frac{\sqrt{2x^2+1}}{3x-5}=\lim_{x\to\infty}\frac{\dfrac{\sqrt{2x^2+1}}{x}}{\dfrac{3x-5}{x}}=\lim_{x\to\infty}\frac{\sqrt{\dfrac{2x^2+1}{x^2}}}{\dfrac{3x-5}{x}} \qquad \left(\text{since } \sqrt{x^2}=x \text{ for } x>0\right)$$

$$=\frac{\lim\limits_{x\to\infty}\sqrt{2+\dfrac{1}{x^2}}}{\lim\limits_{x\to\infty}\left(3-\dfrac{5}{x}\right)}=\frac{\sqrt{\lim\limits_{x\to\infty}2+\lim\limits_{x\to\infty}\dfrac{1}{x^2}}}{\lim\limits_{x\to\infty}3-5\lim\limits_{x\to\infty}\dfrac{1}{x}}$$

$$=\frac{\sqrt{2+0}}{3-5\cdot 0}=\frac{\sqrt{2}}{3}$$

Therefore the line $y=\sqrt{2}/3$ is a horizontal asymptote of the graph of $f$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

In computing the limit as $x \to -\infty$, we must remember that for $x < 0$, we have $\sqrt{x^2} = |x| = -x$. So when we divide the numerator by $x$, for $x < 0$ we get

$$\frac{\sqrt{2x^2+1}}{x} = \frac{\sqrt{2x^2+1}}{-\sqrt{x^2}} = -\sqrt{\frac{2x^2+1}{x^2}} = -\sqrt{2+\frac{1}{x^2}}$$

Therefore

$$\lim_{x\to-\infty}\frac{\sqrt{2x^2+1}}{3x-5} = \lim_{x\to-\infty}\frac{-\sqrt{2+\dfrac{1}{x^2}}}{3-\dfrac{5}{x}} = \frac{-\sqrt{2+\displaystyle\lim_{x\to-\infty}\frac{1}{x^2}}}{3-5\displaystyle\lim_{x\to-\infty}\frac{1}{x}} = -\frac{\sqrt{2}}{3}$$

Thus the line $y = -\sqrt{2}/3$ is also a horizontal asymptote. See Figure 8. ■

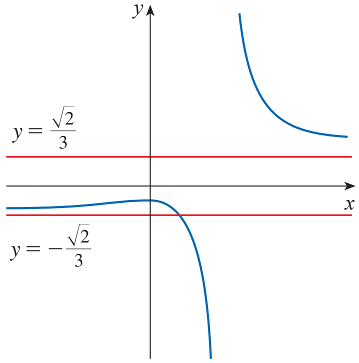

**FIGURE 8**

$$y = \frac{\sqrt{2x^2+1}}{3x-5}$$

**EXAMPLE 5** Compute $\lim_{x\to\infty}\left(\sqrt{x^2+1} - x\right)$.

We can think of the given function as having a denominator of 1.

**SOLUTION** Because both $\sqrt{x^2+1}$ and $x$ are large when $x$ is large, it's difficult to see what happens to their difference, so we use algebra to rewrite the function. We first multiply numerator and denominator by the conjugate radical:

$$\begin{aligned}\lim_{x\to\infty}\left(\sqrt{x^2+1} - x\right) &= \lim_{x\to\infty}\left(\sqrt{x^2+1} - x\right)\cdot\frac{\sqrt{x^2+1}+x}{\sqrt{x^2+1}+x}\\ &= \lim_{x\to\infty}\frac{(x^2+1)-x^2}{\sqrt{x^2+1}+x} = \lim_{x\to\infty}\frac{1}{\sqrt{x^2+1}+x}\end{aligned}$$

Notice that the denominator of this last expression $\left(\sqrt{x^2+1}+x\right)$ becomes large as $x \to \infty$ (it's bigger than $x$). So

$$\lim_{x\to\infty}\left(\sqrt{x^2+1} - x\right) = \lim_{x\to\infty}\frac{1}{\sqrt{x^2+1}+x} = 0$$

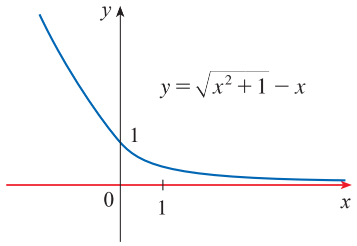

**FIGURE 9**

Figure 9 illustrates this result. ■

**EXAMPLE 6** Evaluate $\lim_{x\to\infty}\sin\frac{1}{x}$.

**PS** The problem-solving strategy for Example 6 is *introducing something extra* (see Principles of Problem Solving following Chapter 1). Here, the something extra, the auxiliary aid, is the new variable *t*.

**SOLUTION** If we let $t = 1/x$, then $t \to 0^+$ as $x \to \infty$. Therefore

$$\lim_{x\to\infty}\sin\frac{1}{x} = \lim_{t\to0^+}\sin t = 0$$

(See Exercise 75.) ■

**EXAMPLE 7** Evaluate $\lim_{x\to\infty}\sin x$.

**SOLUTION** As $x$ increases, the values of $\sin x$ oscillate between 1 and $-1$ infinitely often and so they don't approach any definite number. Thus $\lim_{x\to\infty}\sin x$ does not exist. ■

## Infinite Limits at Infinity

The notation

$$\lim_{x\to\infty} f(x) = \infty$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

is used to indicate that the values of $f(x)$ become large as $x$ becomes large. Similar meanings are attached to the following symbols:

$$\lim_{x \to -\infty} f(x) = \infty \qquad \lim_{x \to \infty} f(x) = -\infty \qquad \lim_{x \to -\infty} f(x) = -\infty$$

**EXAMPLE 8** Find $\lim_{x \to \infty} x^3$ and $\lim_{x \to -\infty} x^3$.

**SOLUTION** When $x$ becomes large, $x^3$ also becomes large. For instance,

$$10^3 = 1000 \qquad 100^3 = 1{,}000{,}000 \qquad 1000^3 = 1{,}000{,}000{,}000$$

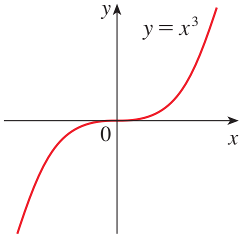

**FIGURE 10**

$\lim_{x \to \infty} x^3 = \infty$, $\lim_{x \to -\infty} x^3 = -\infty$

In fact, we can make $x^3$ as big as we like by requiring $x$ to be large enough. Therefore we can write

$$\lim_{x \to \infty} x^3 = \infty$$

Similarly, when $x$ is large negative, so is $x^3$. Thus

$$\lim_{x \to -\infty} x^3 = -\infty$$

These limit statements can also be seen from the graph of $y = x^3$ in Figure 10. ■

**EXAMPLE 9** Find $\lim_{x \to \infty} (x^2 - x)$.

**SOLUTION** Limit Law 2 says that the limit of a difference is the difference of the limits, provided that these limits exist. We cannot use Law 2 here because

$$\lim_{x \to \infty} x^2 = \infty \qquad \text{and} \qquad \lim_{x \to \infty} x = \infty$$

⊘ In general, the Limit Laws can't be applied to infinite limits because $\infty$ is not a number ($\infty - \infty$ can't be defined). However, we *can* write

$$\lim_{x \to \infty} (x^2 - x) = \lim_{x \to \infty} x(x - 1) = \infty$$

because both $x$ and $x - 1$ become arbitrarily large and so their product does too. ■

**EXAMPLE 10** Find $\lim_{x \to \infty} \dfrac{x^2 + x}{3 - x}$.

**SOLUTION** As in Example 3, we divide the numerator and denominator by the highest power of $x$ in the denominator, which is simply $x$:

$$\lim_{x \to \infty} \frac{x^2 + x}{3 - x} = \lim_{x \to \infty} \frac{x + 1}{\dfrac{3}{x} - 1} = -\infty$$

because $x + 1 \to \infty$ and $3/x - 1 \to 0 - 1 = -1$ as $x \to \infty$. ■

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The next example shows that by using infinite limits at infinity, together with intercepts, we can get a rough idea of the graph of a polynomial without computing derivatives.

**EXAMPLE 11** Sketch the graph of $y = (x-2)^4(x+1)^3(x-1)$ by finding its intercepts and its limits as $x \to \infty$ and as $x \to -\infty$.

**SOLUTION** The $y$-intercept is $f(0) = (-2)^4(1)^3(-1) = -16$ and the $x$-intercepts are found by setting $y = 0$: $x = 2, -1, 1$. Notice that since $(x-2)^4$ is never negative, the function doesn't change sign at 2; thus the graph doesn't cross the $x$-axis at 2. The graph crosses the axis at $-1$ and 1.

When $x$ is large positive, all three factors are large, so

$$\lim_{x\to\infty} (x-2)^4(x+1)^3(x-1) = \infty$$

When $x$ is large negative, the first factor is large positive and the second and third factors are both large negative, so

$$\lim_{x\to-\infty} (x-2)^4(x+1)^3(x-1) = \infty$$

Combining this information, we give a rough sketch of the graph in Figure 11. ■

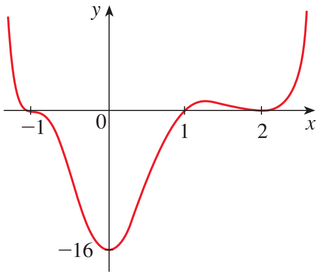

**FIGURE 11**
$y = (x-2)^4(x+1)^3(x-1)$

## Precise Definitions

Definition 1 can be stated precisely as follows.

**5 Precise Definition of a Limit at Infinity** Let $f$ be a function defined on some interval $(a, \infty)$. Then

$$\lim_{x\to\infty} f(x) = L$$

means that for every $\varepsilon > 0$ there is a corresponding number $N$ such that

$$\text{if} \qquad x > N \qquad \text{then} \qquad |f(x) - L| < \varepsilon$$

In words, this says that the values of $f(x)$ can be made arbitrarily close to $L$ (within a distance $\varepsilon$, where $\varepsilon$ is any positive number) by requiring $x$ to be sufficiently large (larger than $N$, where $N$ depends on $\varepsilon$). Graphically, it says that by keeping $x$ large enough (larger than some number $N$) we can make the graph of $f$ lie between the given horizontal lines $y = L - \varepsilon$ and $y = L + \varepsilon$ as in Figure 12. This must be true no matter how small we choose $\varepsilon$.

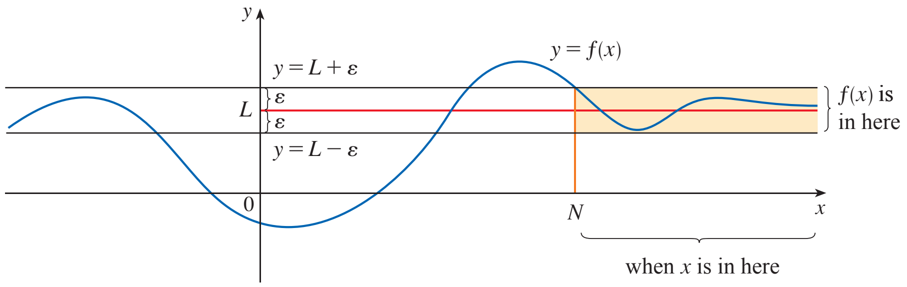

**FIGURE 12**
$\lim_{x\to\infty} f(x) = L$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Figure 13 shows that if a smaller value of $\varepsilon$ is chosen, then a larger value of $N$ may be required.

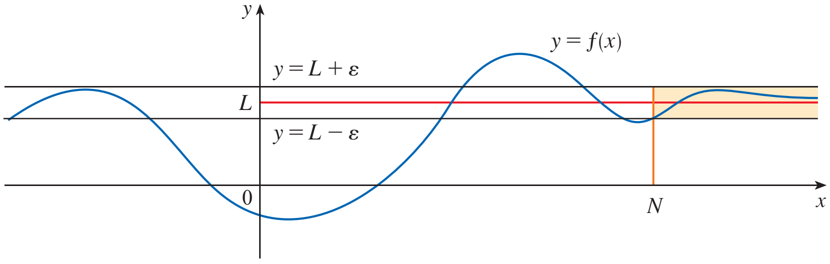

**FIGURE 13**
$\lim_{x \to \infty} f(x) = L$

Similarly, a precise version of Definition 2 is given by Definition 6, which is illustrated in Figure 14.

**6 Definitio** Let $f$ be a function defined on some interval $(-\infty, a)$. Then

$$\lim_{x \to -\infty} f(x) = L$$

means that for every $\varepsilon > 0$ there is a corresponding number $N$ such that

$$\text{if} \quad x < N \quad \text{then} \quad |f(x) - L| < \varepsilon$$

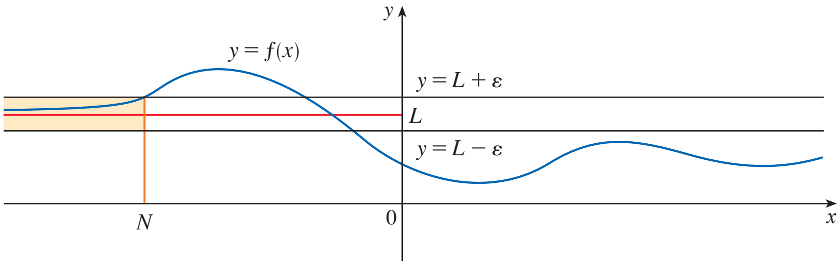

**FIGURE 14**
$\lim_{x \to -\infty} f(x) = L$

In Example 3 we calculated that

$$\lim_{x \to \infty} \frac{3x^2 - x - 2}{5x^2 + 4x + 1} = \frac{3}{5}$$

In the next example we use a calculator (or computer) to relate this statement to Definition 5 with $L = \frac{3}{5} = 0.6$ and $\varepsilon = 0.1$.

**EXAMPLE 12** Use a graph to find a number $N$ such that

$$\text{if} \quad x > N \quad \text{then} \quad \left| \frac{3x^2 - x - 2}{5x^2 + 4x + 1} - 0.6 \right| < 0.1$$

**SOLUTION** We rewrite the given inequality as

$$0.5 < \frac{3x^2 - x - 2}{5x^2 + 4x + 1} < 0.7$$

We need to determine the values of $x$ for which the given curve lies between the horizontal lines $y = 0.5$ and $y = 0.7$. So we graph the curve and these lines in Figure 15. Then we use the graph to estimate that the curve crosses the line $y = 0.5$ when $x \approx 6.7$. To the right of this number it seems that the curve stays between the lines $y = 0.5$ and $y = 0.7$. Rounding up to be safe, we can say that

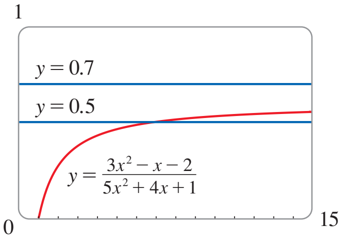

**FIGURE 15**

$$\text{if} \quad x > 7 \qquad \text{then} \qquad \left| \frac{3x^2 - x - 2}{5x^2 + 4x + 1} - 0.6 \right| < 0.1$$

In other words, for $\varepsilon = 0.1$ we can choose $N = 7$ (or any larger number) in Definition 5. ■

**EXAMPLE 13** Use Definition 5 to prove that $\lim_{x \to \infty} \frac{1}{x} = 0$.

**SOLUTION** Given $\varepsilon > 0$, we want to find $N$ such that

$$\text{if} \qquad x > N \qquad \text{then} \qquad \left| \frac{1}{x} - 0 \right| < \varepsilon$$

In computing the limit we may assume that $x > 0$. Then $1/x < \varepsilon \iff x > 1/\varepsilon$. Let's choose $N = 1/\varepsilon$. So

$$\text{if} \qquad x > N = \frac{1}{\varepsilon} \qquad \text{then} \qquad \left| \frac{1}{x} - 0 \right| = \frac{1}{x} < \varepsilon$$

Therefore, by Definition 5,

$$\lim_{x \to \infty} \frac{1}{x} = 0$$

Figure 16 illustrates the proof by showing some values of $\varepsilon$ and the corresponding values of $N$.

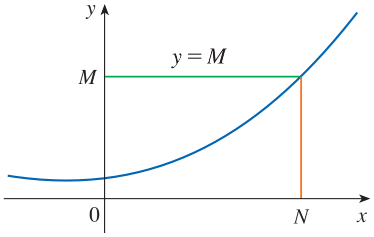

**FIGURE 17**
$\lim_{x\to\infty} f(x) = \infty$

Finally we note that an infinite limit at infinity can be defined as follows. The geometric illustration is given in Figure 17.

**7** **Precise Definition of an Infinite Limit at Infinity** Let $f$ be a function defined on some interval $(a, \infty)$. Then

$$\lim_{x\to\infty} f(x) = \infty$$

means that for every positive number $M$ there is a corresponding positive number $N$ such that

$$\text{if} \quad x > N \quad \text{then} \quad f(x) > M$$

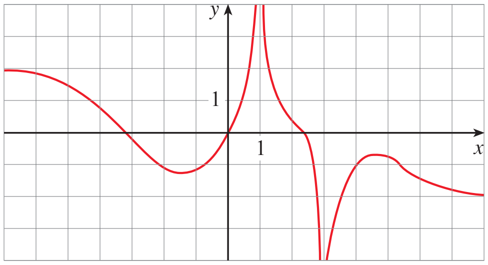
Similar definitions apply when the symbol $\infty$ is replaced by $-\infty$. (See Exercise 76.)

## 3.4 Exercises

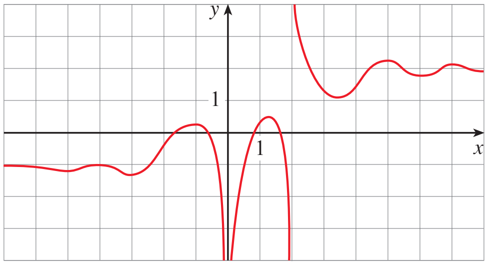
**1.** Explain in your own words the meaning of each of the following.
(a) $\lim_{x\to\infty} f(x) = 5$ (b) $\lim_{x\to-\infty} f(x) = 3$

**2.** (a) Can the graph of $y = f(x)$ intersect a vertical asymptote? Can it intersect a horizontal asymptote? Illustrate by sketching graphs.
(b) How many horizontal asymptotes can the graph of $y = f(x)$ have? Sketch graphs to illustrate the possibilities.

**3.** For the function $f$ whose graph is given, state the following.
(a) $\lim_{x\to\infty} f(x)$ (b) $\lim_{x\to-\infty} f(x)$
(c) $\lim_{x\to1} f(x)$ (d) $\lim_{x\to3} f(x)$
(e) The equations of the asymptotes



**4.** For the function $g$ whose graph is given, state the following.
(a) $\lim_{x\to\infty} g(x)$ (b) $\lim_{x\to-\infty} g(x)$
(c) $\lim_{x\to0} g(x)$ (d) $\lim_{x\to2^-} g(x)$
(e) $\lim_{x\to2^+} g(x)$ (f) The equations of the asymptotes



**5.** Guess the value of the limit

$$\lim_{x\to\infty} \frac{x^2}{2^x}$$

by evaluating the function $f(x) = x^2/2^x$ for $x = 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 20, 50$, and $100$. Then use a graph of $f$ to support your guess.

**6.** (a) Use a graph of

$$f(x) = \left(1 - \frac{2}{x}\right)^x$$

to estimate the value of $\lim_{x\to\infty} f(x)$ correct to two decimal places.
(b) Use a table of values of $f(x)$ to estimate the limit to four decimal places.

**7–8** Evaluate the limit and justify each step by indicating the appropriate properties of limits.

**7.** $\lim_{x\to\infty} \dfrac{2x^2 - 7}{5x^2 + x - 3}$

**8.** $\lim_{x\to\infty} \sqrt{\dfrac{9x^3 + 8x - 4}{3 - 5x + x^3}}$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**9–32** Find the limit or show that it does not exist.

**9.** $\displaystyle\lim_{x\to\infty}\frac{4x+3}{5x-1}$

**10.** $\displaystyle\lim_{x\to\infty}\frac{-2}{3x+7}$

**11.** $\displaystyle\lim_{t\to-\infty}\frac{3t^2+t}{t^3-4t+1}$

**12.** $\displaystyle\lim_{t\to-\infty}\frac{6t^2+t-5}{9-2t^2}$

**13.** $\displaystyle\lim_{r\to\infty}\frac{r-r^3}{2-r^2+3r^3}$

**14.** $\displaystyle\lim_{x\to\infty}\frac{3x^3-8x+2}{4x^3-5x^2-2}$

**15.** $\displaystyle\lim_{x\to\infty}\frac{4-\sqrt{x}}{2+\sqrt{x}}$

**16.** $\displaystyle\lim_{u\to-\infty}\frac{(u^2+1)(2u^2-1)}{(u^2+2)^2}$

**17.** $\displaystyle\lim_{x\to\infty}\frac{\sqrt{x+3x^2}}{4x-1}$

**18.** $\displaystyle\lim_{t\to\infty}\frac{t+3}{\sqrt{2t^2-1}}$

**19.** $\displaystyle\lim_{x\to\infty}\frac{\sqrt{1+4x^6}}{2-x^3}$

**20.** $\displaystyle\lim_{x\to-\infty}\frac{\sqrt{1+4x^6}}{2-x^3}$

**21.** $\displaystyle\lim_{x\to-\infty}\frac{2x^5-x}{x^4+3}$

**22.** $\displaystyle\lim_{q\to\infty}\frac{q^3+6q-4}{4q^2-3q+3}$

**23.** $\displaystyle\lim_{x\to\infty}\cos x$

**24.** $\displaystyle\lim_{x\to-\infty}\frac{1+x^6}{x^4+1}$

**25.** $\displaystyle\lim_{t\to\infty}\left(\sqrt{25t^2+2}-5t\right)$

**26.** $\displaystyle\lim_{x\to-\infty}\left(\sqrt{4x^2+3x}+2x\right)$

**27.** $\displaystyle\lim_{x\to\infty}\left(\sqrt{x^2+ax}-\sqrt{x^2+bx}\right)$

**28.** $\displaystyle\lim_{x\to\infty}\left(x-\sqrt{x}\right)$

**29.** $\displaystyle\lim_{x\to-\infty}(x^2+2x^7)$

**30.** $\displaystyle\lim_{x\to\infty}\frac{\sin^2x}{x^2+1}$

**31.** $\displaystyle\lim_{x\to\infty}x\sin\frac{1}{x}$

**32.** $\displaystyle\lim_{x\to\infty}\sqrt{x}\,\sin\frac{1}{x}$

---

**33.** (a) Estimate the value of

$$\lim_{x\to-\infty}\left(\sqrt{x^2+x+1}+x\right)$$

by graphing the function $f(x)=\sqrt{x^2+x+1}+x$.

(b) Use a table of values of $f(x)$ to guess the value of the limit.

(c) Prove that your guess is correct.

**34.** (a) Use a graph of

$$f(x)=\sqrt{3x^2+8x+6}-\sqrt{3x^2+3x+1}$$

to estimate the value of $\lim_{x\to\infty}f(x)$ to one decimal place.

(b) Use a table of values of $f(x)$ to estimate the limit to four decimal places.

(c) Find the exact value of the limit.

**35–40** Find the horizontal and vertical asymptotes of each curve. You may want to use a graphing calculator (or computer) to check your work by graphing the curve and estimating the asymptotes.

**35.** $\displaystyle y=\frac{5+4x}{x+3}$

**36.** $\displaystyle y=\frac{2x^2+1}{3x^2+2x-1}$

**37.** $\displaystyle y=\frac{2x^2+x-1}{x^2+x-2}$

**38.** $\displaystyle y=\frac{1+x^4}{x^2-x^4}$

**39.** $\displaystyle y=\frac{x^3-x}{x^2-6x+5}$

**40.** $\displaystyle y=\frac{x-9}{\sqrt{4x^2+3x+2}}$

---

**41.** Estimate the horizontal asymptote of the function

$$f(x)=\frac{3x^3+500x^2}{x^3+500x^2+100x+2000}$$

by graphing $f$ for $-10\leqslant x\leqslant 10$. Then calculate the equation of the asymptote by evaluating the limit. How do you explain the discrepancy?

**42.** (a) Graph the function

$$f(x)=\frac{\sqrt{2x^2+1}}{3x-5}$$

How many horizontal and vertical asymptotes do you observe? Use the graph to estimate the values of the limits

$$\lim_{x\to\infty}\frac{\sqrt{2x^2+1}}{3x-5}\quad\text{and}\quad\lim_{x\to-\infty}\frac{\sqrt{2x^2+1}}{3x-5}$$

(b) By calculating values of $f(x)$, give numerical estimates of the limits in part (a).

(c) Calculate the exact values of the limits in part (a). Did you get the same value or different values for these two limits? [In view of your answer to part (a), you might have to check your calculation for the second limit.]

**43.** Let $P$ and $Q$ be polynomials. Find

$$\lim_{x\to\infty}\frac{P(x)}{Q(x)}$$

if the degree of $P$ is (a) less than the degree of $Q$ and (b) greater than the degree of $Q$.

**44.** Make a rough sketch of the curve $y=x^n$ ($n$ an integer) for the following five cases:

(i) $n=0$
(ii) $n>0$, $n$ odd
(iii) $n>0$, $n$ even
(iv) $n<0$, $n$ odd
(v) $n<0$, $n$ even

Then use these sketches to find the following limits.

(a) $\displaystyle\lim_{x\to0^+}x^n$
(b) $\displaystyle\lim_{x\to0^-}x^n$
(c) $\displaystyle\lim_{x\to\infty}x^n$
(d) $\displaystyle\lim_{x\to-\infty}x^n$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**45.** Find a formula for a function $f$ that satisfies the following conditions:

$$\lim_{x\to\pm\infty} f(x) = 0, \quad \lim_{x\to 0} f(x) = -\infty, \quad f(2) = 0,$$
$$\lim_{x\to 3^-} f(x) = \infty, \quad \lim_{x\to 3^+} f(x) = -\infty$$

**46.** Find a formula for a function that has vertical asymptotes $x = 1$ and $x = 3$ and horizontal asymptote $y = 1$.

**47.** A function $f$ is a ratio of quadratic functions and has a vertical asymptote $x = 4$ and just one $x$-intercept, $x = 1$. It is known that $f$ has a removable discontinuity at $x = -1$ and $\lim_{x\to -1} f(x) = 2$. Evaluate

(a) $f(0)$ (b) $\lim_{x\to\infty} f(x)$

**48–51** Find the horizontal asymptotes of the curve and use them, together with concavity and intervals of increase and decrease, to sketch the curve.

**48.** $y = \dfrac{1 + 2x^2}{1 + x^2}$

**49.** $y = \dfrac{1 - x}{1 + x}$

**50.** $y = \dfrac{x}{\sqrt{x^2 + 1}}$

**51.** $y = \dfrac{x}{x^2 + 1}$

---

**52–56** Find the limits as $x \to \infty$ and as $x \to -\infty$. Use this information, together with intercepts, to give a rough sketch of the graph as in Example 11.

**52.** $y = 2x^3 - x^4$

**53.** $y = x^4 - x^6$

**54.** $y = x^3(x + 2)^2(x - 1)$

**55.** $y = (3 - x)(1 + x)^2(1 - x)^4$

**56.** $y = x^2(x^2 - 1)^2(x + 2)$

---

**57–62** Sketch the graph of a function that satisfies all of the given conditions.

**57.** $f(2) = 4, \quad f(-2) = -4, \quad \lim_{x\to -\infty} f(x) = 0, \quad \lim_{x\to\infty} f(x) = 2$

**58.** $\lim_{x\to -\infty} f(x) = -\infty, \quad \lim_{x\to -2^-} f(x) = \infty, \quad \lim_{x\to -2^+} f(x) = -\infty,$
$\lim_{x\to 2} f(x) = \infty, \quad \lim_{x\to\infty} f(x) = \infty$

**59.** $f'(2) = 0, \quad f(2) = -1, \quad f(0) = 0,$
$f'(x) < 0$ if $0 < x < 2, \quad f'(x) > 0$ if $x > 2,$
$f''(x) < 0$ if $0 \leqslant x < 1$ or if $x > 4,$
$f''(x) > 0$ if $1 < x < 4, \quad \lim_{x\to\infty} f(x) = 1,$
$f(-x) = f(x)$ for all $x$

**60.** $f'(2) = 0, \quad f'(0) = 1, \quad f'(x) > 0$ if $0 < x < 2,$
$f'(x) < 0$ if $x > 2, \quad f''(x) < 0$ if $0 < x < 4,$
$f''(x) > 0$ if $x > 4, \quad \lim_{x\to\infty} f(x) = 0,$
$f(-x) = -f(x)$ for all $x$

**61.** $f(1) = f'(1) = 0, \quad \lim_{x\to 2^+} f(x) = \infty,$
$\lim_{x\to 2^-} f(x) = -\infty, \quad \lim_{x\to 0} f(x) = -\infty,$
$\lim_{x\to -\infty} f(x) = \infty, \quad \lim_{x\to\infty} f(x) = 0,$
$f''(x) > 0$ for $x > 2, \quad f''(x) < 0$ for $x < 0$ and for $0 < x < 2$

**62.** $g(0) = 0, \quad g''(x) < 0$ for $x \neq 0, \quad \lim_{x\to -\infty} g(x) = \infty,$
$\lim_{x\to\infty} g(x) = -\infty, \quad \lim_{x\to 0^-} g'(x) = -\infty,$
$\lim_{x\to 0^+} g'(x) = \infty$

---

**63.** (a) Use the Squeeze Theorem to evaluate $\displaystyle\lim_{x\to\infty} \frac{\sin x}{x}$.

(b) Graph $f(x) = (\sin x)/x$. How many times does the graph cross the asymptote?

**64. End Behavior of a Function** By the *end behavior* of a function we mean the behavior of its values as $x \to \infty$ and as $x \to -\infty$.

(a) Describe and compare the end behavior of the functions

$$P(x) = 3x^5 - 5x^3 + 2x \qquad Q(x) = 3x^5$$

by graphing both functions in the viewing rectangles $[-2, 2]$ by $[-2, 2]$ and $[-10, 10]$ by $[-10{,}000, 10{,}000]$.

(b) Two functions are said to have the *same end behavior* if their ratio approaches 1 as $x \to \infty$. Show that $P$ and $Q$ have the same end behavior.

**65.** Find $\lim_{x\to\infty} f(x)$ if

$$\frac{4x - 1}{x} < f(x) < \frac{4x^2 + 3x}{x^2}$$

for all $x > 5$.

**66.** (a) A tank contains 5000 L of pure water. Brine that contains 30 g of salt per liter of water is pumped into the tank at a rate of 25 L/min. Show that the concentration of salt after $t$ minutes (in grams per liter) is

$$C(t) = \frac{30t}{200 + t}$$

(b) What happens to the concentration as $t \to \infty$?

**67.** Use a graph to find a number $N$ such that

$$\text{if} \quad x > N \quad \text{then} \quad \left| \frac{3x^2 + 1}{2x^2 + x + 1} - 1.5 \right| < 0.05$$

**68.** For the limit

$$\lim_{x\to\infty} \frac{1 - 3x}{\sqrt{x^2 + 1}} = -3$$

illustrate Definition 5 by finding values of $N$ that correspond to $\varepsilon = 0.1$ and $\varepsilon = 0.05$.

**69.** For the limit

$$\lim_{x\to-\infty}\frac{1-3x}{\sqrt{x^2+1}}=3$$

illustrate Definition 6 by finding values of $N$ that correspond to $\varepsilon = 0.1$ and $\varepsilon = 0.05$.

**70.** For the limit

$$\lim_{x\to\infty}\frac{3x}{\sqrt{x-3}}=\infty$$

illustrate Definition 7 by finding a value of $N$ that corresponds to $M = 100$.

**71.** (a) How large do we have to take $x$ so that $1/x^2 < 0.0001$?

(b) Taking $r = 2$ in Theorem 4, we have the statement

$$\lim_{x\to\infty}\frac{1}{x^2}=0$$

Prove this directly using Definition 5.

**72.** (a) How large do we have to take $x$ so that $1/\sqrt{x} < 0.0001$?

(b) Taking $r = \frac{1}{2}$ in Theorem 4, we have the statement

$$\lim_{x\to\infty}\frac{1}{\sqrt{x}}=0$$

Prove this directly using Definition 5.

**73.** Use Definition 6 to prove that $\displaystyle\lim_{x\to-\infty}\frac{1}{x}=0$.

**74.** Prove, using Definition 7, that $\displaystyle\lim_{x\to\infty}x^3=\infty$.

**75.** (a) Prove that

$$\lim_{x\to\infty}f(x)=\lim_{t\to0^+}f(1/t)$$

and

$$\lim_{x\to-\infty}f(x)=\lim_{t\to0^-}f(1/t)$$

assuming that these limits exist.

(b) Use part (a) and Exercise 63 to find

$$\lim_{x\to0^+}x\sin\frac{1}{x}$$

**76.** Formulate a precise definition of

$$\lim_{x\to-\infty}f(x)=-\infty$$

Then use your definition to prove that

$$\lim_{x\to-\infty}(1+x^3)=-\infty$$

## 3.5 Summary of Curve Sketching

So far we have been concerned with some particular aspects of curve sketching: domain, range, symmetry, limits, continuity, and vertical asymptotes in Chapter 1; derivatives and tangents in Chapter 2; and extreme values, intervals of increase and decrease, concavity, points of inflection, and horizontal asymptotes in this chapter. It is now time to put all of this information together to sketch graphs that reveal the important features of functions.

You might ask: Why don't we just use a graphing calculator or computer to graph a curve? Why do we need to use calculus?

It's true that technology is capable of producing very accurate graphs. But even the best graphing devices have to be used intelligently. It is easy to arrive at a misleading graph, or to miss important details of a curve, when relying solely on technology. (See the topic Graphing Calculators and Computers at *www.StewartCalculus.com*, especially Examples 1, 3, 4, and 5. See also Section 3.6.) The use of calculus enables us to discover the most interesting aspects of graphs and in many cases to calculate maximum and minimum points and inflection points *exactly* instead of approximately.

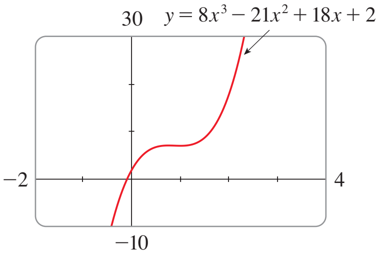


**FIGURE 1**

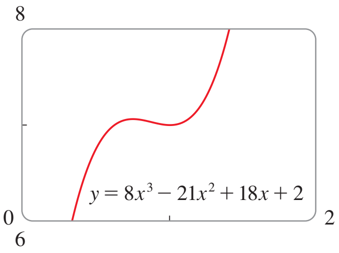

**FIGURE 2**

For instance, Figure 1 shows the graph of $f(x) = 8x^3 - 21x^2 + 18x + 2$. At first glance it seems reasonable: it has the same shape as cubic curves like $y = x^3$, and it appears to have no maximum or minimum point. But if you compute the derivative, you will see that there is a maximum when $x = 0.75$ and a minimum when $x = 1$. Indeed, if we zoom in to this portion of the graph, we see that behavior exhibited in Figure 2. Without calculus, we could easily have overlooked it.

In the next section we will graph functions by using the interaction between calculus and technology. In this section we draw graphs (by hand) by first considering the following information. A graph produced by a calculator or computer can serve as a check on your work.

## Guidelines for Sketching a Curve

The following checklist is intended as a guide to sketching a curve $y = f(x)$ by hand. Not every item is relevant to every function. (For instance, a given curve might not have an asymptote or possess symmetry.) But the guidelines provide all the information you need to make a sketch that displays the most important aspects of the function.

**A. Domain** It's often useful to start by determining the domain $D$ of $f$, that is, the set of values of $x$ for which $f(x)$ is defined.

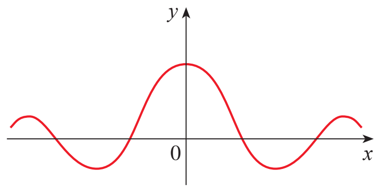
**B. Intercepts** The $y$-intercept is $f(0)$ and this tells us where the curve intersects the $y$-axis. To find the $x$-intercepts, we set $y = 0$ and solve for $x$. (You can omit this step if the equation is difficult to solve.)

**C. Symmetry**

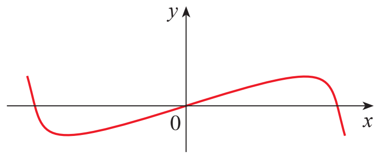
(i) If $f(-x) = f(x)$ for all $x$ in $D$, that is, the equation of the curve is unchanged when $x$ is replaced by $-x$, then $f$ is an *even function* and the curve is symmetric about the $y$-axis. (See Section 1.1.) This means that our work is cut in half. If we know what the curve looks like for $x \geqslant 0$, then we need only reflect about the $y$-axis to obtain the complete curve [see Figure 3(a)]. Here are some examples: $y = x^2$, $y = x^4$, $y = |x|$, and $y = \cos x$.

(ii) If $f(-x) = -f(x)$ for all $x$ in $D$, then $f$ is an *odd function* and the curve is symmetric about the origin. Again we can obtain the complete curve if we know what it looks like for $x \geqslant 0$. [Rotate 180° about the origin; see Figure 3(b).] Some simple examples of odd functions are $y = x$, $y = x^3$, $y = 1/x$, and $y = \sin x$.

(iii) If $f(x + p) = f(x)$ for all $x$ in $D$, where $p$ is a positive constant, then $f$ is a **periodic function** and the smallest such number $p$ is called the **period**. For instance, $y = \sin x$ has period $2\pi$ and $y = \tan x$ has period $\pi$. If we know what the graph looks like in an interval of length $p$, then we can use translation to visualize the entire graph (see Figure 4).



(a) Even function: reflectional symmetry



(b) Odd function: rotational symmetry

**FIGURE 3**

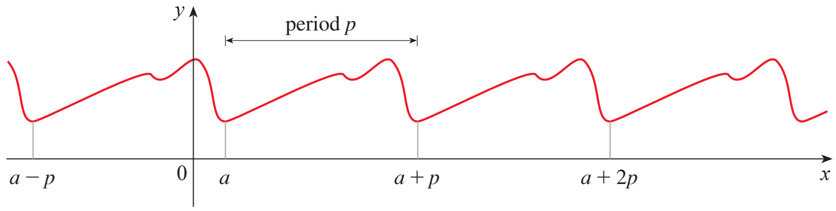


**FIGURE 4** Periodic function: translational symmetry

**D. Asymptotes**

(i) *Horizontal Asymptotes.* Recall from Section 3.4 that if either $\lim_{x\to\infty} f(x) = L$ or $\lim_{x\to-\infty} f(x) = L$, then the line $y = L$ is a horizontal asymptote of the curve $y = f(x)$. If it turns out that $\lim_{x\to\infty} f(x) = \infty$ (or $-\infty$), then we do not have an asymptote to the right, but this fact is still useful information for sketching the curve.

(ii) *Vertical Asymptotes.* Recall from Section 1.5 that the line $x = a$ is a vertical asymptote if at least one of the following statements is true:

$$\boxed{1} \qquad \lim_{x\to a^+} f(x) = \infty \qquad \lim_{x\to a^-} f(x) = \infty$$

$$\lim_{x\to a^+} f(x) = -\infty \qquad \lim_{x\to a^-} f(x) = -\infty$$

(For rational functions you can locate the vertical asymptotes by equating the denominator to 0 after canceling any common factors. But for other functions this method does not apply.) Furthermore, in sketching the curve it is useful to know exactly

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. which of the statements in (1) is true. If $f(a)$ is not defined but $a$ is an endpoint of the domain of $f$, then you should compute $\lim_{x\to a^-} f(x)$ or $\lim_{x\to a^+} f(x)$, whether or not this limit is infinite.

(iii) *Slant Asymptotes.* These are discussed at the end of this section.

**E. Intervals of Increase or Decrease** Use the I/D Test. Compute $f'(x)$ and find the intervals on which $f'(x)$ is positive ($f$ is increasing) and the intervals on which $f'(x)$ is negative ($f$ is decreasing).

**F. Local Maximum or Minimum Values** Find the critical numbers of $f$ [the numbers $c$ where $f'(c) = 0$ or $f'(c)$ does not exist]. Then use the First Derivative Test. If $f'$ changes from positive to negative at a critical number $c$, then $f(c)$ is a local maximum. If $f'$ changes from negative to positive at $c$, then $f(c)$ is a local minimum. Although it is usually preferable to use the First Derivative Test, you can use the Second Derivative Test if $f'(c) = 0$ and $f''(c) \neq 0$. Then $f''(c) > 0$ implies that $f(c)$ is a local minimum, whereas $f''(c) < 0$ implies that $f(c)$ is a local maximum.

**G. Concavity and Points of Inflection** Compute $f''(x)$ and use the Concavity Test. The curve is concave upward where $f''(x) > 0$ and concave downward where $f''(x) < 0$. Inflection points occur where the direction of concavity changes.

**H. Sketch the Curve** Using the information in items A–G, draw the graph. Sketch the asymptotes as dashed lines. Plot the intercepts, maximum and minimum points, and inflection points. Then make the curve pass through these points, rising and falling according to E, with concavity according to G, and approaching the asymptotes. If additional accuracy is desired near any point, you can compute the value of the derivative there. The tangent indicates the direction in which the curve proceeds.

**EXAMPLE 1** Use the guidelines to sketch the curve $y = \dfrac{2x^2}{x^2 - 1}$.

**A. Domain** The domain is

$$\{x \mid x^2 - 1 \neq 0\} = \{x \mid x \neq \pm 1\} = (-\infty, -1) \cup (-1, 1) \cup (1, \infty)$$

**B. Intercepts** The $x$- and $y$-intercepts are both 0.

**C. Symmetry** Since $f(-x) = f(x)$, the function $f$ is even. The curve is symmetric about the $y$-axis.

**D. Asymptotes**

$$\lim_{x\to\pm\infty} \frac{2x^2}{x^2 - 1} = \lim_{x\to\pm\infty} \frac{2}{1 - 1/x^2} = 2$$

Therefore the line $y = 2$ is a horizontal asymptote (at both the left and right).

Since the denominator is 0 when $x = \pm 1$, we compute the following limits:

$$\lim_{x\to 1^+} \frac{2x^2}{x^2 - 1} = \infty \qquad \lim_{x\to 1^-} \frac{2x^2}{x^2 - 1} = -\infty$$

$$\lim_{x\to -1^+} \frac{2x^2}{x^2 - 1} = -\infty \qquad \lim_{x\to -1^-} \frac{2x^2}{x^2 - 1} = \infty$$

Therefore the lines $x = 1$ and $x = -1$ are vertical asymptotes. This information about limits and asymptotes enables us to draw the preliminary sketch in Figure 5, showing the parts of the curve near the asymptotes.

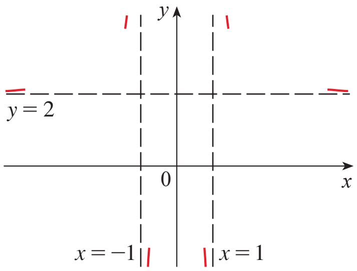

**FIGURE 5**
Preliminary sketch

We have shown the curve approaching its horizontal asymptote from above in Figure 5. This is confirmed by the intervals of increase and decrease.

**E. Intervals of Increase or Decrease**

$$f'(x) = \frac{(x^2 - 1)(4x) - 2x^2 \cdot 2x}{(x^2 - 1)^2} = \frac{-4x}{(x^2 - 1)^2}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Since $f'(x) > 0$ when $x < 0$ $(x \neq -1)$ and $f'(x) < 0$ when $x > 0$ $(x \neq 1)$, $f$ is increasing on $(-\infty, -1)$ and $(-1, 0)$ and decreasing on $(0, 1)$ and $(1, \infty)$.

**F. Local Maximum or Minimum Values** The only critical number is $x = 0$. Since $f'$ changes from positive to negative at 0, $f(0) = 0$ is a local maximum by the First Derivative Test.

**G. Concavity and Points of Inflection**

$$f''(x) = \frac{(x^2-1)^2(-4) + 4x \cdot 2(x^2-1)2x}{(x^2-1)^4} = \frac{12x^2+4}{(x^2-1)^3}$$

Since $12x^2 + 4 > 0$ for all $x$, we have

$$f''(x) > 0 \iff x^2 - 1 > 0 \iff |x| > 1$$

and $f''(x) < 0 \iff |x| < 1$. Thus the curve is concave upward on the intervals $(-\infty, -1)$ and $(1, \infty)$ and concave downward on $(-1, 1)$. It has no point of inflection because 1 and $-1$ are not in the domain of $f$.

**H. Sketch the Curve** Using the information in E–G, we finish the sketch in Figure 6. ■

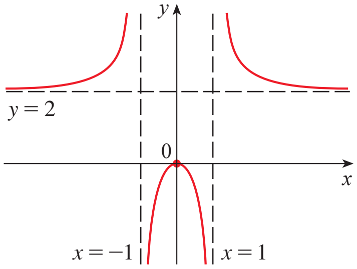

**FIGURE 6**

Finished sketch of $y = \dfrac{2x^2}{x^2-1}$

**EXAMPLE 2** Sketch the graph of $f(x) = \dfrac{x^2}{\sqrt{x+1}}$.

**A. Domain** The domain is $\{x \mid x + 1 > 0\} = \{x \mid x > -1\} = (-1, \infty)$.

**B. Intercepts** The $x$- and $y$-intercepts are both 0.

**C. Symmetry** None

**D. Asymptotes** Since

$$\lim_{x \to \infty} \frac{x^2}{\sqrt{x+1}} = \infty$$

there is no horizontal asymptote. Since $\sqrt{x+1} \to 0$ as $x \to -1^+$ and $f(x)$ is always positive, we have

$$\lim_{x \to -1^+} \frac{x^2}{\sqrt{x+1}} = \infty$$

and so the line $x = -1$ is a vertical asymptote.

**E. Intervals of Increase or Decrease**

$$f'(x) = \frac{\sqrt{x+1}\,(2x) - x^2 \cdot 1/\big(2\sqrt{x+1}\big)}{x+1} = \frac{3x^2+4x}{2(x+1)^{3/2}} = \frac{x(3x+4)}{2(x+1)^{3/2}}$$

We see that $f'(x) = 0$ when $x = 0$ (notice that $-\frac{4}{3}$ is not in the domain of $f$), so the only critical number is 0. Since $f'(x) < 0$ when $-1 < x < 0$ and $f'(x) > 0$ when $x > 0$, $f$ is decreasing on $(-1, 0)$ and increasing on $(0, \infty)$.

**F. Local Maximum or Minimum Values** Since $f'(0) = 0$ and $f'$ changes from negative to positive at 0, $f(0) = 0$ is a local (and absolute) minimum by the First Derivative Test.

**G. Concavity and Points of Inflection**

$$f''(x) = \frac{2(x+1)^{3/2}(6x+4) - (3x^2+4x)3(x+1)^{1/2}}{4(x+1)^3} = \frac{3x^2+8x+8}{4(x+1)^{5/2}}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

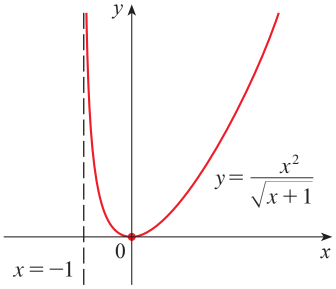

**FIGURE 7**

Note that the denominator is always positive. The numerator is the quadratic $3x^2 + 8x + 8$, which is always positive because its discriminant is $b^2 - 4ac = -32$, which is negative, and the coefficient of $x^2$ is positive. Thus $f''(x) > 0$ for all $x$ in the domain of $f$, which means that $f$ is concave upward on $(-1, \infty)$ and there is no point of inflection.

**H. Sketch the Curve** The curve is sketched in Figure 7. ■

**EXAMPLE 3** Sketch the graph of $f(x) = \dfrac{\cos x}{2 + \sin x}$.

**A. Domain** The domain is $\mathbb{R}$.

**B. Intercepts** The $y$-intercept is $f(0) = \frac{1}{2}$. The $x$-intercepts occur when $\cos x = 0$, that is, $x = (\pi/2) + n\pi$, where $n$ is an integer.

**C. Symmetry** $f$ is neither even nor odd, but $f(x + 2\pi) = f(x)$ for all $x$ and so $f$ is periodic and has period $2\pi$. Thus, in what follows, we need to consider only $0 \leqslant x \leqslant 2\pi$ and then extend the curve by translation in part H.

**D. Asymptotes** None

**E. Intervals of Increase or Decrease**

$$f'(x) = \frac{(2 + \sin x)(-\sin x) - \cos x\,(\cos x)}{(2 + \sin x)^2} = -\frac{2\sin x + 1}{(2 + \sin x)^2}$$

The denominator is always positive, so $f'(x) > 0$ when $2\sin x + 1 < 0 \iff \sin x < -\frac{1}{2} \iff 7\pi/6 < x < 11\pi/6$. So $f$ is increasing on $(7\pi/6, 11\pi/6)$ and decreasing on $(0, 7\pi/6)$ and $(11\pi/6, 2\pi)$.

**F. Local Maximum or Minimum Values** From part E and the First Derivative Test, we see that the local minimum value is $f(7\pi/6) = -1/\sqrt{3}$ and the local maximum value is $f(11\pi/6) = 1/\sqrt{3}$.

**G. Concavity and Points of Inflection** If we use the Quotient Rule again and simplify, we get

$$f''(x) = -\frac{2\cos x\,(1 - \sin x)}{(2 + \sin x)^3}$$

Because $(2 + \sin x)^3 > 0$ and $1 - \sin x \geqslant 0$ for all $x$, we know that $f''(x) > 0$ when $\cos x < 0$, that is, $\pi/2 < x < 3\pi/2$. So $f$ is concave upward on $(\pi/2, 3\pi/2)$ and concave downward on $(0, \pi/2)$ and $(3\pi/2, 2\pi)$. The inflection points are $(\pi/2, 0)$ and $(3\pi/2, 0)$.

**H. Sketch the Curve** The graph of the function restricted to $0 \leqslant x \leqslant 2\pi$ is shown in Figure 8. Then we extend it, using periodicity, to arrive at the graph in Figure 9.

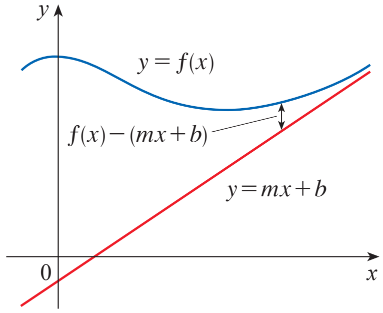

**FIGURE 10**

## Slant Asymptotes

Some curves have asymptotes that are *oblique*, that is, neither horizontal nor vertical. If

$$\lim_{x \to \infty} [f(x) - (mx + b)] = 0$$

where $m \neq 0$, then the line $y = mx + b$ is called a **slant asymptote** because the vertical distance between the curve $y = f(x)$ and the line $y = mx + b$ approaches 0, as in Figure 10. (A similar situation exists if we let $x \to -\infty$.) In the case of rational functions, slant asymptotes occur when the degree of the numerator is one more than the degree of the denominator. In such a case the equation of the slant asymptote can be found by long division as in the following example.

**EXAMPLE 4** Sketch the graph of $f(x) = \dfrac{x^3}{x^2 + 1}$.

**A. Domain** The domain is $\mathbb{R}$.

**B. Intercepts** The $x$- and $y$-intercepts are both 0.

**C. Symmetry** Since $f(-x) = -f(x)$, $f$ is odd and its graph is symmetric about the origin.

**D. Asymptotes** Since $x^2 + 1$ is never 0, there is no vertical asymptote. Since $f(x) \to \infty$ as $x \to \infty$ and $f(x) \to -\infty$ as $x \to -\infty$, there is no horizontal asymptote. But long division gives

$$f(x) = \frac{x^3}{x^2 + 1} = x - \frac{x}{x^2 + 1}$$

This equation suggests that $y = x$ is a candidate for a slant asymptote. In fact,

$$f(x) - x = -\frac{x}{x^2 + 1} = -\frac{\dfrac{1}{x}}{1 + \dfrac{1}{x^2}} \to 0 \quad \text{as} \quad x \to \pm\infty$$

So the line $y = x$ is indeed a slant asymptote.

**E. Intervals of Increase or Decrease**

$$f'(x) = \frac{(x^2 + 1)(3x^2) - x^3 \cdot 2x}{(x^2 + 1)^2} = \frac{x^2(x^2 + 3)}{(x^2 + 1)^2}$$

Since $f'(x) > 0$ for all $x$ (except 0), $f$ is increasing on $(-\infty, \infty)$.

**F. Local Maximum or Minimum Values** Although $f'(0) = 0$, $f'$ does not change sign at 0, so there is no local maximum or minimum.

**G. Concavity and Points of Inflection**

$$f''(x) = \frac{(x^2 + 1)^2(4x^3 + 6x) - (x^4 + 3x^2) \cdot 2(x^2 + 1)2x}{(x^2 + 1)^4} = \frac{2x(3 - x^2)}{(x^2 + 1)^3}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

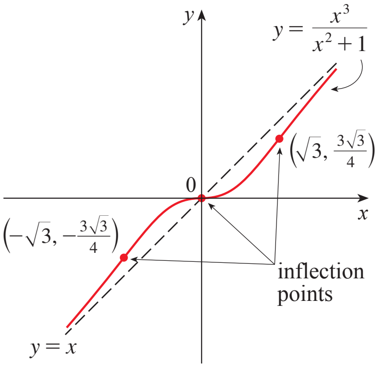

**FIGURE 11**

Since $f''(x) = 0$ when $x = 0$ or $x = \pm\sqrt{3}$, we set up the following chart:

| Interval | $x$ | $3 - x^2$ | $(x^2 + 1)^3$ | $f''(x)$ | $f$ |
|---|---|---|---|---|---|
| $x < -\sqrt{3}$ | $-$ | $-$ | $+$ | $+$ | CU on $(-\infty, -\sqrt{3})$ |
| $-\sqrt{3} < x < 0$ | $-$ | $+$ | $+$ | $-$ | CD on $(-\sqrt{3}, 0)$ |
| $0 < x < \sqrt{3}$ | $+$ | $+$ | $+$ | $+$ | CU on $(0, \sqrt{3})$ |
| $x > \sqrt{3}$ | $+$ | $-$ | $+$ | $-$ | CD on $(\sqrt{3}, \infty)$ |

The points of inflection are $\left(-\sqrt{3}, -\frac{3}{4}\sqrt{3}\right)$, $(0, 0)$, and $\left(\sqrt{3}, \frac{3}{4}\sqrt{3}\right)$.

**H. Sketch the Curve** The graph of $f$ is sketched in Figure 11. ■

## 3.5 Exercises

**1–40** Use the guidelines of this section to sketch the curve.

**1.** $y = x^3 + 3x^2$
**2.** $y = 2x^3 - 12x^2 + 18x$
**3.** $y = x^4 - 4x$
**4.** $y = x^4 - 8x^2 + 8$
**5.** $y = x(x - 4)^3$
**6.** $y = x^5 - 5x$
**7.** $y = \frac{1}{5}x^5 - \frac{8}{3}x^3 + 16x$
**8.** $y = (4 - x^2)^5$
**9.** $y = \dfrac{2x + 3}{x + 2}$
**10.** $y = \dfrac{x^2 + 5x}{25 - x^2}$
**11.** $y = \dfrac{x - x^2}{2 - 3x + x^2}$
**12.** $y = 1 + \dfrac{1}{x} + \dfrac{1}{x^2}$
**13.** $y = \dfrac{x}{x^2 - 4}$
**14.** $y = \dfrac{1}{x^2 - 4}$
**15.** $y = \dfrac{x^2}{x^2 + 3}$
**16.** $y = \dfrac{(x - 1)^2}{x^2 + 1}$
**17.** $y = \dfrac{x - 1}{x^2}$
**18.** $y = \dfrac{x}{x^3 - 1}$
**19.** $y = \dfrac{x^3}{x^3 + 1}$
**20.** $y = \dfrac{x^3}{x - 2}$
**21.** $y = (x - 3)\sqrt{x}$
**22.** $y = (x - 4)\sqrt[3]{x}$
**23.** $y = \sqrt{x^2 + x - 2}$
**24.** $y = \sqrt{x^2 + x} - x$
**25.** $y = \dfrac{x}{\sqrt{x^2 + 1}}$
**26.** $y = x\sqrt{2 - x^2}$
**27.** $y = \dfrac{\sqrt{1 - x^2}}{x}$
**28.** $y = \dfrac{x}{\sqrt{x^2 - 1}}$
**29.** $y = x - 3x^{1/3}$
**30.** $y = x^{5/3} - 5x^{2/3}$
**31.** $y = \sqrt[3]{x^2 - 1}$
**32.** $y = \sqrt[3]{x^3 + 1}$
**33.** $y = \sin^3 x$
**34.** $y = x + \cos x$
**35.** $y = x \tan x, \quad -\pi/2 < x < \pi/2$
**36.** $y = 2x - \tan x, \quad -\pi/2 < x < \pi/2$
**37.** $y = \sin x + \sqrt{3} \cos x, \quad -2\pi \leqslant x \leqslant 2\pi$
**38.** $y = \csc x - 2\sin x, \quad 0 < x < \pi$
**39.** $y = \dfrac{\sin x}{1 + \cos x}$
**40.** $y = \dfrac{\sin x}{2 + \cos x}$

**41–44** The graph of a function $f$ is shown. (The dashed lines indicate horizontal asymptotes.) Find each of the following for the given function $g$.
(a) The domains of $g$ and $g'$
(b) The critical numbers of $g$
(c) The approximate value of $g'(6)$
(d) All vertical and horizontal asymptotes of $g$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**41.** $g(x) = \sqrt{f(x)}$

**42.** $g(x) = \sqrt[3]{f(x)}$

**43.** $g(x) = |f(x)|$

**44.** $g(x) = 1/f(x)$

**45.** In the theory of relativity, the mass of a particle is

$$m = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

where $m_0$ is the rest mass of the particle, $m$ is the mass when the particle moves with speed $v$ relative to the observer, and $c$ is the speed of light. Sketch the graph of $m$ as a function of $v$.

**46.** In the theory of relativity, the energy of a particle is

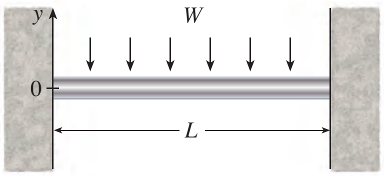
$$E = \sqrt{m_0^2 c^4 + h^2 c^2/\lambda^2}$$

where $m_0$ is the rest mass of the particle, $\lambda$ is its wave length, and $h$ is Planck's constant. Sketch the graph of $E$ as a function of $\lambda$. What does the graph say about the energy?

**47.** The figure shows a beam of length $L$ embedded in concrete walls. If a constant load $W$ is distributed evenly along its length, the beam takes the shape of the deflection curve

$$y = -\frac{W}{24EI}x^4 + \frac{WL}{12EI}x^3 - \frac{WL^2}{24EI}x^2$$

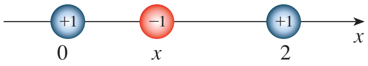
where $E$ and $I$ are positive constants. ($E$ is Young's modulus of elasticity and $I$ is the moment of inertia of a cross-section of the beam.) Sketch the graph of the deflection curve.



**48.** Coulomb's Law states that the force of attraction between two charged particles is directly proportional to the product of the charges and inversely proportional to the square of the distance between them. The figure shows particles with charge 1 located at positions 0 and 2 on a coordinate line and a particle with charge $-1$ at a position $x$ between them. It follows from Coulomb's Law that the net force acting on the middle particle is

$$F(x) = -\frac{k}{x^2} + \frac{k}{(x-2)^2} \qquad 0 < x < 2$$

where $k$ is a positive constant. Sketch the graph of the net force function. What does the graph say about the force?



**49–52** Find an equation of the slant asymptote. Do not sketch the curve.

**49.** $y = \dfrac{x^2 + 1}{x + 1}$

**50.** $y = \dfrac{4x^3 - 10x^2 - 11x + 1}{x^2 - 3x}$

**51.** $y = \dfrac{2x^3 - 5x^2 + 3x}{x^2 - x - 2}$

**52.** $y = \dfrac{-6x^4 + 2x^3 + 3}{2x^3 - x}$

**53–58** Use the guidelines of this section to sketch the curve. In guideline D, find an equation of the slant asymptote.

**53.** $y = \dfrac{x^2}{x - 1}$

**54.** $y = \dfrac{1 + 5x - 2x^2}{x - 2}$

**55.** $y = \dfrac{x^3 + 4}{x^2}$

**56.** $y = \dfrac{x^3}{(x + 1)^2}$

**57.** $y = \dfrac{2x^3 + x^2 + 1}{x^2 + 1}$

**58.** $y = \dfrac{(x + 1)^3}{(x - 1)^2}$

**59.** Show that the curve $y = \sqrt{4x^2 + 9}$ has two slant asymptotes: $y = 2x$ and $y = -2x$. Use this fact to help sketch the curve.

**60.** Show that the curve $y = \sqrt{x^2 + 4x}$ has two slant asymptotes: $y = x + 2$ and $y = -x - 2$. Use this fact to help sketch the curve.

**61.** Show that the lines $y = (b/a)x$ and $y = -(b/a)x$ are slant asymptotes of the hyperbola $(x^2/a^2) - (y^2/b^2) = 1$.

**62.** Let $f(x) = (x^3 + 1)/x$. Show that

$$\lim_{x \to \pm\infty} [f(x) - x^2] = 0$$

This shows that the graph of $f$ approaches the graph of $y = x^2$, and we say that the curve $y = f(x)$ is *asymptotic* to the parabola $y = x^2$. Use this fact to help sketch the graph of $f$.

**63.** Discuss the asymptotic behavior of $f(x) = (x^4 + 1)/x$ in the same manner as in Exercise 62. Then use your results to help sketch the graph of $f$.

**64.** Use the asymptotic behavior of $f(x) = \cos x + 1/x^2$ to sketch its graph without going through the curve-sketching procedure of this section.

# 3.6 Graphing with Calculus *and* Technology

You may want to read Graphing Calculators and Computers at www.StewartCalculus.com if you haven't already. In particular, it explains how to avoid some of the pitfalls of graphing devices by choosing appropriate viewing rectangles.

The method we used to sketch curves in the preceding section was a culmination of much of our study of differential calculus. The graph was the final object that we produced. In this section our point of view is completely different. Here we *start* with a graph produced by a graphing calculator or computer and then we refine it. We use calculus to make sure that we reveal all the important aspects of the curve. And with the use of graphing devices we can tackle curves that would be far too complicated to consider without technology. The theme is the *interaction* between calculus and technology.

**EXAMPLE 1** Graph the polynomial $f(x) = 2x^6 + 3x^5 + 3x^3 - 2x^2$. Use the graphs of $f'$ and $f''$ to estimate all maximum and minimum points and intervals of concavity.

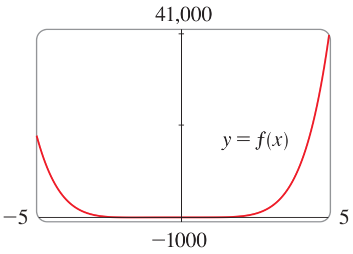


**FIGURE 1**

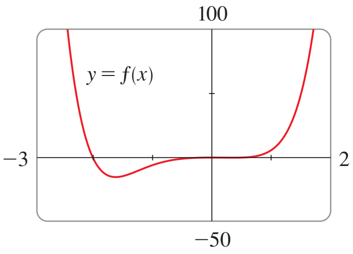

**FIGURE 2**

**SOLUTION** If we specify a domain but not a range, graphing software will often deduce a suitable range from the values computed. Figure 1 shows a plot that may result if we specify that $-5 \leqslant x \leqslant 5$. Although this viewing rectangle is useful for showing that the asymptotic behavior (or end behavior) is the same as for $y = 2x^6$, it is obviously hiding some finer detail. So we change to the viewing rectangle $[-3, 2]$ by $[-50, 100]$ in Figure 2.

Most graphing calculators and graphing software allow us to "trace" along a curve and see approximate coordinates of points. (Some also have features to identify the approximate locations of local maximum and minimum points.) Here it appears that there is an absolute minimum value of about $-15.33$ when $x \approx -1.62$ and $f$ is decreasing on $(-\infty, -1.62)$ and increasing on $(-1.62, \infty)$. Also, there appears to be a horizontal tangent at the origin and inflection points when $x = 0$ and when $x$ is somewhere between $-2$ and $-1$.

Now let's try to confirm these impressions using calculus. We differentiate and get

$$f'(x) = 12x^5 + 15x^4 + 9x^2 - 4x$$

$$f''(x) = 60x^4 + 60x^3 + 18x - 4$$

When we graph $f'$ in Figure 3 we see that $f'(x)$ changes from negative to positive when $x \approx -1.62$; this confirms (by the First Derivative Test) the minimum value that we found earlier. But, perhaps to our surprise, we also notice that $f'(x)$ changes from positive to negative when $x = 0$ and from negative to positive when $x \approx 0.35$. This means that $f$ has a local maximum at 0 and a local minimum when $x \approx 0.35$, but these were hidden in Figure 2. Indeed, if we now zoom in toward the origin in Figure 4, we see what we missed before: a local maximum value of 0 when $x = 0$ and a local minimum value of about $-0.1$ when $x \approx 0.35$.

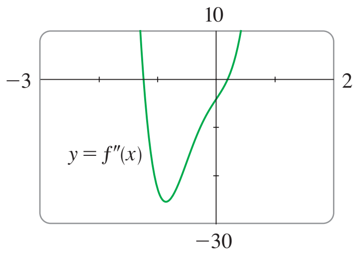

**FIGURE 5**

What about concavity and inflection points? From Figures 2 and 4 there appear to be inflection points when $x$ is a little to the left of $-1$ and when $x$ is a little to the right of 0. But it's difficult to determine inflection points from the graph of $f$, so we graph the second derivative $f''$ in Figure 5. We see that $f''$ changes from positive to negative when $x \approx -1.23$ and from negative to positive when $x \approx 0.19$. So, correct to two decimal places, $f$ is concave upward on $(-\infty, -1.23)$ and $(0.19, \infty)$ and concave downward on $(-1.23, 0.19)$. The inflection points are $(-1.23, -10.18)$ and $(0.19, -0.05)$.

We have discovered that no single graph reveals all the important features of this polynomial. But Figures 2 and 4, when taken together, do provide an accurate picture. ■

**EXAMPLE 2** Draw the graph of the function

$$f(x) = \frac{x^2 + 7x + 3}{x^2}$$

in a viewing rectangle that shows all the important features of the function. Estimate the local maximum and minimum values and the intervals of concavity. Then use calculus to find these quantities exactly.

**SOLUTION** Figure 6—produced by graphing software with automatic scaling—is a disaster. Some graphing calculators use $[-10, 10]$ by $[-10, 10]$ as the default viewing rectangle, so let's try it. We get the graph shown in Figure 7; it's a major improvement.

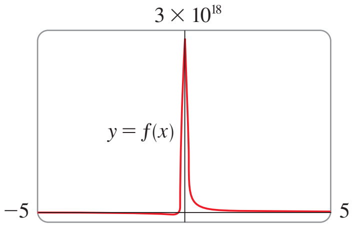

**FIGURE 6**

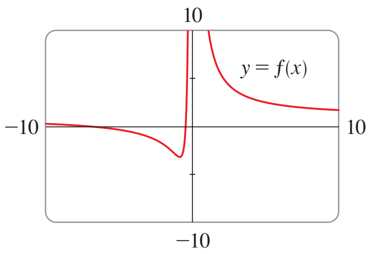

**FIGURE 7**

The $y$-axis appears to be a vertical asymptote and indeed it is because

$$\lim_{x \to 0} \frac{x^2 + 7x + 3}{x^2} = \infty$$

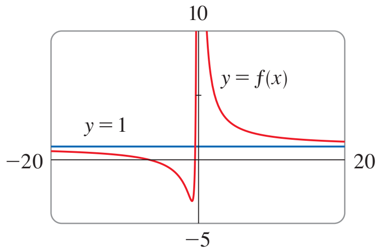

**FIGURE 8**

Figure 7 also allows us to estimate the $x$-intercepts: about $-0.5$ and $-6.5$. The exact values are obtained by using the quadratic formula to solve the equation $x^2 + 7x + 3 = 0$; we get $x = \left(-7 \pm \sqrt{37}\right)/2$.

To get a better look at horizontal asymptotes, we change to the viewing rectangle $[-20, 20]$ by $[-5, 10]$ in Figure 8. It appears that $y = 1$ is the horizontal asymptote and this is easily confirmed:

$$\lim_{x \to \pm\infty} \frac{x^2 + 7x + 3}{x^2} = \lim_{x \to \pm\infty} \left(1 + \frac{7}{x} + \frac{3}{x^2}\right) = 1$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

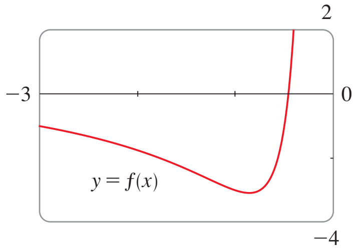

**FIGURE 9**

To estimate the minimum value we zoom in to the viewing rectangle $[-3, 0]$ by $[-4, 2]$ in Figure 9. We find that the absolute minimum value is about $-3.1$ when $x \approx -0.9$, and we see that the function decreases on $(-\infty, -0.9)$ and $(0, \infty)$ and increases on $(-0.9, 0)$. The exact values are obtained by differentiating:

$$f'(x) = -\frac{7}{x^2} - \frac{6}{x^3} = -\frac{7x+6}{x^3}$$

This shows that $f'(x) > 0$ when $-\frac{6}{7} < x < 0$ and $f'(x) < 0$ when $x < -\frac{6}{7}$ and when $x > 0$. The exact minimum value is $f\left(-\frac{6}{7}\right) = -\frac{37}{12} \approx -3.08$.

Figure 9 also shows that an inflection point occurs somewhere between $x = -1$ and $x = -2$. We could estimate it much more accurately using the graph of the second derivative, but in this case it's just as easy to find exact values. Since

$$f''(x) = \frac{14}{x^3} + \frac{18}{x^4} = \frac{2(7x+9)}{x^4}$$

we see that $f''(x) > 0$ when $x > -\frac{9}{7}$ $(x \neq 0)$ and $f''(x) < 0$ when $x < -\frac{9}{7}$. So $f$ is concave upward on $\left(-\frac{9}{7}, 0\right)$ and $(0, \infty)$ and concave downward on $\left(-\infty, -\frac{9}{7}\right)$. The inflection point is $\left(-\frac{9}{7}, -\frac{71}{27}\right)$.

The analysis using the first two derivatives shows that Figure 8 displays all the major aspects of the curve. ■

**EXAMPLE 3** Graph the function $f(x) = \dfrac{x^2(x+1)^3}{(x-2)^2(x-4)^4}$.

**SOLUTION** Drawing on our experience with a rational function in Example 2, let's start by graphing $f$ in the viewing rectangle $[-10, 10]$ by $[-10, 10]$. From Figure 10 we have the feeling that we are going to have to zoom in to see some finer detail and also zoom out to see the larger picture. But, as a guide to intelligent zooming, let's first take a close look at the expression for $f(x)$. Because of the factors $(x-2)^2$ and $(x-4)^4$ in the denominator, we expect $x = 2$ and $x = 4$ to be the vertical asymptotes. Indeed

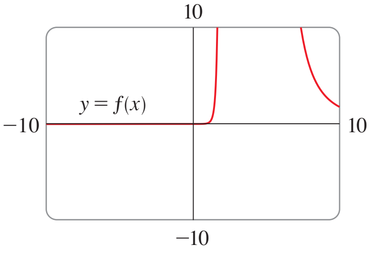

**FIGURE 10**

$$\lim_{x \to 2} \frac{x^2(x+1)^3}{(x-2)^2(x-4)^4} = \infty \qquad \text{and} \qquad \lim_{x \to 4} \frac{x^2(x+1)^3}{(x-2)^2(x-4)^4} = \infty$$

To find the horizontal asymptotes, we divide numerator and denominator by $x^6$:

$$\frac{x^2(x+1)^3}{(x-2)^2(x-4)^4} = \frac{\dfrac{x^2}{x^3} \cdot \dfrac{(x+1)^3}{x^3}}{\dfrac{(x-2)^2}{x^2} \cdot \dfrac{(x-4)^4}{x^4}} = \frac{\dfrac{1}{x}\left(1 + \dfrac{1}{x}\right)^3}{\left(1 - \dfrac{2}{x}\right)^2\left(1 - \dfrac{4}{x}\right)^4}$$

This shows that $f(x) \to 0$ as $x \to \pm\infty$, so the $x$-axis is a horizontal asymptote.

It is also very useful to consider the behavior of the graph near the $x$-intercepts using an analysis like that in Example 3.4.11. Since $x^2$ is positive, $f(x)$ does not change sign at 0 and so its graph doesn't cross the $x$-axis at 0. But, because of the factor $(x+1)^3$, the graph does cross the $x$-axis at $-1$ and has a horizontal tangent there. Putting all this information together, but without using derivatives, we see that the curve has to look something like the one in Figure 11.

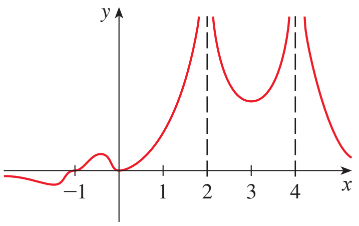

**FIGURE 11**

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Now that we know what to look for, we zoom in (several times) to produce the graphs in Figures 12 and 13 and zoom out (several times) to get Figure 14.

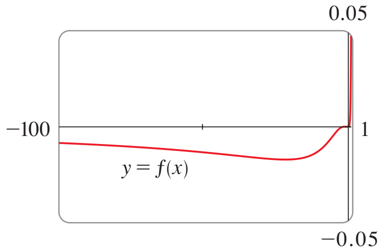

**FIGURE 12**

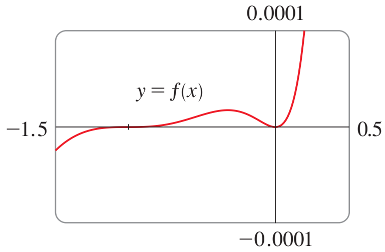

**FIGURE 13**

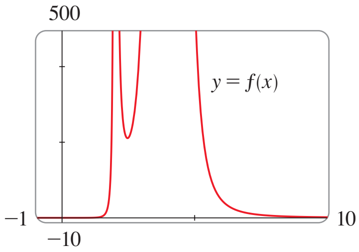

**FIGURE 14**

We can read from these graphs that the absolute minimum is about $-0.02$ and occurs when $x \approx -20$. There is also a local maximum $\approx 0.00002$ when $x \approx -0.3$ and a local minimum $\approx 211$ when $x \approx 2.5$. These graphs also show three inflection points near $-35$, $-5$, and $-1$ and two between $-1$ and 0. To estimate the inflection points closely we would need to graph $f''$, but to compute $f''$ by hand is an unreasonable chore. If you have a computer algebra system, then it's easy to do (see Exercise 13).

We have seen that, for this particular function, *three* graphs (Figures 12, 13, and 14) are necessary to convey all the useful information. The only way to display all these features of the function on a single graph is to draw it by hand. Despite the exaggerations and distortions, Figure 11 does manage to summarize the essential nature of the function. ■

**EXAMPLE 4** Graph the function $f(x) = \sin(x + \sin 2x)$. For $0 \leqslant x \leqslant \pi$, estimate all maximum and minimum values, intervals of increase and decrease, and inflection points.

**SOLUTION** We first note that $f$ is periodic with period $2\pi$. Also, $f$ is odd and $|f(x)| \leqslant 1$ for all $x$. So the choice of a viewing rectangle is not a problem for this function: we start with $[0, \pi]$ by $[-1.1, 1.1]$. (See Figure 15.) It appears that there are three local maximum values and two local minimum values in that window. To confirm these values and locate them more accurately, we calculate that

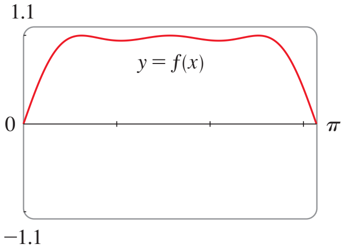

**FIGURE 15**

$$f'(x) = \cos(x + \sin 2x) \cdot (1 + 2\cos 2x)$$

and graph both $f$ and $f'$ in Figure 16.

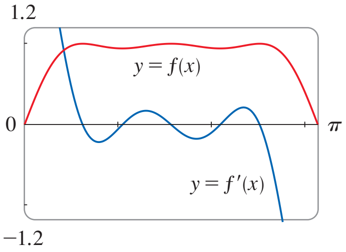

**FIGURE 16**

After estimating the values of the $x$-intercepts of $f'$, we use the First Derivative Test to find the following approximate values:

Intervals of increase: $(0, 0.6)$, $(1.0, 1.6)$, $(2.1, 2.5)$

Intervals of decrease: $(0.6, 1.0)$, $(1.6, 2.1)$, $(2.5, \pi)$

Local maximum values: $f(0.6) \approx 1$, $f(1.6) \approx 1$, $f(2.5) \approx 1$

Local minimum values: $f(1.0) \approx 0.94$, $f(2.1) \approx 0.94$

The second derivative is

$$f''(x) = -(1 + 2\cos 2x)^2 \sin(x + \sin 2x) - 4\sin 2x \cos(x + \sin 2x)$$

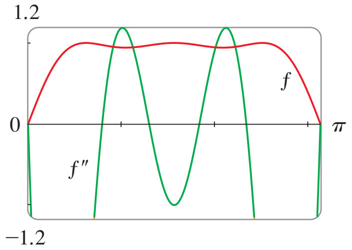

**FIGURE 17**

The family of functions

$$f(x) = \sin(x + \sin cx)$$

where $c$ is a constant, occurs in applications to frequency modulation (FM) synthesis. A sine wave is modulated by a wave with a different frequency ($\sin cx$). The case where $c = 2$ is studied in Example 4. Exercise 19 explores another special case.

Graphing both $f$ and $f''$ in Figure 17, we obtain the following approximate values:

| | |
|---|---|
| Concave upward on: | $(0.8, 1.3)$, $(1.8, 2.3)$ |
| Concave downward on: | $(0, 0.8)$, $(1.3, 1.8)$, $(2.3, \pi)$ |
| Inflection points: | $(0, 0)$, $(0.8, 0.97)$, $(1.3, 0.97)$, $(1.8, 0.97)$, $(2.3, 0.97)$ |

Having checked that Figure 15 does indeed represent $f$ accurately for $0 \leqslant x \leqslant \pi$, we can state that the extended graph in Figure 18 represents $f$ accurately for $-2\pi \leqslant x \leqslant 2\pi$.

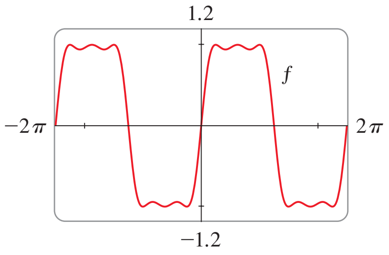

**FIGURE 18**

■

Our final example is concerned with *families* of functions. This means that the functions in the family are related to each other by a formula that contains one or more arbitrary constants. Each value of the constant gives rise to a member of the family and the idea is to see how the graph of the function changes as the constant changes.

**EXAMPLE 5** How does the graph of $f(x) = 1/(x^2 + 2x + c)$ vary as $c$ varies?

**SOLUTION** The graphs in Figures 19 and 20 (the special cases $c = 2$ and $c = -2$) show two very different-looking curves.

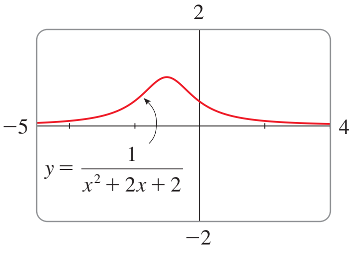

**FIGURE 19**
$c = 2$

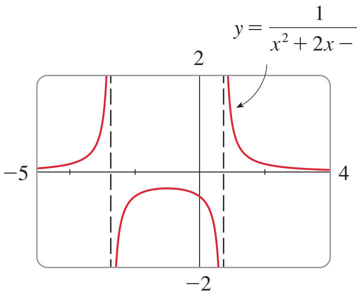

**FIGURE 20**
$c = -2$

Before drawing any more graphs, let's see what members of this family have in common. Since

$$\lim_{x \to \pm\infty} \frac{1}{x^2 + 2x + c} = 0$$

for any value of $c$, they all have the $x$-axis as a horizontal asymptote. A vertical asymptote will occur when $x^2 + 2x + c = 0$. Solving this quadratic equation, we get $x = -1 \pm \sqrt{1 - c}$. When $c > 1$, there is no vertical asymptote (as in Figure 19). When $c = 1$, the graph has a single vertical asymptote $x = -1$ because

$$\lim_{x \to -1} \frac{1}{x^2 + 2x + 1} = \lim_{x \to -1} \frac{1}{(x + 1)^2} = \infty$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

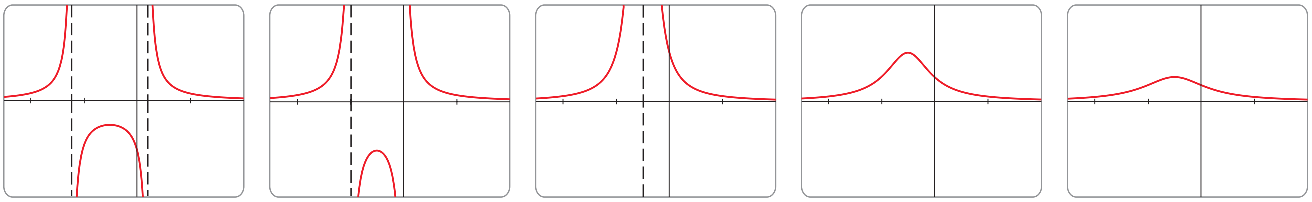
When $c < 1$, there are two vertical asymptotes: $x = -1 \pm \sqrt{1 - c}$ (as in Figure 20).

Now we compute the derivative:

$$f'(x) = -\frac{2x + 2}{(x^2 + 2x + c)^2}$$

This shows that $f'(x) = 0$ when $x = -1$ (if $c \neq 1$), $f'(x) > 0$ when $x < -1$, and $f'(x) < 0$ when $x > -1$. For $c \geqslant 1$, this means that $f$ increases on $(-\infty, -1)$ and decreases on $(-1, \infty)$. For $c > 1$, there is an absolute maximum value $f(-1) = 1/(c - 1)$. For $c < 1$, $f(-1) = 1/(c - 1)$ is a local maximum value and the intervals of increase and decrease are interrupted at the vertical asymptotes.

Figure 21 is a "slide show" displaying five members of the family, all graphed in the viewing rectangle $[-5, 4]$ by $[-2, 2]$. As predicted, a transition takes place from two vertical asymptotes to one for $c = 1$, and then to none for $c > 1$. As $c$ increases from 1, we see that the maximum point becomes lower; this is explained by the fact that $1/(c - 1) \to 0$ as $c \to \infty$. As $c$ decreases from 1, the vertical asymptotes become more widely separated because the distance between them is $2\sqrt{1 - c}$, which becomes large as $c \to -\infty$. Again, the maximum point approaches the $x$-axis because $1/(c - 1) \to 0$ as $c \to -\infty$.



$c = -1$ $c = 0$ $c = 1$ $c = 2$ $c = 3$

**FIGURE 21**
The family of functions
$f(x) = 1/(x^2 + 2x + c)$

There is clearly no inflection point when $c \leqslant 1$. For $c > 1$ we calculate that

$$f''(x) = \frac{2(3x^2 + 6x + 4 - c)}{(x^2 + 2x + c)^3}$$

and deduce that inflection points occur when $x = -1 \pm \sqrt{3(c - 1)}/3$. So the inflection points become more spread out as $c$ increases and this seems plausible from the last two graphs of Figure 21. ■

## 3.6 Exercises

**1–8** Produce graphs of $f$ that reveal all the important aspects of the curve. In particular, you should use graphs of $f'$ and $f''$ to estimate the intervals of increase and decrease, extreme values, intervals of concavity, and inflection points.

**1.** $f(x) = x^5 - 5x^4 - x^3 + 28x^2 - 2x$

**2.** $f(x) = -2x^6 + 5x^5 + 140x^3 - 110x^2$

**3.** $f(x) = x^6 - 5x^5 + 25x^3 - 6x^2 - 48x$

**4.** $f(x) = \dfrac{x^4 - x^3 - 8}{x^2 - x - 6}$

**5.** $f(x) = \dfrac{x}{x^3 + x^2 + 1}$

**6.** $f(x) = 6 \sin x - x^2, \quad -5 \leqslant x \leqslant 3$

**7.** $f(x) = 6 \sin x + \cot x, \quad -\pi \leqslant x \leqslant \pi$

**8.** $f(x) = \dfrac{\sin x}{x}, \quad -2\pi \leqslant x \leqslant 2\pi$

**9–10** Produce graphs of $f$ that reveal all the important aspects of the curve. Estimate the intervals of increase and decrease and intervals of concavity, and use calculus to find these intervals exactly.

**9.** $f(x) = 1 + \dfrac{1}{x} + \dfrac{8}{x^2} + \dfrac{1}{x^3}$

**10.** $f(x) = \dfrac{1}{x^8} - \dfrac{2 \times 10^8}{x^4}$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**11–12** Sketch the graph by hand using asymptotes and intercepts, but not derivatives. Then use your sketch as a guide to producing graphs using a calculator or computer that display the major features of the curve. Use these graphs to estimate the maximum and minimum values.

**11.** $f(x) = \dfrac{(x+4)(x-3)^2}{x^4(x-1)}$

**12.** $f(x) = \dfrac{(2x+3)^2(x-2)^5}{x^3(x-5)^2}$

---

T **13.** For the function $f$ of Example 3, use a computer algebra system to calculate $f'$ and then graph it to confirm that all the maximum and minimum values are as given in the example. Calculate $f''$ and use it to estimate the intervals of concavity and inflection points.

T **14.** For the function $f$ of Exercise 12, use a computer algebra system to find $f'$ and $f''$ and use their graphs to estimate the intervals of increase and decrease and concavity of $f$.

T **15–18** Use a computer algebra system to graph $f$ and to find $f'$ and $f''$. Use graphs of these derivatives to estimate the intervals of increase and decrease, extreme values, intervals of concavity, and inflection points of $f$.

**15.** $f(x) = \dfrac{x^3 + 5x^2 + 1}{x^4 + x^3 - x^2 + 2}$

**16.** $f(x) = \dfrac{x^{2/3}}{1 + x + x^4}$

**17.** $f(x) = \sqrt{x + 5\sin x}, \quad x \leqslant 20$

**18.** $f(x) = \dfrac{2x - 1}{\sqrt[4]{x^4 + x + 1}}$

---

**19.** In Example 4 we considered a member of the family of functions $f(x) = \sin(x + \sin cx)$ that occur in FM synthesis. Here we investigate the function with $c = 3$. Start by graphing $f$ in the viewing rectangle $[0, \pi]$ by $[-1.2, 1.2]$. How many local maximum points do you see? The graph has more than are visible to the naked eye. To discover the hidden maximum and minimum points you will need to examine the graph of $f'$ very carefully. In fact, it helps to look at the graph of $f''$ at the same time. Find all the maximum and minimum values and inflection points. Then graph $f$ in the viewing rectangle $[-2\pi, 2\pi]$ by $[-1.2, 1.2]$ and comment on symmetry.

**20–25** Describe how the graph of $f$ varies as $c$ varies. Graph several members of the family to illustrate the trends that you discover. In particular, you should investigate how maximum and minimum points and inflection points move when $c$ changes. You should also identify any transitional values of $c$ at which the basic shape of the curve changes.

**20.** $f(x) = x^3 + cx$

**21.** $f(x) = x^2 + 6x + c/x$ (trident of Newton)

**22.** $f(x) = x\sqrt{c^2 - x^2}$

**23.** $f(x) = \dfrac{cx}{1 + c^2x^2}$

**24.** $f(x) = \dfrac{\sin x}{c + \cos x}$

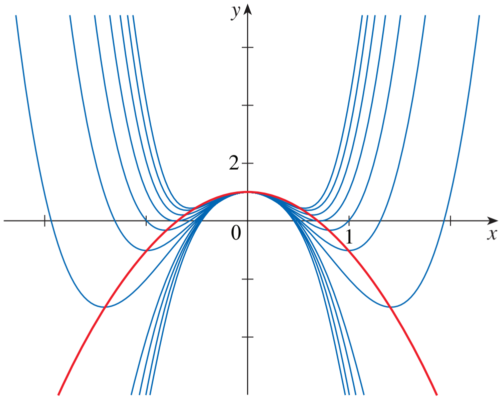
**25.** $f(x) = cx + \sin x$

---

**26.** The figure shows graphs (in blue) of several members of the family of polynomials $f(x) = cx^4 - 4x^2 + 1$.

(a) For which values of $c$ does the curve have minimum points?

(b) Show that the minimum and maximum points of every curve in the family lie on the parabola $y = -2x^2 + 1$ (shown in red).



**27.** Investigate the family of curves given by the equation $f(x) = x^4 + cx^2 + x$. Start by determining the transitional value of $c$ at which the number of inflection points changes. Then graph several members of the family to see what shapes are possible. There is another transitional value of $c$ at which the number of critical numbers changes. Try to discover it graphically. Then prove what you have discovered.

**28.** (a) Investigate the family of polynomials given by the equation

$$f(x) = 2x^3 + cx^2 + 2x$$

For what values of $c$ does the curve have maximum and minimum points?

(b) Show that the minimum and maximum points of every curve in the family lie on the curve $y = x - x^3$. Illustrate by graphing this curve and several members of the family.

## 3.7 Optimization Problems

The methods we have learned in this chapter for finding extreme values have practical applications in many areas of life: A businessperson wants to minimize costs and maximize profits. A traveler wants to minimize transportation time. Fermat's Principle in optics states that light follows the path that takes the least time. In this section we solve such problems as maximizing areas, volumes, and profits and minimizing distances, times, and costs.

PS

In solving such practical problems the greatest challenge is often to convert the word problem into a mathematical optimization problem by setting up the function that is to be maximized or minimized. Let's recall the problem-solving principles discussed in the Principles of Problem Solving following Chapter 1 and adapt them to this situation:

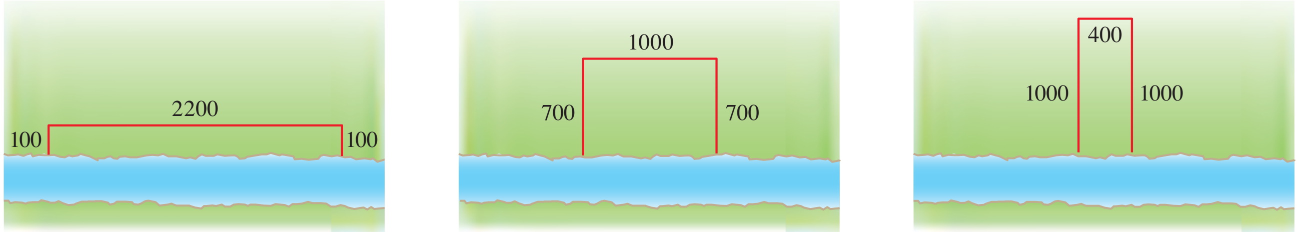
### Steps In Solving Optimization Problems

1. **Understand the Problem** The first step is to read the problem carefully until it is clearly understood. Ask yourself: What is the unknown? What are the given quantities? What are the given conditions?
2. **Draw a Diagram** In most problems it is useful to draw a diagram and identify the given and required quantities on the diagram.
3. **Introduce Notation** Assign a symbol to the quantity that is to be maximized or minimized (let's call it $Q$ for now). Also select symbols $(a, b, c, \ldots, x, y)$ for other unknown quantities and label the diagram with these symbols. It may help to use initials as suggestive symbols—for example, $A$ for area, $h$ for height, $t$ for time.
4. Express $Q$ in terms of some of the other symbols from Step 3.
5. If $Q$ has been expressed as a function of more than one variable in Step 4, use the given information to find relationships (in the form of equations) among these variables. Then use these equations to eliminate all but one of the variables in the expression for $Q$. Thus $Q$ will be expressed as a function of *one* variable $x$, say, $Q = f(x)$. Write the domain of this function in the given context.
6. Use the methods of Sections 3.1 and 3.3 to find the *absolute* maximum or minimum value of $f$. In particular, if the domain of $f$ is a closed interval, then the Closed Interval Method in Section 3.1 can be used.

**EXAMPLE 1** A farmer has 2400 ft of fencing and wants to fence off a rectangular field that borders a straight river. He needs no fence along the river. What are the dimensions of the field that has the largest area?

PS Understand the problem
PS Analogy: Try special cases
PS Draw diagrams

**SOLUTION** In order to get a feeling for what is happening in this problem, let's experiment with some specific cases. Figure 1 (not to scale) shows three possible ways of laying out the 2400 ft of fencing.



Area $= 100 \cdot 2200 = 220{,}000$ ft$^2$

Area $= 700 \cdot 1000 = 700{,}000$ ft$^2$

Area $= 1000 \cdot 400 = 400{,}000$ ft$^2$

**FIGURE 1**

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We see that when we try shallow, wide fields or deep, narrow fields, we get relatively small areas. It seems plausible that there is some intermediate configuration that produces the largest area.

**PS** Introduce notation

Figure 2 illustrates the general case. We wish to maximize the area $A$ of the rectangle. Let $x$ and $y$ be the depth and width of the rectangle (in feet). Then we express $A$ in terms of $x$ and $y$:

$$A = xy$$

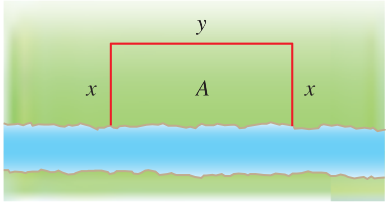


**FIGURE 2**

We want to express $A$ as a function of just one variable, so we eliminate $y$ by expressing it in terms of $x$. To do this we use the given information that the total length of the fencing is 2400 ft. Thus

$$2x + y = 2400$$

From this equation we have $y = 2400 - 2x$, which gives

$$A = xy = x(2400 - 2x) = 2400x - 2x^2$$

Note that the largest $x$ can be is 1200 (this uses all the fence for the depth and none for the width) and $x$ can't be negative, so the function that we wish to maximize is

$$A(x) = 2400x - 2x^2 \qquad 0 \leqslant x \leqslant 1200$$

The derivative is $A'(x) = 2400 - 4x$, so to find the critical numbers we solve the equation

$$2400 - 4x = 0$$

which gives $x = 600$. The maximum value of $A$ must occur either at this critical number or at an endpoint of the interval. Since $A(0) = 0$, $A(600) = 720{,}000$, and $A(1200) = 0$, the Closed Interval Method gives the maximum value as $A(600) = 720{,}000$.

[Alternatively, we could have observed that $A''(x) = -4 < 0$ for all $x$, so $A$ is always concave downward and the local maximum at $x = 600$ must be an absolute maximum.]

The corresponding $y$-value is $y = 2400 - 2(600) = 1200$, so the rectangular field should be 600 ft deep and 1200 ft wide. ■

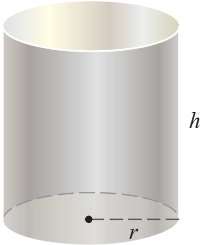

**FIGURE 3**

**EXAMPLE 2** A cylindrical can is to be made to hold 1 L of oil. Find the dimensions that will minimize the cost of the metal to manufacture the can.

**SOLUTION** Draw a diagram as in Figure 3, where $r$ is the radius and $h$ the height (both in centimeters). In order to minimize the cost of the metal, we minimize the total surface area of the cylinder (top, bottom, and sides). From Figure 4 we see that the sides are made from a rectangular sheet with dimensions $2\pi r$ and $h$. So the surface area is

$$A = 2\pi r^2 + 2\pi rh$$

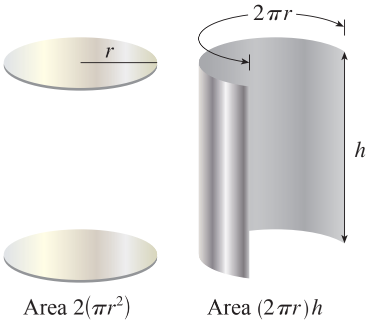

**FIGURE 4**

We would like to express $A$ in terms of one variable, $r$. To eliminate $h$ we use the fact that the volume is given as 1 L, which is equivalent to 1000 cm$^3$. Thus

$$\pi r^2 h = 1000$$

which gives $h = 1000/(\pi r^2)$. Substitution of this into the expression for $A$ gives

$$A = 2\pi r^2 + 2\pi r\left(\frac{1000}{\pi r^2}\right) = 2\pi r^2 + \frac{2000}{r}$$

We know that $r$ must be positive, and there are no limitations on how large $r$ can be. Therefore the function that we want to minimize is

$$A(r) = 2\pi r^2 + \frac{2000}{r} \qquad r > 0$$

To find the critical numbers, we differentiate:

$$A'(r) = 4\pi r - \frac{2000}{r^2} = \frac{4(\pi r^3 - 500)}{r^2}$$

Then $A'(r) = 0$ when $\pi r^3 = 500$, so the only critical number is $r = \sqrt[3]{500/\pi}$.

Since the domain of $A$ is $(0, \infty)$, we can't use the argument of Example 1 concerning endpoints. But we can observe that $A'(r) < 0$ for $r < \sqrt[3]{500/\pi}$ and $A'(r) > 0$ for $r > \sqrt[3]{500/\pi}$, so $A$ is decreasing for *all* $r$ to the left of the critical number and increasing for *all* $r$ to the right. Thus $r = \sqrt[3]{500/\pi}$ must give rise to an *absolute* minimum.

[Alternatively, we could argue that $A(r) \to \infty$ as $r \to 0^+$ and $A(r) \to \infty$ as $r \to \infty$, so there must be a minimum value of $A(r)$, which must occur at the critical number. See Figure 5.]

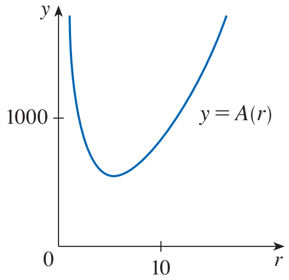

**FIGURE 5**

In the Applied Project following this section we investigate the most economical shape for a can by taking into account other manufacturing costs.

The value of $h$ corresponding to $r = \sqrt[3]{500/\pi}$ is

$$h = \frac{1000}{\pi r^2} = \frac{1000}{\pi(500/\pi)^{2/3}} = 2\sqrt[3]{\frac{500}{\pi}} = 2r$$

Thus, to minimize the cost of the can, the radius should be $\sqrt[3]{500/\pi}$ cm and the height should be equal to twice the radius, namely, the diameter. ■

**NOTE 1** The argument used in Example 2 to justify the absolute minimum is a variant of the First Derivative Test (which applies only to *local* maximum or minimum values) and is stated here for future reference.

**First Derivative Test for Absolute Extreme Values** Suppose that $c$ is a critical number of a continuous function $f$ defined on an interval.

(a) If $f'(x) > 0$ for all $x < c$ and $f'(x) < 0$ for all $x > c$, then $f(c)$ is the absolute maximum value of $f$.

(b) If $f'(x) < 0$ for all $x < c$ and $f'(x) > 0$ for all $x > c$, then $f(c)$ is the absolute minimum value of $f$.

**NOTE 2** An alternative method for solving optimization problems is to use implicit differentiation. Let's look at Example 2 again to illustrate the method. We work with the same equations

$$A = 2\pi r^2 + 2\pi rh \qquad \pi r^2 h = 1000$$

but instead of eliminating $h$, we differentiate both equations implicitly with respect to $r$ (treating both $A$ and $h$ as functions of $r$):

$$A' = 4\pi r + 2\pi rh' + 2\pi h \qquad \pi r^2 h' + 2\pi rh = 0$$

The minimum occurs at a critical number, so we set $A' = 0$, simplify, and arrive at the equations

$$2r + rh' + h = 0 \qquad rh' + 2h = 0$$

Subtraction of these two equations gives $2r - h = 0$, or $h = 2r$.

**EXAMPLE 3** Find the point on the parabola $y^2 = 2x$ that is closest to the point $(1, 4)$.

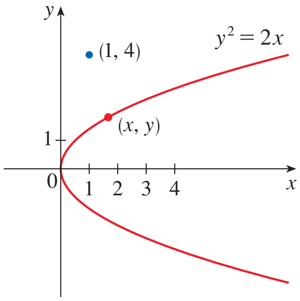

**FIGURE 6**

**SOLUTION** The distance between the point $(1, 4)$ and the point $(x, y)$ is

$$d = \sqrt{(x - 1)^2 + (y - 4)^2}$$

(See Figure 6.) But if $(x, y)$ lies on the parabola, then $x = \frac{1}{2}y^2$, so the expression for $d$ becomes

$$d = \sqrt{\left(\tfrac{1}{2}y^2 - 1\right)^2 + (y - 4)^2}$$

(Alternatively, we could have substituted $y = \sqrt{2x}$ to get $d$ in terms of $x$ alone.)

Instead of minimizing $d$, we minimize its square:

$$d^2 = f(y) = \left(\tfrac{1}{2}y^2 - 1\right)^2 + (y - 4)^2$$

(You should convince yourself that the minimum of $d$ occurs at the same point as the minimum of $d^2$, but $d^2$ is easier to work with.) Note that there is no restriction on $y$, so the domain is all real numbers. Differentiating, we obtain

$$f'(y) = 2\left(\tfrac{1}{2}y^2 - 1\right)y + 2(y - 4) = y^3 - 8$$

so $f'(y) = 0$ when $y = 2$. Observe that $f'(y) < 0$ when $y < 2$ and $f'(y) > 0$ when $y > 2$, so by the First Derivative Test for Absolute Extreme Values, the absolute minimum occurs when $y = 2$. (Or we could simply say that because of the geometric nature of the problem, it's obvious that there is a closest point but not a farthest point.) The corresponding value of $x$ is $x = \frac{1}{2}y^2 = 2$. Thus the point on $y^2 = 2x$ closest to $(1, 4)$ is $(2, 2)$. [The distance between the points is $d = \sqrt{f(2)} = \sqrt{5}$.] ■

**EXAMPLE 4** A woman launches her boat from point $A$ on a bank of a straight river, 3 km wide, and wants to reach point $B$, 8 km downstream on the opposite bank, as quickly as possible (see Figure 7). She could row her boat directly across the river to point $C$ and then run to $B$, or she could row directly to $B$, or she could row to some point $D$ between $C$ and $B$ and then run to $B$. If she can row 6 km/h and run 8 km/h, where should she land to reach $B$ as soon as possible? (We assume that the speed of the water is negligible compared with the speed at which the woman rows.)

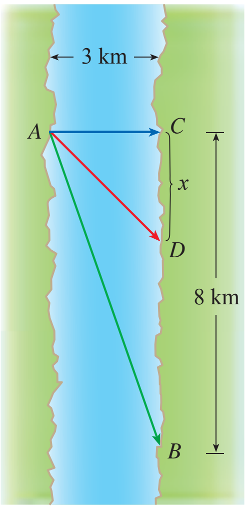

**FIGURE 7**

**SOLUTION** If we let $x$ be the distance from $C$ to $D$, then the running distance is $|DB| = 8 - x$ and the Pythagorean Theorem gives the rowing distance as $|AD| = \sqrt{x^2 + 9}$. We use the equation

$$\text{time} = \frac{\text{distance}}{\text{rate}}$$

Then the rowing time is $\sqrt{x^2 + 9}/6$ and the running time is $(8 - x)/8$, so the total time $T$ as a function of $x$ is

$$T(x) = \frac{\sqrt{x^2 + 9}}{6} + \frac{8 - x}{8}$$

The domain of this function $T$ is $[0, 8]$. Notice that if $x = 0$, she rows to $C$ and if $x = 8$, she rows directly to $B$. The derivative of $T$ is

$$T'(x) = \frac{x}{6\sqrt{x^2 + 9}} - \frac{1}{8}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Thus, using the fact that $x \geqslant 0$, we have

$$T'(x) = 0 \iff \frac{x}{6\sqrt{x^2+9}} = \frac{1}{8} \iff 4x = 3\sqrt{x^2+9}$$

$$\iff 16x^2 = 9(x^2+9) \iff 7x^2 = 81 \iff x = \frac{9}{\sqrt{7}}$$

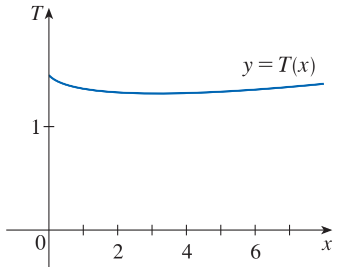

**FIGURE 8**

The only critical number is $x = 9/\sqrt{7}$. To see whether the minimum occurs at this critical number or at an endpoint of the domain $[0, 8]$, we follow the Closed Interval Method by evaluating $T$ at all three points:

$$T(0) = 1.5 \qquad T\left(\frac{9}{\sqrt{7}}\right) = 1 + \frac{\sqrt{7}}{8} \approx 1.33 \qquad T(8) = \frac{\sqrt{73}}{6} \approx 1.42$$

Since the smallest of these values of $T$ occurs when $x = 9/\sqrt{7}$, the absolute minimum value of $T$ must occur there. Figure 8 illustrates this calculation by showing the graph of $T$.

Thus the woman should land the boat at a point $9/\sqrt{7}$ km ($\approx$3.4 km) downstream from her starting point. ■

**EXAMPLE 5** Find the area of the largest rectangle that can be inscribed in a semicircle of radius $r$.

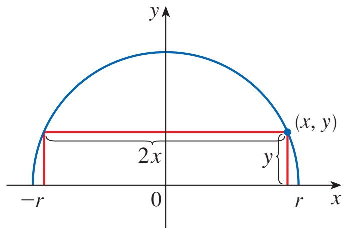

**FIGURE 9**

**SOLUTION 1** Let's take the semicircle to be the upper half of the circle $x^2 + y^2 = r^2$ with center the origin. Then the word *inscribed* means that the rectangle has two vertices on the semicircle and two vertices on the $x$-axis as shown in Figure 9.

Let $(x, y)$ be the vertex that lies in the first quadrant. Then the rectangle has sides of lengths $2x$ and $y$, so its area is

$$A = 2xy$$

To eliminate $y$ we use the fact that $(x, y)$ lies on the circle $x^2 + y^2 = r^2$ and so $y = \sqrt{r^2 - x^2}$. Thus

$$A = 2x\sqrt{r^2 - x^2}$$

The domain of this function is $0 \leqslant x \leqslant r$. Its derivative is

$$A' = 2\sqrt{r^2 - x^2} - \frac{2x^2}{\sqrt{r^2 - x^2}} = \frac{2(r^2 - 2x^2)}{\sqrt{r^2 - x^2}}$$

which is 0 when $2x^2 = r^2$, that is, $x = r/\sqrt{2}$ (since $x \geqslant 0$). This value of $x$ gives a maximum value of $A$ since $A(0) = 0$ and $A(r) = 0$. Therefore the area of the largest inscribed rectangle is

$$A\left(\frac{r}{\sqrt{2}}\right) = 2\frac{r}{\sqrt{2}}\sqrt{r^2 - \frac{r^2}{2}} = r^2$$

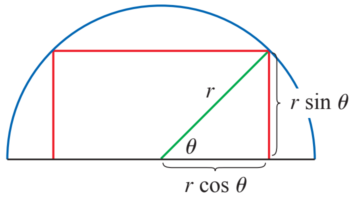

**FIGURE 10**

**SOLUTION 2** A simpler solution is possible if we think of using an angle as a variable. Let $\theta$ be the angle shown in Figure 10. Then the area of the rectangle is

$$A(\theta) = (2r\cos\theta)(r\sin\theta) = r^2(2\sin\theta\cos\theta) = r^2\sin 2\theta$$

We know that $\sin 2\theta$ has a maximum value of 1 and it occurs when $2\theta = \pi/2$. So $A(\theta)$ has a maximum value of $r^2$ and it occurs when $\theta = \pi/4$.

Notice that this trigonometric solution doesn't involve differentiation. In fact, we didn't need to use calculus at all. ■

## Applications to Business and Economics

In Section 2.7 we introduced the idea of marginal cost. Recall that if $C(x)$, the **cost function**, is the cost of producing $x$ units of a certain product, then the **marginal cost** is the rate of change of $C$ with respect to $x$. In other words, the marginal cost function is the derivative, $C'(x)$, of the cost function.

Now let's consider marketing. Let $p(x)$ be the price per unit that the company can charge if it sells $x$ units. Then $p$ is called the **demand function** (or **price function**) and we would expect it to be a decreasing function of $x$. (More units sold corresponds to a lower price.) If $x$ units are sold and the price per unit is $p(x)$, then the total revenue is

$$R(x) = \text{quantity} \times \text{price} = xp(x)$$

and $R$ is called the **revenue function**. The derivative $R'$ of the revenue function is called the **marginal revenue function** and it is the rate of change of revenue with respect to the number of units sold.

If $x$ units are sold, then the total profit is

$$P(x) = R(x) - C(x)$$

and $P$ is called the **profit function**. The **marginal profit function** is $P'$, the derivative of the profit function. In Exercises 65–69 you are asked to use the marginal cost, revenue, and profit functions to minimize costs and maximize revenues and profits.

**EXAMPLE 6** A store has been selling 200 TV monitors a week at \$350 each. A market survey indicates that for each \$10 rebate offered to buyers, the number of monitors sold will increase by 20 a week. Find the demand function and the revenue function. How large a rebate should the store offer to maximize revenue?

**SOLUTION** If $x$ is the number of monitors sold per week, then the weekly increase in sales is $x - 200$. For each increase of 20 units sold, the price is decreased by \$10. So for each additional unit sold, the decrease in price will be $\frac{1}{20} \times 10$ and the demand function is

$$p(x) = 350 - \tfrac{10}{20}(x - 200) = 450 - \tfrac{1}{2}x$$

The revenue function is

$$R(x) = xp(x) = 450x - \tfrac{1}{2}x^2$$

Since $R'(x) = 450 - x$, we see that $R'(x) = 0$ when $x = 450$. This value of $x$ gives an absolute maximum by the First Derivative Test (or simply by observing that the graph of $R$ is a parabola that opens downward). The corresponding price is

$$p(450) = 450 - \tfrac{1}{2}(450) = 225$$

and the rebate is $350 - 225 = 125$. Therefore, to maximize revenue, the store should offer a rebate of \$125. ■

## 3.7 Exercises

**1.** Consider the following problem: find two numbers whose sum is 23 and whose product is a maximum.
   (a) Make a table of values, like the one at the right, so that the sum of the numbers in the first two columns is always 23. On the basis of the evidence in your table, estimate the answer to the problem.
   (b) Use calculus to solve the problem and compare with your answer to part (a).

| First number | Second number | Product |
|---|---|---|
| 1 | 22 | 22 |
| 2 | 21 | 42 |
| 3 | 20 | 60 |
| ⋮ | ⋮ | ⋮ |

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**2.** Find two numbers whose difference is 100 and whose product is a minimum.

**3.** Find two positive numbers whose product is 100 and whose sum is a minimum.

**4.** The sum of two positive numbers is 16. What is the smallest possible value of the sum of their squares?

**5.** What is the maximum vertical distance between the line $y = x + 2$ and the parabola $y = x^2$ for $-1 \leqslant x \leqslant 2$?

**6.** What is the minimum vertical distance between the parabolas $y = x^2 + 1$ and $y = x - x^2$?

**7.** Find the dimensions of a rectangle with perimeter 100 m whose area is as large as possible.

**8.** Find the dimensions of a rectangle with area 1000 $\text{m}^2$ whose perimeter is as small as possible.

**9.** A model used for the yield $Y$ of an agricultural crop as a function of the nitrogen level $N$ in the soil (measured in appropriate units) is

$$Y = \frac{kN}{1 + N^2}$$

where $k$ is a positive constant. What nitrogen level gives the best yield?

**10.** The rate (in mg carbon/$\text{m}^3$/h) at which photosynthesis takes place for a species of phytoplankton is modeled by the function

$$P = \frac{100I}{I^2 + I + 4}$$

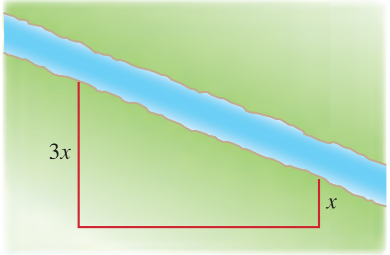
where $I$ is the light intensity (measured in thousands of foot-candles). For what light intensity is $P$ a maximum?

**11.** Consider the following problem: a farmer with 750 ft of fencing wants to enclose a rectangular area and then divide it into four pens with fencing parallel to one side of the rectangle. What is the largest possible total area of the four pens?
- (a) Draw several diagrams illustrating the situation, some with shallow, wide pens and some with deep, narrow pens. Find the total areas of these configurations. Does it appear that there is a maximum area? If so, estimate it.
- (b) Draw a diagram illustrating the general situation. Introduce notation and label the diagram with your symbols.
- (c) Write an expression for the total area.
- (d) Use the given information to write an equation that relates the variables.
- (e) Use part (d) to write the total area as a function of one variable.
- (f) Finish solving the problem and compare the answer with your estimate in part (a).

**12.** Consider the following problem: a box with an open top is to be constructed from a square piece of cardboard, 3 ft wide, by cutting out a square from each of the four corners and bending up the sides. Find the largest volume that such a box can have.
- (a) Draw several diagrams to illustrate the situation, some short boxes with large bases and some tall boxes with small bases. Find the volumes of several such boxes. Does it appear that there is a maximum volume? If so, estimate it.
- (b) Draw a diagram illustrating the general situation. Introduce notation and label the diagram with your symbols.
- (c) Write an expression for the volume.
- (d) Use the given information to write an equation that relates the variables.
- (e) Use part (d) to write the volume as a function of one variable.
- (f) Finish solving the problem and compare the answer with your estimate in part (a).

**13.** A farmer wants to fence in an area of 1.5 million square feet in a rectangular field and then divide it in half with a fence parallel to one of the sides of the rectangle. How can he do this so as to minimize the cost of the fence?

**14.** A farmer has 1200 ft of fencing for enclosing a trapezoidal field along a river as shown. One of the parallel sides is three times longer than the other. No fencing is needed along the river. Find the largest area the farmer can enclose.



**15.** A farmer wants to fence in a rectangular plot of land adjacent to the north wall of his barn. No fencing is needed along the barn, and the fencing along the west side of the plot is shared with a neighbor who will split the cost of that portion of the fence. If the fencing costs \$20 per linear foot to install and the farmer is not willing to spend more than \$5000, find the dimensions for the plot that would enclose the most area.

**16.** If the farmer in Exercise 15 wants to enclose 8000 square feet of land, what dimensions will minimize the cost of the fence?

**17.**
- (a) Show that of all the rectangles with a given area, the one with smallest perimeter is a square.
- (b) Show that of all the rectangles with a given perimeter, the one with greatest area is a square.

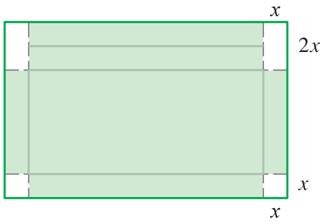
**18.** A box with a square base and open top must have a volume of 32,000 $\text{cm}^3$. Find the dimensions of the box that minimize the amount of material used.

**19.** If 1200 $\text{cm}^2$ of material is available to make a box with a square base and an open top, find the largest possible volume of the box.

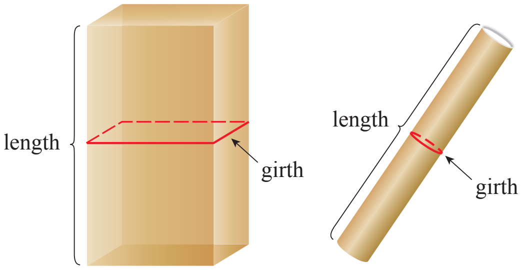
**20.** A box with an open top is to be constructed from a 4 ft by 3 ft rectangular piece of cardboard by cutting out squares or rectangles from each of the four corners, as shown in the figure, and bending up the sides. One of the longer sides of the box is to have a double layer of cardboard, which is obtained by folding the side twice. Find the largest volume that such a box can have.



**21.** A rectangular storage container without a lid is to have a volume of 10 $\text{m}^3$. The length of its base is twice the width. Material for the base costs \$10 per square meter. Material for the sides costs \$6 per square meter. Find the cost of materials for the least expensive such container.

**22.** Rework Exercise 21 assuming the container has a lid that is made from the same material as the sides.

**23.** A package to be mailed using the US postal service may not measure more than 108 inches in length plus girth. (Length is the longest dimension and girth is the largest distance around the package, perpendicular to the length.) Find the dimensions of the rectangular box with square base of greatest volume that may be mailed.



**24.** Refer to Exercise 23. Find the dimensions of the cylindrical mailing tube of greatest volume that may be mailed using the US postal service.

**25.** Find the point on the line $y = 2x + 3$ that is closest to the origin.

**26.** Find the point on the curve $y = \sqrt{x}$ that is closest to the point $(3, 0)$.

**27.** Find the points on the ellipse $4x^2 + y^2 = 4$ that are farthest away from the point $(1, 0)$.

**28.** Find, correct to two decimal places, the coordinates of the point on the curve $y = \sin x$ that is closest to the point $(4, 2)$.

**29.** Find the dimensions of the rectangle of largest area that can be inscribed in a circle of radius $r$.

**30.** Find the area of the largest rectangle that can be inscribed in the ellipse $x^2/a^2 + y^2/b^2 = 1$.

**31.** Find the dimensions of the rectangle of largest area that can be inscribed in an equilateral triangle of side $L$ if one side of the rectangle lies on the base of the triangle.

**32.** Find the area of the largest trapezoid that can be inscribed in a circle of radius 1 and whose base is a diameter of the circle.

**33.** Find the dimensions of the isosceles triangle of largest area that can be inscribed in a circle of radius $r$.

**34.** If the two equal sides of an isosceles triangle have length $a$, find the length of the third side that maximizes the area of the triangle.

**35.** If one side of a triangle has length $a$ and another has length $2a$, show that the largest possible area of the triangle is $a^2$.

**36.** A rectangle has its base on the $x$-axis and its upper two vertices on the parabola $y = 4 - x^2$. What is the largest possible area of the rectangle?

**37.** A right circular cylinder is inscribed in a sphere of radius $r$. Find the largest possible volume of such a cylinder.

**38.** A right circular cylinder is inscribed in a cone with height $h$ and base radius $r$. Find the largest possible volume of such a cylinder.

**39.** A right circular cylinder is inscribed in a sphere of radius $r$. Find the largest possible surface area of such a cylinder.

**40.** A Norman window has the shape of a rectangle surmounted by a semicircle. (Thus the diameter of the semicircle is equal to the width of the rectangle. See Exercise 1.1.72.) If the perimeter of the window is 30 ft, find the dimensions of the window so that the greatest possible amount of light is admitted.

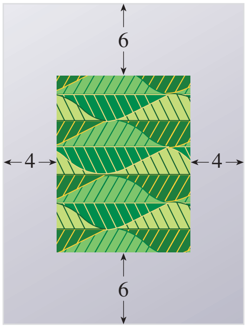
**41.** The top and bottom margins of a poster are each 6 cm and the side margins are each 4 cm. If the area of printed material on the poster is fixed at 384 $\text{cm}^2$, find the dimensions of the poster with the smallest area.



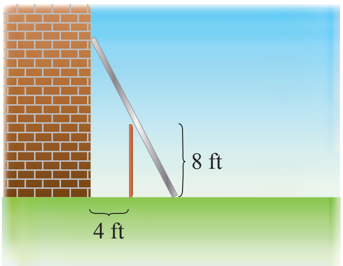
**42.** A poster is to have an area of 180 $\text{in}^2$ with 1-inch margins at the bottom and sides and a 2-inch margin at the top. What dimensions will give the largest printed area?

**43.** A piece of wire 10 m long is cut into two pieces. One piece is bent into a square and the other is bent into an equilateral triangle. How should the wire be cut so that the total area enclosed is (a) a maximum? (b) A minimum?

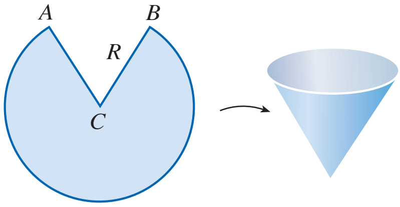
**44.** Answer Exercise 43 if one piece is bent into a square and the other into a circle.

**45.** If you are offered one slice from a round pizza (in other words, a sector of a circle) and the slice must have a perimeter of 32 inches, what diameter pizza will reward you with the largest slice?

**46.** A fence 8 ft tall runs parallel to a tall building at a distance of 4 ft from the building. What is the length of the shortest ladder that will reach from the ground over the fence to the wall of the building?



**47.** A cone-shaped drinking cup is made from a circular piece of paper of radius $R$ by cutting out a sector and joining the edges $CA$ and $CB$. Find the maximum capacity of such a cup.



**48.** A cone-shaped paper drinking cup is to be made to hold 27 $\text{cm}^3$ of water. Find the height and radius of the cup that will use the smallest amount of paper.

**49.** A cone with height $h$ is inscribed in a larger cone with height $H$ so that its vertex is at the center of the base of the larger cone. Show that the inner cone has maximum volume when $h = \frac{1}{3}H$.

**50.** An object with weight $W$ is dragged along a horizontal plane by a force acting along a rope attached to the object. If the rope makes an angle $\theta$ with a plane, then the magnitude of the force is

$$F = \frac{\mu W}{\mu \sin\theta + \cos\theta}$$

where $\mu$ is a constant called the coefficient of friction. For what value of $\theta$ is $F$ smallest?

**51.** If a resistor of $R$ ohms is connected across a battery of $E$ volts with internal resistance $r$ ohms, then the power (in watts) in the external resistor is

$$P = \frac{E^2 R}{(R + r)^2}$$

If $E$ and $r$ are fixed but $R$ varies, what is the maximum value of the power?

**52.** For a fish swimming at a speed $v$ relative to the water, the energy expenditure per unit time is proportional to $v^3$. It is believed that migrating fish try to minimize the total energy required to swim a fixed distance. If the fish are swimming against a current $u$ ($u < v$), then the time required to swim a distance $L$ is $L/(v - u)$ and the total energy $E$ required to swim the distance is given by

$$E(v) = av^3 \cdot \frac{L}{v - u}$$

where $a$ is the proportionality constant.
(a) Determine the value of $v$ that minimizes $E$.
(b) Sketch the graph of $E$.

*Note:* This result has been verified experimentally; migrating fish swim against a current at a speed 50% greater than the current speed.

**53.** In a beehive, each cell is a regular hexagonal prism, open at one end; the other end is capped by three congruent rhombi forming a trihedral angle at the apex, as in the figure on page 274. Let $\theta$ be the angle at which each rhombus meets the altitude, $s$ the side length of the hexagon, and $h$ the length of the longer base of the trapezoids on the sides of the cell. It can be shown that if $s$ and $h$ are held fixed, then the volume of the cell is constant (independent of $\theta$), and for a given value of $\theta$ the surface area $S$ of the cell is

$$S = 6sh - \tfrac{3}{2}s^2 \cot\theta + \tfrac{3}{2}\sqrt{3}s^2 \csc\theta$$

It is believed that bees form their cells in such a way as to

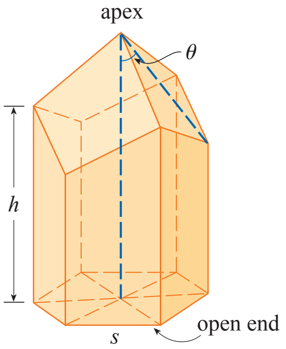
minimize surface area, thus using the least amount of wax in cell construction.

(a) Calculate $dS/d\theta$.
(b) What angle $\theta$ should the bees prefer?
(c) Determine the minimum surface area of the cell in terms of $s$ and $h$.

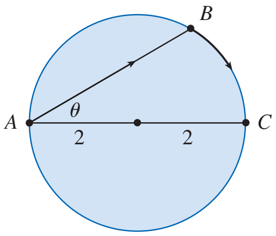
*Note:* Actual measurements of the angle $\theta$ in beehives have been made, and the measures of these angles seldom differ from the calculated value by more than 2°.



**54.** A boat leaves a dock at 2:00 PM and travels due south at a speed of 20 km/h. Another boat has been heading due east at 15 km/h and reaches the same dock at 3:00 PM. At what time were the two boats closest together?

**55.** Solve the problem in Example 4 if the river is 5 km wide and point $B$ is only 5 km downstream from $A$.

**56.** A woman at a point $A$ on the shore of a circular lake with radius 2 mi wants to arrive at the point $C$ diametrically opposite $A$ on the other side of the lake in the shortest possible time (see the figure). She can walk at the rate of 4 mi/h and row a boat at 2 mi/h. How should she proceed?



**57.** An oil refinery is located on the north bank of a straight river that is 2 km wide. A pipeline is to be constructed from the refinery to storage tanks located on the south bank of the river 6 km east of the refinery. The cost of laying pipe is \$400,000/km over land to a point $P$ on the north bank and \$800,000/km under the river to the tanks. To minimize the cost of the pipeline, where should $P$ be located?

T **58.** Suppose the refinery in Exercise 57 is located 1 km north of the river. Where should $P$ be located?

**59.** The illumination of an object by a light source is directly proportional to the strength of the source and inversely proportional to the square of the distance from the source. If two light sources, one three times as strong as the other, are placed 10 ft apart, where should an object be placed on the line between the sources so as to receive the least illumination?

**60.** Find an equation of the line through the point (3, 5) that cuts off the least area from the first quadrant.

**61.** Let $a$ and $b$ be positive numbers. Find the length of the shortest line segment that is cut off by the first quadrant and passes through the point $(a, b)$.

**62.** At which points on the curve $y = 1 + 40x^3 - 3x^5$ does the tangent line have the largest slope?

**63.** What is the shortest possible length of the line segment that is cut off by the first quadrant and is tangent to the curve $y = 3/x$ at some point?

**64.** What is the smallest possible area of the triangle that is cut off by the first quadrant and whose hypotenuse is tangent to the parabola $y = 4 - x^2$ at some point?

**65.** (a) If $C(x)$ is the cost of producing $x$ units of a commodity, then the **average cost** per unit is $c(x) = C(x)/x$. Show that if the average cost is a minimum, then the marginal cost equals the average cost.
(b) If $C(x) = 16{,}000 + 200x + 4x^{3/2}$, in dollars, find (i) the cost, average cost, and marginal cost at a production level of 1000 units; (ii) the production level that will minimize the average cost; and (iii) the minimum average cost.

**66.** (a) Show that if the profit $P(x)$ is a maximum, then the marginal revenue equals the marginal cost.
(b) If $C(x) = 16{,}000 + 500x - 1.6x^2 + 0.004x^3$ is the cost function and $p(x) = 1700 - 7x$ is the demand function, find the production level that will maximize profit.

**67.** A baseball team plays in a stadium that seats 55,000 spectators. With ticket prices at \$10, the average attendance had been 27,000. When ticket prices were lowered to \$8, the average attendance rose to 33,000.
(a) Find the demand function, assuming that it is linear.
(b) How should ticket prices be set to maximize revenue?

**68.** During the summer months Terry makes and sells necklaces on the beach. Last summer she sold the necklaces for \$10 each and her sales averaged 20 per day. When she increased the price by \$1, she found that the average sales decreased by two per day.
(a) Find the demand function, assuming that it is linear.
(b) If the material for each necklace costs \$6, what selling price should Terry set to maximize her profit?

**69.** A retailer has been selling 1200 tablet computers a week at \$350 each. The marketing department estimates that an additional 80 tablets will sell each week for every \$10 that the price is lowered.

(a) Find the demand function.

(b) What should the price be set at in order to maximize revenue?

(c) If the retailer's weekly cost function is

$$C(x) = 35{,}000 + 120x$$

what price should it choose in order to maximize its profit?

**70.** A company operates 16 oil wells in a designated area. Each pump, on average, extracts 240 barrels of oil daily. The company can add more wells but every added well reduces the average daily ouput of each of the wells by 8 barrels. How many wells should the company add in order to maximize daily production?

**71.** Show that of all the isosceles triangles with a given perimeter, the one with the greatest area is equilateral.

**72.** Consider the situation in Exercise 57 if the cost of laying pipe under the river is considerably higher than the cost of laying pipe over land (\$400,000/km). You may suspect that in some instances, the minimum distance possible under the river should be used, and $P$ should be located 6 km from the refinery, directly across from the storage tanks. Show that this is *never* the case, no matter what the "under river" cost is.

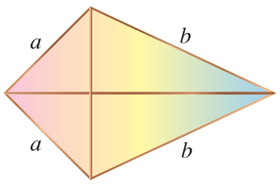
**73.** Consider the tangent line to the ellipse $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$ at a point $(p, q)$ in the first quadrant.

(a) Show that the tangent line has $x$-intercept $a^2/p$ and $y$-intercept $b^2/q$.

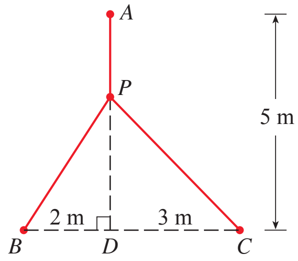
(b) Show that the portion of the tangent line cut off by the coordinate axes has minimum length $a + b$.

(c) Show that the triangle formed by the tangent line and the coordinate axes has minimum area $ab$.

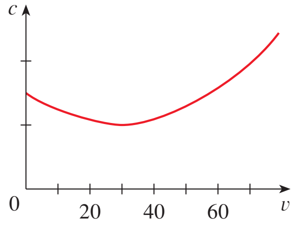
T **74.** The frame for a kite is to be made from six pieces of wood. The four exterior pieces have been cut with the lengths indicated in the figure. To maximize the area of the kite, how long should the diagonal pieces be?



**75.** A point $P$ needs to be located somewhere on the line $AD$ so that the total length $L$ of cables linking $P$ to the points $A$, $B$, and $C$ is minimized (see the figure). Express $L$ as a function of $x = |AP|$ and use the graphs of $L$ and $dL/dx$ to estimate the minimum value of $L$.



**76.** The graph shows the fuel consumption $c$ of a car (measured in gallons per hour) as a function of the speed $v$ of the car. At very low speeds the engine runs inefficiently, so initially $c$ decreases as the speed increases. But at high speeds the fuel consumption increases. You can see that $c(v)$ is minimized for this car when $v \approx 30$ mi/h. However, for fuel efficiency, what must be minimized is not the consumption in gallons per hour but rather the fuel consumption in gallons *per mile*. Let's call this consumption $G$. Using the graph, estimate the speed at which $G$ has its minimum value.



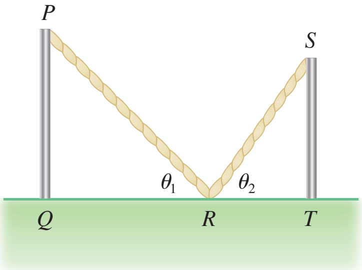
**77.** Let $v_1$ be the velocity of light in air and $v_2$ the velocity of light in water. According to Fermat's Principle, a ray of light will travel from a point $A$ in the air to a point $B$ in the water by a path $ACB$ that minimizes the time taken. Show that

$$\frac{\sin \theta_1}{\sin \theta_2} = \frac{v_1}{v_2}$$

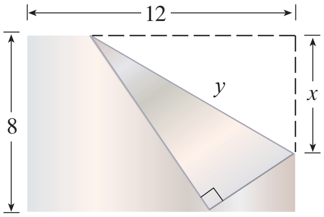
where $\theta_1$ (the angle of incidence) and $\theta_2$ (the angle of refraction) are as shown. This equation is known as Snell's Law.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

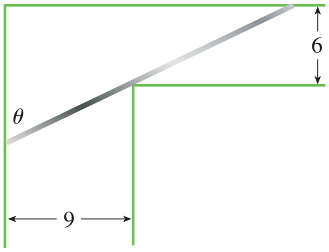
**78.** Two vertical poles $PQ$ and $ST$ are secured by a rope $PRS$ going from the top of the first pole to a point $R$ on the ground between the poles and then to the top of the second pole as in the figure. Show that the shortest length of such a rope occurs when $\theta_1 = \theta_2$.



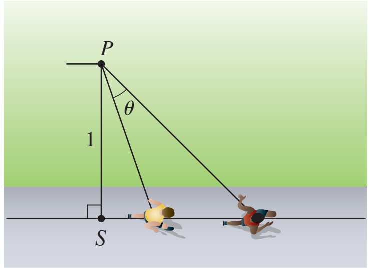
**79.** The upper right-hand corner of a piece of paper, 12 inches by 8 inches, as in the figure, is folded over to the bottom edge. How would you fold the paper so as to minimize the length of the fold? In other words, how would you choose $x$ to minimize $y$?



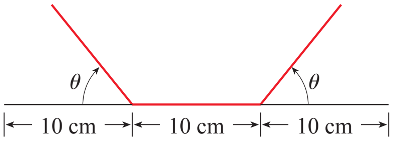
**80.** A steel pipe is being carried down a hallway that is 9 ft wide. At the end of the hall there is a right-angled turn into a narrower hallway, 6 ft wide. What is the length of the longest pipe that can be carried horizontally around the corner?



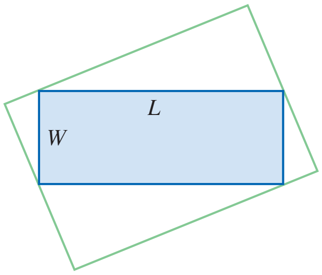
**81.** An observer stands at a point $P$, one unit away from a track. Two runners start at the point $S$ in the following figure and run along the track. One runner runs three times as fast as the other. Find the maximum value of the observer's angle of sight $\theta$ between the runners. [*Hint:* Maximize $\tan\theta$.]



**82.** A rain gutter is to be constructed from a metal sheet of width 30 cm by bending up one-third of the sheet on each side through an angle $\theta$. How should $\theta$ be chosen so that the gutter will carry the maximum amount of water?



**83.** Find the maximum area of a rectangle that can be circumscribed about a given rectangle with length $L$ and width $W$. [*Hint:* Express the area as a function of an angle $\theta$.]



**84.** The blood vascular system consists of blood vessels (arteries, arterioles, capillaries, and veins) that convey blood from the heart to the organs and back to the heart. This system should work so as to minimize the energy expended by the heart in pumping the blood. In particular, this energy is reduced when the resistance of the blood is lowered. One of Poiseuille's Laws gives the resistance $R$ of the blood as

$$R = C\frac{L}{r^4}$$

where $L$ is the length of the blood vessel, $r$ is the radius, and $C$ is a positive constant determined by the viscosity of the blood. (Poiseuille established this law experimentally, but it also follows from Equation 8.4.2.) The following figure

shows a main blood vessel with radius $r_1$ branching at an angle $\theta$ into a smaller vessel with radius $r_2$.

(a) Use Poiseuille's Law to show that the total resistance of the blood along the path ABC is

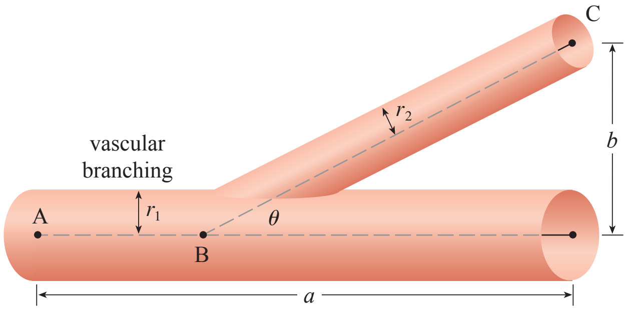
$$R = C\left(\frac{a - b\cot\theta}{r_1^4} + \frac{b\csc\theta}{r_2^4}\right)$$

where $a$ and $b$ are the distances shown in the figure.

(b) Prove that this resistance is minimized when

$$\cos\theta = \frac{r_2^4}{r_1^4}$$

(c) Find the optimal branching angle (correct to the nearest degree) when the radius of the smaller blood vessel is two-thirds the radius of the larger vessel.



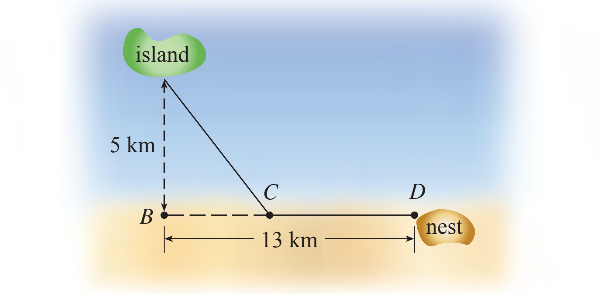
**85.** Ornithologists have determined that some species of birds tend to avoid flights over large bodies of water during daylight hours. It is believed that more energy is required to fly over water than over land because air generally rises over land and falls over water during the day. A bird with these tendencies is released from an island that is 5 km from the nearest point $B$ on a straight shoreline, flies to a point $C$ on the shoreline, and then flies along the shoreline to its nesting area $D$ as in the figure. Assume that the bird instinctively chooses a path that will minimize its energy expenditure. Points $B$ and $D$ are 13 km apart.

(a) In general, if it takes 1.4 times as much energy to fly over water as it does over land, to what point $C$ should the bird fly in order to minimize the total energy expended in returning to its nesting area?

(b) Let $W$ and $L$ denote the energy (in joules) per kilometer flown over water and land, respectively. What would a large value of the ratio $W/L$ mean in terms of the bird's flight? What would a small value mean? Determine the ratio $W/L$ corresponding to the minimum expenditure of energy.

(c) What should the value of $W/L$ be in order for the bird to fly directly to its nesting area $D$? What should the value of $W/L$ be for the bird to fly to $B$ and then along the shore to $D$?

(d) If the ornithologists observe that birds of a certain species reach the shore at a point 4 km from $B$, how many times more energy does it take a bird to fly over water than over land?



**86.** Two light sources of identical strength are placed 10 m apart. An object is to be placed at a point $P$ on a line $\ell$, parallel to the line joining the light sources and at a distance $d$ meters from it (see the figure). We want to locate $P$ on $\ell$ so that the intensity of illumination is minimized. We need to use the fact that the intensity of illumination for a single source is directly proportional to the strength of the source and inversely proportional to the square of the distance from the source.

(a) Find an expression for the intensity $I(x)$ at the point $P$.

(b) If $d = 5$ m, use graphs of $I(x)$ and $I'(x)$ to show that the intensity is minimized when $x = 5$ m, that is, when $P$ is at the midpoint of $\ell$.

(c) If $d = 10$ m, show that the intensity (perhaps surprisingly) is *not* minimized at the midpoint.

(d) Somewhere between $d = 5$ m and $d = 10$ m there is a transitional value of $d$ at which the point of minimal illumination abruptly changes. Estimate this value of $d$ by graphical methods. Then find the exact value of $d$.

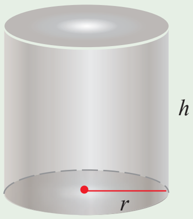
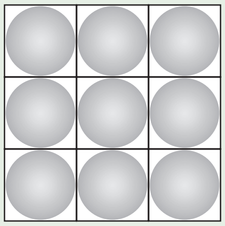
## APPLIED PROJECT | THE SHAPE OF A CAN



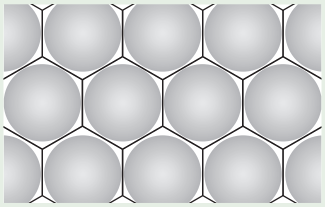
In this project we investigate the most economical shape for a can. We first interpret this to mean that the volume $V$ of a cylindrical can is given and we need to find the height $h$ and radius $r$ that minimize the cost of the metal to construct the can (see the figure). If we disregard any waste metal in the manufacturing process, then the problem is to minimize the surface area of the cylinder. We solved this problem in Example 3.7.2 and we found that $h = 2r$; that is, the height should be the same as the diameter. But if you go to your cupboard or your supermarket with a ruler, you will discover that the height is usually greater than the diameter and the ratio $h/r$ varies from 2 up to about 3.8. Let's see if we can explain this phenomenon.



Discs cut from squares

**1.** The material for the cans is cut from sheets of metal. The cylindrical sides are formed by bending rectangles; these rectangles are cut from the sheet with little or no waste. But if the top and bottom discs are cut from squares of side $2r$ (as in the figure), this leaves considerable waste metal, which may be recycled but has little or no value to the can makers. If this is the case, show that the amount of metal used is minimized when

$$\frac{h}{r} = \frac{8}{\pi} \approx 2.55$$



Discs cut from hexagons

**2.** A more efficient packing of the discs is obtained by dividing the metal sheet into hexagons and cutting the circular lids and bases from the hexagons (see the figure). Show that if this strategy is adopted, then

$$\frac{h}{r} = \frac{4\sqrt{3}}{\pi} \approx 2.21$$

**3.** The values of $h/r$ that we found in Problems 1 and 2 are a little closer to the ones that actually occur on supermarket shelves, but they still don't account for everything. If we look more closely at some real cans, we see that the lid and the base are formed from discs with radius larger than $r$ that are bent over the ends of the can. If we allow for this we would increase $h/r$. More significantly, in addition to the cost of the metal we need to incorporate the manufacturing of the can into the cost. Let's assume that most of the expense is incurred in joining the sides to the rims of the cans. If we cut the discs from hexagons as in Problem 2, then the total cost is proportional to

$$4\sqrt{3}\,r^2 + 2\pi rh + k(4\pi r + h)$$

where $k$ is the reciprocal of the length that can be joined for the cost of one unit area of metal. Show that this expression is minimized when

$$\frac{\sqrt[3]{V}}{k} = \sqrt[3]{\frac{\pi h}{r}} \cdot \frac{2\pi - h/r}{\pi h/r - 4\sqrt{3}}$$

**4.** Plot $\sqrt[3]{V}/k$ as a function of $x = h/r$ and use your graph to argue that when a can is large or joining is cheap, we should make $h/r$ approximately 2.21 (as in Problem 2). But when the can is small or joining is costly, $h/r$ should be substantially larger.

**5.** Our analysis shows that large cans should be almost square but small cans should be tall and thin. Take a look at the relative shapes of the cans in a supermarket. Is our conclusion usually true in practice? Are there exceptions? Can you suggest reasons why small cans are not always tall and thin?

## APPLIED PROJECT | PLANES AND BIRDS: MINIMIZING ENERGY

Targn Pleiades / Shutterstock.com

Small birds like finches alternate between flapping their wings and keeping them folded while gliding (see Figure 1). In this project we analyze this phenomenon and try to determine how frequently a bird should flap its wings. Some of the principles are the same as for fixed-wing aircraft and so we begin by considering how required power and energy depend on the speed of airplanes.[1]

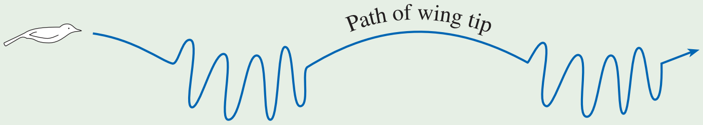


**FIGURE 1**

1. The power needed to propel an airplane forward at velocity $v$ is

$$P = Av^3 + \frac{BL^2}{v}$$

where $A$ and $B$ are positive constants specific to the particular aircraft and $L$ is the lift, the upward force supporting the weight of the plane. Find the speed that minimizes the required power.

2. The speed found in Problem 1 minimizes power but a faster speed might use less fuel. The energy needed to propel the airplane a unit distance is $E = P/v$. At what speed is energy minimized?

3. How much faster is the speed for minimum energy than the speed for minimum power?

4. In applying the equation of Problem 1 to bird flight we split the term $Av^3$ into two parts: $A_b v^3$ for the bird's body and $A_w v^3$ for its wings. Let $x$ be the fraction of flying time spent in flapping mode. If $m$ is the bird's mass and all the lift occurs during flapping, then the lift is $mg/x$ and so the power needed during flapping is

$$P_{\text{flap}} = (A_b + A_w)v^3 + \frac{B(mg/x)^2}{v}$$

The power while wings are folded is $P_{\text{fold}} = A_b v^3$. Show that the average power over an entire flight cycle is

$$\overline{P} = xP_{\text{flap}} + (1 - x)P_{\text{fold}} = A_b v^3 + xA_w v^3 + \frac{Bm^2g^2}{xv}$$

5. For what value of $x$ is the average power a minimum? What can you conclude if the bird flies slowly? What can you conclude if the bird flies faster and faster?

6. The average energy over a cycle is $\overline{E} = \overline{P}/v$. What value of $x$ minimizes $\overline{E}$?

---

## 3.8 Newton's Method

Suppose that a car dealer offers to sell you a car for \$18,000 or for payments of \$375 per month for five years. You would like to know what monthly interest rate the dealer is, in effect, charging you. To find the answer, you have to solve the equation

$$\boxed{1} \qquad 48x(1+x)^{60} - (1+x)^{60} + 1 = 0$$

(The details are explained in Exercise 39.) How would you solve such an equation?

For a quadratic equation $ax^2 + bx + c = 0$ there is a well-known formula for the solutions. For third- and fourth-degree equations there are also formulas for the solutions, but they are extremely complicated. If $f$ is a polynomial of degree 5 or higher, there is no such formula. Likewise, there is no formula that will enable us to find the exact solutions of a transcendental equation such as $\cos x = x$.

We can find an *approximate* solution to Equation 1 by plotting the left side of the equation and finding the $x$-intercepts. Using a graphing calculator (or computer), and after experimenting with viewing rectangles, we produce the graph in Figure 1.

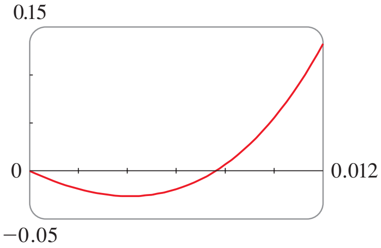

**FIGURE 1**

Try to solve Equation 1 numerically using a calculator or computer. Some machines are not able to solve it. Others are successful but require you to specify a starting point for the search.

We see that in addition to the solution $x = 0$, which doesn't interest us, there is a solution between 0.007 and 0.008. Zooming in shows that the $x$-intercept is approximately 0.0076. If we need more accuracy than graphing provides, we can use a calculator or computer algebra system to solve the equation numerically. If we do so, we find that the solution, correct to nine decimal places, is 0.007628603.

How do these devices solve equations? They use a variety of methods, but most of them make some use of **Newton's method**, also called the **Newton-Raphson method**. We will explain how this method works, partly to show what happens inside a calculator or computer, and partly as an application of the idea of linear approximation.

The geometry behind Newton's method is shown in Figure 2. We wish to solve an equation of the form $f(x) = 0$, so the solutions of the equation correspond to the $x$-intercepts of the graph of $f$. The solution that we are trying to find is labeled $r$ in the figure. We start with a first approximation $x_1$, which is obtained by guessing, or from a rough sketch of the graph of $f$, or from a computer-generated graph of $f$. Consider the tangent line $L$ to the curve $y = f(x)$ at the point $(x_1, f(x_1))$ and look at the $x$-intercept of $L$, labeled $x_2$. The idea behind Newton's method is that the tangent line is close to the curve and so its $x$-intercept, $x_2$, is close to the $x$-intercept of the curve (namely, the solution $r$ that we are seeking). Because the tangent is a line, we can easily find its $x$-intercept.

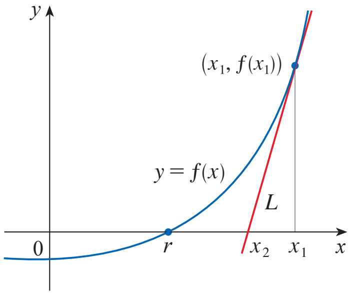

**FIGURE 2**

To find a formula for $x_2$ in terms of $x_1$ we use the fact that the slope of $L$ is $f'(x_1)$, so its equation is

$$y - f(x_1) = f'(x_1)(x - x_1)$$

Since the $x$-intercept of $L$ is $x_2$, we know that the point $(x_2, 0)$ is on the line, and so

$$0 - f(x_1) = f'(x_1)(x_2 - x_1)$$

If $f'(x_1) \neq 0$, we can solve this equation for $x_2$:

$$x_2 = x_1 - \frac{f(x_1)}{f'(x_1)}$$

We use $x_2$ as a second approximation to $r$.

Next we repeat this procedure with $x_1$ replaced by the second approximation $x_2$, using the tangent line at $(x_2, f(x_2))$. This gives a third approximation:

$$x_3 = x_2 - \frac{f(x_2)}{f'(x_2)}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

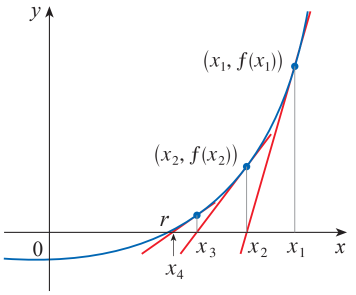

**FIGURE 3**

If we keep repeating this process, we obtain a sequence of approximations $x_1, x_2, x_3, x_4, \ldots$ as shown in Figure 3. In general, if the $n$th approximation is $x_n$ and $f'(x_n) \neq 0$, then the next approximation is given by

$$\boxed{x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}} \tag{2}$$

If the numbers $x_n$ become closer and closer to $r$ as $n$ becomes large, then we say that the sequence *converges* to $r$ and we write

$$\lim_{n \to \infty} x_n = r$$

Sequences are discussed in more detail in Section 11.1.

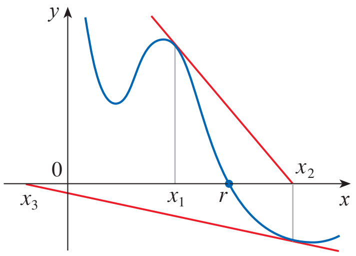

**FIGURE 4**

⊘ Although the sequence of successive approximations converges to the desired solution for functions of the type illustrated in Figure 3, in certain circumstances the sequence may not converge. For example, consider the situation shown in Figure 4. You can see that $x_2$ is a worse approximation than $x_1$. This is likely to be the case when $f'(x_1)$ is close to 0. It might even happen that an approximation (such as $x_3$ in Figure 4) falls outside the domain of $f$. Then Newton's method fails and a better initial approximation $x_1$ should be chosen. See Exercises 29–32 for specific examples in which Newton's method works very slowly or does not work at all.

**EXAMPLE 1** Starting with $x_1 = 2$, find the third approximation $x_3$ to the solution of the equation $x^3 - 2x - 5 = 0$.

**SOLUTION** We apply Newton's method with

$$f(x) = x^3 - 2x - 5 \qquad \text{and} \qquad f'(x) = 3x^2 - 2$$

Newton himself used this equation to illustrate his method and he chose $x_1 = 2$ after some experimentation because $f(1) = -6$, $f(2) = -1$, and $f(3) = 16$. Equation 2 becomes

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^3 - 2x_n - 5}{3x_n^2 - 2}$$

Figure 5 shows the geometry behind the first step in Newton's method in Example 1. Since $f'(2) = 10$, the tangent line to $y = x^3 - 2x - 5$ at $(2, -1)$ has equation $y = 10x - 21$ so its $x$-intercept is $x_2 = 2.1$.

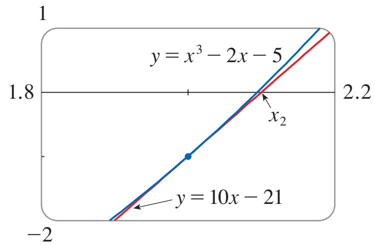

**FIGURE 5**

With $n = 1$ we have

$$x_2 = x_1 - \frac{f(x_1)}{f'(x_1)} = x_1 - \frac{x_1^3 - 2x_1 - 5}{3x_1^2 - 2}$$

$$= 2 - \frac{2^3 - 2(2) - 5}{3(2)^2 - 2} = 2.1$$

Then with $n = 2$ we obtain

$$x_3 = x_2 - \frac{x_2^3 - 2x_2 - 5}{3x_2^2 - 2} = 2.1 - \frac{(2.1)^3 - 2(2.1) - 5}{3(2.1)^2 - 2} \approx 2.0946$$

It turns out that this third approximation $x_3 \approx 2.0946$ is accurate to four decimal places. ■

Suppose that we want to achieve a given accuracy, say to eight decimal places, using Newton's method. How do we know when to stop? The rule of thumb that is generally used is: stop when successive approximations $x_n$ and $x_{n+1}$ agree to eight decimal places. (A precise statement concerning accuracy in Newton's method will be given in Exercise 11.11.39.)

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Notice that the procedure in going from $n$ to $n + 1$ is the same for all values of $n$. (It is called an *iterative* process.) This means that Newton's method is particularly convenient for use with a programmable calculator or a computer.

**EXAMPLE 2** Use Newton's method to find $\sqrt[6]{2}$ correct to eight decimal places.

**SOLUTION** First we observe that finding $\sqrt[6]{2}$ is equivalent to finding the positive solution of the equation

$$x^6 - 2 = 0$$

so we take $f(x) = x^6 - 2$. Then $f'(x) = 6x^5$ and Formula 2 (Newton's method) becomes

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^6 - 2}{6x_n^5}$$

If we choose $x_1 = 1$ as the initial approximation, then we obtain

$$x_2 \approx 1.16666667$$

$$x_3 \approx 1.12644368$$

$$x_4 \approx 1.12249707$$

$$x_5 \approx 1.12246205$$

$$x_6 \approx 1.12246205$$

Since $x_5$ and $x_6$ agree to eight decimal places, we conclude that

$$\sqrt[6]{2} \approx 1.12246205$$

to eight decimal places. ■

**EXAMPLE 3** Find, correct to six decimal places, the solution of the equation $\cos x = x$.

**SOLUTION** We first rewrite the equation in standard form: $\cos x - x = 0$. Therefore we let $f(x) = \cos x - x$. Then $f'(x) = -\sin x - 1$, so Formula 2 becomes

$$x_{n+1} = x_n - \frac{\cos x_n - x_n}{-\sin x_n - 1} = x_n + \frac{\cos x_n - x_n}{\sin x_n + 1}$$

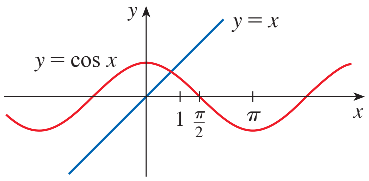

**FIGURE 6**

In order to guess a suitable value for $x_1$ we sketch the graphs of $y = \cos x$ and $y = x$ in Figure 6. It appears that they intersect at a point whose $x$-coordinate is somewhat less than 1, so let's take $x_1 = 1$ as a convenient first approximation. Then, remembering to put our calculator in radian mode, we get

$$x_2 \approx 0.75036387$$

$$x_3 \approx 0.73911289$$

$$x_4 \approx 0.73908513$$

$$x_5 \approx 0.73908513$$

Since $x_4$ and $x_5$ agree to six decimal places (eight, in fact), we conclude that the solution of the equation, correct to six decimal places, is 0.739085. ■

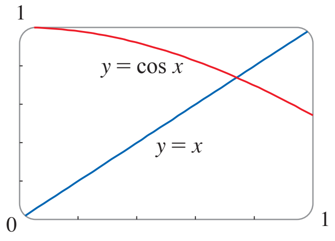

**FIGURE 7**

Instead of using the rough sketch in Figure 6 to get a starting approximation for Newton's method in Example 3, we could have used the more accurate graph that a calculator or computer provides. Figure 7 suggests that we use $x_1 = 0.75$ as the initial approximation. Then Newton's method gives

$$x_2 \approx 0.73911114$$

$$x_3 \approx 0.73908513$$

$$x_4 \approx 0.73908513$$

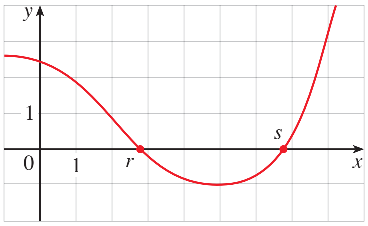
and so we obtain the same answer as before, but with one fewer step.

## 3.8 Exercises

**1.** The figure shows the graph of a function $f$. Suppose that Newton's method is used to approximate the solution $s$ of the equation $f(x) = 0$ with initial approximation $x_1 = 6$.

(a) Draw the tangent lines that are used to find $x_2$ and $x_3$, and estimate the numerical values of $x_2$ and $x_3$.

(b) Would $x_1 = 8$ be a better first approximation? Explain.

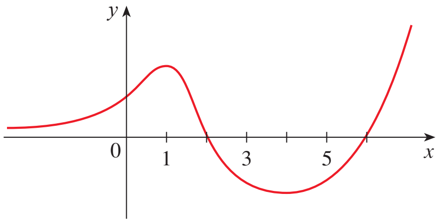


**2.** Follow the instructions for Exercise 1(a) but use $x_1 = 1$ as the starting approximation for finding the solution $r$.

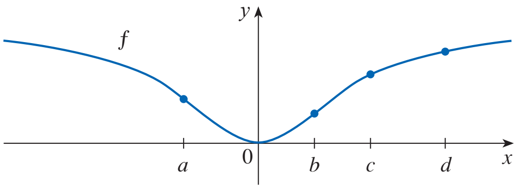
**3.** Suppose the tangent line to the curve $y = f(x)$ at the point $(2, 5)$ has the equation $y = 9 - 2x$. If Newton's method is used to locate a solution of the equation $f(x) = 0$ and the initial approximation is $x_1 = 2$, find the second approximation $x_2$.

**4.** For each initial approximation, determine graphically what happens if Newton's method is used for the function whose graph is shown.

(a) $x_1 = 0$ (b) $x_1 = 1$ (c) $x_1 = 3$
(d) $x_1 = 4$ (e) $x_1 = 5$



**5.** For which of the initial approximations $x_1 = a, b, c,$ and $d$ do you think Newton's method will work and lead to the solution of the equation $f(x) = 0$?



**6–8** Use Newton's method with the specified initial approximation $x_1$ to find $x_3$, the third approximation to the solution of the given equation. (Give your answer to four decimal places.)

**6.** $2x^3 - 3x^2 + 2 = 0, \quad x_1 = -1$

**7.** $\dfrac{2}{x} - x^2 + 1 = 0, \quad x_1 = 2$

**8.** $x^5 = x^2 + 1, \quad x_1 = 1$

---

**9.** Use Newton's method with initial approximation $x_1 = -1$ to find $x_2$, the second approximation to the solution of the equation $x^3 + x + 3 = 0$. Explain how the method works by first graphing the function and its tangent line at $(-1, 1)$.

**10.** Use Newton's method with initial approximation $x_1 = 1$ to find $x_2$, the second approximation to the solution of the equation $x^4 - x - 1 = 0$. Explain how the method works by first graphing the function and its tangent line at $(1, -1)$.

**11–12** Use Newton's method to approximate the given number correct to eight decimal places.

**11.** $\sqrt[4]{75}$ **12.** $\sqrt[8]{500}$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**13–14** (a) Explain how we know that the given equation must have a solution in the given interval. (b) Use Newton's method to approximate the solution correct to six decimal places.

**13.** $3x^4 - 8x^3 + 2 = 0, \quad [2, 3]$

**14.** $-2x^5 + 9x^4 - 7x^3 - 11x = 0, \quad [3, 4]$

---

**15–16** Use Newton's method to approximate the indicated solution of the equation correct to six decimal places.

**15.** The negative solution of $\cos x = x^2 - 4$

**16.** The positive solution of $3 \sin x = x$

---

**17–22** Use Newton's method to find all solutions of the equation correct to six decimal places.

**17.** $\sin x = x - 1$

**18.** $\cos 2x = x^3$

**19.** $\dfrac{1}{x} = \sqrt[3]{x} - 1$

**20.** $(x - 1)^2 = \sqrt{x}$

**21.** $x^3 = \cos x$

**22.** $x^3 = 5x - 3$

---

**23–26** Use Newton's method to find all the solutions of the equation correct to eight decimal places. Start by looking at a graph to find initial approximations.

**23.** $-2x^7 - 5x^4 + 9x^3 + 5 = 0$

**24.** $x^5 - 3x^4 + x^3 - x^2 - x + 6 = 0$

**25.** $\dfrac{x}{x^2 + 1} = \sqrt{1 - x}$

**26.** $\cos(x^2 - x) = x^4$

---

**27.** (a) Apply Newton's method to the equation $x^2 - a = 0$ to derive the following square-root algorithm (used by the ancient Babylonians to compute $\sqrt{a}$):

$$x_{n+1} = \frac{1}{2}\left(x_n + \frac{a}{x_n}\right)$$

(b) Use part (a) to compute $\sqrt{1000}$ correct to six decimal places.

**28.** (a) Apply Newton's method to the equation $1/x - a = 0$ to derive the following reciprocal algorithm:

$$x_{n+1} = 2x_n - ax_n^2$$

(This algorithm enables a computer to find reciprocals without actually dividing.)

(b) Use part (a) to compute $1/1.6984$ correct to six decimal places.

**29.** Explain why Newton's method doesn't work for finding the solution of the equation $x^3 - 3x + 6 = 0$ if the initial approximation is chosen to be $x_1 = 1$.

**30.** (a) Use Newton's method with $x_1 = 1$ to find the solution of the equation $x^3 - x = 1$ correct to six decimal places.

(b) Solve the equation in part (a) using $x_1 = 0.6$ as the initial approximation.

(c) Solve the equation in part (a) using $x_1 = 0.57$. (You definitely need a programmable calculator for this part.)

(d) Graph $f(x) = x^3 - x - 1$ and its tangent lines at $x_1 = 1$, 0.6, and 0.57 to explain why Newton's method is so sensitive to the value of the initial approximation.

**31.** Explain why Newton's method fails when applied to the equation $\sqrt[3]{x} = 0$ with any initial approximation $x_1 \neq 0$. Illustrate your explanation with a sketch.

**32.** If

$$f(x) = \begin{cases} \sqrt{x} & \text{if } x \geqslant 0 \\ -\sqrt{-x} & \text{if } x < 0 \end{cases}$$

then the solution of the equation $f(x) = 0$ is $x = 0$. Explain why Newton's method fails to find the solution no matter which initial approximation $x_1 \neq 0$ is used. Illustrate your explanation with a sketch.

**33.** (a) Use Newton's method to find the critical numbers of the function $f(x) = x^6 - x^4 + 3x^3 - 2x$ correct to six decimal places.

(b) Find the absolute minimum value of $f$ correct to four decimal places.

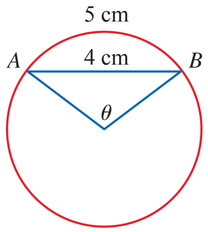
**34.** Use Newton's method to find the absolute maximum value of the function $f(x) = x \cos x$, $0 \leqslant x \leqslant \pi$, correct to six decimal places.

**35.** Use Newton's method to find the coordinates of the inflection point of the curve $y = x^2 \sin x$, $0 \leqslant x \leqslant \pi$, correct to six decimal places.

**36.** Of the infinitely many lines that are tangent to the curve $y = -\sin x$ and pass through the origin, there is one that has the largest slope. Use Newton's method to find the slope of that line correct to six decimal places.

**37.** Use Newton's method to find the coordinates, correct to six decimal places, of the point on the parabola $y = (x - 1)^2$ that is closest to the origin.

**38.** In the figure, the length of the chord $AB$ is 4 cm and the length of the arc $AB$ is 5 cm. Find the central angle $\theta$, in radians, correct to four decimal places. Then give the answer to the nearest degree.



**39.** A car dealer sells a new car for \$18,000. He also offers to sell the same car for payments of \$375 per month for five years. What monthly interest rate is this dealer charging?

To solve this problem you will need to use the formula for the present value $A$ of an annuity consisting of $n$ equal payments of size $R$ with interest rate $i$ per time period:

$$A = \frac{R}{i}[1 - (1 + i)^{-n}]$$

Replacing $i$ by $x$, show that

$$48x(1 + x)^{60} - (1 + x)^{60} + 1 = 0$$

Use Newton's method to solve this equation.

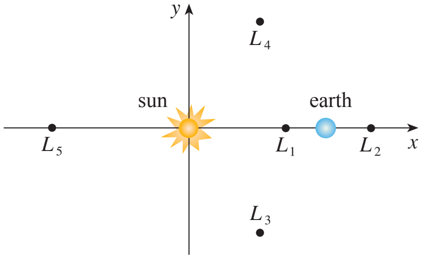
**40.** The figure shows the sun located at the origin and the earth at the point $(1, 0)$. (The unit here is the distance between the centers of the earth and the sun, called an *astronomical unit:* 1 AU $\approx 1.496 \times 10^8$ km.) There are five locations $L_1$, $L_2$, $L_3$, $L_4$, and $L_5$ in this plane of rotation of the earth about the sun where a satellite remains motionless with respect to the earth because the forces acting on the satellite (including the gravitational attractions of the earth and the sun) balance each other. These locations are called *libration points*. (A solar research satellite has been placed at one of these libration points.) If $m_1$ is the mass of the sun, $m_2$ is the mass of the earth, and $r = m_2/(m_1 + m_2)$, it turns out that the $x$-coordinate of $L_1$ is the unique solution of the fifth-degree equation

$$p(x) = x^5 - (2 + r)x^4 + (1 + 2r)x^3 - (1 - r)x^2$$
$$+ 2(1 - r)x + r - 1 = 0$$

and the $x$-coordinate of $L_2$ is the solution of the equation

$$p(x) - 2rx^2 = 0$$

Using the value $r \approx 3.04042 \times 10^{-6}$, find the locations of the libration points (a) $L_1$ and (b) $L_2$.



## 3.9 Antiderivatives

A physicist who knows the velocity of a particle might wish to know its position at a given time. An engineer who can measure the variable rate at which water is leaking from a tank wants to know the amount leaked over a certain time period. A biologist who knows the rate at which a bacteria population is increasing might want to deduce what the size of the population will be at some future time. In each case, the problem is to find a function whose derivative is a known function.

### The Antiderivative of a Function

If we have a function $F$ whose derivative is the function $f$, then $F$ is called an *antiderivative* of $f$.

**Definitio** A function $F$ is called an **antiderivative** of $f$ on an interval $I$ if $F'(x) = f(x)$ for all $x$ in $I$.

For instance, let $f(x) = x^2$. It isn't difficult to discover an antiderivative of $f$ if we keep the Power Rule in mind. In fact, if $F(x) = \frac{1}{3}x^3$, then $F'(x) = x^2 = f(x)$. But the function $G(x) = \frac{1}{3}x^3 + 100$ also satisfies $G'(x) = x^2$. Therefore both $F$ and $G$ are antiderivatives of $f$. Indeed, any function of the form $H(x) = \frac{1}{3}x^3 + C$, where $C$ is a constant, is an antiderivative of $f$. The question arises: are there any others?

To answer this question, recall that in Section 3.2 we used the Mean Value Theorem to prove that if two functions have identical derivatives on an interval, then they must differ by a constant (Corollary 3.2.7). Thus if $F$ and $G$ are any two antiderivatives of $f$, then

$$F'(x) = f(x) = G'(x)$$

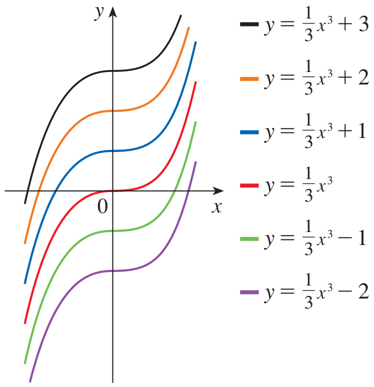


**FIGURE 1**
Members of the family of antiderivatives of $f(x) = x^2$

so $G(x) - F(x) = C$, where $C$ is a constant. We can write this as $G(x) = F(x) + C$, so we have the following result.

**1 Theorem** If $F$ is an antiderivative of $f$ on an interval $I$, then the most general antiderivative of $f$ on $I$ is

$$F(x) + C$$

where $C$ is an arbitrary constant.

Going back to the function $f(x) = x^2$, we see that the general antiderivative of $f$ is $\frac{1}{3}x^3 + C$. By assigning specific values to the constant $C$, we obtain a family of functions whose graphs are vertical translates of one another (see Figure 1). This makes sense because each curve must have the same slope at any given value of $x$.

**EXAMPLE 1** Find the most general antiderivative of each of the following functions.

(a) $f(x) = \sin x$ (b) $f(x) = x^n,\quad n \geqslant 0$ (c) $f(x) = x^{-3}$

**SOLUTION**

(a) If $F(x) = -\cos x$, then $F'(x) = \sin x$, so an antiderivative of $\sin x$ is $-\cos x$. By Theorem 1, the most general antiderivative is $G(x) = -\cos x + C$.

(b) We use the Power Rule to discover an antiderivative of $x^n$:

$$\frac{d}{dx}\left(\frac{x^{n+1}}{n+1}\right) = \frac{(n+1)x^n}{n+1} = x^n$$

Therefore the general antiderivative of $f(x) = x^n$ is

$$F(x) = \frac{x^{n+1}}{n+1} + C$$

This is valid for $n \geqslant 0$ because then $f(x) = x^n$ is defined on an interval.

(c) If we put $n = -3$ in the antiderivative formula from part (b), we get the particular antiderivative $F(x) = x^{-2}/(-2)$. But notice that $f(x) = x^{-3}$ is not defined at $x = 0$. Thus Theorem 1 tells us only that the general antiderivative of $f$ is $x^{-2}/(-2) + C$ on any interval that does not contain 0. So the general antiderivative of $f(x) = 1/x^3$ is

$$F(x) = \begin{cases} -\dfrac{1}{2x^2} + C_1 & \text{if } x > 0 \\ -\dfrac{1}{2x^2} + C_2 & \text{if } x < 0 \end{cases}$$ ■

## ■ Antidifferentiation Formulas

As in Example 1, every differentiation formula, when read from right to left, gives rise to an antidifferentiation formula. In Table 2 we list some particular antiderivatives. Each formula in the table is true because the derivative of the function in the right column appears in the left column. In particular, the first formula says that the antiderivative of a constant times a function is the constant times the antiderivative of the function. The second formula says that the antiderivative of a sum is the sum of the antiderivatives. (We use the notation $F' = f$, $G' = g$.)

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

To obtain the most general antiderivative from the particular ones in Table 2, we have to add a constant (or constants), as in Example 1.

**2 Table of Antidifferentiation Formulas**

| Function | Particular antiderivative | Function | Particular antiderivative |
|---|---|---|---|
| $cf(x)$ | $cF(x)$ | $\cos x$ | $\sin x$ |
| $f(x)+g(x)$ | $F(x)+G(x)$ | $\sin x$ | $-\cos x$ |
| $x^n \quad (n \neq -1)$ | $\dfrac{x^{n+1}}{n+1}$ | $\sec^2 x$ | $\tan x$ |
| | | $\sec x \tan x$ | $\sec x$ |

**EXAMPLE 2** Find all functions $g$ such that

$$g'(x) = 4\sin x + \frac{2x^5 - \sqrt{x}}{x}$$

**SOLUTION** We first rewrite the given function as follows:

$$g'(x) = 4\sin x + \frac{2x^5}{x} - \frac{\sqrt{x}}{x} = 4\sin x + 2x^4 - \frac{1}{\sqrt{x}}$$

Thus we want to find an antiderivative of

$$g'(x) = 4\sin x + 2x^4 - x^{-1/2}$$

Using the formulas in Table 2 together with Theorem 1, we obtain

We often use a capital letter $F$ to represent an antiderivative of a function $f$. If we begin with derivative notation, $f'$, an antiderivative is $f$, of course.

$$g(x) = 4(-\cos x) + 2\frac{x^5}{5} - \frac{x^{1/2}}{\frac{1}{2}} + C$$

$$= -4\cos x + \tfrac{2}{5}x^5 - 2\sqrt{x} + C$$ ■

In applications of calculus it is very common to have a situation as in Example 2, where it is required to find a function, given knowledge about its derivatives. An equation that involves the derivatives of a function is called a **differential equation**. These will be studied in some detail in Chapter 9, but for the present we can solve some elementary differential equations. The general solution of a differential equation involves an arbitrary constant (or constants) as in Example 2. However, there may be some extra conditions given that will determine the constants and therefore uniquely specify the solution.

**EXAMPLE 3** Find $f$ if $f'(x) = x\sqrt{x}$ and $f(1) = 2$.

**SOLUTION** The general antiderivative of

$$f'(x) = x\sqrt{x} = x^{3/2}$$

is

$$f(x) = \frac{x^{5/2}}{\frac{5}{2}} + C = \tfrac{2}{5}x^{5/2} + C$$

To determine $C$ we use the fact that $f(1) = 2$:

$$f(1) = \tfrac{2}{5} + C = 2$$

Solving for $C$, we get $C = 2 - \frac{2}{5} = \frac{8}{5}$, so the particular solution is

$$f(x) = \frac{2x^{5/2} + 8}{5}$$ ■

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 4** Find $f$ if $f''(x) = 12x^2 + 6x - 4$, $f(0) = 4$, and $f(1) = 1$.

**SOLUTION** The general antiderivative of $f''(x) = 12x^2 + 6x - 4$ is

$$f'(x) = 12\frac{x^3}{3} + 6\frac{x^2}{2} - 4x + C = 4x^3 + 3x^2 - 4x + C$$

Using the antidifferentiation rules once more, we find that

$$f(x) = 4\frac{x^4}{4} + 3\frac{x^3}{3} - 4\frac{x^2}{2} + Cx + D = x^4 + x^3 - 2x^2 + Cx + D$$

To determine $C$ and $D$ we use the given conditions that $f(0) = 4$ and $f(1) = 1$. Since $f(0) = 0 + D = 4$, we have $D = 4$. Since

$$f(1) = 1 + 1 - 2 + C + 4 = 1$$

we have $C = -3$. Therefore the required function is

$$f(x) = x^4 + x^3 - 2x^2 - 3x + 4$$ ■

## ■ Graphing Antiderivatives

If we are given the graph of a function $f$, it seems reasonable that we should be able to sketch the graph of an antiderivative $F$. Suppose, for instance, that we are given that $F(0) = 1$. Then we have a place to start, the point $(0, 1)$, and the direction in which we move our pencil is given at each stage by the derivative $F'(x) = f(x)$. In the next example we use the principles of this chapter to show how to graph $F$ even when we don't have a formula for $f$. This would be the case, for instance, when $f(x)$ is determined by experimental data.

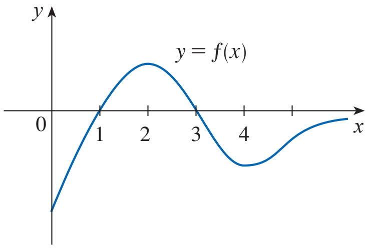

**FIGURE 2**

**EXAMPLE 5** The graph of a function $f$ is given in Figure 2. Make a rough sketch of an antiderivative $F$, given that $F(0) = 2$.

**SOLUTION** We are guided by the fact that the slope of $y = F(x)$ is $f(x)$. We start at the point $(0, 2)$ and draw $F$ as an initially decreasing function since $f(x)$ is negative when $0 < x < 1$. Notice that $f(1) = f(3) = 0$, so $F$ has horizontal tangents when $x = 1$ and $x = 3$. For $1 < x < 3$, $f(x)$ is positive and so $F$ is increasing. We see that $F$ has a local minimum when $x = 1$ and a local maximum when $x = 3$. For $x > 3$, $f(x)$ is negative and so $F$ is decreasing on $(3, \infty)$. Since $f(x) \to 0$ as $x \to \infty$, the graph of $F$ becomes flatter as $x \to \infty$. Also notice that $F''(x) = f'(x)$ changes from positive to negative at $x = 2$ and from negative to positive at $x = 4$, so $F$ has inflection points when $x = 2$ and $x = 4$. We use this information to sketch the graph of the antiderivative in Figure 3. ■

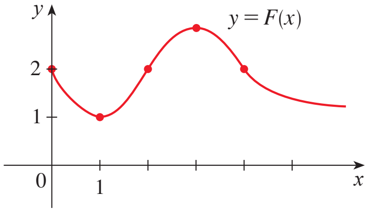

**FIGURE 3**

## ■ Linear Motion

Antidifferentiation is particularly useful in analyzing the motion of an object moving in a straight line. Recall that if the object has position function $s = f(t)$, then the velocity function is $v(t) = s'(t)$. This means that the position function is an antiderivative of the velocity function. Likewise, the acceleration function is $a(t) = v'(t)$, so the velocity function is an antiderivative of the acceleration. If the acceleration and the initial values $s(0)$ and $v(0)$ are known, then the position function can be found by antidifferentiating twice.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 6** A particle moves in a straight line and has acceleration given by $a(t) = 6t + 4$. Its initial velocity is $v(0) = -6$ cm/s and its initial displacement is $s(0) = 9$ cm. Find its position function $s(t)$.

**SOLUTION** Since $v'(t) = a(t) = 6t + 4$, antidifferentiation gives

$$v(t) = 6\frac{t^2}{2} + 4t + C = 3t^2 + 4t + C$$

Note that $v(0) = C$. But we are given that $v(0) = -6$, so $C = -6$ and

$$v(t) = 3t^2 + 4t - 6$$

Since $v(t) = s'(t)$, $s$ is the antiderivative of $v$:

$$s(t) = 3\frac{t^3}{3} + 4\frac{t^2}{2} - 6t + D = t^3 + 2t^2 - 6t + D$$

This gives $s(0) = D$. We are given that $s(0) = 9$, so $D = 9$ and the required position function is

$$s(t) = t^3 + 2t^2 - 6t + 9$$

■

An object near the surface of the earth is subject to a gravitational force that produces a downward acceleration denoted by $g$. For motion close to the ground we may assume that $g$ is constant, its value being about 9.8 m/s$^2$ (or 32 ft/s$^2$). It is remarkable that from the single fact that the acceleration due to gravity is constant, we can use calculus to deduce the position and velocity of any object moving under the force of gravity, as illustrated in the next example.

**EXAMPLE 7** A ball is thrown upward with a speed of 48 ft/s from the edge of a cliff, 432 ft above the ground. Find its height above the ground $t$ seconds later. When does it reach its maximum height? When does it hit the ground?

**SOLUTION** The motion is vertical and we choose the positive direction to be upward. At time $t$ the distance above the ground is $s(t)$ and the velocity $v(t)$ is decreasing. Therefore the acceleration must be negative and we have

$$a(t) = \frac{dv}{dt} = -32$$

Taking antiderivatives, we have

$$v(t) = -32t + C$$

To determine $C$ we use the given information that $v(0) = 48$. This gives $48 = 0 + C$, so

$$v(t) = -32t + 48$$

The maximum height is reached when $v(t) = 0$, that is, after 1.5 seconds. Since $s'(t) = v(t)$, we antidifferentiate again and obtain

$$s(t) = -16t^2 + 48t + D$$

Using the fact that $s(0) = 432$, we have $432 = 0 + D$ and so

$$s(t) = -16t^2 + 48t + 432$$

The expression for $s(t)$ is valid until the ball hits the ground. This happens when $s(t) = 0$, that is, when

$$-16t^2 + 48t + 432 = 0$$

or, equivalently,

$$t^2 - 3t - 27 = 0$$

Using the quadratic formula to solve this equation, we get

$$t = \frac{3 \pm 3\sqrt{13}}{2}$$

We reject the solution with the minus sign because it gives a negative value for $t$. Therefore the ball hits the ground after $3(1 + \sqrt{13})/2 \approx 6.9$ seconds. ■

Figure 4 shows the position function of the ball in Example 7. The graph corroborates the conclusions we reached: the ball reaches its maximum height after 1.5 seconds and hits the ground after about 6.9 seconds.

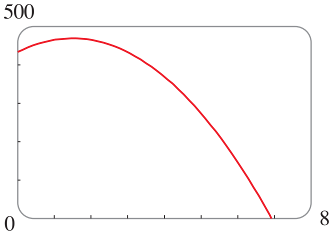

**FIGURE 4**

## 3.9 Exercises

**1–4** Find an antiderivative of the function.

**1.** (a) $f(x) = 6$ (b) $g(t) = 3t^2$

**2.** (a) $f(x) = 2x$ (b) $g(x) = -1/x^2$

**3.** (a) $h(q) = \cos q$ (b) $f(x) = \sec x \tan x$

**4.** (a) $g(t) = \sin t$ (b) $r(\theta) = \sec^2\theta$

---

**5–24** Find the most general antiderivative of the function. (Check your answer by differentiation.)

**5.** $f(x) = 4x + 7$

**6.** $f(x) = x^2 - 3x + 2$

**7.** $f(x) = 2x^3 - \frac{2}{3}x^2 + 5x$

**8.** $f(x) = 6x^5 - 8x^4 - 9x^2$

**9.** $f(x) = x(12x + 8)$

**10.** $f(x) = (x - 5)^2$

**11.** $g(x) = 4x^{-2/3} - 2x^{5/3}$

**12.** $h(z) = 3z^{0.8} + z^{-2.5}$

**13.** $f(x) = 3\sqrt{x} - 2\sqrt[3]{x}$

**14.** $g(x) = \sqrt{x}\,(2 - x + 6x^2)$

**15.** $f(t) = \dfrac{2t - 4 + 3\sqrt{t}}{\sqrt{t}}$

**16.** $f(x) = \sqrt[4]{5} + \sqrt[4]{x}$

**17.** $f(x) = \dfrac{10}{x^9}$

**18.** $g(x) = \dfrac{5 - 4x^3 + 2x^6}{x^6}$

**19.** $f(\theta) = 2\sin\theta - 3\sec\theta\tan\theta$

**20.** $f(t) = 3\cos t - 4\sin t$

**21.** $h(\theta) = 2\sin\theta - \sec^2\theta$

**22.** $h(x) = \sec^2 x + \pi\cos x$

**23.** $g(v) = \sqrt[3]{v^2} - 2\sec^2 v$

**24.** $f(x) = 1 + 2\sin x + 3/\sqrt{x}$

---

**25–26** Find the antiderivative $F$ of $f$ that satisfies the given condition. Check your answer by comparing the graphs of $f$ and $F$.

**25.** $f(x) = 5x^4 - 2x^5$, $F(0) = 4$

**26.** $f(x) = x + 2\sin x$, $F(0) = -6$

---

**27–48** Find $f$.

**27.** $f''(x) = 24x$

**28.** $f''(t) = t^2 - 4$

**29.** $f''(x) = 4x^3 + 24x - 1$

**30.** $f''(x) = 6x - x^4 + 3x^5$

**31.** $f''(x) = 4 - \sqrt[3]{x}$

**32.** $f''(x) = x^{2/3} + x^{-2/3}$

**33.** $f'''(t) = 12 + \sin t$

**34.** $f'''(t) = \sqrt{t} - 2\cos t$

**35.** $f'(x) = 5x^4 - 3x^2 + 4$, $f(-1) = 2$

**36.** $f'(x) = \sqrt{x} - 2$, $f(9) = 4$

**37.** $f'(x) = 5x^{2/3}$, $f(8) = 21$

**38.** $f'(t) = t + 1/t^3$, $t > 0$, $f(1) = 6$

**39.** $f'(t) = \sec t\,(\sec t + \tan t)$, $-\pi/2 < t < \pi/2$, $f(\pi/4) = -1$

**40.** $f'(x) = (x + 1)/\sqrt{x}$, $f(1) = 5$

**41.** $f''(x) = -2 + 12x - 12x^2$, $f(0) = 4$, $f'(0) = 12$

**42.** $f''(x) = 8x^3 + 5$, $f(1) = 0$, $f'(1) = 8$

**43.** $f''(\theta) = \sin\theta + \cos\theta$, $f(0) = 3$, $f'(0) = 4$

**44.** $f''(t) = 4 - 6/t^4$, $f(1) = 6$, $f'(2) = 9$, $t > 0$

**45.** $f''(x) = 4 + 6x + 24x^2$, $f(0) = 3$, $f(1) = 10$

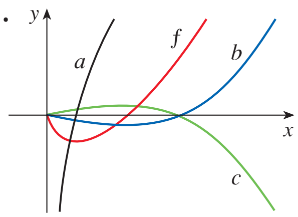
---

**49.** Given that the graph of $f$ passes through the point $(2, 5)$ and that the slope of its tangent line at $(x, f(x))$ is $3 - 4x$, find $f(1)$.

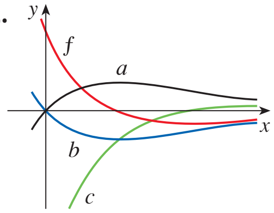
**50.** Find a function $f$ such that $f'(x) = x^3$ and the line $x + y = 0$ is tangent to the graph of $f$.

**51–52** The graph of a function $f$ is shown. Which graph is an antiderivative of $f$ and why?

**51.**

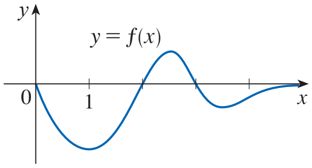


**52.**

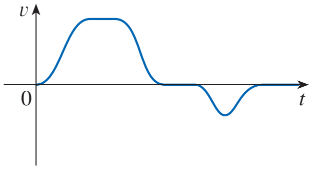


---

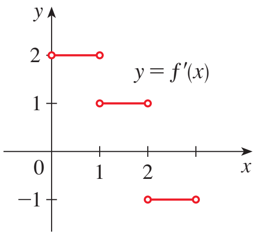
**53.** The graph of a function is shown in the figure. Make a rough sketch of an antiderivative $F$, given that $F(0) = 1$.



**54.** The graph of the velocity function of a particle is shown in the figure. Sketch the graph of a position function.



**55.** The graph of $f'$ is shown in the figure. Sketch the graph of $f$ if $f$ is continuous on $[0, 3]$ and $f(0) = -1$.



**56.** (a) Graph $f(x) = 2x - 3\sqrt{x}$.
(b) Starting with the graph in part (a), sketch a rough graph of the antiderivative $F$ that satisfies $F(0) = 1$.
(c) Use the rules of this section to find an expression for $F(x)$.
(d) Graph $F$ using the expression in part (c). Compare with your sketch in part (b).

**57–58** Draw a graph of $f$ and use it to make a rough sketch of the antiderivative that passes through the origin.

**57.** $f(x) = \dfrac{\sin x}{1 + x^2}, \quad -2\pi \leqslant x \leqslant 2\pi$

**58.** $f(x) = \sqrt{x^4 - 2x^2 + 2} - 2, \quad -3 \leqslant x \leqslant 3$

---

**59–64** A particle is moving with the given data. Find the position of the particle.

**59.** $v(t) = 2\cos t + 4\sin t, \quad s(0) = 3$

**60.** $v(t) = t^2 - 3\sqrt{t}, \quad s(4) = 8$

**61.** $a(t) = 2t + 1, \quad s(0) = 3, \quad v(0) = -2$

**62.** $a(t) = 3\cos t - 2\sin t, \quad s(0) = 0, \quad v(0) = 4$

**63.** $a(t) = \sin t - \cos t, \quad s(0) = 0, \quad s(\pi) = 6$

**64.** $a(t) = t^2 - 4t + 6, \quad s(0) = 0, \quad s(1) = 20$

---

**65.** A stone is dropped from the upper observation deck (the Space Deck) of the CN Tower, 450 m above the ground.
(a) Find the distance of the stone above ground level at time $t$.
(b) How long does it take the stone to reach the ground?
(c) With what velocity does it strike the ground?
(d) If the stone is thrown downward with a speed of 5 m/s, how long does it take to reach the ground?

**66.** Show that for motion in a straight line with constant acceleration $a$, initial velocity $v_0$, and initial displacement $s_0$, the displacement after time $t$ is $s = \frac{1}{2}at^2 + v_0 t + s_0$.

**67.** An object is projected upward with initial velocity $v_0$ meters per second from a point $s_0$ meters above the ground. Show that

$$[v(t)]^2 = v_0^2 - 19.6[s(t) - s_0]$$

**68.** Two balls are thrown upward from the edge of the cliff in Example 7. The first is thrown with a speed of 48 ft/s and the other is thrown a second later with a speed of 24 ft/s. Do the balls ever pass each other?

**69.** A stone was dropped off a cliff and hit the ground with a speed of 120 ft/s. What is the height of the cliff?

**70.** If a diver of mass $m$ stands at the end of a diving board with length $L$ and linear density $\rho$, then the board takes on the shape of a curve $y = f(x)$, where

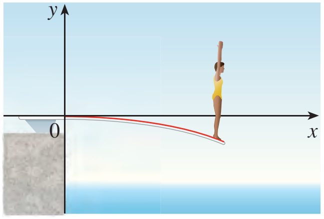
$$EIy'' = mg(L - x) + \tfrac{1}{2}\rho g(L - x)^2$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

$E$ and $I$ are positive constants that depend on the material of the board and $g$ ($< 0$) is the acceleration due to gravity.

(a) Find an expression for the shape of the curve.

(b) Use $f(L)$ to estimate the distance below the horizontal at the end of the board.



**71.** A company estimates that the marginal cost (in dollars per item) of producing $x$ items is $1.92 - 0.002x$. If the cost of producing one item is \$562, find the cost of producing 100 items.

**72.** The linear density of a rod of length 1 m is given by $\rho(x) = 1/\sqrt{x}$, in grams per centimeter, where $x$ is measured in centimeters from one end of the rod. Find the mass of the rod.

**73.** Since raindrops grow as they fall, their surface area increases and therefore the resistance to their falling increases. A raindrop has an initial downward velocity of 10 m/s and its downward acceleration is

$$a = \begin{cases} 9 - 0.9t & \text{if } 0 \leqslant t \leqslant 10 \\ 0 & \text{if } t > 10 \end{cases}$$

If the raindrop forms 500 m above the ground, how long does it take to fall?

**74.** A car is traveling at 50 mi/h when the brakes are fully applied, producing a constant deceleration of 22 ft/s$^2$. What is the distance traveled before the car comes to a stop?

**75.** What constant acceleration is required to increase the speed of a car from 30 mi/h to 50 mi/h in 5 seconds?

**76.** A car braked with a constant deceleration of 16 ft/s$^2$, producing skid marks measuring 200 ft before coming to a stop. How fast was the car traveling when the brakes were first applied?

**77.** A car is traveling at 100 km/h when the driver sees an accident 80 m ahead and slams on the brakes. What constant deceleration is required to stop the car in time to avoid a multicar pileup?

**78.** A model rocket is fired vertically upward from rest. Its acceleration for the first three seconds is $a(t) = 60t$, at which time the fuel is exhausted and it becomes a freely "falling" body. Fourteen seconds later, the rocket's parachute opens, and the (downward) velocity slows linearly to $-18$ ft/s in 5 seconds. The rocket then "floats" to the ground at that rate.

(a) Determine the position function $s$ and the velocity function $v$ (for all times $t$). Sketch the graphs of $s$ and $v$.

(b) At what time does the rocket reach its maximum height, and what is that height?

(c) At what time does the rocket land?

**79.** A particular bullet train accelerates and decelerates at the rate of 2.4 ft/s$^2$. Its maximum cruising speed is 180 mi/h.

(a) What is the maximum distance the train can travel if it accelerates from rest until it reaches its cruising speed and then runs at that speed for 20 minutes?

(b) Suppose that the train starts from rest and must come to a complete stop in 20 minutes. What is the maximum distance it can travel under these conditions?

(c) Find the minimum time that the train takes to travel between two consecutive stations that are 60 miles apart.

(d) The trip from one station to the next takes 37.5 minutes. How far apart are the stations?

## 3 REVIEW

### CONCEPT CHECK

Answers to the Concept Check are available at StewartCalculus.com.

**1.** Explain the difference between an absolute maximum and a local maximum. Illustrate with a sketch.

**2.** (a) What does the Extreme Value Theorem say?
(b) Explain how the Closed Interval Method works.

**3.** (a) State Fermat's Theorem.
(b) Define a critical number of $f$.

**4.** (a) State Rolle's Theorem.
(b) State the Mean Value Theorem and give a geometric interpretation.

**5.** (a) State the Increasing/Decreasing Test.
(b) What does it mean to say that $f$ is concave upward on an interval $I$?
(c) State the Concavity Test.
(d) What are inflection points? How do you find them?

**6.** (a) State the First Derivative Test.
(b) State the Second Derivative Test.
(c) What are the relative advantages and disadvantages of these tests?

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**7.** Explain the meaning of each of the following statements.

(a) $\lim_{x\to\infty} f(x) = L$ (b) $\lim_{x\to -\infty} f(x) = L$ (c) $\lim_{x\to\infty} f(x) = \infty$

(d) The curve $y = f(x)$ has the horizontal asymptote $y = L$.

**8.** If you have a graphing calculator or computer, why do you need calculus to graph a function?

**9.** (a) Given an initial approximation $x_1$ to a solution of the equation $f(x) = 0$, explain geometrically, with a diagram, how the second approximation $x_2$ in Newton's method is obtained.

(b) Write an expression for $x_2$ in terms of $x_1$, $f(x_1)$, and $f'(x_1)$.

(c) Write an expression for $x_{n+1}$ in terms of $x_n$, $f(x_n)$, and $f'(x_n)$.

(d) Under what circumstances is Newton's method likely to fail or to work very slowly?

**10.** (a) What is an antiderivative of a function $f$?

(b) Suppose $F_1$ and $F_2$ are both antiderivatives of $f$ on an interval $I$. How are $F_1$ and $F_2$ related?

## TRUE-FALSE QUIZ

Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

**1.** If $f'(c) = 0$, then $f$ has a local maximum or minimum at $c$.

**2.** If $f$ has an absolute minimum value at $c$, then $f'(c) = 0$.

**3.** If $f$ is continuous on $(a, b)$, then $f$ attains an absolute maximum value $f(c)$ and an absolute minimum value $f(d)$ at some numbers $c$ and $d$ in $(a, b)$.

**4.** If $f$ is differentiable and $f(-1) = f(1)$, then there is a number $c$ such that $|c| < 1$ and $f'(c) = 0$.

**5.** If $f'(x) < 0$ for $1 < x < 6$, then $f$ is decreasing on $(1, 6)$.

**6.** If $f''(2) = 0$, then $(2, f(2))$ is an inflection point of the curve $y = f(x)$.

**7.** If $f'(x) = g'(x)$ for $0 < x < 1$, then $f(x) = g(x)$ for $0 < x < 1$.

**8.** There exists a function $f$ such that $f(1) = -2$, $f(3) = 0$, and $f'(x) > 1$ for all $x$.

**9.** There exists a function $f$ such that $f(x) > 0$, $f'(x) < 0$, and $f''(x) > 0$ for all $x$.

**10.** There exists a function $f$ such that $f(x) < 0$, $f'(x) < 0$, and $f''(x) > 0$ for all $x$.

**11.** If $f$ and $g$ are increasing on an interval $I$, then $f + g$ is increasing on $I$.

**12.** If $f$ and $g$ are increasing on an interval $I$, then $f - g$ is increasing on $I$.

**13.** If $f$ and $g$ are increasing on an interval $I$, then $fg$ is increasing on $I$.

**14.** If $f$ and $g$ are positive increasing functions on an interval $I$, then $fg$ is increasing on $I$.

**15.** If $f$ is increasing and $f(x) > 0$ on $I$, then $g(x) = 1/f(x)$ is decreasing on $I$.

**16.** If $f$ is even, then $f'$ is even.

**17.** If $f$ is periodic, then $f'$ is periodic.

**18.** The most general antiderivative of $f(x) = x^{-2}$ is $F(x) = -(1/x) + C$.

**19.** If $f'(x)$ exists and is nonzero for all $x$, then $f(1) \neq f(0)$.

**20.** If $f$ has domain $[0, \infty)$ and has no horizontal asymptote, then $\lim_{x\to\infty} f(x) = \infty$ or $\lim_{x\to\infty} f(x) = -\infty$.

## EXERCISES

**1–6** Find the local and absolute extreme values of the function on the given interval.

**1.** $f(x) = x^3 - 9x^2 + 24x - 2, \quad [0, 5]$

**2.** $f(x) = x\sqrt{1 - x}, \quad [-1, 1]$

**3.** $f(x) = \dfrac{3x - 4}{x^2 + 1}, \quad [-2, 2]$

**4.** $f(x) = \sqrt{x^2 + x + 1}, \quad [-2, 1]$

**5.** $f(x) = x + 2\cos x, \quad [-\pi, \pi]$

**6.** $f(x) = \sin x + \cos^2 x, \quad [0, \pi]$

**7–12** Find the limit.

**7.** $\displaystyle\lim_{x\to\infty} \frac{3x^4 + x - 5}{6x^4 - 2x^2 + 1}$

**8.** $\displaystyle\lim_{t\to\infty} \frac{t^3 - t + 2}{(2t - 1)(t^2 + t + 1)}$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**9.** $\displaystyle\lim_{x\to-\infty}\frac{\sqrt{4x^2+1}}{3x-1}$

**10.** $\displaystyle\lim_{x\to-\infty}(x^2+x^3)$

**11.** $\displaystyle\lim_{x\to\infty}\left(\sqrt{4x^2+3x}-2x\right)$

**12.** $\displaystyle\lim_{x\to\infty}\frac{\sin^4 x}{\sqrt{x}}$

---

**13–15** Sketch the graph of a function that satisfies the given conditions.

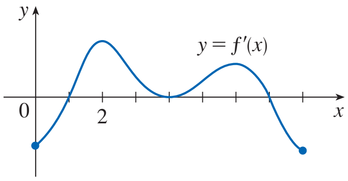
**13.** $f(0)=0$, $f'(-2)=f'(1)=f'(9)=0$,
$\displaystyle\lim_{x\to\infty}f(x)=0$, $\displaystyle\lim_{x\to 6}f(x)=-\infty$,
$f'(x)<0$ on $(-\infty,-2)$, $(1,6)$, and $(9,\infty)$,
$f'(x)>0$ on $(-2,1)$ and $(6,9)$,
$f''(x)>0$ on $(-\infty,0)$ and $(12,\infty)$,
$f''(x)<0$ on $(0,6)$ and $(6,12)$

**14.** $f(0)=0$, $f$ is continuous and even,
$f'(x)=2x$ if $0<x<1$, $f'(x)=-1$ if $1<x<3$,
$f'(x)=1$ if $x>3$

**15.** $f$ is odd, $f'(x)<0$ for $0<x<2$,
$f'(x)>0$ for $x>2$, $f''(x)>0$ for $0<x<3$,
$f''(x)<0$ for $x>3$, $\displaystyle\lim_{x\to\infty}f(x)=-2$

---

**16.** The figure shows the graph of the *derivative* $f'$ of a function $f$.
(a) On what intervals is $f$ increasing or decreasing?
(b) For what values of $x$ does $f$ have a local maximum or minimum?
(c) Sketch the graph of $f''$.
(d) Sketch a possible graph of $f$.



**17–28** Use the guidelines of Section 3.5 to sketch the curve.

**17.** $y=2-2x-x^3$

**18.** $y=-2x^3-3x^2+12x+5$

**19.** $y=3x^4-4x^3+2$

**20.** $y=\dfrac{x}{1-x^2}$

**21.** $y=\dfrac{1}{x(x-3)^2}$

**22.** $y=\dfrac{1}{x^2}-\dfrac{1}{(x-2)^2}$

**23.** $y=\dfrac{(x-1)^3}{x^2}$

**24.** $y=\sqrt{1-x}+\sqrt{1+x}$

**25.** $y=x\sqrt{2+x}$

**26.** $y=x^{2/3}(x-3)^2$

**27.** $y=\sin^2 x-2\cos x$

**28.** $y=4x-\tan x$, $-\pi/2<x<\pi/2$

---

**29–32** Produce graphs of $f$ that reveal all the important aspects of the curve. Use graphs of $f'$ and $f''$ to estimate the intervals of increase and decrease, extreme values, intervals of concavity, and inflection points. In Exercise 29 use calculus to find these quantities exactly.

**29.** $f(x)=\dfrac{x^2-1}{x^3}$

**30.** $f(x)=\dfrac{x^3+1}{x^6+1}$

**31.** $f(x)=3x^6-5x^5+x^4-5x^3-2x^2+2$

**32.** $f(x)=x^2+6.5\sin x$, $-5\leqslant x\leqslant 5$

---

**33.** Show that the equation $3x+2\cos x+5=0$ has exactly one real solution.

**34.** Suppose that $f$ is continuous on $[0,4]$, $f(0)=1$, and $2\leqslant f'(x)\leqslant 5$ for all $x$ in $(0,4)$. Show that $9\leqslant f(4)\leqslant 21$.

**35.** By applying the Mean Value Theorem to the function $f(x)=x^{1/5}$ on the interval $[32,33]$, show that

$$2<\sqrt[5]{33}<2.0125$$

**36.** For what values of the constants $a$ and $b$ is $(1,3)$ a point of inflection of the curve $y=ax^3+bx^2$?

**37.** Let $g(x)=f(x^2)$, where $f$ is twice differentiable for all $x$, $f'(x)>0$ for all $x\neq 0$, and $f$ is concave downward on $(-\infty,0)$ and concave upward on $(0,\infty)$.
(a) At what numbers does $g$ have an extreme value?
(b) Discuss the concavity of $g$.

**38.** Find two positive integers such that the sum of the first number and four times the second number is 1000 and the product of the numbers is as large as possible.

**39.** Show that the shortest distance from the point $(x_1,y_1)$ to the straight line $Ax+By+C=0$ is

$$\frac{|Ax_1+By_1+C|}{\sqrt{A^2+B^2}}$$

**40.** Find the point on the hyperbola $xy=8$ that is closest to the point $(3,0)$.

**41.** Find the smallest possible area of an isosceles triangle that is circumscribed about a circle of radius $r$.

**42.** Find the volume of the largest circular cone that can be inscribed in a sphere of radius $r$.

**43.** In $\Delta ABC$, $D$ lies on $AB$, $CD \perp AB$, $|AD| = |BD| = 4$ cm, and $|CD| = 5$ cm. Where should a point $P$ be chosen on $CD$ so that the sum $|PA| + |PB| + |PC|$ is a minimum?

**44.** Solve Exercise 43 when $|CD| = 2$ cm.

**45.** The velocity of a wave of length $L$ in deep water is

$$v = K\sqrt{\frac{L}{C} + \frac{C}{L}}$$

where $K$ and $C$ are known positive constants. What is the length of the wave that gives the minimum velocity?

**46.** A metal storage tank with volume $V$ is to be constructed in the shape of a right circular cylinder surmounted by a hemisphere. What dimensions will require the least amount of metal?

**47.** A hockey team plays in an arena that seats 15,000 spectators. With the ticket price set at \$12, average attendance at a game has been 11,000. A market survey indicates that for each dollar the ticket price is lowered, average attendance will increase by 1000. How should the owners of the team set the ticket price to maximize their revenue from ticket sales?

**48.** A manufacturer determines that the cost of making $x$ units of a commodity is

$$C(x) = 1800 + 25x - 0.2x^2 + 0.001x^3$$

and the demand function is $p(x) = 48.2 - 0.03x$.

(a) Graph the cost and revenue functions and use the graphs to estimate the production level for maximum profit.

(b) Use calculus to find the production level for maximum profit.

(c) Estimate the production level that minimizes the average cost.

**49.** Use Newton's method to find the solution of the equation $x^5 - x^4 + 3x^2 - 3x - 2 = 0$ in the interval $[1, 2]$ correct to six decimal places.

**50.** Use Newton's method to find all solutions of the equation $\sin x = x^2 - 3x + 1$ correct to six decimal places.

**51.** Use Newton's method to find the absolute maximum value of the function $f(t) = \cos t + t - t^2$ correct to eight decimal places.

**52.** Use the guidelines in Section 3.5 to sketch the curve $y = x \sin x$, $0 \leqslant x \leqslant 2\pi$. Use Newton's method when necessary.

**53–56** Find the most general antiderivative of the function.

**53.** $f(x) = 4\sqrt{x} - 6x^2 + 3$

**54.** $g(x) = \cos x + 2\sec^2 x$

**55.** $h(t) = t^{-3} + 5\sin t$

**56.** $f(x) = \dfrac{3x^5 - 4x^2 + 1}{x^2}$

**57–60** Find $f$.

**57.** $f'(t) = 2t - 3\sin t, \quad f(0) = 5$

**58.** $f'(u) = \dfrac{u^2 + \sqrt{u}}{u}, \quad f(1) = 3$

**59.** $f''(x) = 1 - 6x + 48x^2, \quad f(0) = 1, \quad f'(0) = 2$

**60.** $f''(x) = 5x^3 + 6x^2 + 2, \quad f(0) = 3, \quad f(1) = -2$

**61–62** A particle is moving along a straight line with the given data. Find the position of the particle.

**61.** $v(t) = 2t - \sin t, \quad s(0) = 3$

**62.** $a(t) = \sin t + 3\cos t, \quad s(0) = 0, \quad v(0) = 2$

**63.** Graph the function $f(x) = x^2 \sin(x^2)$, $0 \leqslant x \leqslant \pi$, and use that graph to sketch the antiderivative $F$ of $f$ that satisfies the initial condition $F(0) = 0$.

**64.** Investigate the family of curves given by

$$f(x) = x^4 + x^3 + cx^2$$

In particular you should determine the transitional value of $c$ at which the number of critical numbers changes and the transitional value at which the number of inflection points changes. Illustrate the various possible shapes with graphs.

**65.** A canister is dropped from a helicopter hovering 500 m above the ground. Its parachute does not open, but the canister has been designed to withstand an impact velocity of 100 m/s. Will it burst?

**66.** In an automobile race along a straight road, car A passed car B twice. Prove that at some time during the race their accelerations were equal. State the assumptions that you make.

**67.** A rectangular beam will be cut from a cylindrical log of radius 10 inches.

(a) Show that the beam of maximal cross-sectional area is a square.

(b) Four rectangular planks will be cut from the four sections of the log that remain after cutting the square beam. Determine the dimensions of the planks that will have maximal cross-sectional area.

(c) Suppose that the strength of a rectangular beam is proportional to the product of its width and the square of its depth. Find the dimensions of the strongest beam that can be cut from the cylindrical log.

**68.** If a projectile is fired with an initial velocity $v$ at an angle of inclination $\theta$ from the horizontal, then its trajectory, neglecting air resistance, is the parabola

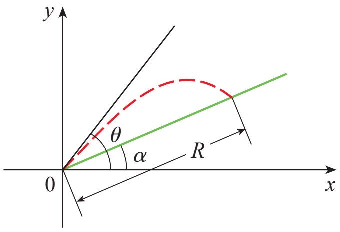
$$y = (\tan\theta)x - \frac{g}{2v^2\cos^2\theta}x^2 \qquad 0 < \theta < \frac{\pi}{2}$$

(a) Suppose the projectile is fired from the base of a plane that is inclined at an angle $\alpha$, $\alpha > 0$, from the horizontal, as shown in the figure. Show that the range of the projectile, measured up the slope, is given by

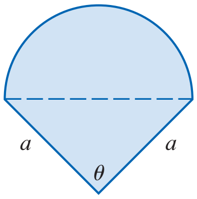
$$R(\theta) = \frac{2v^2\cos\theta\,\sin(\theta - \alpha)}{g\cos^2\alpha}$$

(b) Determine $\theta$ so that $R$ is a maximum.

(c) Suppose the plane is at an angle $\alpha$ *below* the horizontal. Determine the range $R$ in this case, and determine the angle at which the projectile should be fired to maximize $R$.



**69.** The following figure shows an isosceles triangle with equal sides of length $a$ surmounted by a semicircle. What should the measure of angle $\theta$ be in order to maximize the total area?



**70.** Water is flowing at a constant rate into a spherical tank. Let $V(t)$ be the volume of water in the tank and $H(t)$ be the height of the water in the tank at time $t$.

(a) What are the meanings of $V'(t)$ and $H'(t)$? Are these derivatives positive, negative, or zero?

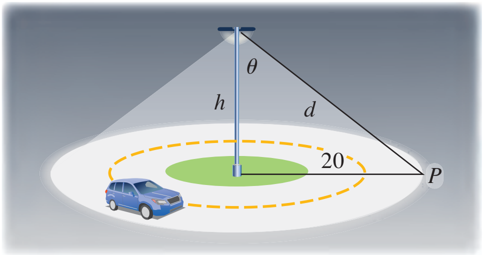
(b) Is $V''(t)$ positive, negative, or zero? Explain.

(c) Let $t_1$, $t_2$, and $t_3$ be the times when the tank is one-quarter full, half full, and three-quarters full, respectively. Are each of the values $H''(t_1)$, $H''(t_2)$, and $H''(t_3)$ positive, negative, or zero? Why?

**71.** A light is to be mounted atop a pole of height $h$ feet to illuminate a busy traffic circle, which has a radius of 40 ft. The intensity of illumination $I$ at any point $P$ on the circle is directly proportional to the cosine of the angle $\theta$ (see the figure) and inversely proportional to the square of the distance $d$ from the source.

(a) How tall should the light pole be to maximize $I$?

(b) Suppose that the light pole is $h$ feet tall and that a woman is walking away from the base of the pole at the rate of 4 ft/s. At what rate is the intensity of the light at the point on her back 4 ft above the ground decreasing when she reaches the outer edge of the traffic circle?



T **72.** If $f(x) = \dfrac{\cos^2 x}{\sqrt{x^2 + x + 1}}$, $-\pi \leqslant x \leqslant \pi$, use the graphs of $f$, $f'$, and $f''$ to estimate the $x$-coordinates of the maximum and minimum points and inflection points of $f$.

# Problems Plus

One of the most important principles of problem solving is *analogy* (see Principles of Problem Solving following Chapter 1). If you are having trouble getting started on a problem, it is sometimes helpful to start by solving a similar, but simpler, problem. The following example illustrates the principle. Cover up the solution and try solving it yourself first.

**EXAMPLE 1** If $x$, $y$, and $z$ are positive numbers, prove that

$$\frac{(x^2+1)(y^2+1)(z^2+1)}{xyz} \geqslant 8$$

**SOLUTION** It may be difficult to get started on this problem. (Some students have tackled it by multiplying out the numerator, but that just creates a mess.) Let's try to think of a similar, simpler problem. When several variables are involved, it's often helpful to think of an analogous problem with fewer variables. In the present case we can reduce the number of variables from three to one and prove the analogous inequality

$$\boxed{1} \qquad \frac{x^2+1}{x} \geqslant 2 \qquad \text{for } x > 0$$

In fact, if we are able to prove (1), then the desired inequality follows because

$$\frac{(x^2+1)(y^2+1)(z^2+1)}{xyz} = \left(\frac{x^2+1}{x}\right)\left(\frac{y^2+1}{y}\right)\left(\frac{z^2+1}{z}\right) \geqslant 2 \cdot 2 \cdot 2 = 8$$

The key to proving (1) is to recognize that it is a disguised version of a minimum problem. If we let

$$f(x) = \frac{x^2+1}{x} = x + \frac{1}{x} \qquad x > 0$$

then $f'(x) = 1 - (1/x^2)$, so $f'(x) = 0$ when $x = 1$. Also, $f'(x) < 0$ for $0 < x < 1$ and $f'(x) > 0$ for $x > 1$. Therefore the absolute minimum value of $f$ is $f(1) = 2$. This means that

$$\frac{x^2+1}{x} \geqslant 2 \qquad \text{for all positive values of } x$$

and, as previously mentioned, the given inequality follows by multiplication.

The inequality in (1) could also be proved without calculus. In fact, if $x > 0$, we have

$$\frac{x^2+1}{x} \geqslant 2 \iff x^2 + 1 \geqslant 2x \iff x^2 - 2x + 1 \geqslant 0$$

$$\iff (x-1)^2 \geqslant 0$$

Because the last inequality is obviously true, the first one is true too. ■

**PS** Look Back

What have we learned from the solution to this example?

- To solve a problem involving several variables, it might help to solve a similar problem with just one variable.
- When trying to prove an inequality, it might help to think of it as a maximum or minimum problem.

## Problems

1. Show that $|\sin x - \cos x| \leqslant \sqrt{2}$ for all $x$.

2. Show that $x^2y^2(4 - x^2)(4 - y^2) \leqslant 16$ for all numbers $x$ and $y$ such that $|x| \leqslant 2$ and $|y| \leqslant 2$.

3. Show that the inflection points of the curve $y = (\sin x)/x$ lie on the curve $y^2(x^4 + 4) = 4$.

4. Find the point on the parabola $y = 1 - x^2$ at which the tangent line cuts from the first quadrant the triangle with the smallest area.

5. Find the highest and lowest points on the curve $x^2 + xy + y^2 = 12$.

6. Find the absolute maximum value of the function

$$f(x) = \frac{1}{1 + |x|} + \frac{1}{1 + |x - 2|}$$

7. Show that if $f$ is a differentiable function that satisfies

$$\frac{f(x + n) - f(x)}{n} = f'(x)$$

for all real numbers $x$ and all positive integers $n$, then $f$ is a linear function.

8. Find a function $f$ such that $f'(-1) = \frac{1}{2}$, $f'(0) = 0$, and $f''(x) > 0$ for all $x$, or prove that such a function cannot exist.

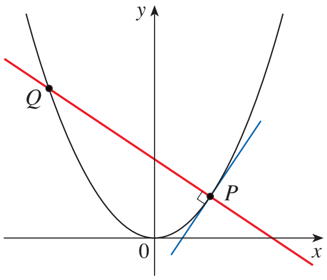

**FIGURE FOR PROBLEM 9**

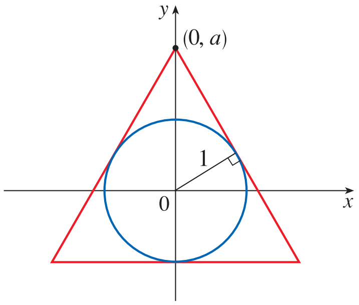
9. If $P(a, a^2)$ is any first-quadrant point on the parabola $y = x^2$, let $Q$ be the point where the normal line at $P$ intersects the parabola again (see the figure).
   (a) Show that the $y$-coordinate of $Q$ is smallest when $a = 1/\sqrt{2}$.
   (b) Show that the line segment $PQ$ has the shortest possible length when $a = 1/\sqrt{2}$.

10. An isosceles triangle is circumscribed about the unit circle so that the equal sides meet at the point $(0, a)$ on the $y$-axis (see the figure). Find the value of $a$ that minimizes the lengths of the equal sides. (You may be surprised that the result does not give an equilateral triangle.).



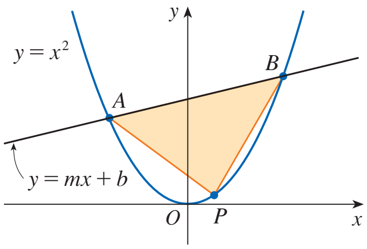


**FIGURE FOR PROBLEM 11**

11. The line $y = mx + b$ intersects the parabola $y = x^2$ in points $A$ and $B$. (See the figure.) Find the point $P$ on the arc $AOB$ of the parabola that maximizes the area of the triangle $PAB$.

12. Sketch the graph of a function $f$ such that $f'(x) < 0$ for all $x$, $f''(x) > 0$ for $|x| > 1$, $f''(x) < 0$ for $|x| < 1$, and $\lim_{x \to \pm\infty} [f(x) + x] = 0$.

**13.** Determine the values of the number $a$ for which the function $f$ has no critical number:

$$f(x) = (a^2 + a - 6)\cos 2x + (a - 2)x + \cos 1$$

**14.** Sketch the region in the plane consisting of all points $(x, y)$ such that

$$2xy \leqslant |x - y| \leqslant x^2 + y^2$$

**15.** Let $ABC$ be a triangle with $\angle BAC = 120°$ and $|AB| \cdot |AC| = 1$.

(a) Express the length of the angle bisector $AD$ in terms of $x = |AB|$.

(b) Find the largest possible value of $|AD|$.

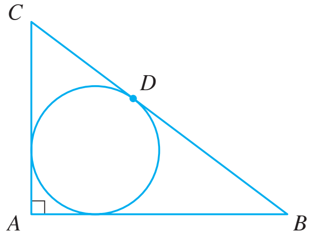

**FIGURE FOR PROBLEM 16**

**16.** (a) Let $ABC$ be a triangle with right angle $A$ and hypotenuse $a = |BC|$. (See the figure.) If the inscribed circle touches the hypotenuse at $D$, show that

$$|CD| = \tfrac{1}{2}(|BC| + |AC| - |AB|)$$

(b) If $\theta = \frac{1}{2}\angle C$, express the radius $r$ of the inscribed circle in terms of $a$ and $\theta$.

(c) If $a$ is fixed and $\theta$ varies, find the maximum value of $r$.

**17.** A triangle with sides $a$, $b$, and $c$ varies with time $t$, but its area never changes. Let $\theta$ be the angle opposite the side of length $a$ and suppose $\theta$ always remains acute.

(a) Express $d\theta/dt$ in terms of $b$, $c$, $\theta$, $db/dt$, and $dc/dt$.

(b) Express $da/dt$ in terms of the quantities in part (a).

**18.** $ABCD$ is a square piece of paper with sides of length 1 m. A quarter-circle is drawn from $B$ to $D$ with center $A$. The piece of paper is folded along $EF$, with $E$ on $AB$ and $F$ on $AD$, so that $A$ falls on the quarter-circle. Determine the maximum and minimum areas that the triangle $AEF$ can have.

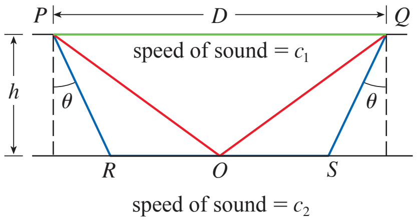
**19.** The speeds of sound $c_1$ in an upper layer and $c_2$ in a lower layer of rock and the thickness $h$ of the upper layer can be determined by seismic exploration if the speed of sound in the lower layer is greater than the speed in the upper layer. A dynamite charge is detonated at a point $P$ and the transmitted signals are recorded at a point $Q$, which is a distance $D$ from $P$. The first signal to arrive at $Q$ travels along the surface and takes $T_1$ seconds. The next signal travels from $P$ to a point $R$, from $R$ to $S$ in the lower layer, and then to $Q$, taking $T_2$ seconds. The third signal is reflected off the lower layer at the midpoint $O$ of $RS$ and takes $T_3$ seconds to reach $Q$. (See the figure.)

(a) Express $T_1$, $T_2$, and $T_3$ in terms of $D$, $h$, $c_1$, $c_2$, and $\theta$.

(b) Show that $T_2$ is a minimum when $\sin\theta = c_1/c_2$.

(c) Suppose that $D = 1$ km, $T_1 = 0.26$ s, $T_2 = 0.32$ s, and $T_3 = 0.34$ s. Find $c_1$, $c_2$, and $h$.

*Note:* Geophysicists use this technique when studying the structure of the earth's crust—searching for oil or examining fault lines, for example.



**20.** For what values of $c$ is there a straight line that intersects the curve

$$y = x^4 + cx^3 + 12x^2 - 5x + 2$$

in four distinct points?

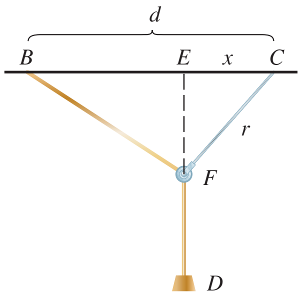


**FIGURE FOR PROBLEM 21**

**21.** One of the problems posed by the Marquis de l'Hospital in his calculus textbook *Analyse des infiniment petits* concerns a pulley that is attached to the ceiling of a room at a point $C$ by a rope of length $r$. At another point $B$ on the ceiling, at a distance $d$ from $C$ (where $d > r$), a rope of length $\ell$ is attached and passed through the pulley at $F$ and connected to a weight $W$. The weight is released and comes to rest at its equilibrium position $D$. (See the figure.) As l'Hospital argued, this happens when the distance $|ED|$ is maximized. Show that when the system reaches equilibrium, the value of $x$ is

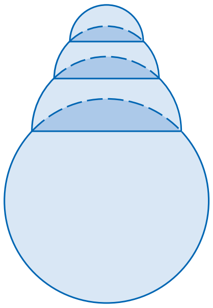
$$\frac{r}{4d}\left(r + \sqrt{r^2 + 8d^2}\right)$$

Notice that this expression is independent of both $W$ and $\ell$.

**22.** Given a sphere with radius $r$, find the height of a pyramid of minimum volume whose base is a square and whose base and triangular faces are all tangent to the sphere. What if the base of the pyramid is a regular $n$-gon? (A regular $n$-gon is a polygon with $n$ equal sides and angles.) (Use the fact that the volume of a pyramid is $\frac{1}{3}Ah$, where $A$ is the area of the base.)

**23.** Assume that a snowball melts so that its volume decreases at a rate proportional to its surface area. If it takes three hours for the snowball to decrease to half its original volume, how much longer will it take for the snowball to melt completely?

**24.** A hemispherical bubble is placed on a spherical bubble of radius 1. A smaller hemispherical bubble is then placed on the first one. This process is continued until $n$ chambers, including the sphere, are formed. (The figure shows the case $n = 4$.) Use mathematical induction to prove that the maximum height of any bubble tower with $n$ chambers is $1 + \sqrt{n}$.



**In Exercise 4.4.73 we see how to use electric power consumption data and an integral to compute the amount of electric energy used in a typical day in the New England states.**

ixpert / Shutterstock.com

# 4 Integrals

**IN CHAPTER 2 WE USED** the tangent and velocity problems to introduce the derivative. In this chapter we use the area and distance problems to introduce the other central idea in calculus—the integral. The all-important relationship between the derivative and the integral is expressed in the Fundamental Theorem of Calculus, which says that differentiation and integration are in a sense inverse processes. We learn in this chapter, and in Chapters 5 and 8, how integration can be used to solve problems involving volumes, length of curves, population predictions, cardiac output, forces on a dam, work, consumer surplus, and baseball, among many others.

## 4.1 The Area and Distance Problems

Now is a good time to read (or reread) A Preview of Calculus, which discusses the unifying ideas of calculus and helps put in perspective where we have been and where we are going.

In this section we discover that in trying to find the area under a curve or the distance traveled by a car, we end up with the same special type of limit.

### The Area Problem

We begin by attempting to solve the *area problem:* find the area of the region $S$ that lies under the curve $y = f(x)$ from $a$ to $b$. This means that $S$, illustrated in Figure 1, is bounded by the graph of a continuous function $f$ [where $f(x) \geqslant 0$], the vertical lines $x = a$ and $x = b$, and the $x$-axis.

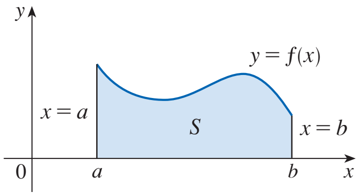


**FIGURE 1**
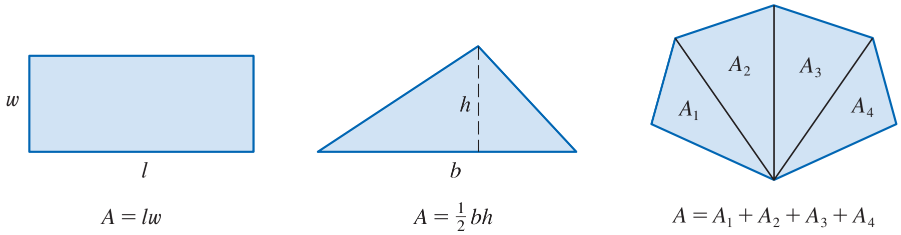
$S = \{(x, y) \mid a \leqslant x \leqslant b, 0 \leqslant y \leqslant f(x)\}$

In trying to solve the area problem we have to ask ourselves: what is the meaning of the word *area*? This question is easy to answer for regions with straight sides. For a rectangle, the area is defined as the product of the length and the width. The area of a triangle is half the base times the height. The area of a polygon is found by dividing it into triangles (as in Figure 2) and adding the areas of the triangles.



$A = lw$ $A = \frac{1}{2}bh$ $A = A_1 + A_2 + A_3 + A_4$

**FIGURE 2**

It isn't so easy, however, to find the area of a region with curved sides. We all have an intuitive idea of what the area of a region is. But part of the area problem is to make this intuitive idea precise by giving an exact definition of area.

Recall that in defining a tangent we first approximated the slope of the tangent line by slopes of secant lines and then we took the limit of these approximations. We pursue a similar idea for areas. We first approximate the region $S$ by rectangles and then we take the limit of the sum of the areas of the approximating rectangles as we increase the number of rectangles. The following example illustrates the procedure.

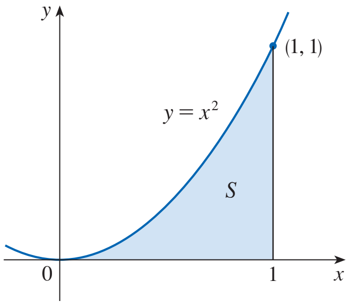


**FIGURE 3**

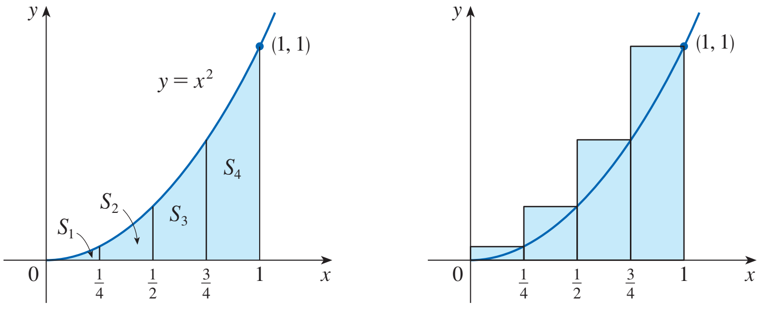
**EXAMPLE 1** Use rectangles to estimate the area under the parabola $y = x^2$ for $0 \leqslant x \leqslant 1$ (the parabolic region $S$ illustrated in Figure 3).

**SOLUTION** We first notice that the area of $S$ must be somewhere between 0 and 1 because $S$ is contained in a square with side length 1, but we can certainly do better than that. Suppose we divide $S$ into four strips $S_1$, $S_2$, $S_3$, and $S_4$ by drawing the vertical lines $x = \frac{1}{4}$, $x = \frac{1}{2}$, and $x = \frac{3}{4}$ as in Figure 4(a).



(a) (b)

**FIGURE 4**

We can approximate each strip by a rectangle that has the same base as the strip and whose height is the same as the right edge of the strip [see Figure 4(b)]. In other words, the heights of these rectangles are the values of the function $f(x) = x^2$ at the *right* endpoints of the subintervals $\left[0, \frac{1}{4}\right]$, $\left[\frac{1}{4}, \frac{1}{2}\right]$, $\left[\frac{1}{2}, \frac{3}{4}\right]$, and $\left[\frac{3}{4}, 1\right]$.

Each rectangle has width $\frac{1}{4}$ and the heights are $\left(\frac{1}{4}\right)^2$, $\left(\frac{1}{2}\right)^2$, $\left(\frac{3}{4}\right)^2$, and $1^2$. If we let $R_4$ be the sum of the areas of these approximating rectangles, we get

$$R_4 = \frac{1}{4} \cdot \left(\frac{1}{4}\right)^2 + \frac{1}{4} \cdot \left(\frac{1}{2}\right)^2 + \frac{1}{4} \cdot \left(\frac{3}{4}\right)^2 + \frac{1}{4} \cdot 1^2 = \frac{15}{32} = 0.46875$$

From Figure 4(b) we see that the area $A$ of $S$ is less than $R_4$, so

$$A < 0.46875$$

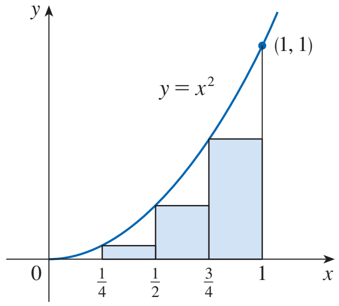

**FIGURE 5**

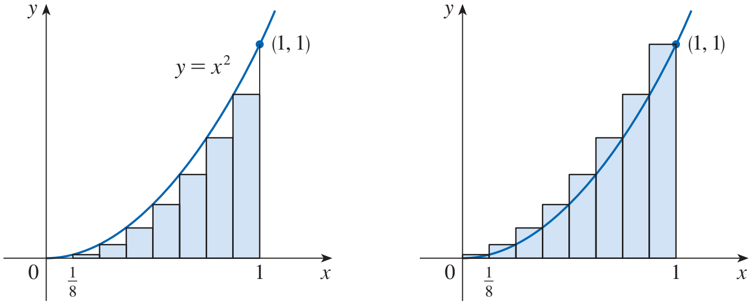
Instead of using the rectangles in Figure 4(b) we could use the smaller rectangles in Figure 5 whose heights are the values of $f$ at the *left* endpoints of the subintervals. (The leftmost rectangle has collapsed because its height is 0.) The sum of the areas of these approximating rectangles is

$$L_4 = \frac{1}{4} \cdot 0^2 + \frac{1}{4} \cdot \left(\frac{1}{4}\right)^2 + \frac{1}{4} \cdot \left(\frac{1}{2}\right)^2 + \frac{1}{4} \cdot \left(\frac{3}{4}\right)^2 = \frac{7}{32} = 0.21875$$

We see that the area of $S$ is larger than $L_4$, so we have lower and upper estimates for $A$:

$$0.21875 < A < 0.46875$$

We can repeat this procedure with a larger number of strips. Figure 6 shows what happens when we divide the region $S$ into eight strips of equal width.



(a) Using left endpoints

(b) Using right endpoints

**FIGURE 6**
Approximating $S$ with eight rectangles

By computing the sum of the areas of the smaller rectangles ($L_8$) and the sum of the areas of the larger rectangles ($R_8$), we obtain better lower and upper estimates for $A$:

$$0.2734375 < A < 0.3984375$$

So one possible answer to the question is to say that the true area of $S$ lies somewhere between 0.2734375 and 0.3984375.

| $n$ | $L_n$ | $R_n$ |
|---|---|---|
| 10 | 0.2850000 | 0.3850000 |
| 20 | 0.3087500 | 0.3587500 |
| 30 | 0.3168519 | 0.3501852 |
| 50 | 0.3234000 | 0.3434000 |
| 100 | 0.3283500 | 0.3383500 |
| 1000 | 0.3328335 | 0.3338335 |

We could obtain better estimates by increasing the number of strips. The table at the left shows the results of similar calculations (with a computer) using $n$ rectangles whose heights are found with left endpoints ($L_n$) or right endpoints ($R_n$). In particular, we see by using 50 strips that the area lies between 0.3234 and 0.3434. With 1000 strips we narrow it down even more: $A$ lies between 0.3328335 and 0.3338335. A good estimate is obtained by averaging these numbers: $A \approx 0.3333335$. ■

From the values listed in the table in Example 1, it looks as if $R_n$ is approaching $\frac{1}{3}$ as $n$ increases. We confirm this in the next example.

**EXAMPLE 2** For the region $S$ in Example 1, show that the approximating sums $R_n$ approach $\frac{1}{3}$, that is,

$$\lim_{n\to\infty} R_n = \tfrac{1}{3}$$

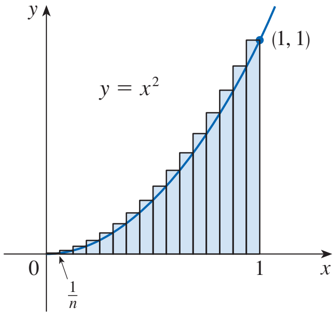


**FIGURE 7**

**SOLUTION** $R_n$ is the sum of the areas of the $n$ rectangles in Figure 7. Each rectangle has width $1/n$ and the heights are the values of the function $f(x) = x^2$ at the points $1/n, 2/n, 3/n, \ldots, n/n$; that is, the heights are $(1/n)^2, (2/n)^2, (3/n)^2, \ldots, (n/n)^2$. Thus

$$\begin{aligned}R_n &= \frac{1}{n} f\left(\frac{1}{n}\right) + \frac{1}{n} f\left(\frac{2}{n}\right) + \frac{1}{n} f\left(\frac{3}{n}\right) + \cdots + \frac{1}{n} f\left(\frac{n}{n}\right)\\ &= \frac{1}{n}\left(\frac{1}{n}\right)^2 + \frac{1}{n}\left(\frac{2}{n}\right)^2 + \frac{1}{n}\left(\frac{3}{n}\right)^2 + \cdots + \frac{1}{n}\left(\frac{n}{n}\right)^2\\ &= \frac{1}{n}\cdot\frac{1}{n^2}(1^2 + 2^2 + 3^2 + \cdots + n^2)\\ &= \frac{1}{n^3}(1^2 + 2^2 + 3^2 + \cdots + n^2)\end{aligned}$$

Here we need the formula for the sum of the squares of the first $n$ positive integers:

$$\boxed{1} \qquad 1^2 + 2^2 + 3^2 + \cdots + n^2 = \frac{n(n+1)(2n+1)}{6}$$

Perhaps you have seen this formula before. It is proved in Example 5 in Appendix E.

Putting Formula 1 into our expression for $R_n$, we get

$$R_n = \frac{1}{n^3}\cdot\frac{n(n+1)(2n+1)}{6} = \frac{(n+1)(2n+1)}{6n^2}$$

Here we are computing the limit of the sequence $\{R_n\}$. Sequences and their limits will be studied in detail in Section 11.1. The idea is very similar to a limit at infinity (Section 3.4) except that in writing $\lim_{n\to\infty}$ we restrict $n$ to be a positive integer. In particular, we know that

$$\lim_{n\to\infty}\frac{1}{n} = 0$$

When we write $\lim_{n\to\infty} R_n = \frac{1}{3}$ we mean that we can make $R_n$ as close to $\frac{1}{3}$ as we like by taking $n$ sufficiently large.

Thus we have

$$\begin{aligned}\lim_{n\to\infty} R_n &= \lim_{n\to\infty}\frac{(n+1)(2n+1)}{6n^2}\\ &= \lim_{n\to\infty}\frac{1}{6}\left(\frac{n+1}{n}\right)\left(\frac{2n+1}{n}\right)\\ &= \lim_{n\to\infty}\frac{1}{6}\left(1+\frac{1}{n}\right)\left(2+\frac{1}{n}\right)\\ &= \frac{1}{6}\cdot 1\cdot 2 = \frac{1}{3}\end{aligned}$$ ■

It can be shown that the approximating sums $L_n$ in Example 2 also approach $\frac{1}{3}$, that is,

$$\lim_{n\to\infty} L_n = \tfrac{1}{3}$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

From Figures 8 and 9 it appears that as $n$ increases, both $L_n$ and $R_n$ become better and better approximations to the area of $S$. Therefore we *define* the area $A$ to be the limit of the sums of the areas of the approximating rectangles, that is,

$$A = \lim_{n \to \infty} R_n = \lim_{n \to \infty} L_n = \tfrac{1}{3}$$

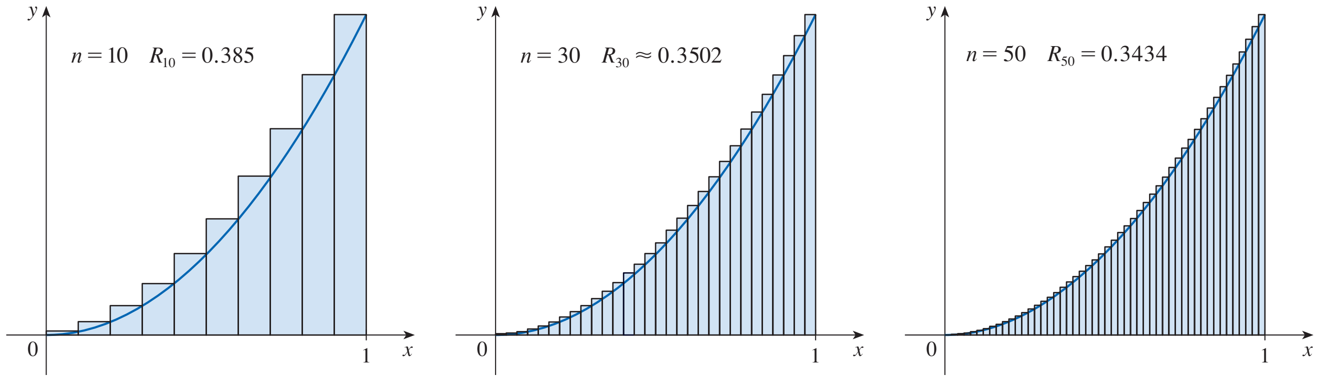

**FIGURE 8** Right endpoints produce upper estimates because $f(x) = x^2$ is increasing.

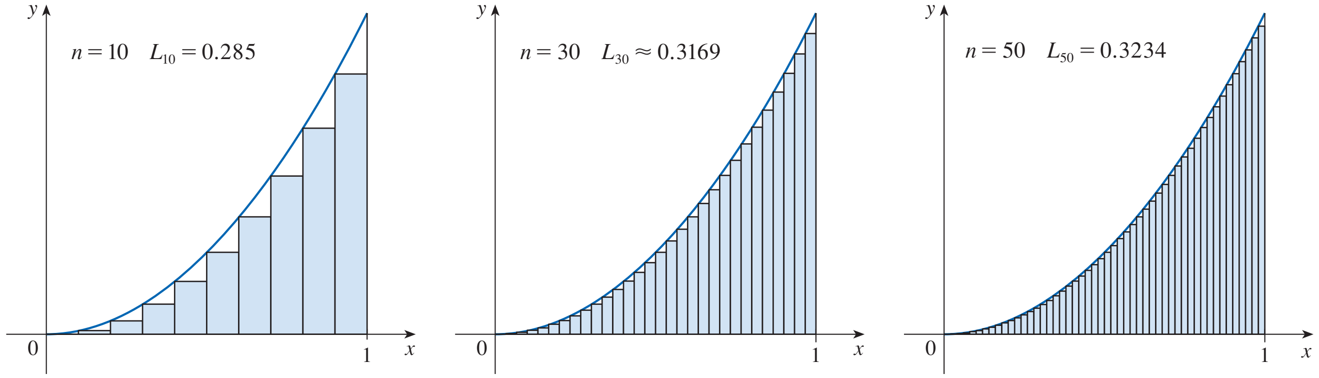

**FIGURE 9** Left endpoints produce lower estimates because $f(x) = x^2$ is increasing.

Let's apply the idea of Examples 1 and 2 to the more general region $S$ of Figure 1. We start by subdividing $S$ into $n$ strips $S_1, S_2, \ldots, S_n$ of equal width as in Figure 10.

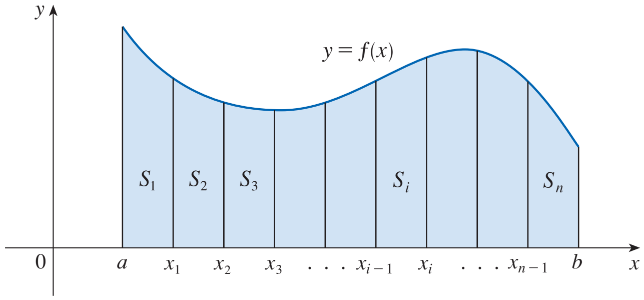

**FIGURE 10**

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The width of the interval $[a, b]$ is $b - a$, so the width of each of the $n$ strips is

$$\Delta x = \frac{b-a}{n}$$

These strips divide the interval $[a, b]$ into $n$ subintervals

$$[x_0, x_1], \quad [x_1, x_2], \quad [x_2, x_3], \quad \ldots, \quad [x_{n-1}, x_n]$$

where $x_0 = a$ and $x_n = b$. The right endpoints of the subintervals are

$$\begin{gathered} x_1 = a + \Delta x, \\ x_2 = a + 2\,\Delta x, \\ x_3 = a + 3\,\Delta x, \\ \vdots \end{gathered}$$

and, in general, $x_i = a + i\,\Delta x$. Now let's approximate the $i$th strip $S_i$ by a rectangle with width $\Delta x$ and height $f(x_i)$, which is the value of $f$ at the right endpoint (see Figure 11). Then the area of the $i$th rectangle is $f(x_i)\,\Delta x$. What we think of intuitively as the area of $S$ is approximated by the sum of the areas of these rectangles, which is

$$R_n = f(x_1)\,\Delta x + f(x_2)\,\Delta x + \cdots + f(x_n)\,\Delta x$$

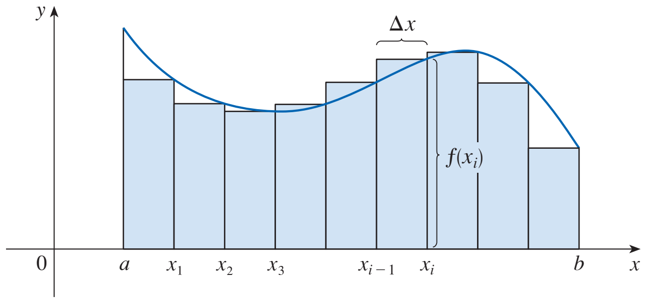

**FIGURE 11**

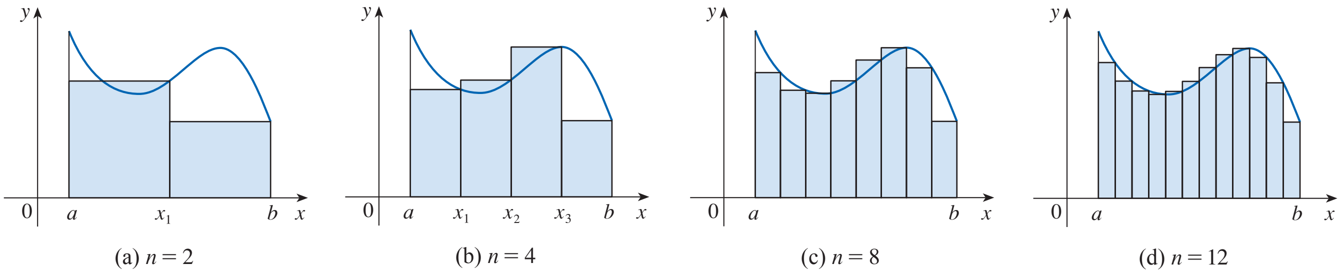
Figure 12 shows this approximation for $n = 2, 4, 8$, and 12. Notice that this approximation appears to become better and better as the number of strips increases, that is, as $n \to \infty$. Therefore we define the area $A$ of the region $S$ in the following way.



(a) $n = 2$ (b) $n = 4$ (c) $n = 8$ (d) $n = 12$

**FIGURE 12**

**2 Definitio** The **area** $A$ of the region $S$ that lies under the graph of the continuous function $f$ is the limit of the sum of the areas of approximating rectangles:

$$A = \lim_{n \to \infty} R_n = \lim_{n \to \infty} [f(x_1)\,\Delta x + f(x_2)\,\Delta x + \cdots + f(x_n)\,\Delta x]$$

It can be proved that the limit in Definition 2 always exists, since we are assuming that $f$ is continuous. It can also be shown that we get the same value if we use left endpoints:

$$\boxed{3} \qquad A = \lim_{n \to \infty} L_n = \lim_{n \to \infty} [f(x_0)\,\Delta x + f(x_1)\,\Delta x + \cdots + f(x_{n-1})\,\Delta x]$$

In fact, instead of using left endpoints or right endpoints, we could take the height of the $i$th rectangle to be the value of $f$ at *any* number $x_i^*$ in the $i$th subinterval $[x_{i-1}, x_i]$. We call the numbers $x_1^*, x_2^*, \ldots, x_n^*$ the **sample points**. Figure 13 shows approximating rectangles when the sample points are not chosen to be endpoints. So a more general expression for the area of $S$ is

$$\boxed{4} \qquad A = \lim_{n \to \infty} [f(x_1^*)\,\Delta x + f(x_2^*)\,\Delta x + \cdots + f(x_n^*)\,\Delta x]$$

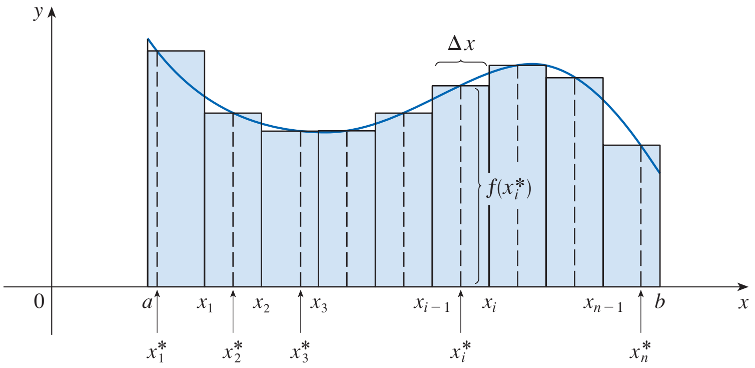

**FIGURE 13**

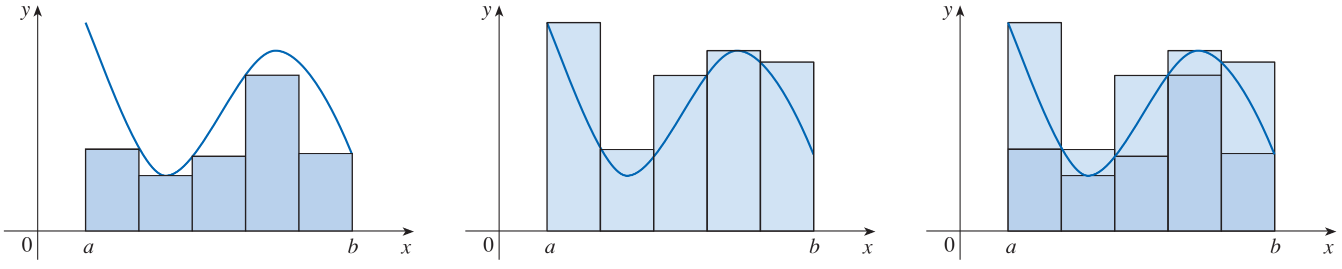
**NOTE** To approximate the area under the graph of $f$ we can form **lower sums** (or **upper sums**) by choosing the sample points $x_i^*$ so that $f(x_i^*)$ is the minimum (or maximum) value of $f$ on the $i$th subinterval (see Figure 14). [Since $f$ is continuous, we know that the minimum and maximum values of $f$ exist on each subinterval by the Extreme Value Theorem.] It can be shown that an equivalent definition of area is the following: *$A$ is the unique number that is smaller than all the upper sums and bigger than all the lower sums.*



(a) Lower sums (b) Upper sums (c) Upper and lower sums

**FIGURE 14**

We saw in Examples 1 and 2, for instance, that the area $\left(A = \frac{1}{3}\right)$ is trapped between all the left approximating sums $L_n$ and all the right approximating sums $R_n$. The function in those examples, $f(x) = x^2$, happens to be increasing on $[0, 1]$ and so the lower sums arise from left endpoints and the upper sums from right endpoints. (See Figures 8 and 9.)

We often use **sigma notation** to write sums with many terms more compactly. For instance,

$$\sum_{i=1}^{n} f(x_i)\,\Delta x = f(x_1)\,\Delta x + f(x_2)\,\Delta x + \cdots + f(x_n)\,\Delta x$$

This tells us to end with $i = n$.

This tells us to add.

$$\sum_{i=m}^{n} f(x_i)\,\Delta x$$

This tells us to start with $i = m$.

If you need practice with sigma notation, look at the examples and try some of the exercises in Appendix E.

So the expressions for area in Equations 2, 3, and 4 can be written as follows:

$$A = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i)\,\Delta x$$

$$A = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_{i-1})\,\Delta x$$

$$A = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i^*)\,\Delta x$$

We can also rewrite Formula 1 in the following way:

$$\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$$

**EXAMPLE 3** Let $A$ be the area of the region that lies under the graph of $f(x) = \cos x$ between $x = 0$ and $x = b$, where $0 \leqslant b \leqslant \pi/2$.

(a) Using right endpoints, find an expression for $A$ as a limit. Do not evaluate the limit.
(b) Estimate the area for the case $b = \pi/2$ by taking the sample points to be midpoints and using four subintervals.

**SOLUTION**
(a) Since $a = 0$, the width of a subinterval is

$$\Delta x = \frac{b-0}{n} = \frac{b}{n}$$

So $x_1 = b/n$, $x_2 = 2b/n$, $x_3 = 3b/n$, $x_i = ib/n$, and $x_n = nb/n$. The sum of the areas of the approximating rectangles is

$$\begin{aligned} R_n &= f(x_1)\,\Delta x + f(x_2)\,\Delta x + \cdots + f(x_n)\,\Delta x \\ &= (\cos x_1)\,\Delta x + (\cos x_2)\,\Delta x + \cdots + (\cos x_n)\,\Delta x \\ &= \left(\cos\frac{b}{n}\right)\frac{b}{n} + \left(\cos\frac{2b}{n}\right)\frac{b}{n} + \cdots + \left(\cos\frac{nb}{n}\right)\frac{b}{n} \end{aligned}$$

According to Definition 2, the area is

$$A = \lim_{n\to\infty} R_n = \lim_{n\to\infty} \frac{b}{n}\left(\cos\frac{b}{n} + \cos\frac{2b}{n} + \cos\frac{3b}{n} + \cdots + \cos\frac{nb}{n}\right)$$

Using sigma notation we could write

$$A = \lim_{n\to\infty} \frac{b}{n} \sum_{i=1}^{n} \cos\frac{ib}{n}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

It is very difficult to evaluate this limit directly by hand, but with the aid of a computer algebra system it isn't hard (see Exercise 33). In Section 4.3 we will be able to find $A$ more easily using a different method.

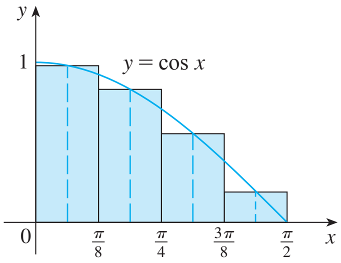


**FIGURE 15**

(b) With $n = 4$ and $b = \pi/2$ we have $\Delta x = (\pi/2)/4 = \pi/8$, so the subintervals are $[0, \pi/8]$, $[\pi/8, \pi/4]$, $[\pi/4, 3\pi/8]$, and $[3\pi/8, \pi/2]$. The midpoints of these subintervals are

$$x_1^* = \frac{\pi}{16} \qquad x_2^* = \frac{3\pi}{16} \qquad x_3^* = \frac{5\pi}{16} \qquad x_4^* = \frac{7\pi}{16}$$

and the sum $M_4$ of the areas of the four approximating rectangles (see Figure 15) is

$$\begin{aligned} M_4 &= \sum_{i=1}^{4} f(x_i^*)\,\Delta x \\ &= f(\pi/16)\,\Delta x + f(3\pi/16)\,\Delta x + f(5\pi/16)\,\Delta x + f(7\pi/16)\,\Delta x \\ &= \left(\cos\frac{\pi}{16}\right)\frac{\pi}{8} + \left(\cos\frac{3\pi}{16}\right)\frac{\pi}{8} + \left(\cos\frac{5\pi}{16}\right)\frac{\pi}{8} + \left(\cos\frac{7\pi}{16}\right)\frac{\pi}{8} \\ &= \frac{\pi}{8}\left(\cos\frac{\pi}{16} + \cos\frac{3\pi}{16} + \cos\frac{5\pi}{16} + \cos\frac{7\pi}{16}\right) \approx 1.006 \end{aligned}$$

So an estimate for the area is

$$A \approx 1.006$$

■

## ■ The Distance Problem

In Section 1.4 we considered the *velocity problem:* find the velocity of a moving object at a given instant if the distance of the object (from a starting point) is known at all times. Now let's consider the *distance problem:* find the distance traveled by an object during a certain time period if the velocity of the object is known at all times. (In a sense this is the inverse problem of the velocity problem.) If the velocity remains constant, then the distance problem is easy to solve by means of the formula

$$\text{distance} = \text{velocity} \times \text{time}$$

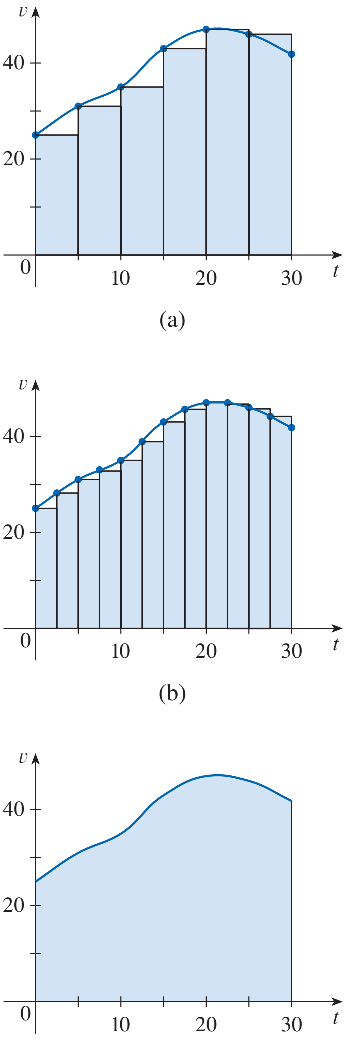
But if the velocity varies, it's not so easy to find the distance traveled. We investigate the problem in the following example.

**EXAMPLE 4** Suppose the odometer on our car is broken and we want to estimate the distance driven over a 30-second time interval. We take speedometer readings every five seconds and record them in the following table:

| Time (s) | 0 | 5 | 10 | 15 | 20 | 25 | 30 |
|---|---|---|---|---|---|---|---|
| Velocity (mi/h) | 17 | 21 | 24 | 29 | 32 | 31 | 28 |

In order to have the time and the velocity in consistent units, let's convert the velocity readings to feet per second (1 mi/h = 5280/3600 ft/s):

| Time (s) | 0 | 5 | 10 | 15 | 20 | 25 | 30 |
|---|---|---|---|---|---|---|---|
| Velocity (ft/s) | 25 | 31 | 35 | 43 | 47 | 45 | 41 |



(a)

(b)

(c)

**FIGURE 16**

During the first five seconds the velocity doesn't change very much, so we can estimate the distance traveled during that time by assuming that the velocity is constant. If we take the velocity during that time interval to be the initial velocity (25 ft/s), then we obtain the approximate distance traveled during the first five seconds:

$$25 \text{ ft/s} \times 5 \text{ s} = 125 \text{ ft}$$

Similarly, during the second time interval the velocity is approximately constant and we take it to be the velocity when $t = 5$ s. So our estimate for the distance traveled from $t = 5$ s to $t = 10$ s is

$$31 \text{ ft/s} \times 5 \text{ s} = 155 \text{ ft}$$

If we add similar estimates for the other time intervals, we obtain an estimate for the total distance traveled:

$$(25 \times 5) + (31 \times 5) + (35 \times 5) + (43 \times 5) + (47 \times 5) + (45 \times 5) = 1130 \text{ ft}$$

We could just as well have used the velocity at the *end* of each time period instead of the velocity at the beginning as our assumed constant velocity. Then our estimate becomes

$$(31 \times 5) + (35 \times 5) + (43 \times 5) + (47 \times 5) + (45 \times 5) + (41 \times 5) = 1210 \text{ ft}$$

Now let's sketch an approximate graph of the velocity function of the car along with rectangles whose heights are the initial velocities for each time interval [see Figure 16(a)]. The area of the first rectangle is $25 \times 5 = 125$, which is also our estimate for the distance traveled in the first five seconds. In fact, the area of each rectangle can be interpreted as a distance because the height represents velocity and the width represents time. The sum of the areas of the rectangles in Figure 16(a) is $L_6 = 1130$, which is our initial estimate for the total distance traveled.

If we want a more accurate estimate, we could take velocity readings more often, as illustrated in Figure 16(b). You can see that the more velocity readings we take, the closer the sum of the areas of the rectangles gets to the exact area under the velocity curve [see Figure 16(c)]. This suggests that the total distance traveled is equal to the area under the velocity graph. ■

In general, suppose an object moves with velocity $v = f(t)$, where $a \leqslant t \leqslant b$ and $f(t) \geqslant 0$ (so the object always moves in the positive direction). We take velocity readings at times $t_0 \, (= a), t_1, t_2, \ldots, t_n \, (= b)$ so that the velocity is approximately constant on each subinterval. If these times are equally spaced, then the time between consecutive readings is $\Delta t = (b - a)/n$. During the first time interval the velocity is approximately $f(t_0)$ and so the distance traveled is approximately $f(t_0)\,\Delta t$. Similarly, the distance traveled during the second time interval is about $f(t_1)\,\Delta t$ and the total distance traveled during the time interval $[a, b]$ is approximately

$$f(t_0)\,\Delta t + f(t_1)\,\Delta t + \cdots + f(t_{n-1})\,\Delta t = \sum_{i=1}^{n} f(t_{i-1})\,\Delta t$$

If we use the velocity at right endpoints instead of left endpoints, our estimate for the total distance becomes

$$f(t_1)\,\Delta t + f(t_2)\,\Delta t + \cdots + f(t_n)\,\Delta t = \sum_{i=1}^{n} f(t_i)\,\Delta t$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The more frequently we measure the velocity, the more accurate our estimates become, so it seems plausible that the *exact* distance $d$ traveled is the *limit* of such expressions:

$$\boxed{5} \qquad d = \lim_{n\to\infty} \sum_{i=1}^{n} f(t_{i-1})\,\Delta t = \lim_{n\to\infty} \sum_{i=1}^{n} f(t_i)\,\Delta t$$

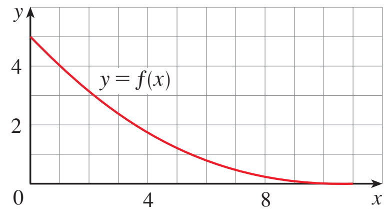
We will see in Section 4.4 that this is indeed true.

Because Equation 5 has the same form as our expressions for area in Equations 2 and 3, it follows that the distance traveled is equal to the area under the graph of the velocity function. In Chapters 5 and 8 we will see that other quantities of interest in the natural and social sciences—such as the work done by a variable force or the cardiac output of the heart—can also be interpreted as the area under a curve. So when we compute areas in this chapter, bear in mind that they can be interpreted in a variety of practical ways.

## 4.1 Exercises

**1.** (a) By reading values from the given graph of $f$, use five rectangles to find a lower estimate and an upper estimate for the area under the given graph of $f$ from $x = 0$ to $x = 10$. In each case sketch the rectangles that you use.

(b) Find new estimates using ten rectangles in each case.



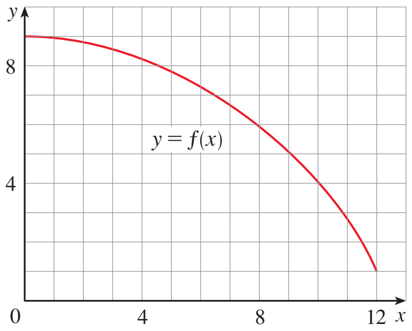
**2.** (a) Use six rectangles to find estimates of each type for the area under the given graph of $f$ from $x = 0$ to $x = 12$.

(i) $L_6$ (sample points are left endpoints)
(ii) $R_6$ (sample points are right endpoints)
(iii) $M_6$ (sample points are midpoints)

(b) Is $L_6$ an underestimate or overestimate of the true area?

(c) Is $R_6$ an underestimate or overestimate of the true area?

(d) Which of the numbers $L_6$, $R_6$, or $M_6$ gives the best estimate? Explain.



**3.** (a) Estimate the area under the graph of $f(x) = 1/x$ from $x = 1$ to $x = 2$ using four approximating rectangles and right endpoints. Sketch the graph and the rectangles. Is your estimate an underestimate or an overestimate?

(b) Repeat part (a) using left endpoints.

**4.** (a) Estimate the area under the graph of $f(x) = \sin x$ from $x = 0$ to $x = \pi/2$ using four approximating rectangles and right endpoints. Sketch the graph and the rectangles. Is your estimate an underestimate or an overestimate?

(b) Repeat part (a) using left endpoints.

**5.** (a) Estimate the area under the graph of $f(x) = 1 + x^2$ from $x = -1$ to $x = 2$ using three rectangles and right endpoints. Then improve your estimate by using six rectangles. Sketch the curve and the approximating rectangles.

(b) Repeat part (a) using left endpoints.

(c) Repeat part (a) using midpoints.

(d) From your sketches in parts (a)–(c), which estimate appears to be the most accurate?

**6.** (a) Graph the function

$$f(x) = 1/(1 + x^2) \qquad -2 \leqslant x \leqslant 2$$

(b) Estimate the area under the graph of $f$ using four approximating rectangles and taking the sample points to be (i) right endpoints and (ii) midpoints. In each case sketch the curve and the rectangles.

(c) Improve your estimates in part (b) by using eight rectangles.

**7.** Evaluate the upper and lower sums for $f(x) = 6 - x^2$, $-2 \leqslant x \leqslant 2$, with $n = 2$, 4, and 8. Illustrate with diagrams like Figure 14.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**8.** Evaluate the upper and lower sums for

$$f(x) = 1 + \cos(x/2) \qquad -\pi \leqslant x \leqslant \pi$$

with $n = 3$, 4, and 6. Illustrate with diagrams like Figure 14.

**9.** The speed of a runner increased steadily during the first three seconds of a race. Her speed at half-second intervals is given in the table. Find lower and upper estimates for the distance that she traveled during these three seconds.

| $t$ (s) | 0 | 0.5 | 1.0 | 1.5 | 2.0 | 2.5 | 3.0 |
|---|---|---|---|---|---|---|---|
| $v$ (ft/s) | 0 | 6.2 | 10.8 | 14.9 | 18.1 | 19.4 | 20.2 |

**10.** The table shows speedometer readings at 10-second intervals during a 1-minute period for a car racing at the Daytona International Speedway in Florida.

(a) Estimate the distance the race car traveled during this time period using the velocities at the beginning of the time intervals.

(b) Give another estimate using the velocities at the end of the time periods.

(c) Are your estimates in parts (a) and (b) upper and lower estimates? Explain.

| Time(s) | Velocity (mi/h) |
|---|---|
| 0 | 182.9 |
| 10 | 168.0 |
| 20 | 106.6 |
| 30 | 99.8 |
| 40 | 124.5 |
| 50 | 176.1 |
| 60 | 175.6 |

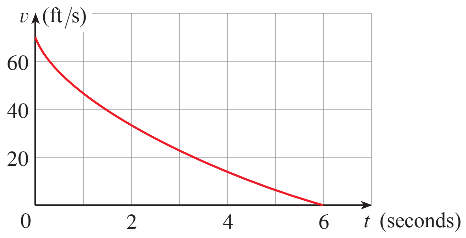
**11.** Oil leaked from a tank at a rate of $r(t)$ liters per hour. The rate decreased as time passed and values of the rate at two-hour time intervals are shown in the table. Find lower and upper estimates for the total amount of oil that leaked out.

| $t$ (h) | 0 | 2 | 4 | 6 | 8 | 10 |
|---|---|---|---|---|---|---|
| $r(t)$ (L/h) | 8.7 | 7.6 | 6.8 | 6.2 | 5.7 | 5.3 |

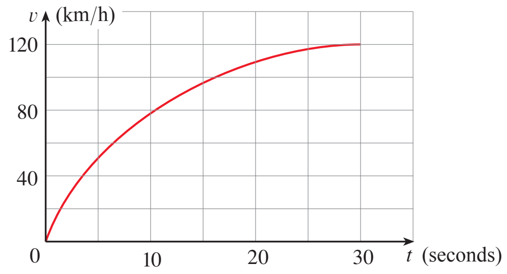
**12.** When we estimate distances from velocity data, it is sometimes necessary to use times $t_0, t_1, t_2, t_3, \ldots$ that are not equally spaced. We can still estimate distances using the time periods $\Delta t_i = t_i - t_{i-1}$. For example, in 1992 the space shuttle *Endeavour* was launched on mission STS-49 in order to install a new perigee kick motor in an Intelsat communications satellite. The table, provided by NASA, gives the velocity data for the shuttle between liftoff and the jettisoning of the solid rocket boosters. Use these data to estimate the height above the earth's surface of the *Endeavour*, 62 seconds after liftoff.

| Event | Time (s) | Velocity (ft/s) |
|---|---|---|
| Launch | 0 | 0 |
| Begin roll maneuver | 10 | 185 |
| End roll maneuver | 15 | 319 |
| Throttle to 89% | 20 | 447 |
| Throttle to 67% | 32 | 742 |
| Throttle to 104% | 59 | 1325 |
| Maximum dynamic pressure | 62 | 1445 |
| Solid rocket booster separation | 125 | 4151 |

**13.** The velocity graph of a braking car is shown. Use it to estimate the distance traveled by the car while the brakes are applied.



**14.** The velocity graph of a car accelerating from rest to a speed of 120 km/h over a period of 30 seconds is shown. Estimate the distance traveled during this period.



**15.** In a person infected with measles, the virus level $N$ (measured in number of infected cells per mL of blood plasma) reaches a peak density at about $t = 12$ days (when a rash appears) and then decreases fairly rapidly as a result of immune response. The area under the graph of $N(t)$ from $t = 0$ to $t = 12$ (as shown in the figure) is equal to the total amount of infection needed to develop symptoms (measured in density of infected cells × time). The function $N$ has been modeled by the function

$$f(t) = -t(t - 21)(t + 1)$$

Use this model with six subintervals and their midpoints to

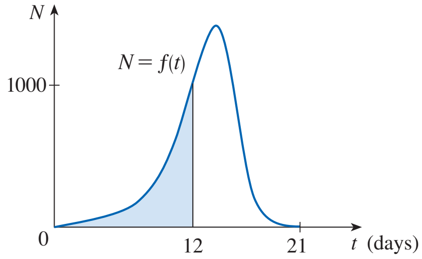
estimate the total amount of infection needed to develop symptoms of measles.



*Source:* J. M. Heffernan et al., "An In-Host Model of Acute Infection: Measles as a Case Study," *Theoretical Population Biology* 73 (2006): 134–47.

**16–19** Use Definition 2 to find an expression for the area under the graph of $f$ as a limit. Do not evaluate the limit.

**16.** $f(x) = \dfrac{2x}{x^2 + 1}, \quad 1 \leqslant x \leqslant 3$

**17.** $f(x) = 2 + \sin^2 x, \quad 0 \leqslant x \leqslant \pi$

**18.** $f(x) = x^2 + \sqrt{1 + 2x}, \quad 4 \leqslant x \leqslant 7$

**19.** $f(x) = x\sqrt{x^3 + 8}, \quad 1 \leqslant x \leqslant 5$

---

**20–23** Determine a region whose area is equal to the given limit. Do not evaluate the limit.

**20.** $\displaystyle \lim_{n\to\infty} \sum_{i=1}^{n} \frac{1}{n}\left(\frac{i}{n}\right)^5$

**21.** $\displaystyle \lim_{n\to\infty} \sum_{i=1}^{n} \frac{2}{n}\,\frac{1}{1 + (2i/n)}$

**22.** $\displaystyle \lim_{n\to\infty} \sum_{i=1}^{n} \frac{3}{n}\sqrt{1 + \frac{3i}{n}}$

**23.** $\displaystyle \lim_{n\to\infty} \sum_{i=1}^{n} \frac{\pi}{4n} \tan \frac{i\pi}{4n}$

---

**24.** (a) Use Definition 2 to express the area under the curve $y = x^3$ from 0 to 1 as a limit.

(b) The following formula for the sum of the cubes of the first $n$ integers is proved in Appendix E. Use it to evaluate the limit in part (a).

$$1^3 + 2^3 + 3^3 + \cdots + n^3 = \left[\frac{n(n + 1)}{2}\right]^2$$

**25.** Let $A$ be the area under the graph of an increasing continuous function $f$ from $a$ to $b$, and let $L_n$ and $R_n$ be the approximations to $A$ with $n$ subintervals using left and right endpoints, respectively.

(a) How are $A$, $L_n$, and $R_n$ related?

(b) Show that

$$R_n - L_n = \frac{b - a}{n}[f(b) - f(a)]$$

Then draw a diagram to illustrate this equation by showing that the $n$ rectangles representing $R_n - L_n$ can be reassembled to form a single rectangle whose area is the right-hand side of the equation.

(c) Deduce that

$$R_n - A < \frac{b - a}{n}[f(b) - f(a)]$$

**26.** If $A$ is the area under the curve $y = \sin x$ from 0 to $\pi/2$, use Exercise 25 to find a value of $n$ such that $R_n - A < 0.0001$.

T **27–28** With a programmable calculator (or a computer), it is possible to evaluate the expressions for the sums of areas of approximating rectangles, even for large values of $n$, using looping. (On a TI use the Is> command or a For-EndFor loop, on a Casio use Isz, on an HP or in BASIC use a FOR-NEXT loop.) Compute the sum of the areas of approximating rectangles using equal subintervals and right endpoints for $n = 10$, 30, 50, and 100. Then guess the value of the exact area.

**27.** The region under $y = x^4$ from 0 to 1

**28.** The region under $y = \cos x$ from 0 to $\pi/2$

---

T **29–30** Some computer algebra systems have commands that will draw approximating rectangles and evaluate the sums of their areas, at least if $x_i^*$ is a left or right endpoint. (For instance, in Maple use `leftbox`, `rightbox`, `leftsum`, and `rightsum`.)

**29.** Let $f(x) = 1/(x^2 + 1)$, $0 \leqslant x \leqslant 1$.

(a) Find the left and right sums for $n = 10$, 30, and 50.

(b) Illustrate by graphing the rectangles in part (a).

(c) Show that the exact area under $f$ lies between 0.780 and 0.791.

**30.** Let $f(x) = x/(x + 2)$, $1 \leqslant x \leqslant 4$.

(a) Find the left and right sums for $n = 10$, 30, and 50.

(b) Illustrate by graphing the rectangles in part (a).

(c) Show that the exact area under $f$ lies between 1.603 and 1.624.

---

T **31.** (a) Express the area under the curve $y = x^5$ for $0 \leqslant x \leqslant 2$ as a limit.

(b) Use a computer algebra system to find the sum in your expression from part (a).

(c) Evaluate the limit in part (a).

T **32.** (a) Express the area under the curve $y = x^4 + 5x^2 + x$ for $2 \leqslant x \leqslant 7$ as a limit.

(b) Use a computer algebra system to evaluate the sum in part (a).

(c) Use a computer algebra system to find the exact area by evaluating the limit of the expression in part (b).

T **33.** Find the exact area under the cosine curve $y = \cos x$ from $x = 0$ to $x = b$, where $0 \leqslant b \leqslant \pi/2$. (Use a computer algebra system both to evaluate the sum and compute the limit.) In particular, what is the area if $b = \pi/2$?

**34.** (a) Let $A_n$ be the area of a polygon with $n$ equal sides inscribed in a circle with radius $r$. By dividing the polygon into $n$ congruent triangles with central angle $2\pi/n$, show that

$$A_n = \tfrac{1}{2}nr^2 \sin \frac{2\pi}{n}$$

(b) Show that $\lim_{n\to\infty} A_n = \pi r^2$. [*Hint:* Use Equation 2.4.5.]

## 4.2 The Definite Integral

We saw in Section 4.1 that a limit of the form

$$\boxed{1} \qquad \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i^*)\,\Delta x = \lim_{n\to\infty} [f(x_1^*)\,\Delta x + f(x_2^*)\,\Delta x + \cdots + f(x_n^*)\,\Delta x]$$

arises when we compute an area. We also saw that it arises when we try to find the distance traveled by an object. It turns out that this same type of limit occurs in a wide variety of situations even when $f$ is not necessarily a positive function. In Chapters 5 and 8 we will see that limits of this type also arise in finding lengths of curves, volumes of solids, centers of mass, force due to water pressure, and work, as well as other quantities.

### ■ The Definite Integral

We give limits of the form (1) a special name and notation.

**2 Definition of a Definite Integral** If $f$ is a function defined for $a \leqslant x \leqslant b$, we divide the interval $[a, b]$ into $n$ subintervals of equal width $\Delta x = (b - a)/n$. We let $x_0\ (= a), x_1, x_2, \ldots, x_n\ (= b)$ be the endpoints of these subintervals and we let $x_1^*, x_2^*, \ldots, x_n^*$ be any **sample points** in these subintervals, so $x_i^*$ lies in the $i$th subinterval $[x_{i-1}, x_i]$. Then the **definite integral of *f* from *a* to *b*** is

$$\int_a^b f(x)\,dx = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i^*)\,\Delta x$$

provided that this limit exists and gives the same value for all possible choices of sample points. If it does exist, we say that $f$ is **integrable** on $[a, b]$.

The precise meaning of the limit that defines the integral is as follows:

For every number $\varepsilon > 0$ there is an integer $N$ such that

$$\left| \int_a^b f(x)\,dx - \sum_{i=1}^{n} f(x_i^*)\,\Delta x \right| < \varepsilon$$

for every integer $n > N$ and for every choice of $x_i^*$ in $[x_{i-1}, x_i]$.

**NOTE 1** The symbol $\int$ was introduced by Leibniz and is called an **integral sign**. It is an elongated $S$ and was chosen because an integral is a limit of sums. In the notation $\int_a^b f(x)\,dx$, $f(x)$ is called the **integrand** and $a$ and $b$ are called the **limits of integration**; $a$ is the **lower limit** and $b$ is the **upper limit**. For now, the symbol $dx$ has no meaning by itself; $\int_a^b f(x)\,dx$ is all one symbol. The $dx$ simply indicates that the independent variable is $x$. The procedure of calculating an integral is called **integration**.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**NOTE 2** The definite integral $\int_a^b f(x)\,dx$ is a number; it does not depend on $x$. In fact, we could use any letter in place of $x$ without changing the value of the integral:

$$\int_a^b f(x)\,dx = \int_a^b f(t)\,dt = \int_a^b f(r)\,dr$$

**NOTE 3** The sum

$$\sum_{i=1}^{n} f(x_i^*)\,\Delta x$$

that occurs in Definition 2 is called a **Riemann sum** after the German mathematician Bernhard Riemann (1826–1866). So Definition 2 says that the definite integral of an integrable function can be approximated to within any desired degree of accuracy by a Riemann sum.

**Riemann**

Bernhard Riemann received his Ph.D. under the direction of the legendary Gauss at the University of Göttingen and remained there to teach. Gauss, who was not in the habit of praising other mathematicians, spoke of Riemann's "creative, active, truly mathematical mind and gloriously fertile originality." The definition (2) of an integral that we use is due to Riemann. He also made major contributions to the theory of functions of a complex variable, mathematical physics, number theory, and the foundations of geometry. Riemann's broad concept of space and geometry turned out to be the right setting, 50 years later, for Einstein's general relativity theory. Riemann's health was poor throughout his life, and he died of tuberculosis at the age of 39.

We know that if $f$ happens to be positive, then the Riemann sum can be interpreted as a sum of areas of approximating rectangles (see Figure 1). By comparing Definition 2 with the definition of area in Section 4.1, we see that the definite integral $\int_a^b f(x)\,dx$ can be interpreted as the area under the curve $y = f(x)$ from $a$ to $b$. (See Figure 2.)

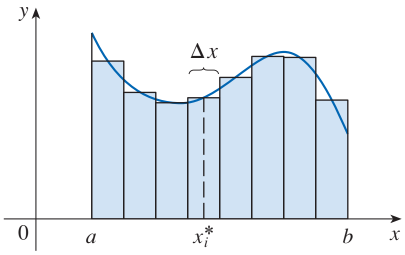

**FIGURE 1**
If $f(x) \geqslant 0$, the Riemann sum $\sum f(x_i^*)\,\Delta x$ is the sum of areas of rectangles.

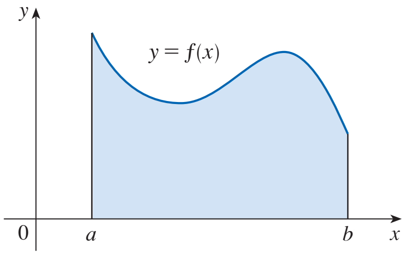

**FIGURE 2**
If $f(x) \geqslant 0$, the integral $\int_a^b f(x)\,dx$ is the area under the curve $y = f(x)$ from $a$ to $b$.

If $f$ takes on both positive and negative values, as in Figure 3, then the Riemann sum is the sum of the areas of the rectangles that lie above the $x$-axis and the *negatives* of the areas of the rectangles that lie below the $x$-axis (the areas of the blue rectangles *minus* the areas of the gold rectangles). When we take the limit of such Riemann sums, we get the situation illustrated in Figure 4. A definite integral can be interpreted as a **net area**, that is, a difference of areas:

$$\int_a^b f(x)\,dx = A_1 - A_2$$

where $A_1$ is the area of the region above the $x$-axis and below the graph of $f$, and $A_2$ is the area of the region below the $x$-axis and above the graph of $f$.

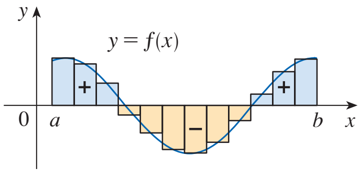

**FIGURE 3**
$\sum f(x_i^*)\,\Delta x$ is an approximation to the net area.

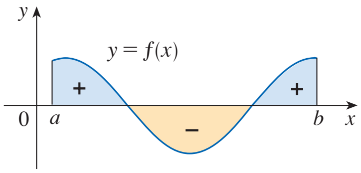

**FIGURE 4**
$\int_a^b f(x)\,dx$ is the net area.

**EXAMPLE 1** Evaluate the Riemann sum for $f(x) = x^3 - 6x$, $0 \leqslant x \leqslant 3$, with $n = 6$ subintervals and taking the sample endpoints to be right endpoints.

**SOLUTION**

With $n = 6$ subintervals, the interval width is $\Delta x = (3 - 0)/6 = \frac{1}{2}$ and the right endpoints are

$$x_1 = 0.5 \qquad x_2 = 1.0 \qquad x_3 = 1.5 \qquad x_4 = 2.0 \qquad x_5 = 2.5 \qquad x_6 = 3.0$$

So the Riemann sum is

$$\begin{aligned} R_6 &= \sum_{i=1}^{6} f(x_i)\,\Delta x \\ &= f(0.5)\,\Delta x + f(1.0)\,\Delta x + f(1.5)\,\Delta x + f(2.0)\,\Delta x + f(2.5)\,\Delta x + f(3.0)\,\Delta x \\ &= \tfrac{1}{2}(-2.875 - 5 - 5.625 - 4 + 0.625 + 9) \\ &= -3.9375 \end{aligned}$$

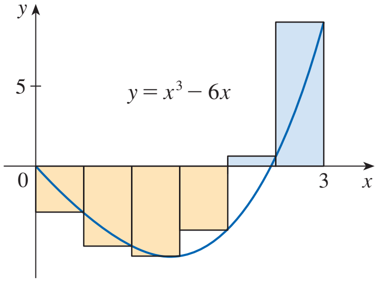

**FIGURE 5**

Notice that $f$ is not a positive function and so the Riemann sum does not represent a sum of areas of rectangles. But it does represent the sum of the areas of the blue rectangles (above the $x$-axis) minus the sum of the areas of the gold rectangles (below the $x$-axis) in Figure 5. ■

**NOTE 4** Although we have defined $\int_a^b f(x)\,dx$ by dividing $[a, b]$ into subintervals of equal width, there are situations in which it is advantageous to work with subintervals of unequal width. For instance, in Exercise 4.1.12, NASA provided velocity data at times that were not equally spaced, but we were still able to estimate the distance traveled. And there are methods for numerical integration that take advantage of unequal subintervals. If the subinterval widths are $\Delta x_1, \Delta x_2, \ldots, \Delta x_n$, we have to ensure that all these widths approach 0 in the limiting process. This happens if the largest width, $\max \Delta x_i$, approaches 0. So in this case the definition of a definite integral becomes

$$\int_a^b f(x)\,dx = \lim_{\max \Delta x_i \to 0} \sum_{i=1}^{n} f(x_i^*)\,\Delta x_i$$

We have defined the definite integral for an integrable function, but not all functions are integrable (see Exercises 81–82). The following theorem shows that the most commonly occurring functions are in fact integrable. The theorem is proved in more advanced courses.

**3 Theorem** If $f$ is continuous on $[a, b]$, or if $f$ has only a finite number of jump discontinuities, then $f$ is integrable on $[a, b]$; that is, the definite integral $\int_a^b f(x)\,dx$ exists.

If $f$ is integrable on $[a, b]$, then the limit in Definition 2 exists and gives the same value no matter how we choose the sample points $x_i^*$. To simplify the calculation of the integral we often take the sample points to be right endpoints. Then $x_i^* = x_i$ and the definition of an integral simplifies as follows.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**4 Theorem** If $f$ is integrable on $[a, b]$, then

$$\int_a^b f(x)\,dx = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i)\,\Delta x$$

where $$\Delta x = \frac{b-a}{n} \quad \text{and} \quad x_i = a + i\,\Delta x$$

**EXAMPLE 2** Express

$$\lim_{n\to\infty} \sum_{i=1}^{n} (x_i^3 + x_i \sin x_i)\,\Delta x$$

as an integral on the interval $[0, \pi]$.

**SOLUTION** Comparing the given limit with the limit in Theorem 4, we see that they will be identical if we choose $f(x) = x^3 + x \sin x$. We are given that $a = 0$ and $b = \pi$. Therefore, by Theorem 4 we have

$$\lim_{n\to\infty} \sum_{i=1}^{n} (x_i^3 + x_i \sin x_i)\,\Delta x = \int_0^{\pi} (x^3 + x \sin x)\,dx$$ ■

Later, when we apply the definite integral to physical situations, it will be important to recognize limits of sums as integrals, as we did in Example 2. When Leibniz chose the notation for an integral, he chose the ingredients as reminders of the limiting process. In general, when we write

$$\lim_{n\to\infty} \sum_{i=1}^{n} f(x_i^*)\,\Delta x = \int_a^b f(x)\,dx$$

we replace $\lim \Sigma$ by $\int$, $x_i^*$ by $x$, and $\Delta x$ by $dx$.

## Evaluating Definite Integrals

In order to use a limit to evaluate a definite integral, we need to know how to work with sums. The following four equations give formulas for sums of powers of positive integers. Equation 6 may be familiar to you from a course in algebra. Equations 7 and 8 were discussed in Section 4.1 and are proved in Appendix E.

**Sums of Powers**

**5** $$\sum_{i=1}^{n} 1 = n$$

**6** $$\sum_{i=1}^{n} i = \frac{n(n+1)}{2}$$

**7** $$\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$$

**8** $$\sum_{i=1}^{n} i^3 = \left[\frac{n(n+1)}{2}\right]^2$$

The remaining formulas are simple rules for working with sigma notation:

**Properties of Sums**

**9** $$\sum_{i=1}^{n} ca_i = c\sum_{i=1}^{n} a_i$$

**10** $$\sum_{i=1}^{n} (a_i + b_i) = \sum_{i=1}^{n} a_i + \sum_{i=1}^{n} b_i$$

**11** $$\sum_{i=1}^{n} (a_i - b_i) = \sum_{i=1}^{n} a_i - \sum_{i=1}^{n} b_i$$

Formulas 9–11 are proved by writing out each side in expanded form. The left side of Equation 9 is

$$ca_1 + ca_2 + \cdots + ca_n$$

The right side is

$$c(a_1 + a_2 + \cdots + a_n)$$

These are equal by the distributive property. The other formulas are discussed in Appendix E.

In the next example we calculate a definite integral of the function $f$ from Example 1.

**EXAMPLE 3** Evaluate $\int_0^3 (x^3 - 6x)\,dx$.

**SOLUTION** We use Theorem 4. We have $f(x) = x^3 - 6x$, $a = 0$, $b = 3$, and

$$\Delta x = \frac{b-a}{n} = \frac{3-0}{n} = \frac{3}{n}$$

Then the endpoints of the subintervals are $x_0 = 0$, $x_1 = 0 + 1(3/n) = 3/n$, $x_2 = 0 + 2(3/n) = 6/n$, $x_3 = 0 + 3(3/n) = 9/n$, and in general,

$$x_i = 0 + i\left(\frac{3}{n}\right) = \frac{3i}{n}$$

Thus

In the sum, $n$ is a constant (unlike $i$), so we can move $3/n$ in front of the $\Sigma$ sign.

$$\begin{aligned}
\int_0^3 (x^3 - 6x)\,dx &= \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i)\,\Delta x = \lim_{n\to\infty} \sum_{i=1}^{n} f\left(\frac{3i}{n}\right)\frac{3}{n} \\
&= \lim_{n\to\infty} \frac{3}{n} \sum_{i=1}^{n} \left[\left(\frac{3i}{n}\right)^3 - 6\left(\frac{3i}{n}\right)\right] && \text{(Equation 9 with } c = 3/n\text{)} \\
&= \lim_{n\to\infty} \frac{3}{n} \sum_{i=1}^{n} \left[\frac{27}{n^3} i^3 - \frac{18}{n} i\right] \\
&= \lim_{n\to\infty} \left[\frac{81}{n^4} \sum_{i=1}^{n} i^3 - \frac{54}{n^2} \sum_{i=1}^{n} i\right] && \text{(Equations 11 and 9)} \\
&= \lim_{n\to\infty} \left\{\frac{81}{n^4}\left[\frac{n(n+1)}{2}\right]^2 - \frac{54}{n^2}\,\frac{n(n+1)}{2}\right\} && \text{(Equations 8 and 6)} \\
&= \lim_{n\to\infty} \left[\frac{81}{4}\left(1 + \frac{1}{n}\right)^2 - 27\left(1 + \frac{1}{n}\right)\right] \\
&= \frac{81}{4} - 27 = -\frac{27}{4} = -6.75
\end{aligned}$$

This integral can't be interpreted as an area because $f$ takes on both positive and negative values. But it can be interpreted as the difference of areas $A_1 - A_2$, where $A_1$ and $A_2$ are shown in Figure 6. ■

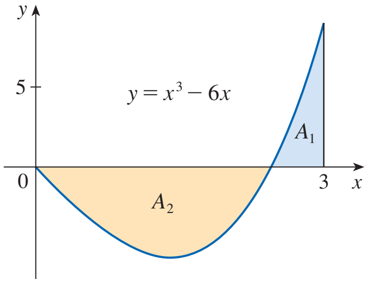

**FIGURE 6**
$\int_0^3 (x^3 - 6x)\,dx = A_1 - A_2 = -6.75$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Figure 7 illustrates the calculation in Example 3 by showing the positive and negative terms in the right Riemann sum $R_n$ for $n = 40$. The values in the table show the Riemann sums approaching the exact value of the integral, $-6.75$, as $n \to \infty$.

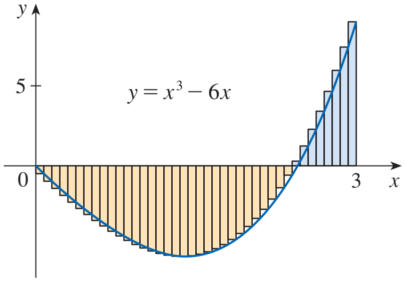

**FIGURE 7**
$R_{40} \approx -6.3998$

| $n$ | $R_n$ |
|---|---|
| 40 | $-6.3998$ |
| 100 | $-6.6130$ |
| 500 | $-6.7229$ |
| 1000 | $-6.7365$ |
| 5000 | $-6.7473$ |

A much simpler method (made possible by the Fundamental Theorem of Calculus) for evaluating integrals like the one in Example 3 will be given in Section 4.3.

Because $f(x) = x^4$ is positive, the integral in Example 4 represents the area shown in Figure 8.

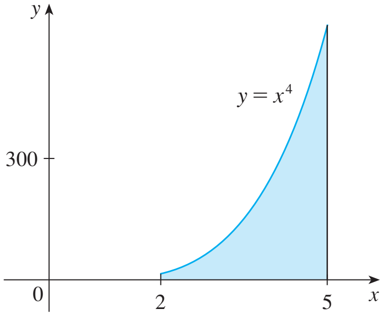

**FIGURE 8**

**EXAMPLE 4**

(a) Set up an expression for $\int_2^5 x^4\,dx$ as a limit of sums.

(b) Use a computer algebra system to evaluate the expression.

**SOLUTION**

(a) Here we have $f(x) = x^4$, $a = 2$, $b = 5$, and

$$\Delta x = \frac{b-a}{n} = \frac{3}{n}$$

$x_0 = 2$, $x_1 = 2 + 3/n$, $x_2 = 2 + 6/n$, $x_3 = 2 + 9/n$, and

$$x_i = 2 + \frac{3i}{n}$$

From Theorem 4, we get

$$\int_2^5 x^4\,dx = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i)\,\Delta x = \lim_{n\to\infty} \sum_{i=1}^{n} f\left(2 + \frac{3i}{n}\right)\frac{3}{n}$$

$$= \lim_{n\to\infty} \frac{3}{n} \sum_{i=1}^{n} \left(2 + \frac{3i}{n}\right)^4$$

(b) If we ask a computer algebra system to evaluate the sum and simplify, we obtain

$$\sum_{i=1}^{n} \left(2 + \frac{3i}{n}\right)^4 = \frac{2062n^4 + 3045n^3 + 1170n^2 - 27}{10n^3}$$

Now we ask the computer algebra system to evaluate the limit:

$$\int_2^5 x^4\,dx = \lim_{n\to\infty} \frac{3}{n} \sum_{i=1}^{n} \left(2 + \frac{3i}{n}\right)^4 = \lim_{n\to\infty} \frac{3(2062n^4 + 3045n^3 + 1170n^2 - 27)}{10n^4}$$

$$= \frac{3(2062)}{10} = \frac{3093}{5} = 618.6$$

■

**EXAMPLE 5** Evaluate the following integrals by interpreting each in terms of areas.

(a) $\int_0^1 \sqrt{1 - x^2}\, dx$   (b) $\int_0^3 (x - 1)\, dx$

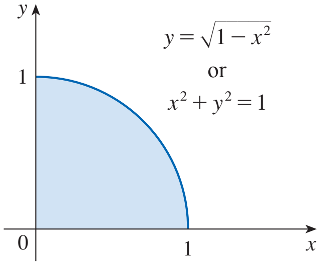

**FIGURE 9**

**SOLUTION**

(a) Since $f(x) = \sqrt{1 - x^2} \geqslant 0$, we can interpret this integral as the area under the curve $y = \sqrt{1 - x^2}$ from 0 to 1. But, because $y^2 = 1 - x^2$, we get $x^2 + y^2 = 1$, which shows that the graph of $f$ is the quarter-circle with radius 1 in Figure 9. Therefore

$$\int_0^1 \sqrt{1 - x^2}\, dx = \tfrac{1}{4}\pi(1)^2 = \frac{\pi}{4}$$

(In Section 7.3 we will be able to *prove* that the area of a circle of radius $r$ is $\pi r^2$.)

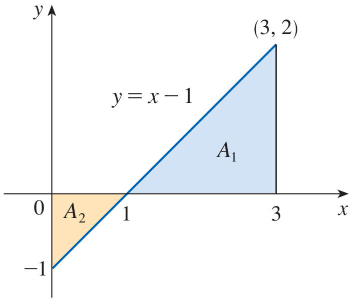

**FIGURE 10**

(b) The graph of $y = x - 1$ is the line with slope 1 shown in Figure 10. We compute the integral as the difference of the areas of the two triangles:

$$\int_0^3 (x - 1)\, dx = A_1 - A_2 = \tfrac{1}{2}(2 \cdot 2) - \tfrac{1}{2}(1 \cdot 1) = 1.5$$ ■

## ■ The Midpoint Rule

We often choose the sample point $x_i^*$ to be the right endpoint of the $i$th subinterval because it is convenient for computing the limit. But if the purpose is to find an *approximation* to an integral, it is usually better to choose $x_i^*$ to be the midpoint of the interval, which we denote by $\overline{x}_i$. Any Riemann sum is an approximation to an integral, but if we use midpoints we get the following approximation.

**Midpoint Rule**

$$\int_a^b f(x)\, dx \approx \sum_{i=1}^{n} f(\overline{x}_i)\, \Delta x = \Delta x\, [f(\overline{x}_1) + \cdots + f(\overline{x}_n)]$$

where $\Delta x = \dfrac{b - a}{n}$

and $\overline{x}_i = \tfrac{1}{2}(x_{i-1} + x_i) = \text{midpoint of } [x_{i-1}, x_i]$

**EXAMPLE 6** Use the Midpoint Rule with $n = 5$ to approximate $\int_1^2 \frac{1}{x}\, dx$.

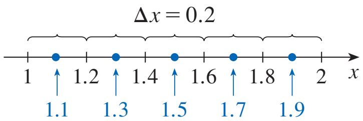

**FIGURE 11**
The endpoints and midpoints of the subintervals used in Example 6

**SOLUTION** The endpoints of the five subintervals are 1, 1.2, 1.4, 1.6, 1.8, and 2.0, so the midpoints are 1.1, 1.3, 1.5, 1.7, and 1.9. (See Figure 11.) The width of the subintervals is $\Delta x = (2 - 1)/5 = \frac{1}{5}$, so the Midpoint Rule gives

$$\int_1^2 \frac{1}{x}\, dx \approx \Delta x\, [f(1.1) + f(1.3) + f(1.5) + f(1.7) + f(1.9)]$$

$$= \frac{1}{5}\left(\frac{1}{1.1} + \frac{1}{1.3} + \frac{1}{1.5} + \frac{1}{1.7} + \frac{1}{1.9}\right)$$

$$\approx 0.691908$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

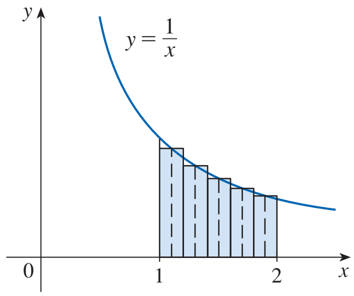

**FIGURE 12**

Since $f(x) = 1/x > 0$ for $1 \leqslant x \leqslant 2$, the integral represents an area, and the approximation given by the Midpoint Rule is the sum of the areas of the rectangles shown in Figure 12. ■

At the moment we don't know how accurate the approximation in Example 6 is, but in Section 7.7 we will learn a method for estimating the error involved in using the Midpoint Rule. At that time we will discuss other methods for approximating definite integrals.

If we apply the Midpoint Rule to the integral in Example 3, we get the picture in Figure 13. The approximation $M_{40} \approx -6.7563$ is much closer to the true value $-6.75$ than the right endpoint approximation, $R_{40} \approx -6.3998$, shown in Figure 7.

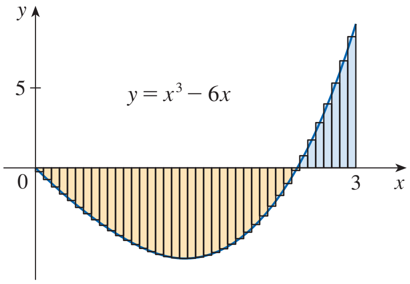

**FIGURE 13**
$M_{40} \approx -6.7563$

## ■ Properties of the Definite Integral

When we defined the definite integral $\int_a^b f(x)\,dx$, we implicitly assumed that $a < b$. But the definition as a limit of Riemann sums makes sense even if $a > b$. Notice that if we interchange $a$ and $b$, then $\Delta x$ changes from $(b - a)/n$ to $(a - b)/n$. Therefore

$$\boxed{\int_b^a f(x)\,dx = -\int_a^b f(x)\,dx}$$

If $a = b$, then $\Delta x = 0$ and so

$$\boxed{\int_a^a f(x)\,dx = 0}$$

We now develop some basic properties of integrals that will help us to evaluate integrals in a simple manner. We assume that $f$ and $g$ are continuous functions.

### Properties of the Integral

**1.** $\int_a^b c\,dx = c(b - a)$, where $c$ is any constant

**2.** $\int_a^b [f(x) + g(x)]\,dx = \int_a^b f(x)\,dx + \int_a^b g(x)\,dx$

**3.** $\int_a^b cf(x)\,dx = c\int_a^b f(x)\,dx$, where $c$ is any constant

**4.** $\int_a^b [f(x) - g(x)]\,dx = \int_a^b f(x)\,dx - \int_a^b g(x)\,dx$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Property 1 says that the integral of a constant function $f(x) = c$ is the constant times the length of the interval. If $c > 0$ and $a < b$, this is to be expected because $c(b - a)$ is the area of the shaded rectangle in Figure 14.

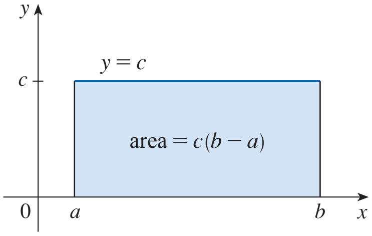

**FIGURE 14**
$\int_a^b c\,dx = c(b - a)$

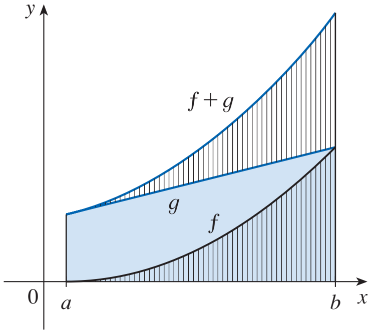

**FIGURE 15**
$\int_a^b [f(x) + g(x)]\,dx = \int_a^b f(x)\,dx + \int_a^b g(x)\,dx$

Property 2 says that the integral of a sum is the sum of the integrals. For positive functions it says that the area under $f + g$ is the area under $f$ plus the area under $g$. Figure 15 helps us understand why this is true: in view of how graphical addition works, the corresponding vertical line segments have equal height.

In general, Property 2 follows from Theorem 4 and the fact that the limit of a sum is the sum of the limits:

$$\begin{aligned}\int_a^b [f(x) + g(x)]\,dx &= \lim_{n\to\infty} \sum_{i=1}^{n} [f(x_i) + g(x_i)]\,\Delta x \\ &= \lim_{n\to\infty} \left[\sum_{i=1}^{n} f(x_i)\,\Delta x + \sum_{i=1}^{n} g(x_i)\,\Delta x\right] \\ &= \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i)\,\Delta x + \lim_{n\to\infty} \sum_{i=1}^{n} g(x_i)\,\Delta x \\ &= \int_a^b f(x)\,dx + \int_a^b g(x)\,dx\end{aligned}$$

Property 3 seems intuitively reasonable because we know that multiplying a function by a positive number $c$ stretches or shrinks its graph vertically by a factor of $c$. So it stretches or shrinks each approximating rectangle by a factor of $c$ and therefore it has the effect of multiplying the area by $c$.

Property 3 can be proved in a similar manner and says that the integral of a constant times a function is the constant times the integral of the function. In other words, a constant (but *only* a constant) can be taken in front of an integral sign. Property 4 is proved by writing $f - g = f + (-g)$ and using Properties 2 and 3 with $c = -1$.

**EXAMPLE 7** Use the properties of integrals to evaluate $\int_0^1 (4 + 3x^2)\,dx$.

**SOLUTION** Using Properties 2 and 3 of integrals, we have

$$\int_0^1 (4 + 3x^2)\,dx = \int_0^1 4\,dx + \int_0^1 3x^2\,dx = \int_0^1 4\,dx + 3\int_0^1 x^2\,dx$$

We know from Property 1 that

$$\int_0^1 4\,dx = 4(1 - 0) = 4$$

and we found in Example 4.1.2 that $\int_0^1 x^2\,dx = \frac{1}{3}$. So

$$\begin{aligned}\int_0^1 (4 + 3x^2)\,dx &= \int_0^1 4\,dx + 3\int_0^1 x^2\,dx \\ &= 4 + 3 \cdot \tfrac{1}{3} = 5\end{aligned}$$ ■

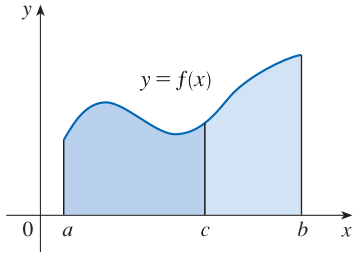

**FIGURE 16**

The next property tells us how to combine integrals of the same function over adjacent intervals.

**5.** $$\int_a^c f(x)\,dx + \int_c^b f(x)\,dx = \int_a^b f(x)\,dx$$

This is not easy to prove in general, but for the case where $f(x) \geqslant 0$ and $a < c < b$ Property 5 can be seen from the geometric interpretation in Figure 16: the area under $y = f(x)$ from $a$ to $c$ plus the area from $c$ to $b$ is equal to the total area from $a$ to $b$.

**EXAMPLE 8** If it is known that $\int_0^{10} f(x)\,dx = 17$ and $\int_0^8 f(x)\,dx = 12$, find $\int_8^{10} f(x)\,dx$.

**SOLUTION** By Property 5, we have

$$\int_0^8 f(x)\,dx + \int_8^{10} f(x)\,dx = \int_0^{10} f(x)\,dx$$

so $$\int_8^{10} f(x)\,dx = \int_0^{10} f(x)\,dx - \int_0^8 f(x)\,dx = 17 - 12 = 5$$ ■

Properties 1–5 are true whether $a < b$, $a = b$, or $a > b$. The following properties, in which we compare sizes of functions and sizes of integrals, are true only if $a \leqslant b$.

**Comparison Properties of the Integral**

**6.** If $f(x) \geqslant 0$ for $a \leqslant x \leqslant b$, then $\int_a^b f(x)\,dx \geqslant 0$.

**7.** If $f(x) \geqslant g(x)$ for $a \leqslant x \leqslant b$, then $\int_a^b f(x)\,dx \geqslant \int_a^b g(x)\,dx$.

**8.** If $m \leqslant f(x) \leqslant M$ for $a \leqslant x \leqslant b$, then

$$m(b - a) \leqslant \int_a^b f(x)\,dx \leqslant M(b - a)$$

If $f(x) \geqslant 0$, then $\int_a^b f(x)\,dx$ represents the area under the graph of $f$, so the geometric interpretation of Property 6 is simply that areas are positive. (It also follows directly from the definition because all the quantities involved are positive.) Property 7 says that a bigger function has a bigger integral. It follows from Properties 6 and 4 because $f - g \geqslant 0$.

Property 8 is illustrated by Figure 17 for the case where $f(x) \geqslant 0$. If $f$ is continuous, we could take $m$ and $M$ to be the absolute minimum and maximum values of $f$ on the interval $[a, b]$. In this case Property 8 says that the area under the graph of $f$ is greater than the area of the rectangle with height $m$ and less than the area of the rectangle with height $M$.

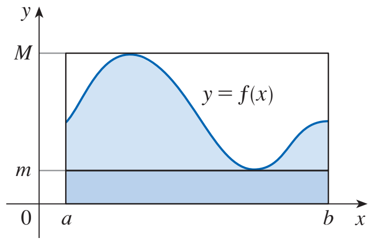

**FIGURE 17**

**PROOF OF PROPERTY 8** Since $m \leqslant f(x) \leqslant M$, Property 7 gives

$$\int_a^b m\,dx \leqslant \int_a^b f(x)\,dx \leqslant \int_a^b M\,dx$$

Using Property 1 to evaluate the integrals on the left and right sides, we obtain

$$m(b - a) \leqslant \int_a^b f(x)\,dx \leqslant M(b - a)$$ ■

Property 8 is useful when all we want is a rough estimate of the size of an integral without going to the bother of using the Midpoint Rule.

**EXAMPLE 9** Use Property 8 to estimate $\int_1^4 \sqrt{x}\, dx$.

**SOLUTION** Since $f(x) = \sqrt{x}$ is an increasing function, its absolute minimum on $[1, 4]$ is $m = f(1) = 1$ and its absolute maximum on $[1, 4]$ is $M = f(4) = \sqrt{4} = 2$. Thus Property 8 gives

$$1(4 - 1) \leqslant \int_1^4 \sqrt{x}\, dx \leqslant 2(4 - 1)$$

or

$$3 \leqslant \int_1^4 \sqrt{x}\, dx \leqslant 6 \qquad ■$$

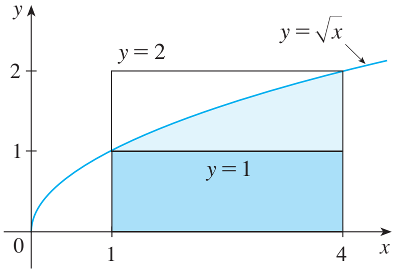

**FIGURE 18**

The result of Example 9 is illustrated in Figure 18. The area under $y = \sqrt{x}$ from $x = 1$ to $x = 4$ is greater than the area of the lower rectangle and less than the area of the large rectangle.

## 4.2 Exercises

**1.** Evaluate the Riemann sum for $f(x) = x - 1$, $-6 \leqslant x \leqslant 4$, with five subintervals, taking the sample points to be right endpoints. Explain, with the aid of a diagram, what the Riemann sum represents.

**2.** If

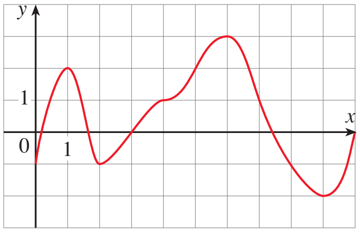
$$f(x) = \cos x \qquad 0 \leqslant x \leqslant 3\pi/4$$

evaluate the Riemann sum with $n = 6$, taking the sample points to be left endpoints. (Give your answer correct to six decimal places.) What does the Riemann sum represent? Illustrate with a diagram.

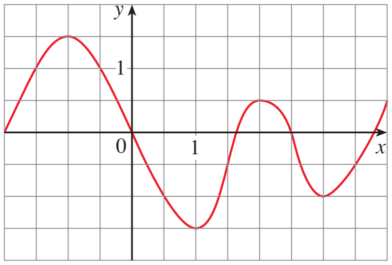
**3.** If $f(x) = x^2 - 4$, $0 \leqslant x \leqslant 3$, evaluate the Riemann sum with $n = 6$, taking the sample points to be midpoints. What does the Riemann sum represent? Illustrate with a diagram.

**4.** (a) Evaluate the Riemann sum for $f(x) = 1/x$, $1 \leqslant x \leqslant 2$, with four terms, taking the sample points to be right endpoints. (Give your answer correct to six decimal places.) Explain what the Riemann sum represents with the aid of a sketch.
(b) Repeat part (a) with midpoints as the sample points.

**5.** The graph of a function $f$ is given. Estimate $\int_0^{10} f(x)\, dx$ using five subintervals with (a) right endpoints, (b) left endpoints, and (c) midpoints.



**6.** The graph of a function $g$ is shown. Estimate $\int_{-2}^{4} g(x)\, dx$ with six subintervals using (a) right endpoints, (b) left endpoints, and (c) midpoints.



**7.** A table of values of an increasing function $f$ is shown. Use the table to find lower and upper estimates for $\int_{10}^{30} f(x)\, dx$.

| $x$ | 10 | 14 | 18 | 22 | 26 | 30 |
|---|---|---|---|---|---|---|
| $f(x)$ | $-12$ | $-6$ | $-2$ | 1 | 3 | 8 |

**8.** The table gives the values of a function obtained from an experiment. Use them to estimate $\int_3^9 f(x)\, dx$ using three equal subintervals with (a) right endpoints, (b) left endpoints, and (c) midpoints. If the function is known to be an increasing function, can you say whether your estimates are less than or greater than the exact value of the integral?

| $x$ | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
|---|---|---|---|---|---|---|---|
| $f(x)$ | $-3.4$ | $-2.1$ | $-0.6$ | 0.3 | 0.9 | 1.4 | 1.8 |

**9–10** Use the Midpoint Rule with $n = 4$ to approximate the integral.

**9.** $\int_0^8 x^2\,dx$

**10.** $\int_0^2 (8x + 3)\,dx$

**11–14** Use the Midpoint Rule with the given value of $n$ to approximate the integral. Round the answer to four decimal places.

**11.** $\int_0^8 \sin\sqrt{x}\,dx, \quad n = 4$

**12.** $\int_0^1 \sqrt{x^3 + 1}\,dx, \quad n = 5$

**13.** $\int_1^3 \frac{x}{x^2 + 8}\,dx, \quad n = 5$

**14.** $\int_0^{\pi} x\sin^2 x\,dx, \quad n = 4$

T **15.** Use a computer algebra system that evaluates midpoint approximations and graphs the corresponding rectangles (use `RiemannSum` or `middlesum` and `middlebox` commands in Maple) to check the answer to Exercise 13 and illustrate with a graph. Then repeat with $n = 10$ and $n = 20$.

T **16.** Use a computer algebra system to compute the left and right Riemann sums for the function $f(x) = x/(x + 1)$ on the interval $[0, 2]$ with $n = 100$. Explain why these estimates show that

$$0.8946 < \int_0^2 \frac{x}{x + 1}\,dx < 0.9081$$

T **17.** Use a calculator or computer to make a table of values of right Riemann sums $R_n$ for the integral $\int_0^{\pi} \sin x\,dx$ with $n = 5$, 10, 50, and 100. What value do these numbers appear to be approaching?

T **18.** Use a calculator or computer to make a table of values of left and right Riemann sums $L_n$ and $R_n$ for the integral $\int_0^2 \sqrt{1 + x^4}\,dx$ with $n = 5$, 10, 50, and 100. Between what two numbers must the value of the integral lie? Can you make a similar statement for the integral $\int_{-1}^2 \sqrt{1 + x^4}\,dx$? Explain.

**19–22** Express the limit as a definite integral on the given interval.

**19.** $\lim_{n\to\infty} \sum_{i=1}^{n} \frac{\sin x_i}{1 + x_i}\,\Delta x, \quad [0, \pi]$

**20.** $\lim_{n\to\infty} \sum_{i=1}^{n} x_i\sqrt{1 + x_i^3}\,\Delta x, \quad [2, 5]$

**21.** $\lim_{n\to\infty} \sum_{i=1}^{n} [5(x_i^*)^3 - 4x_i^*]\,\Delta x, \quad [2, 7]$

**22.** $\lim_{n\to\infty} \sum_{i=1}^{n} \frac{x_i^*}{(x_i^*)^2 + 4}\,\Delta x, \quad [1, 3]$

**23–24** Show that the definite integral is equal to $\lim_{n\to\infty} R_n$ and then evaluate the limit.

**23.** $\int_0^4 (x - x^2)\,dx, \quad R_n = \frac{4}{n}\sum_{i=1}^{n}\left[\frac{4i}{n} - \frac{16i^2}{n^2}\right]$

**24.** $\int_1^3 (x^3 + 5x^2)\,dx, \quad R_n = \frac{2}{n}\sum_{i=1}^{n}\left[6 + \frac{26i}{n} + \frac{32i^2}{n^2} + \frac{8i^3}{n^3}\right]$

**25–26** Express the integral as a limit of Riemann sums using right endpoints. Do not evaluate the limit.

**25.** $\int_1^3 \sqrt{4 + x^2}\,dx$

**26.** $\int_2^5 \left(x^2 + \frac{1}{x}\right) dx$

**27–34** Use the form of the definition of the integral given in Theorem 4 to evaluate the integral.

**27.** $\int_0^2 3x\,dx$

**28.** $\int_0^3 x^2\,dx$

**29.** $\int_0^3 (5x + 2)\,dx$

**30.** $\int_0^4 (6 - x^2)\,dx$

**31.** $\int_1^5 (3x^2 + 7x)\,dx$

**32.** $\int_{-1}^2 (4x^2 + x + 2)\,dx$

**33.** $\int_0^1 (x^3 - 3x^2)\,dx$

**34.** $\int_0^2 (2x - x^3)\,dx$

**35.** The graph of $f$ is shown. Evaluate each integral by interpreting it in terms of areas.

(a) $\int_0^2 f(x)\,dx$

(b) $\int_0^5 f(x)\,dx$

(c) $\int_5^7 f(x)\,dx$

(d) $\int_3^7 f(x)\,dx$

(e) $\int_3^7 |f(x)|\,dx$

(f) $\int_2^0 f(x)\,dx$

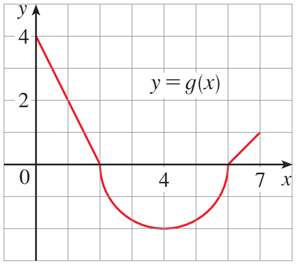
**36.** The graph of $g$ consists of two straight lines and a semicircle. Evaluate each integral by interpreting it in terms of areas.

(a) $\int_0^2 g(x)\,dx$ (b) $\int_2^6 g(x)\,dx$ (c) $\int_0^7 g(x)\,dx$



**37–38**

(a) Use the form of the definition of the integral given in Theorem 4 to evaluate the given integral.

(b) Confirm your answer to part (a) graphically by interpreting the integral in terms of areas.

**37.** $\int_0^3 4x\,dx$ **38.** $\int_{-1}^4 \left(2 - \frac{1}{2}x\right) dx$

**39–40**

(a) Find an approximation to the integral using a Riemann sum with right endpoints and $n = 8$.

(b) Draw a diagram like Figure 3 to illustrate the approximation in part (a).

(c) Use Theorem 4 to evaluate the integral.

(d) Interpret the integral in part (c) as a difference of areas and illustrate with a diagram like Figure 4.

**39.** $\int_0^8 (3 - 2x)\,dx$ **40.** $\int_0^4 (x^2 - 3x)\,dx$

**41–46** Evaluate the integral by interpreting it in terms of areas.

**41.** $\int_{-2}^5 (10 - 5x)\,dx$ **42.** $\int_{-1}^3 (2x - 1)\,dx$

**43.** $\int_{-4}^3 \left|\frac{1}{2}x\right| dx$ **44.** $\int_0^1 |2x - 1|\,dx$

**45.** $\int_{-3}^0 \left(1 + \sqrt{9 - x^2}\right) dx$ **46.** $\int_{-4}^4 \left(2x - \sqrt{16 - x^2}\right) dx$

**47.** Prove that $\displaystyle\int_a^b x\,dx = \frac{b^2 - a^2}{2}$.

**48.** Prove that $\displaystyle\int_a^b x^2\,dx = \frac{b^3 - a^3}{3}$.

**T** **49–50** Express the integral as a limit of sums. Then evaluate, using a computer algebra system to find both the sum and the limit.

**49.** $\int_0^\pi \sin 5x\,dx$ **50.** $\int_2^{10} x^6\,dx$

**51.** Evaluate $\int_1^1 \sqrt{1 + x^4}\,dx$.

**52.** Given that $\int_0^\pi \sin^4 x\,dx = \frac{3}{8}\pi$, what is $\int_\pi^0 \sin^4\theta\,d\theta$?

**53.** In Example 4.1.2 we showed that $\int_0^1 x^2\,dx = \frac{1}{3}$. Use this fact and the properties of integrals to evaluate $\int_0^1 (5 - 6x^2)\,dx$.

**54.** Use the properties of integrals and the result of Example 4 to evaluate $\int_2^5 (1 + 3x^4)\,dx$.

**55.** Use the results of Exercises 47 and 48 and the properties of integrals to evaluate $\int_1^4 (2x^2 - 3x + 1)\,dx$.

**56.** Use the result of Exercise 47 and the fact that $\int_0^{\pi/2} \cos x\,dx = 1$ (from Exercise 4.1.33), together with the properties of integrals, to evaluate $\int_0^{\pi/2} (2\cos x - 5x)\,dx$.

**57.** Write as a single integral in the form $\int_a^b f(x)\,dx$:

$$\int_{-2}^2 f(x)\,dx + \int_2^5 f(x)\,dx - \int_{-2}^{-1} f(x)\,dx$$

**58.** If $\int_2^8 f(x)\,dx = 7.3$ and $\int_2^4 f(x)\,dx = 5.9$, find $\int_4^8 f(x)\,dx$.

**59.** If $\int_0^9 f(x)\,dx = 37$ and $\int_0^9 g(x)\,dx = 16$, find

$$\int_0^9 [2f(x) + 3g(x)]\,dx$$

**60.** Find $\int_0^5 f(x)\,dx$ if

$$f(x) = \begin{cases} 3 & \text{for } x < 3 \\ x & \text{for } x \geqslant 3 \end{cases}$$

**61.** For the function $f$ whose graph is shown, list the following quantities in increasing order, from smallest to largest, and explain your reasoning.

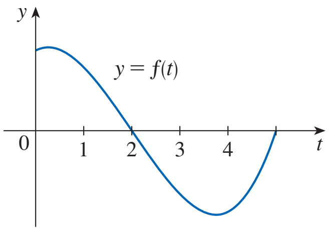
(A) $\int_0^8 f(x)\,dx$ (B) $\int_0^3 f(x)\,dx$ (C) $\int_3^8 f(x)\,dx$

(D) $\int_4^8 f(x)\,dx$ (E) $f'(1)$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

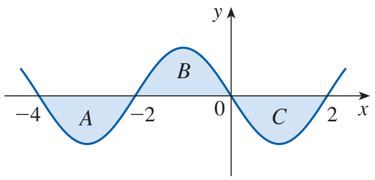
**62.** If $F(x) = \int_2^x f(t)\,dt$, where $f$ is the function whose graph is given, which of the following values is largest?

(A) $F(0)$ (B) $F(1)$ (C) $F(2)$
(D) $F(3)$ (E) $F(4)$



**63.** Each of the regions $A$, $B$, and $C$ bounded by the graph of $f$ and the $x$-axis has area 3. Find the value of

$$\int_{-4}^{2} [f(x) + 2x + 5]\,dx$$



**64.** Suppose $f$ has absolute minimum value $m$ and absolute maximum value $M$. Between what two values must $\int_0^2 f(x)\,dx$ lie? Which property of integrals allows you to make your conclusion?

**65–68** Use the properties of integrals to verify the inequality without evaluating the integrals.

**65.** $\int_0^4 (x^2 - 4x + 4)\,dx \geqslant 0$

**66.** $\int_0^1 \sqrt{1 + x^2}\,dx \leqslant \int_0^1 \sqrt{1 + x}\,dx$

**67.** $2 \leqslant \int_{-1}^{1} \sqrt{1 + x^2}\,dx \leqslant 2\sqrt{2}$

**68.** $\dfrac{\pi}{12} \leqslant \int_{\pi/6}^{\pi/3} \sin x\,dx \leqslant \dfrac{\sqrt{3}\,\pi}{12}$

**69–74** Use Property 8 of integrals to estimate the value of the integral.

**69.** $\int_0^1 x^3\,dx$

**70.** $\int_0^3 \dfrac{1}{x + 4}\,dx$

**71.** $\int_{\pi/4}^{\pi/3} \tan x\,dx$

**72.** $\int_0^2 (x^3 - 3x + 3)\,dx$

**73.** $\int_{-1}^{1} \sqrt{1 + x^4}\,dx$

**74.** $\int_{\pi}^{2\pi} (x - 2\sin x)\,dx$

**75–76** Use properties of integrals, together with Exercises 47 and 48, to prove the inequality.

**75.** $\int_1^3 \sqrt{x^4 + 1}\,dx \geqslant \dfrac{26}{3}$

**76.** $\int_0^{\pi/2} x \sin x\,dx \leqslant \dfrac{\pi^2}{8}$

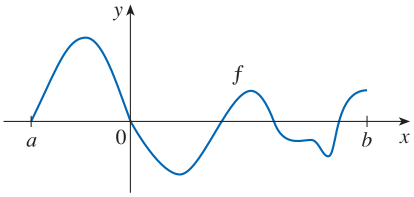
**77.** Which of the integrals $\int_1^2 \sqrt{x}\,dx$, $\int_1^2 \sqrt{1/x}\,dx$, and $\int_1^2 \sqrt{\sqrt{x}}\,dx$ has the largest value? Why?

**78.** Which of the integrals $\int_0^{0.5} \cos(x^2)\,dx$, $\int_0^{0.5} \cos\sqrt{x}\,dx$ is larger? Why?

**79.** Prove Property 3 of integrals.

**80.** (a) For the function $f$ shown in the graph, verify graphically that the following inequality holds:

$$\left| \int_a^b f(x)\,dx \right| \leqslant \int_a^b |f(x)|\,dx$$



(b) Prove that the inequality from part (a) holds for any function $f$ that is continuous on $[a, b]$.

(c) Show that

$$\left| \int_a^b f(x) \sin 2x\,dx \right| \leqslant \int_a^b |f(x)|\,dx$$

**81.** Let $f(x) = 0$ if $x$ is any rational number and $f(x) = 1$ if $x$ is any irrational number. Show that $f$ is not integrable on $[0, 1]$.

**82.** Let $f(0) = 0$ and $f(x) = 1/x$ if $0 < x \leqslant 1$. Show that $f$ is not integrable on $[0, 1]$. [*Hint:* Show that the first term in the Riemann sum, $f(x_1^*)\,\Delta x$, can be made arbitrarily large.]

**83–84** Express the limit as a definite integral.

**83.** $\displaystyle\lim_{n\to\infty} \sum_{i=1}^{n} \frac{i^4}{n^5}$ [*Hint:* Consider $f(x) = x^4$.]

**84.** $\displaystyle\lim_{n\to\infty} \frac{1}{n} \sum_{i=1}^{n} \frac{1}{1 + (i/n)^2}$

**85.** Find $\int_1^2 x^{-2}\,dx$. *Hint:* Choose $x_i^*$ to be the geometric mean of $x_{i-1}$ and $x_i$ (that is, $x_i^* = \sqrt{x_{i-1}x_i}$) and use the identity

$$\frac{1}{m(m + 1)} = \frac{1}{m} - \frac{1}{m + 1}$$

## DISCOVERY PROJECT | AREA FUNCTIONS

**1.** (a) Draw the line $y = 2t + 1$ and use geometry to find the area under this line, above the $t$-axis, and between the vertical lines $t = 1$ and $t = 3$.

(b) If $x > 1$, let $A(x)$ be the area of the region that lies under the line $y = 2t + 1$ between $t = 1$ and $t = x$. Sketch this region and use geometry to find an expression for $A(x)$.

(c) Differentiate the area function $A(x)$. What do you notice?

**2.** (a) If $x \geqslant -1$, let

$$A(x) = \int_{-1}^{x} (1 + t^2)\, dt$$

$A(x)$ represents the area of a region. Sketch that region.

(b) Use the result of Exercise 4.2.48 to find an expression for $A(x)$.

(c) Find $A'(x)$. What do you notice?

(d) If $x \geqslant -1$ and $h$ is a small positive number, then $A(x + h) - A(x)$ represents the area of a region. Describe and sketch the region.

(e) Draw a rectangle that approximates the region in part (d). By comparing the areas of these two regions, show that

$$\frac{A(x + h) - A(x)}{h} \approx 1 + x^2$$

(f) Use part (e) to give an intuitive explanation for the result of part (c).

**3.** (a) Draw the graph of the function $f(x) = \cos(x^2)$ in the viewing rectangle $[0, 2]$ by $[-1.25, 1.25]$.

(b) If we define a new function $g$ by

$$g(x) = \int_{0}^{x} \cos(t^2)\, dt$$

then $g(x)$ is the area under the graph of $f$ from 0 to $x$ [until $f(x)$ becomes negative, at which point $g(x)$ becomes a difference of areas]. Use part (a) to determine the value of $x$ at which $g(x)$ starts to decrease. [Unlike the integral in Problem 2, it is impossible to evaluate the integral defining $g$ to obtain an explicit expression for $g(x)$.]

(c) Use the integration command on a calculator or computer to estimate $g(0.2)$, $g(0.4)$, $g(0.6), \ldots, g(1.8)$, $g(2)$. Then use these values to sketch a graph of $g$.

(d) Use your graph of $g$ from part (c) to sketch the graph of $g'$ using the interpretation of $g'(x)$ as the slope of a tangent line. How does the graph of $g'$ compare with the graph of $f$?

**4.** Suppose $f$ is a continuous function on the interval $[a, b]$ and we define a new function $g$ by the equation

$$g(x) = \int_{a}^{x} f(t)\, dt$$

Based on your results in Problems 1–3, conjecture an expression for $g'(x)$.

# 4.3 The Fundamental Theorem of Calculus

The Fundamental Theorem of Calculus is appropriately named because it establishes a connection between the two branches of calculus: differential calculus and integral calculus. Differential calculus arose from the tangent problem, whereas integral calculus arose from a seemingly unrelated problem, the area problem. Newton's mentor at Cambridge, Isaac Barrow (1630–1677), discovered that these two problems are actually closely related. In fact, he realized that differentiation and integration are inverse processes. The Fundamental Theorem of Calculus gives the precise inverse relationship between the derivative and the integral. It was Newton and Leibniz who exploited this relationship and used it to develop calculus into a systematic mathematical method. In particular, they saw that the Fundamental Theorem enabled them to compute areas and integrals very easily without having to compute them as limits of sums as we did in Sections 4.1 and 4.2.

## The Fundamental Theorem of Calculus, Part 1

The first part of the Fundamental Theorem deals with functions defined by an equation of the form

$$\boxed{1} \qquad g(x) = \int_a^x f(t)\,dt$$

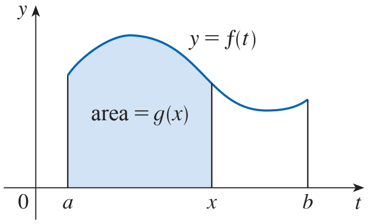


**FIGURE 1**

where $f$ is a continuous function on $[a, b]$ and $x$ varies between $a$ and $b$. Observe that $g$ depends only on $x$, which appears as the variable upper limit in the integral. If $x$ is a fixed number, then the integral $\int_a^x f(t)\,dt$ is a definite number. If we then let $x$ vary, the number $\int_a^x f(t)\,dt$ also varies and defines a function of $x$ denoted by $g(x)$.

If $f$ happens to be a positive function, then $g(x)$ can be interpreted as the area under the graph of $f$ from $a$ to $x$, where $x$ can vary from $a$ to $b$. (Think of $g$ as the "area so far" function; see Figure 1.)

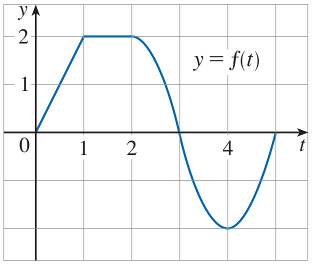

**FIGURE 2**

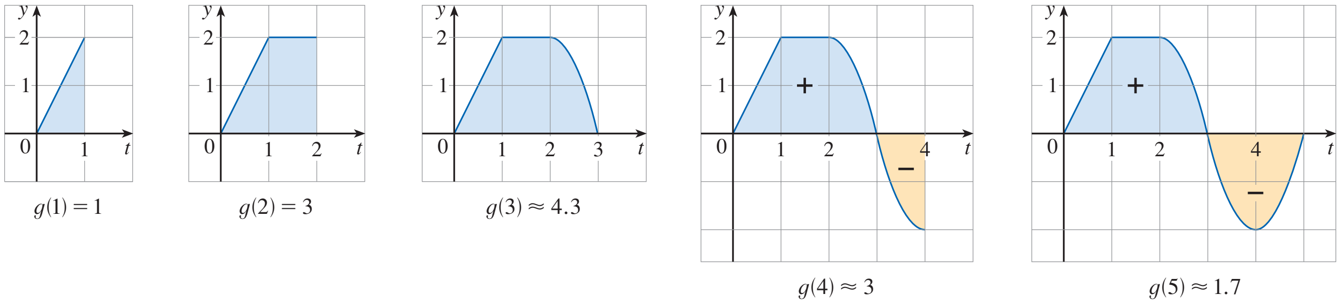
**EXAMPLE 1** If $f$ is the function whose graph is shown in Figure 2 and $g(x) = \int_0^x f(t)\,dt$, find the values of $g(0)$, $g(1)$, $g(2)$, $g(3)$, $g(4)$, and $g(5)$. Then sketch a rough graph of $g$.

**SOLUTION** First we notice that $g(0) = \int_0^0 f(t)\,dt = 0$. From Figure 3 we see that $g(1)$ is the area of a triangle:

$$g(1) = \int_0^1 f(t)\,dt = \tfrac{1}{2}(1 \cdot 2) = 1$$

To find $g(2)$ we add to $g(1)$ the area of a rectangle:

$$g(2) = \int_0^2 f(t)\,dt = \int_0^1 f(t)\,dt + \int_1^2 f(t)\,dt = 1 + (1 \cdot 2) = 3$$



$g(1) = 1$ $g(2) = 3$ $g(3) \approx 4.3$ $g(4) \approx 3$ $g(5) \approx 1.7$

**FIGURE 3**

We estimate that the area under $f$ from 2 to 3 is about 1.3, so

$$g(3) = g(2) + \int_2^3 f(t)\,dt \approx 3 + 1.3 = 4.3$$

For $t > 3$, $f(t)$ is negative and so we start subtracting areas:

$$g(4) = g(3) + \int_3^4 f(t)\,dt \approx 4.3 + (-1.3) = 3.0$$

$$g(5) = g(4) + \int_4^5 f(t)\,dt \approx 3 + (-1.3) = 1.7$$

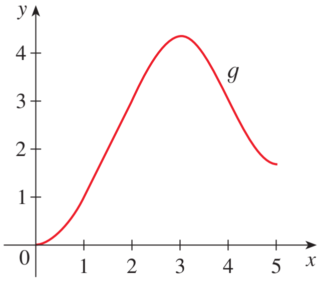

**FIGURE 4**

$g(x) = \int_0^x f(t)\,dt$

We use these values to sketch the graph of $g$ in Figure 4. Notice that, because $f(t)$ is positive for $t < 3$, we keep adding area for $t < 3$ and so $g$ is increasing up to $x = 3$, where it attains a maximum value. For $x > 3$, $g$ decreases because $f(t)$ is negative. ■

If we take $f(t) = t$ and $a = 0$, then, using Exercise 4.2.47, we have

$$g(x) = \int_0^x t\,dt = \frac{x^2}{2}$$

Notice that $g'(x) = x$, that is, $g' = f$. In other words, if $g$ is defined as the integral of $f$ by Equation 1, then $g$ turns out to be an antiderivative of $f$, at least in this case. And if we sketch the derivative of the function $g$ shown in Figure 4 by estimating slopes of tangents, we get a graph like that of $f$ in Figure 2. So we suspect that $g' = f$ in Example 1 too.

To see why this might be generally true we consider any continuous function $f$ with $f(x) \geqslant 0$. Then $g(x) = \int_a^x f(t)\,dt$ can be interpreted as the area under the graph of $f$ from $a$ to $x$, as in Figure 1.

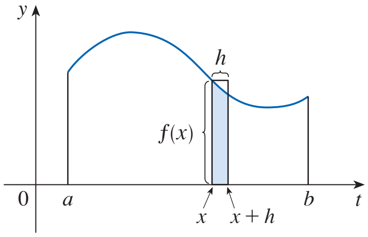

**FIGURE 5**

In order to compute $g'(x)$ from the definition of a derivative we first observe that, for $h > 0$, $g(x + h) - g(x)$ is obtained by subtracting areas, so it is the area under the graph of $f$ from $x$ to $x + h$ (the blue area in Figure 5). For small $h$ you can see from the figure that this area is approximately equal to the area of the rectangle with height $f(x)$ and width $h$:

$$g(x + h) - g(x) \approx hf(x)$$

so

$$\frac{g(x + h) - g(x)}{h} \approx f(x)$$

Intuitively, we therefore expect that

$$g'(x) = \lim_{h \to 0} \frac{g(x + h) - g(x)}{h} = f(x)$$

The fact that this is true, even when $f$ is not necessarily positive, is the first part of the Fundamental Theorem of Calculus.

We abbreviate the name of this theorem as FTC1. In words, it says that the derivative of a definite integral with respect to its upper limit is the integrand evaluated at the upper limit.

**The Fundamental Theorem of Calculus, Part 1** If $f$ is continuous on $[a, b]$, then the function $g$ defined by

$$g(x) = \int_a^x f(t)\,dt \qquad a \leqslant x \leqslant b$$

is continuous on $[a, b]$ and differentiable on $(a, b)$, and $g'(x) = f(x)$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PROOF** If $x$ and $x + h$ are in $(a, b)$, then

$$\begin{aligned} g(x+h) - g(x) &= \int_a^{x+h} f(t)\,dt - \int_a^x f(t)\,dt \\ &= \left( \int_a^x f(t)\,dt + \int_x^{x+h} f(t)\,dt \right) - \int_a^x f(t)\,dt \qquad \text{(by Property 5 of integrals)} \\ &= \int_x^{x+h} f(t)\,dt \end{aligned}$$

and so, for $h \neq 0$,

**2** $$\frac{g(x+h) - g(x)}{h} = \frac{1}{h} \int_x^{x+h} f(t)\,dt$$

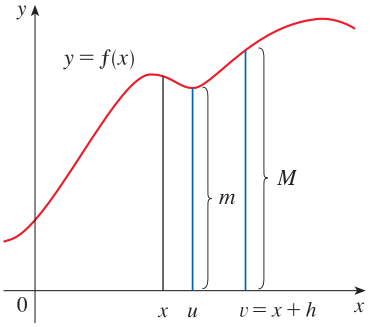

**FIGURE 6**

For now let's assume that $h > 0$. Since $f$ is continuous on $[x, x + h]$, the Extreme Value Theorem says that there are numbers $u$ and $v$ in $[x, x + h]$ such that $f(u) = m$ and $f(v) = M$, where $m$ and $M$ are the absolute minimum and maximum values of $f$ on $[x, x + h]$. (See Figure 6.)

By Property 8 of integrals, we have

$$mh \leqslant \int_x^{x+h} f(t)\,dt \leqslant Mh$$

that is,

$$f(u)h \leqslant \int_x^{x+h} f(t)\,dt \leqslant f(v)h$$

Since $h > 0$, we can divide this inequality by $h$:

$$f(u) \leqslant \frac{1}{h} \int_x^{x+h} f(t)\,dt \leqslant f(v)$$

Now we use Equation 2 to replace the middle part of this inequality:

**3** $$f(u) \leqslant \frac{g(x+h) - g(x)}{h} \leqslant f(v)$$

Inequality 3 can be proved in a similar manner for the case where $h < 0$. (See Exercise 75.)

Now we let $h \to 0$. Then $u \to x$ and $v \to x$ because $u$ and $v$ lie between $x$ and $x + h$. Therefore

$$\lim_{h \to 0} f(u) = \lim_{u \to x} f(u) = f(x) \qquad \text{and} \qquad \lim_{h \to 0} f(v) = \lim_{v \to x} f(v) = f(x)$$

because $f$ is continuous at $x$. We conclude, from (3) and the Squeeze Theorem, that

**4** $$g'(x) = \lim_{h \to 0} \frac{g(x+h) - g(x)}{h} = f(x)$$

If $x = a$ or $b$, then Equation 4 can be interpreted as a one-sided limit. Then Theorem 2.2.4 (modified for one-sided limits) shows that $g$ is continuous on $[a, b]$. ■

Using Leibniz notation for derivatives, we can write FTC1 as

**5** $$\frac{d}{dx} \int_a^x f(t)\,dt = f(x)$$

when $f$ is continuous. Roughly speaking, Equation 5 says that if we first integrate $f$ and then differentiate the result, we get back to the original function $f$.

**EXAMPLE 2** Find the derivative of the function $g(x) = \int_0^x \sqrt{1 + t^2}\, dt$.

**SOLUTION** Since $f(t) = \sqrt{1 + t^2}$ is continuous, Part 1 of the Fundamental Theorem of Calculus gives

$$g'(x) = \sqrt{1 + x^2}$$ ■

**EXAMPLE 3** Although a formula of the form $g(x) = \int_a^x f(t)\, dt$ may seem like a strange way of defining a function, books on physics, chemistry, and statistics are full of such functions. For instance, the **Fresnel function**

$$S(x) = \int_0^x \sin(\pi t^2/2)\, dt$$

is named after the French physicist Augustin Fresnel (1788–1827), who is famous for his works in optics. This function first appeared in Fresnel's theory of the diffraction of light waves, but more recently it has been applied to the design of highways.

Part 1 of the Fundamental Theorem tells us how to differentiate the Fresnel function:

$$S'(x) = \sin(\pi x^2/2)$$

This means that we can apply all the methods of differential calculus to analyze $S$ (see Exercise 69).

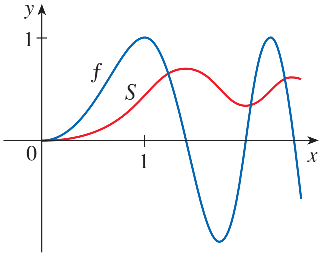

**FIGURE 7**
$f(x) = \sin(\pi x^2/2)$
$S(x) = \int_0^x \sin(\pi t^2/2)\, dt$

Figure 7 shows the graphs of $f(x) = \sin(\pi x^2/2)$ and the Fresnel function $S(x) = \int_0^x f(t)\, dt$. A computer was used to graph $S$ by computing the value of this integral for many values of $x$. It does indeed look as if $S(x)$ is the area under the graph of $f$ from 0 to $x$ [until $x \approx 1.4$ when $S(x)$ becomes a difference of areas]. Figure 8 shows a larger part of the graph of $S$.

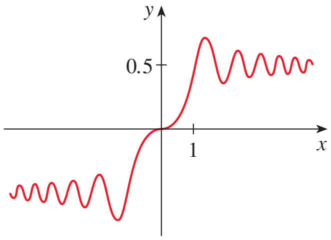

**FIGURE 8**
The Fresnel function
$S(x) = \int_0^x \sin(\pi t^2/2)\, dt$

If we now start with the graph of $S$ in Figure 7 and think about what its derivative should look like, it seems reasonable that $S'(x) = f(x)$. [For instance, $S$ is increasing when $f(x) > 0$ and decreasing when $f(x) < 0$.] So this gives a visual confirmation of Part 1 of the Fundamental Theorem of Calculus. ■

**EXAMPLE 4** Find $\dfrac{d}{dx} \displaystyle\int_1^{x^4} \sec t\, dt$.

**SOLUTION** Here we have to be careful to use the Chain Rule in conjunction with FTC1. Let $u = x^4$. Then

$$\begin{aligned} \frac{d}{dx} \int_1^{x^4} \sec t\, dt &= \frac{d}{dx} \int_1^{u} \sec t\, dt \\ &= \frac{d}{du} \left[ \int_1^u \sec t\, dt \right] \frac{du}{dx} && \text{(by the Chain Rule)} \\ &= \sec u \, \frac{du}{dx} && \text{(by FTC1)} \\ &= \sec(x^4) \cdot 4x^3 \end{aligned}$$ ■

## The Fundamental Theorem of Calculus, Part 2

In Section 4.2 we computed integrals from the definition as a limit of Riemann sums and we saw that this procedure is sometimes long and difficult. The second part of the Fundamental Theorem of Calculus, which follows easily from the first part, provides us with a much simpler method for the evaluation of integrals.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We abbreviate this theorem as FTC2.

**The Fundamental Theorem of Calculus, Part 2** If $f$ is continuous on $[a, b]$, then

$$\int_a^b f(x)\,dx = F(b) - F(a)$$

where $F$ is any antiderivative of $f$, that is, a function $F$ such that $F' = f$.

**PROOF** Let $g(x) = \int_a^x f(t)\,dt$. We know from Part 1 that $g'(x) = f(x)$; that is, $g$ is an antiderivative of $f$. If $F$ is any other antiderivative of $f$ on $[a, b]$, then we know from Corollary 3.2.7 that $F$ and $g$ differ by a constant:

$$\boxed{6} \qquad F(x) = g(x) + C$$

for $a < x < b$. But both $F$ and $g$ are continuous on $[a, b]$ and so, by taking limits of both sides of Equation 6 (as $x \to a^+$ and $x \to b^-$), we see that it also holds when $x = a$ and $x = b$. So $F(x) = g(x) + C$ for all $x$ in $[a, b]$.

If we put $x = a$ in the formula for $g(x)$, we get

$$g(a) = \int_a^a f(t)\,dt = 0$$

So, using Equation 6 with $x = b$ and $x = a$, we have

$$\begin{aligned} F(b) - F(a) &= [g(b) + C] - [g(a) + C] \\ &= g(b) - g(a) = g(b) = \int_a^b f(t)\,dt \end{aligned}$$ ■

Part 2 of the Fundamental Theorem states that if we know an antiderivative $F$ of $f$, then we can evaluate $\int_a^b f(x)\,dx$ simply by subtracting the values of $F$ at the endpoints of the interval $[a, b]$. It's very surprising that $\int_a^b f(x)\,dx$, which was defined by a complicated procedure involving all of the values of $f(x)$ for $a \leqslant x \leqslant b$, can be found by knowing the values of $F(x)$ at only two points, $a$ and $b$.

Although the theorem may be surprising at first glance, it becomes plausible if we interpret it in physical terms. If $v(t)$ is the velocity of an object and $s(t)$ is its position at time $t$, then $v(t) = s'(t)$, so $s$ is an antiderivative of $v$. In Section 4.1 we considered an object that always moves in the positive direction and made the observation that the area under the velocity curve is equal to the distance traveled. In symbols:

$$\int_a^b v(t)\,dt = s(b) - s(a)$$

That is exactly what FTC2 says in this context.

**EXAMPLE 5** Evaluate the integral $\displaystyle\int_{-2}^{1} x^3\,dx$.

**SOLUTION** The function $f(x) = x^3$ is continuous on $[-2, 1]$ and we know from Section 3.9 that an antiderivative is $F(x) = \frac{1}{4}x^4$, so Part 2 of the Fundamental Theorem gives

$$\int_{-2}^{1} x^3\,dx = F(1) - F(-2) = \tfrac{1}{4}(1)^4 - \tfrac{1}{4}(-2)^4 = -\tfrac{15}{4}$$

Notice that FTC2 says we can use *any* antiderivative $F$ of $f$. So we may as well use the simplest one, namely $F(x) = \frac{1}{4}x^4$, instead of $\frac{1}{4}x^4 + 7$ or $\frac{1}{4}x^4 + C$. ■

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**Notation** We often use the notation

$$F(x)\Big]_a^b = F(b) - F(a)$$

So the equation of FTC2 can be written as

$$\int_a^b f(x)\,dx = F(x)\Big]_a^b \qquad \text{where} \qquad F' = f$$

Other common notations are $F(x)\,\big|_a^b$ and $[F(x)]_a^b$.

**EXAMPLE 6** Find the area under the parabola $y = x^2$ for $0 \leqslant x \leqslant 1$.

**SOLUTION** An antiderivative of $f(x) = x^2$ is $F(x) = \frac{1}{3}x^3$. The required area $A$ is found using Part 2 of the Fundamental Theorem:

$$A = \int_0^1 x^2\,dx = \frac{x^3}{3}\bigg]_0^1 = \frac{1^3}{3} - \frac{0^3}{3} = \frac{1}{3}$$ ■

In applying the Fundamental Theorem we use a particular antiderivative $F$ of $f$. It is not necessary to use the most general antiderivative.

If you compare the calculation in Example 6 with the one in Example 4.1.2, you will see that the Fundamental Theorem gives a *much* shorter method.

**EXAMPLE 7** Find the area under the cosine curve from $x = 0$ to $x = b$, where $0 \leqslant b \leqslant \pi/2$.

**SOLUTION** Since an antiderivative of $f(x) = \cos x$ is $F(x) = \sin x$, we have

$$A = \int_0^b \cos x\,dx = \sin x\Big]_0^b = \sin b - \sin 0 = \sin b$$

In particular, taking $b = \pi/2$, we have proved that the area under the cosine curve from 0 to $\pi/2$ is $\sin(\pi/2) = 1$. (See Figure 9.) ■

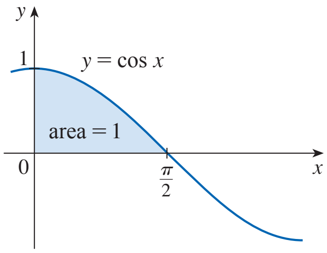

**FIGURE 9**

When the French mathematician Gilles de Roberval first found the area under the sine and cosine curves in 1635, this was a very challenging problem that required a great deal of ingenuity. If we didn't have the benefit of the Fundamental Theorem, we would have to compute a difficult limit of sums using obscure trigonometric identities (or use a computer algebra system as in Exercise 4.1.33). It was even more difficult for Roberval because the apparatus of limits had not been invented in 1635. But in the 1660s and 1670s, when the Fundamental Theorem was discovered by Barrow and exploited by Newton and Leibniz, such problems became very easy, as you can see from Example 7.

**EXAMPLE 8** What is wrong with the following calculation?

$$\int_{-1}^3 \frac{1}{x^2}\,dx = \frac{x^{-1}}{-1}\bigg]_{-1}^3 = -\frac{1}{3} - 1 = -\frac{4}{3}$$

**SOLUTION** To start, we notice that this calculation must be wrong because the answer is negative but $f(x) = 1/x^2 \geqslant 0$ and Property 6 of integrals says that $\int_a^b f(x)\,dx \geqslant 0$ when $f \geqslant 0$. The Fundamental Theorem of Calculus applies to continuous functions. It can't be applied here because $f(x) = 1/x^2$ is not continuous on $[-1, 3]$. In fact, $f$ has an infinite discontinuity at $x = 0$, and we will see in Section 7.8 that

$$\int_{-1}^3 \frac{1}{x^2}\,dx \qquad \text{does not exist}$$ ■

## Differentiation and Integration as Inverse Processes

We end this section by bringing together the two parts of the Fundamental Theorem.

**The Fundamental Theorem of Calculus** Suppose $f$ is continuous on $[a, b]$.

**1.** If $g(x) = \int_a^x f(t)\,dt$, then $g'(x) = f(x)$.

**2.** $\int_a^b f(x)\,dx = F(b) - F(a)$, where $F$ is any antiderivative of $f$, that is, $F' = f$.

We noted that Part 1 can be rewritten as

$$\frac{d}{dx}\int_a^x f(t)\,dt = f(x)$$

This says that if we integrate a continuous function $f$ and then differentiate the result, we arrive back at the original function $f$. We could use Part 2 to write

$$\int_a^x F'(t)\,dt = F(x) - F(a)$$

which says that if we differentiate a function $F$ and then integrate the result, we arrive back at the original function $F$, except for the constant $F(a)$. So taken together, the two parts of the Fundamental Theorem of Calculus say that integration and differentiation are inverse processes.

The Fundamental Theorem of Calculus is unquestionably the most important theorem in calculus and, indeed, it ranks as one of the great accomplishments of the human mind. Before it was discovered, from the time of Eudoxus and Archimedes to the time of Galileo and Fermat, problems of finding areas, volumes, and lengths of curves were so difficult that only a genius could meet the challenge, and even then, only for very special cases. But now, armed with the systematic method that Newton and Leibniz fashioned out of the Fundamental Theorem, we will see in the chapters to come that these challenging problems are accessible to all of us.

## 4.3 Exercises

**1.** Explain exactly what is meant by the statement that "differentiation and integration are inverse processes."

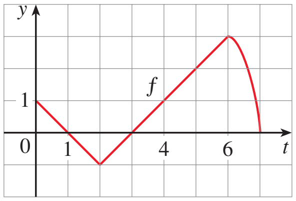
**2.** Let $g(x) = \int_0^x f(t)\,dt$, where $f$ is the function whose graph is shown.

(a) Evaluate $g(x)$ for $x = 0, 1, 2, 3, 4, 5,$ and $6$.

(b) Estimate $g(7)$.

(c) Where does $g$ have a maximum value? Where does it have a minimum value?

(d) Sketch a rough graph of $g$.



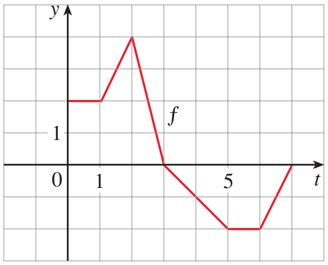
**3.** Let $g(x) = \int_0^x f(t)\,dt$, where $f$ is the function whose graph is shown.

(a) Evaluate $g(0)$, $g(1)$, $g(2)$, $g(3)$, and $g(6)$.

(b) On what interval is $g$ increasing?

(c) Where does $g$ have a maximum value?

(d) Sketch a rough graph of $g$.



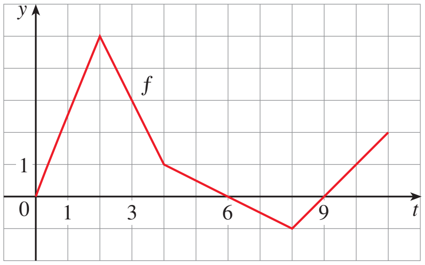
**4.** Let $g(x) = \int_0^x f(t)\,dt$, where $f$ is the function whose graph is shown.

(a) Use Part 1 of the Fundamental Theorem of Calculus to graph $g'$.

(b) Find $g(3)$, $g'(3)$, and $g''(3)$.

(c) Does $g$ have a local maximum, a local minimum, or neither at $x = 6$?

(d) Does $g$ have a local maximum, a local minimum, or neither at $x = 9$?

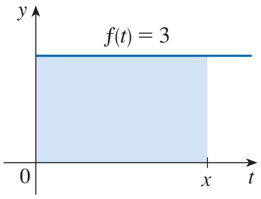


**5–6** The graph of a function $f$ is shown. Let $g$ be the function that represents the area under the graph of $f$ between 0 and $x$.

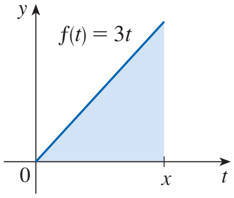
(a) Use geometry to find a formula for $g(x)$.

(b) Verify that $g$ is an antiderivative of $f$ and explain how this confirms Part 1 of the Fundamental Theorem of Calculus for the function $f$.

**5.**



**6.**



**7–8** Sketch the area represented by $g(x)$. Then find $g'(x)$ in two ways: (a) by using Part 1 of the Fundamental Theorem and (b) by evaluating the integral using Part 2 and then differentiating.

**7.** $g(x) = \int_1^x t^2\,dt$

**8.** $g(x) = \int_0^x (2 + \sin t)\,dt$

**9–20** Use Part 1 of the Fundamental Theorem of Calculus to find the derivative of the function.

**9.** $g(x) = \int_0^x \sqrt{t + t^3}\,dt$

**10.** $g(x) = \int_1^x \cos(t^2)\,dt$

**11.** $g(w) = \int_0^w \sin(1 + t^3)\,dt$

**12.** $h(u) = \int_0^u \dfrac{\sqrt{t}}{t + 1}\,dt$

**13.** $F(x) = \int_x^0 \sqrt{1 + \sec t}\,dt$

$\left[\textit{Hint}: \int_x^0 \sqrt{1 + \sec t}\,dt = -\int_0^x \sqrt{1 + \sec t}\,dt\right]$

**14.** $R(y) = \int_y^2 t^3 \sin t\,dt$

**15.** $h(x) = \int_2^{1/x} \sin^4 t\,dt$

**16.** $h(x) = \int_1^{\sqrt{x}} \dfrac{z^2}{z^4 + 1}\,dz$

**17.** $y = \int_1^{3x+2} \dfrac{t}{1 + t^3}\,dt$

**18.** $y = \int_0^{x^4} \cos^2\theta\,d\theta$

**19.** $y = \int_{\sqrt{x}}^{\pi/4} \theta \tan\theta\,d\theta$

**20.** $y = \int_{1/x}^4 \sqrt{1 + \dfrac{1}{t}}\,dt$

**21–24** Use Part 2 of the Fundamental Theorem of Calculus to evaluate the integral and interpret the result as an area or a difference of areas. Illustrate with a sketch.

**21.** $\int_{-1}^2 x^3\,dx$

**22.** $\int_0^4 (x^2 - 4x)\,dx$

**23.** $\int_{\pi/2}^{2\pi} (2 \sin x)\,dx$

**24.** $\int_0^4 (\sqrt{x} - 1)\,dx$

**25–46** Evaluate the integral.

**25.** $\int_1^3 (x^2 + 2x - 4)\,dx$

**26.** $\int_{-1}^1 x^{100}\,dx$

**27.** $\int_0^2 \left(\frac{4}{5}t^3 - \frac{3}{4}t^2 + \frac{2}{5}t\right) dt$

**28.** $\int_0^1 \left(1 - 8v^3 + 16v^7\right) dv$

**29.** $\int_1^9 \sqrt{x}\,dx$

**30.** $\int_1^8 x^{-2/3}\,dx$

**31.** $\int_0^4 (t^2 + t^{3/2})\,dt$

**32.** $\int_1^3 \left(\dfrac{1}{z^2} + \dfrac{1}{z^3}\right) dz$

**33.** $\int_{\pi/2}^0 \cos\theta\,d\theta$

**34.** $\int_{-5}^5 \pi\,dx$

**35.** $\int_0^1 (u + 2)(u - 3)\,du$

**36.** $\int_0^4 (4 - t)\sqrt{t}\,dt$

**37.** $\int_1^4 \dfrac{2 + x^2}{\sqrt{x}}\,dx$

**38.** $\int_{-1}^2 (3u - 2)(u + 1)\,du$

**39.** $\int_1^2 \dfrac{s^4 + 1}{s^2}\,ds$

**40.** $\int_5^5 \sqrt{t^2 + \sin t}\,dt$

**41.** $\int_0^{\pi/3} \sec\theta \tan\theta\,d\theta$

**42.** $\int_{\pi/4}^{\pi/3} \csc^2\theta\,d\theta$

**43.** $\int_0^1 (1 + r)^3\,dr$

**44.** $\int_1^{18} \sqrt{\dfrac{3}{z}}\,dz$

**45.** $\int_0^\pi f(x)\,dx$ where $f(x) = \begin{cases} \sin x & \text{if } 0 \leqslant x < \pi/2 \\ \cos x & \text{if } \pi/2 \leqslant x \leqslant \pi \end{cases}$

**46.** $\int_{-2}^2 f(x)\,dx$ where $f(x) = \begin{cases} 2 & \text{if } -2 \leqslant x \leqslant 0 \\ 4 - x^2 & \text{if } 0 < x \leqslant 2 \end{cases}$

---

**47–50** Sketch the region enclosed by the given curves and calculate its area.

**47.** $y = \sqrt{x}, \quad y = 0, \quad x = 4$

**48.** $y = x^3, \quad y = 0, \quad x = 1$

**49.** $y = 4 - x^2, \quad y = 0$

**50.** $y = 2x - x^2, \quad y = 0$

---

**51–54** Use a graph to give a rough estimate of the area of the region that lies beneath the given curve. Then find the exact area.

**51.** $y = \sqrt[3]{x}, \quad 0 \leqslant x \leqslant 27$

**52.** $y = x^{-4}, \quad 1 \leqslant x \leqslant 6$

**53.** $y = \sin x, \quad 0 \leqslant x \leqslant \pi$

**54.** $y = \sec^2 x, \quad 0 \leqslant x \leqslant \pi/3$

---

**55–58** What is wrong with the equation?

**55.** $\displaystyle\int_{-2}^1 x^{-4}\,dx = \frac{x^{-3}}{-3}\bigg]_{-2}^1 = -\frac{3}{8}$

**56.** $\displaystyle\int_{-1}^2 \frac{4}{x^3}\,dx = -\frac{2}{x^2}\bigg]_{-1}^2 = \frac{3}{2}$

**57.** $\displaystyle\int_{\pi/3}^\pi \sec\theta\tan\theta\,d\theta = \sec\theta\Big]_{\pi/3}^\pi = -3$

**58.** $\displaystyle\int_0^\pi \sec^2 x\,dx = \tan x\Big]_0^\pi = 0$

---

**59–62** Find the derivative of the function.

**59.** $\displaystyle g(x) = \int_{2x}^{3x} \frac{u^2 - 1}{u^2 + 1}\,du$

$$\left[\textit{Hint}: \int_{2x}^{3x} f(u)\,du = \int_{2x}^{0} f(u)\,du + \int_0^{3x} f(u)\,du\right]$$

**60.** $\displaystyle g(x) = \int_{1-2x}^{1+2x} t\sin t\,dt$

**61.** $\displaystyle h(x) = \int_{\sqrt{x}}^{x^3} \cos(t^2)\,dt$

**62.** $\displaystyle g(x) = \int_{\tan x}^{x^2} \frac{1}{\sqrt{2 + t^4}}\,dt$

---

**63.** Let $\displaystyle F(x) = \int_\pi^x \frac{\cos t}{t}\,dt$. Find an equation of the tangent line to the curve $y = F(x)$ at the point with $x$-coordinate $\pi$.

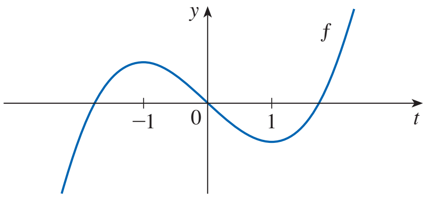
**64.** If $f(x) = \int_0^x (1 - t^2)\cos^2 t\,dt$, on what interval is $f$ increasing?

**65.** On what interval is the curve

$$y = \int_0^x \frac{t^2}{t^2 + t + 2}\,dt$$

concave downward?

**66.** Let $F(x) = \int_1^x f(t)\,dt$, where $f$ is the function whose graph is shown. Where is $F$ concave downward?



**67.** If $f(1) = 12$, $f'$ is continuous, and $\int_1^4 f'(x)\,dx = 17$, what is the value of $f(4)$?

**68.** If $f(x) = \int_0^{\sin x} \sqrt{1 + t^2}\,dt$ and $g(y) = \int_3^y f(x)\,dx$, find $g''(\pi/6)$.

**69. The Fresnel Function** The Fresnel function $S$ was defined in Example 3 and graphed in Figures 7 and 8.

(a) At what values of $x$ does this function have local maximum values?

(b) On what intervals is the function concave upward?

(c) Use a graph to solve the following equation correct to two decimal places:

$$\int_0^x \sin(\pi t^2/2)\,dt = 0.2$$

**70. The Sine Integral Function** The *sine integral function*

$$\mathrm{Si}(x) = \int_0^x \frac{\sin t}{t}\,dt$$

is important in electrical engineering. [The integrand $f(t) = (\sin t)/t$ is not defined when $t = 0$, but we know that its limit is 1 when $t \to 0$. So we define $f(0) = 1$ and this makes $f$ a continuous function everywhere.]

(a) Draw the graph of Si.

(b) At what values of $x$ does this function have local maximum values?

(c) Find the coordinates of the first inflection point to the right of the origin.

(d) Does this function have horizontal asymptotes?

(e) Solve the following equation correct to one decimal place:

$$\int_0^x \frac{\sin t}{t}\,dt = 1$$

**71–72** Let $g(x) = \int_0^x f(t)\,dt$, where $f$ is the function whose graph is shown on page 338.

(a) At what values of $x$ do the local maximum and minimum values of $g$ occur?

(b) Where does $g$ attain its absolute maximum value?

(c) On what intervals is $g$ concave downward?

(d) Sketch the graph of $g$.

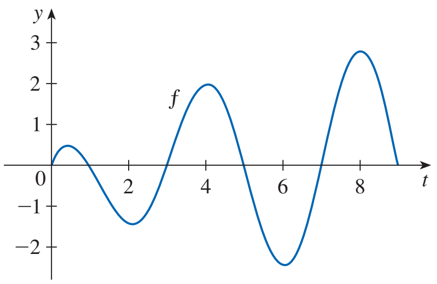
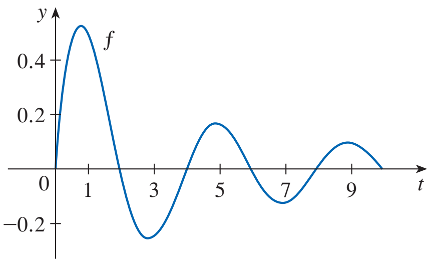
**71.**



**72.**



**73–74** Evaluate the limit by first recognizing the sum as a Riemann sum for a function defined on $[0, 1]$.

**73.** $\displaystyle\lim_{n\to\infty}\sum_{i=1}^{n}\left(\frac{i^4}{n^5}+\frac{i}{n^2}\right)$

**74.** $\displaystyle\lim_{n\to\infty}\frac{1}{n}\left(\sqrt{\frac{1}{n}}+\sqrt{\frac{2}{n}}+\sqrt{\frac{3}{n}}+\cdots+\sqrt{\frac{n}{n}}\right)$

**75.** Justify (3) for the case $h < 0$.

**76.** If $f$ is continuous and $g$ and $h$ are differentiable functions, show that

$$\frac{d}{dx}\int_{g(x)}^{h(x)} f(t)\,dt = f(h(x))\,h'(x) - f(g(x))\,g'(x)$$

**77.** (a) Show that $1 \leqslant \sqrt{1+x^3} \leqslant 1 + x^3$ for $x \geqslant 0$.
(b) Show that $1 \leqslant \int_0^1 \sqrt{1+x^3}\,dx \leqslant 1.25$.

**78.** (a) Show that $\cos(x^2) \geqslant \cos x$ for $0 \leqslant x \leqslant 1$.
(b) Deduce that $\int_0^{\pi/6} \cos(x^2)\,dx \geqslant \frac{1}{2}$.

**79.** Show that

$$0 \leqslant \int_5^{10} \frac{x^2}{x^4 + x^2 + 1}\,dx \leqslant 0.1$$

by comparing the integrand to a simpler function.

**80.** Let

$$f(x) = \begin{cases} 0 & \text{if } x < 0 \\ x & \text{if } 0 \leqslant x \leqslant 1 \\ 2 - x & \text{if } 1 < x \leqslant 2 \\ 0 & \text{if } x > 2 \end{cases}$$

and $\qquad g(x) = \int_0^x f(t)\,dt$

(a) Find an expression for $g(x)$ similar to the one for $f(x)$.
(b) Sketch the graphs of $f$ and $g$.
(c) Where is $f$ differentiable? Where is $g$ differentiable?

**81.** Find a function $f$ and a number $a$ such that

$$6 + \int_a^x \frac{f(t)}{t^2}\,dt = 2\sqrt{x} \qquad \text{for all } x > 0$$

**82.** Suppose $h$ is a function such that $h(1) = -2$, $h'(1) = 2$, $h''(1) = 3$, $h(2) = 6$, $h'(2) = 5$, $h''(2) = 13$, and $h''$ is continuous everywhere. Evaluate $\int_1^2 h''(u)\,du$.

**83.** A manufacturing company owns a major piece of equipment that depreciates at the (continuous) rate $f(t)$, where $t$ is the time measured in months since its last overhaul. Because a fixed cost $A$ is incurred each time the machine is overhauled, the company wants to determine the optimal time $T$ (in months) between overhauls.
(a) Explain why $\int_0^t f(s)\,ds$ represents the loss in value of the machine over the period of time $t$ since the last overhaul.
(b) Let $C = C(t)$ be given by

$$C(t) = \frac{1}{t}\left[A + \int_0^t f(s)\,ds\right]$$

What does $C$ represent and why would the company want to minimize $C$?
(c) Show that $C$ has a minimum value at the numbers $t = T$ where $C(T) = f(T)$.

The following exercises are intended only for those who have already covered Chapter 6.

**84–90** Evaluate the integral.

**84.** $\displaystyle\int_0^3 (2\sin x - e^x)\,dx$

**85.** $\displaystyle\int_1^9 \frac{1}{2x}\,dx$

**86.** $\displaystyle\int_0^1 10^x\,dx$

**87.** $\displaystyle\int_{1/2}^{1/\sqrt{2}} \frac{4}{\sqrt{1-x^2}}\,dx$

**88.** $\displaystyle\int_0^1 \frac{4}{t^2+1}\,dt$

**89.** $\displaystyle\int_{-1}^1 e^{u+1}\,du$

**90.** $\displaystyle\int_1^3 \frac{y^3 - 2y^2 - y}{y^2}\,dy$

## 4.4 Indefinite Integrals and the Net Change Theorem

We saw in Section 4.3 that the second part of the Fundamental Theorem of Calculus provides a very powerful method for evaluating the definite integral of a function, assuming that we can find an antiderivative of the function. In this section we introduce a notation for antiderivatives, review the formulas for antiderivatives, and use them to evaluate definite integrals. We also reformulate FTC2 in a way that makes it easier to apply to science and engineering problems.

### ■ Indefinite Integrals

Both parts of the Fundamental Theorem establish connections between antiderivatives and definite integrals. Part 1 says that if $f$ is continuous, then $\int_a^x f(t)\,dt$ is an antiderivative of $f$. Part 2 says that $\int_a^b f(x)\,dx$ can be found by evaluating $F(b) - F(a)$, where $F$ is an antiderivative of $f$.

We need a convenient notation for antiderivatives that makes them easy to work with. Because of the relation between antiderivatives and integrals given by the Fundamental Theorem, the notation $\int f(x)\,dx$ is traditionally used for an antiderivative of $f$ and is called an **indefinite integral**. Thus

$$\boxed{\int f(x)\,dx = F(x) \qquad \text{means} \qquad F'(x) = f(x)}$$

For example, we can write

$$\int x^2\,dx = \frac{x^3}{3} + C$$

because

$$\frac{d}{dx}\left(\frac{x^3}{3} + C\right) = x^2$$

So we can regard an indefinite integral as representing an entire *family* of functions (one antiderivative for each value of the constant $C$).

⊘ You should distinguish carefully between definite and indefinite integrals. A definite integral $\int_a^b f(x)\,dx$ is a *number*, whereas an indefinite integral $\int f(x)\,dx$ is a *function* (or family of functions). The connection between them is given by Part 2 of the Fundamental Theorem: if $f$ is continuous on $[a, b]$, then

$$\int_a^b f(x)\,dx = \int f(x)\,dx\Big]_a^b$$

The effectiveness of the Fundamental Theorem depends on having a supply of antiderivatives of functions. We therefore restate the Table of Antidifferentiation Formulas from Section 3.9, together with a few others, in the notation of indefinite integrals. Any formula can be verified by differentiating the function on the right side and obtaining the integrand. For instance,

$$\int \sec^2 x\,dx = \tan x + C \qquad \text{because} \qquad \frac{d}{dx}(\tan x + C) = \sec^2 x$$

### 1 Table of Indefinite Integrals

$$\int cf(x)\,dx = c\int f(x)\,dx \qquad \int [f(x) + g(x)]\,dx = \int f(x)\,dx + \int g(x)\,dx$$

$$\int k\,dx = kx + C \qquad \int x^n\,dx = \frac{x^{n+1}}{n+1} + C \quad (n \neq -1)$$

$$\int \sin x\,dx = -\cos x + C \qquad \int \cos x\,dx = \sin x + C$$

$$\int \sec^2 x\,dx = \tan x + C \qquad \int \csc^2 x\,dx = -\cot x + C$$

$$\int \sec x \tan x\,dx = \sec x + C \qquad \int \csc x \cot x\,dx = -\csc x + C$$

Recall from Theorem 3.9.1 that the most general antiderivative *on a given interval* is obtained by adding a constant to a particular antiderivative. **We adopt the convention that when a formula for a general indefinite integral is given, it is valid only on an interval.** Thus we write

$$\int \frac{1}{x^2}\,dx = -\frac{1}{x} + C$$

with the understanding that it is valid on the interval $(0, \infty)$ or on the interval $(-\infty, 0)$. This is true despite the fact that the general antiderivative of the function $f(x) = 1/x^2$, $x \neq 0$, is

$$F(x) = \begin{cases} -\dfrac{1}{x} + C_1 & \text{if } x < 0 \\ -\dfrac{1}{x} + C_2 & \text{if } x > 0 \end{cases}$$

**EXAMPLE 1** Find the general indefinite integral

$$\int (10x^4 - 2\sec^2 x)\,dx$$

**SOLUTION** Using our convention and Table 1, we have

$$\begin{aligned} \int (10x^4 - 2\sec^2 x)\,dx &= 10\int x^4\,dx - 2\int \sec^2 x\,dx \\ &= 10\,\frac{x^5}{5} - 2\tan x + C \\ &= 2x^5 - 2\tan x + C \end{aligned}$$

You should check this answer by differentiating it. ■

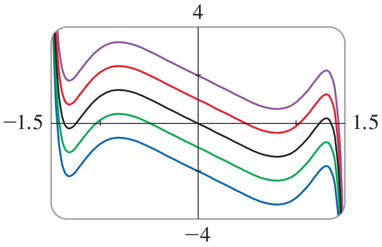

**FIGURE 1**

The indefinite integral in Example 1 is graphed in Figure 1 for several values of $C$. Here the value of $C$ is the $y$-intercept.

**EXAMPLE 2** Evaluate $\displaystyle\int \frac{\cos\theta}{\sin^2\theta}\,d\theta$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**SOLUTION** This indefinite integral isn't immediately apparent from Table 1, so we use trigonometric identities to rewrite the function before integrating:

$$\int \frac{\cos\theta}{\sin^2\theta}\,d\theta = \int \left(\frac{1}{\sin\theta}\right)\left(\frac{\cos\theta}{\sin\theta}\right)d\theta$$

$$= \int \csc\theta\,\cot\theta\,d\theta = -\csc\theta + C \qquad ■$$

**EXAMPLE 3** Evaluate $\int_0^3 (x^3 - 6x)\,dx$.

**SOLUTION** Using FTC2 and Table 1, we have

$$\int_0^3 (x^3 - 6x)\,dx = \frac{x^4}{4} - 6\,\frac{x^2}{2}\bigg]_0^3$$

$$= \left(\tfrac{1}{4}\cdot 3^4 - 3\cdot 3^2\right) - \left(\tfrac{1}{4}\cdot 0^4 - 3\cdot 0^2\right)$$

$$= \tfrac{81}{4} - 27 - 0 + 0 = -6.75$$

Compare this calculation with Example 4.2.3. ■

Figure 2 shows the graph of the integrand in Example 4. We know from Section 4.2 that the value of the integral can be interpreted as a net area: the sum of the areas labeled with a plus sign minus the areas labeled with a minus sign.

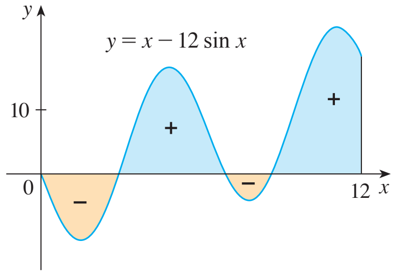

**FIGURE 2**

**EXAMPLE 4** Find $\int_0^{12} (x - 12\sin x)\,dx$.

**SOLUTION** The Fundamental Theorem gives

$$\int_0^{12} (x - 12\sin x)\,dx = \frac{x^2}{2} - 12(-\cos x)\bigg]_0^{12}$$

$$= \tfrac{1}{2}(12)^2 + 12(\cos 12 - \cos 0)$$

$$= 72 + 12\cos 12 - 12 = 60 + 12\cos 12$$

This is the exact value of the integral. If a decimal approximation is desired, we can use a calculator to approximate cos 12. Doing so, we get

$$\int_0^{12} (x - 12\sin x)\,dx \approx 70.1262 \qquad ■$$

**EXAMPLE 5** Evaluate $\displaystyle\int_1^9 \frac{2t^2 + t^2\sqrt{t} - 1}{t^2}\,dt$.

**SOLUTION** First we need to write the integrand in a simpler form by carrying out the division:

$$\int_1^9 \frac{2t^2 + t^2\sqrt{t} - 1}{t^2}\,dt = \int_1^9 (2 + t^{1/2} - t^{-2})\,dt$$

$$= 2t + \frac{t^{3/2}}{\frac{3}{2}} - \frac{t^{-1}}{-1}\bigg]_1^9 = 2t + \tfrac{2}{3}t^{3/2} + \frac{1}{t}\bigg]_1^9$$

$$= \left(2\cdot 9 + \tfrac{2}{3}\cdot 9^{3/2} + \tfrac{1}{9}\right) - \left(2\cdot 1 + \tfrac{2}{3}\cdot 1^{3/2} + \tfrac{1}{1}\right)$$

$$= 18 + 18 + \tfrac{1}{9} - 2 - \tfrac{2}{3} - 1 = 32\tfrac{4}{9} \qquad ■$$

## The Net Change Theorem

Part 2 of the Fundamental Theorem says that if $f$ is continuous on $[a, b]$, then

$$\int_a^b f(x)\,dx = F(b) - F(a)$$

where $F$ is any antiderivative of $f$. This means that $F' = f$, so the equation can be rewritten as

$$\int_a^b F'(x)\,dx = F(b) - F(a)$$

We know that $F'(x)$ represents the rate of change of $y = F(x)$ with respect to $x$ and $F(b) - F(a)$ is the change in $y$ when $x$ changes from $a$ to $b$. [Note that $y$ could, for instance, increase, then decrease, then increase again. Although $y$ might change in both directions, $F(b) - F(a)$ represents the *net* change in $y$.] So we can reformulate FTC2 in words as follows.

**Net Change Theorem** The integral of a rate of change is the net change:

$$\int_a^b F'(x)\,dx = F(b) - F(a)$$

The principle expressed in the Net Change Theorem applies to all of the rates of change in the natural and social sciences that we discussed in Section 2.7. These applications show that part of the power of mathematics is in its abstractness. A single abstract idea (in this case the integral) can have many different interpretations. Here are a few instances of how the Net Change Theorem can be applied.

- If $V(t)$ is the volume of water in a reservoir at time $t$, then its derivative $V'(t)$ is the rate at which water flows into the reservoir at time $t$. So

  $$\int_{t_1}^{t_2} V'(t)\,dt = V(t_2) - V(t_1)$$

  is the change in the amount of water in the reservoir between time $t_1$ and time $t_2$.
- If $[\text{C}](t)$ is the concentration of the product of a chemical reaction at time $t$, then the rate of reaction is the derivative $d[\text{C}]/dt$. So

  $$\int_{t_1}^{t_2} \frac{d[\text{C}]}{dt}\,dt = [\text{C}](t_2) - [\text{C}](t_1)$$

  is the change in the concentration of C from time $t_1$ to time $t_2$.
- If the mass of a rod measured from the left end to a point $x$ is $m(x)$, then the linear density is $\rho(x) = m'(x)$. So

  $$\int_a^b \rho(x)\,dx = m(b) - m(a)$$

  is the mass of the segment of the rod that lies between $x = a$ and $x = b$.
- If the rate of growth of a population is $dn/dt$, then

  $$\int_{t_1}^{t_2} \frac{dn}{dt}\,dt = n(t_2) - n(t_1)$$

  is the net change in population during the time period from $t_1$ to $t_2$. (The population increases when births happen and decreases when deaths occur. The net change takes into account both births and deaths.)

- If $C(x)$ is the cost of producing $x$ units of a commodity, then the marginal cost is the derivative $C'(x)$. So

$$\int_{x_1}^{x_2} C'(x)\,dx = C(x_2) - C(x_1)$$

is the increase in cost when production is increased from $x_1$ units to $x_2$ units.

- If an object moves along a straight line with position function $s(t)$, then its velocity is $v(t) = s'(t)$, so

$$\boxed{2} \qquad \int_{t_1}^{t_2} v(t)\,dt = s(t_2) - s(t_1)$$

is the net change of position, or *displacement*, of the object during the time period from $t_1$ to $t_2$. In Section 4.1 we guessed that this was true for the case where the object moves in the positive direction, but now we have proved that it is always true.

- If we want to calculate the distance the object travels during a time interval, we have to consider the intervals when $v(t) \geqslant 0$ (the object moves to the right) and also the intervals when $v(t) \leqslant 0$ (the object moves to the left). In both cases the distance is computed by integrating $|v(t)|$, the speed. Therefore

$$\boxed{3} \qquad \int_{t_1}^{t_2} |v(t)|\,dt = \text{total distance traveled}$$

Figure 3 shows how both displacement and distance traveled can be interpreted in terms of areas under a velocity curve.

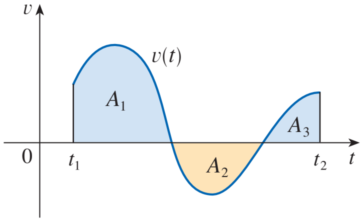

**FIGURE 3**

$$\text{displacement} = \int_{t_1}^{t_2} v(t)\,dt = A_1 - A_2 + A_3$$

$$\text{distance} = \int_{t_1}^{t_2} |v(t)|\,dt = A_1 + A_2 + A_3$$

- The acceleration of the object is $a(t) = v'(t)$, so

$$\int_{t_1}^{t_2} a(t)\,dt = v(t_2) - v(t_1)$$

is the change in velocity from time $t_1$ to time $t_2$.

**EXAMPLE 6** A particle moves along a line so that its velocity at time $t$ is $v(t) = t^2 - t - 6$ (measured in meters per second).
(a) Find the displacement of the particle during the time period $1 \leqslant t \leqslant 4$.
(b) Find the distance traveled during this time period.

**SOLUTION**
(a) By Equation 2, the displacement is

$$s(4) - s(1) = \int_1^4 v(t)\,dt = \int_1^4 (t^2 - t - 6)\,dt$$

$$= \left[\frac{t^3}{3} - \frac{t^2}{2} - 6t\right]_1^4 = -\frac{9}{2}$$

This means that the particle moved 4.5 m toward the left.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(b) Note that $v(t) = t^2 - t - 6 = (t-3)(t+2)$ and so $v(t) \leqslant 0$ on the interval $[1, 3]$ and $v(t) \geqslant 0$ on $[3, 4]$. Thus, from Equation 3, the distance traveled is

To integrate the absolute value of $v(t)$, we use Property 5 of integrals from Section 4.2 to split the integral into two parts, one where $v(t) \leqslant 0$ and one where $v(t) \geqslant 0$.

$$\begin{aligned}\int_1^4 |v(t)|\,dt &= \int_1^3 [-v(t)]\,dt + \int_3^4 v(t)\,dt \\ &= \int_1^3 (-t^2 + t + 6)\,dt + \int_3^4 (t^2 - t - 6)\,dt \\ &= \left[-\frac{t^3}{3} + \frac{t^2}{2} + 6t\right]_1^3 + \left[\frac{t^3}{3} - \frac{t^2}{2} - 6t\right]_3^4 \\ &= \frac{61}{6} \approx 10.17 \text{ m}\end{aligned}$$

■

**EXAMPLE 7** Figure 4 shows the power consumption in the city of San Francisco for a day in September ($P$ is measured in megawatts; $t$ is measured in hours starting at midnight). Estimate the energy used on that day.

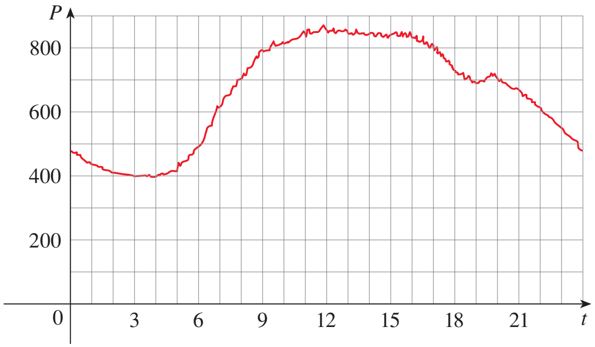

**FIGURE 4**

Pacific Gas & Electric

**SOLUTION** Power is the rate of change of energy: $P(t) = E'(t)$. So, by the Net Change Theorem,

$$\int_0^{24} P(t)\,dt = \int_0^{24} E'(t)\,dt = E(24) - E(0)$$

is the total amount of energy used on that day. We approximate the value of the integral using the Midpoint Rule with 12 subintervals and $\Delta t = 2$:

$$\begin{aligned}\int_0^{24} P(t)\,dt &\approx [P(1) + P(3) + P(5) + \cdots + P(21) + P(23)]\,\Delta t \\ &\approx (440 + 400 + 420 + 620 + 790 + 840 + 850 \\ &\qquad + 840 + 810 + 690 + 670 + 550)(2) \\ &= 15{,}840\end{aligned}$$

The energy used was approximately 15,840 megawatt-hours. ■

A note on units

How did we know what units to use for energy in Example 7? The integral $\int_0^{24} P(t)\,dt$ is defined as the limit of sums of terms of the form $P(t_i^*)\,\Delta t$. Now $P(t_i^*)$ is measured in megawatts and $\Delta t$ is measured in hours, so their product is measured in megawatt-hours. The same is true of the limit. In general, the unit of measurement for $\int_a^b f(x)\,dx$ is the product of the unit for $f(x)$ and the unit for $x$.

## 4.4 Exercises

**1–4** Verify by differentiation that the formula is correct.

**1.** $\int \cos^2 x\,dx = \frac{1}{2}x + \frac{1}{4}\sin 2x + C$

**2.** $\int \tan^2 x\,dx = \tan x - x + C$

**3.** $\int \frac{1}{x^2\sqrt{1+x^2}}\,dx = -\frac{\sqrt{1+x^2}}{x} + C$

**4.** $\int x\sqrt{a+bx}\,dx = \frac{2}{15b^2}(3bx - 2a)(a+bx)^{3/2} + C$

**5–20** Find the general indefinite integral.

**5.** $\int (3x^2 + 4x + 1)\,dx$

**6.** $\int (5 + 2\sqrt{x})\,dx$

**7.** $\int (x + \cos x)\,dx$

**8.** $\int \left(\sqrt[3]{x} + \frac{1}{\sqrt[3]{x}}\right) dx$

**9.** $\int (x^{1.3} + 7x^{2.5})\,dx$

**10.** $\int \sqrt[4]{x^5}\,dx$

**11.** $\int \left(5 + \frac{2}{3}x^2 + \frac{3}{4}x^3\right) dx$

**12.** $\int \left(u^6 - 2u^5 - u^3 + \frac{2}{7}\right) du$

**13.** $\int (u + 4)(2u + 1)\,du$

**14.** $\int \sqrt{t}\,(t^2 + 3t + 2)\,dt$

**15.** $\int \frac{1 + \sqrt{x} + x}{\sqrt{x}}\,dx$

**16.** $\int \left(u^2 + 1 + \frac{1}{u^2}\right) du$

**17.** $\int (2 + \tan^2\theta)\,d\theta$

**18.** $\int \sec t\,(\sec t + \tan t)\,dt$

**19.** $\int 3\csc^2 t\,dt$

**20.** $\int \frac{\sin 2x}{\sin x}\,dx$

**21–22** Find the general indefinite integral. Illustrate by graphing several members of the family on the same screen.

**21.** $\int \left(\cos x + \frac{1}{2}x\right) dx$

**22.** $\int (1 - x^2)^2\,dx$

**23–46** Evaluate the definite integral.

**23.** $\int_{-2}^{3} (x^2 - 3)\,dx$

**24.** $\int_{1}^{2} (4x^3 - 3x^2 + 2x)\,dx$

**25.** $\int_{1}^{4} (8t^3 - 6t^{-2})\,dt$

**26.** $\int_{0}^{8} \left(\frac{1}{8} + \frac{1}{2}w + \frac{1}{3}w^{1/3}\right) dw$

**27.** $\int_{0}^{2} (2x - 3)(4x^2 + 1)\,dx$

**28.** $\int_{1}^{2} \left(\frac{1}{x^2} - \frac{4}{x^3}\right) dx$

**29.** $\int_{0}^{\pi} (4\sin\theta - 3\cos\theta)\,d\theta$

**30.** $\int_{-1}^{1} t(1 - t)^2\,dt$

**31.** $\int_{1}^{4} \left(\frac{4 + 6u}{\sqrt{u}}\right) du$

**32.** $\int_{1}^{2} \left(2 - \frac{1}{p^2}\right)^2 dp$

**33.** $\int_{\pi/6}^{\pi/3} (4\sec^2 y)\,dy$

**34.** $\int_{0}^{\pi/2} (\sqrt{t} - 3\cos t)\,dt$

**35.** $\int_{0}^{1} x(\sqrt[3]{x} + \sqrt[4]{x})\,dx$

**36.** $\int_{1}^{8} \left(\frac{2}{\sqrt[3]{w}} - \sqrt[3]{w}\right) dw$

**37.** $\int_{1}^{4} \sqrt{\frac{5}{x}}\,dx$

**38.** $\int_{\pi/6}^{\pi/2} \csc t\cot t\,dt$

**39.** $\int_{0}^{\pi/4} \frac{1 + \cos^2\theta}{\cos^2\theta}\,d\theta$

**40.** $\int_{0}^{\pi/3} \frac{\sin\theta + \sin\theta\,\tan^2\theta}{\sec^2\theta}\,d\theta$

**41.** $\int_{0}^{64} \sqrt{u}\,(u - \sqrt[3]{u})\,du$

**42.** $\int_{0}^{1} (1 + x^2)^3\,dx$

**43.** $\int_{2}^{5} |x - 3|\,dx$

**44.** $\int_{0}^{2} |2x - 1|\,dx$

**45.** $\int_{-1}^{2} (x - 2|x|)\,dx$

**46.** $\int_{0}^{3\pi/2} |\sin x|\,dx$

**47.** Use a graph to estimate the $x$-intercepts of the curve $y = 1 - 2x - 5x^4$. Then use this information to estimate the area of the region that lies under the curve and above the $x$-axis.

**48.** Repeat Exercise 47 for the curve $y = 2x + 3x^4 - 2x^6$.

**49.** The area of the region that lies to the right of the $y$-axis and to the left of the parabola $x = 2y - y^2$ (the shaded region in the figure) is given by the integral $\int_0^2 (2y - y^2)\,dy$. (Turn

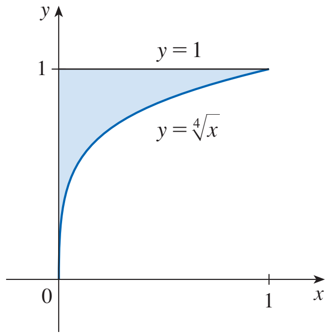
your head clockwise and think of the region as lying below the curve $x = 2y - y^2$ from $y = 0$ to $y = 2$.) Find the area of the region.

**50.** The boundaries of the shaded region are the $y$-axis, the line $y = 1$, and the curve $y = \sqrt[4]{x}$. Find the area of this region by writing $x$ as a function of $y$ and integrating with respect to $y$ (as in Exercise 49).



**51.** If $w'(t)$ is the rate of growth of a child in pounds per year, what does $\int_5^{10} w'(t)\,dt$ represent?

**52.** The current in a wire is defined as the derivative of the charge: $I(t) = Q'(t)$. (See Example 2.7.3.) What does $\int_a^b I(t)\,dt$ represent?

**53.** If oil leaks from a tank at a rate of $r(t)$ gallons per minute at time $t$, what does $\int_0^{120} r(t)\,dt$ represent?

**54.** A honeybee population starts with 100 bees and increases at a rate of $n'(t)$ bees per week. What does $100 + \int_0^{15} n'(t)\,dt$ represent?

**55.** In Section 3.7 we defined the marginal revenue function $R'(x)$ as the derivative of the revenue function $R(x)$, where $x$ is the number of units sold. What does $\int_{1000}^{5000} R'(x)\,dx$ represent?

**56.** If $f(x)$ is the slope of a trail at a distance of $x$ miles from the start of the trail, what does $\int_3^5 f(x)\,dx$ represent?

**57.** If $h(t)$ is a person's heart rate in beats per minute $t$ minutes into an exercise session, what does $\int_0^{30} h(t)\,dt$ represent?

**58.** If the units for $x$ are feet and the units for $a(x)$ are pounds per foot, what are the units for $da/dx$? What units does $\int_2^8 a(x)\,dx$ have?

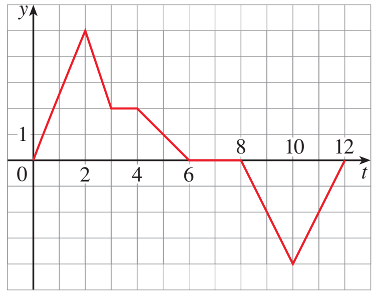
**59.** If $x$ is measured in meters and $f(x)$ is measured in newtons, what are the units for $\int_0^{100} f(x)\,dx$?

**60.** The graph shows the velocity (in m/s) of an electric autonomous vehicle moving along a straight track. At $t = 0$ the vehicle is at the charging station.

(a) How far is the vehicle from the charging station when $t = 2, 4, 6, 8, 10$, and 12?

(b) At what times is the vehicle farthest from the charging station?

(c) What is the total distance traveled by the vehicle?



**61–62** The velocity function (in m/s) is given for a particle moving along a line. Find (a) the displacement and (b) the distance traveled by the particle during the given time interval.

**61.** $v(t) = 3t - 5, \quad 0 \leqslant t \leqslant 3$

**62.** $v(t) = t^2 - 2t - 3, \quad 2 \leqslant t \leqslant 4$

---

**63–64** The acceleration function (in m/s$^2$) and the initial velocity are given for a particle moving along a line. Find (a) the velocity at time $t$ and (b) the distance traveled during the given time interval.

**63.** $a(t) = t + 4, \quad v(0) = 5, \quad 0 \leqslant t \leqslant 10$

**64.** $a(t) = 2t + 3, \quad v(0) = -4, \quad 0 \leqslant t \leqslant 3$

---

**65.** The linear density of a rod of length 4 m is given by $\rho(x) = 9 + 2\sqrt{x}$ measured in kilograms per meter, where $x$ is measured in meters from one end of the rod. Find the total mass of the rod.

**66.** Water flows from the bottom of a storage tank at a rate of $r(t) = 200 - 4t$ liters per minute, where $0 \leqslant t \leqslant 50$. Find the amount of water that flows from the tank during the first 10 minutes.

**67.** The velocity of a car was read from its speedometer at 10-second intervals and recorded in the table. Use the Midpoint Rule to estimate the distance traveled by the car.

| $t$ (s) | $v$ (mi/h) | $t$ (s) | $v$ (mi/h) |
|---|---|---|---|
| 0 | 0 | 60 | 56 |
| 10 | 38 | 70 | 53 |
| 20 | 52 | 80 | 50 |
| 30 | 58 | 90 | 47 |
| 40 | 55 | 100 | 45 |
| 50 | 51 | | |

**68.** Suppose that a volcano is erupting and readings of the rate $r(t)$ at which solid materials are spewed into the atmosphere are given in the table. The time $t$ is measured in seconds and the units for $r(t)$ are tonnes (metric tons) per second.

| $t$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|---|
| $r(t)$ | 2 | 10 | 24 | 36 | 46 | 54 | 60 |

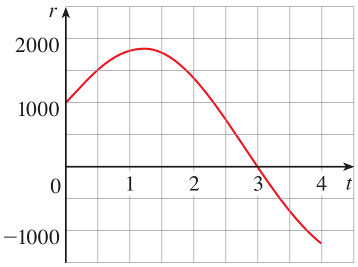
(a) Give upper and lower estimates for the total quantity $Q(6)$ of erupted materials after six seconds.

(b) Use the Midpoint Rule to estimate $Q(6)$.

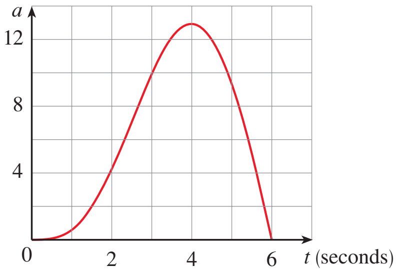
**69.** Lake Lanier in Georgia, USA, is a reservoir created by Buford Dam on the Chattahoochee River. The table shows the rate of inflow of water, in cubic feet per second, as measured every morning at 7:30 AM by the US Army Corps of Engineers. Use the Midpoint Rule to estimate the amount of water that flowed into Lake Lanier from July 18th, 2013, at 7:30 AM to July 26th at 7:30 AM.

| Day | Inflow rate ($\text{ft}^3/\text{s}$) |
|---|---|
| July 18 | 5275 |
| July 19 | 6401 |
| July 20 | 2554 |
| July 21 | 4249 |
| July 22 | 3016 |
| July 23 | 3821 |
| July 24 | 2462 |
| July 25 | 2628 |
| July 26 | 3003 |

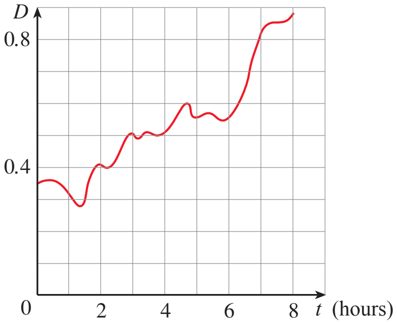
**70.** Water flows into and out of a storage tank. A graph of the rate of change $r(t)$ of the volume of water in the tank, in liters per day, is shown. If the amount of water in the tank at time $t = 0$ is 25,000 L, use the Midpoint Rule to estimate the amount of water in the tank four days later.



**71.** The graph of a car's acceleration $a(t)$, measured in $\text{ft/s}^2$, is shown. Use the Midpoint Rule to estimate the increase in the velocity of the car during the six-second time interval.



**72.** Shown is the graph of traffic on an Internet service provider's T1 data line from midnight to 8:00 AM. $D$ is the data throughput, measured in megabits per second. Use the Midpoint Rule to estimate the total amount of data transmitted during that time period.



**73.** Shown is a graph of the electric power consumption in the New England states (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont) for October 22, 2010 ($P$ is measured in gigawatts and $t$ is measured in hours starting at midnight). Use the fact that power is the rate of change of energy to estimate the electric energy used on that day.

The following exercises are intended only for those who have already covered Chapter 6.

**75–79** Evaluate the integral.

**75.** $\int (\sin x + \sinh x)\, dx$

**76.** $\int_{-10}^{10} \frac{2e^x}{\sinh x + \cosh x}\, dx$

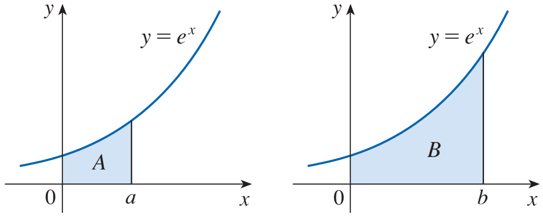
**77.** $\int \left( x^2 + 1 + \frac{1}{x^2 + 1} \right) dx$

**78.** $\int_1^2 \frac{(x-1)^3}{x^2}\, dx$

**79.** $\int_0^{1/\sqrt{3}} \frac{t^2 - 1}{t^4 - 1}\, dt$

---

**80.** The area labeled $B$ is three times the area labeled $A$. Express $b$ in terms of $a$.



## WRITING PROJECT | NEWTON, LEIBNIZ, AND THE INVENTION OF CALCULUS

We sometimes read that the inventors of calculus were Sir Isaac Newton (1642–1727) and Gottfried Wilhelm Leibniz (1646–1716). But we know that the basic ideas behind integration were investigated 2500 years ago by ancient Greeks such as Eudoxus and Archimedes, and methods for finding tangents were pioneered by Pierre Fermat (1601–1665), Isaac Barrow (1630–1677), and others. Barrow—who taught at Cambridge and was a major influence on Newton—was the first to understand the inverse relationship between differentiation and integration. What Newton and Leibniz did was to use this relationship, in the form of the Fundamental Theorem of Calculus, in order to develop calculus into a systematic mathematical discipline. It is in this sense that both Newton and Leibniz are credited with the invention of calculus.

Search the Internet to find out more about the contributions of these men, and consult one or more of the given references. Write an essay on one of the following three topics. You can include biographical details, but the main thrust of your report should be a description, in some detail, of their methods and notations. In particular, you should consult one of the source books, which give excerpts from the original publications of Newton and Leibniz, translated from Latin to English.

- The Role of Newton in the Development of Calculus
- The Role of Leibniz in the Development of Calculus
- The Controversy between the Followers of Newton and Leibniz over Priority in the Invention of Calculus

## 4.5 The Substitution Rule

Because of the Fundamental Theorem, it's important to be able to find antiderivatives. But our antidifferentiation formulas don't tell us how to evaluate integrals such as

$$\int 2x\sqrt{1+x^2}\,dx \tag{1}$$

**PS** To find this integral we use the problem-solving strategy of *introducing something extra.* Here the "something extra" is a new variable; we change from the variable $x$ to a new variable $u$.

### Substitution: Indefinite Integrals

Differentials were defined in Section 2.9. If $u = f(x)$, then

$$du = f'(x)\,dx$$

Suppose that we let $u$ be the quantity under the root sign in (1), $u = 1 + x^2$. Then the differential of $u$ is $du = 2x\,dx$. Notice that if the $dx$ in the notation for an integral were to be interpreted as a differential, then the differential $2x\,dx$ would occur in (1) and so, formally, without justifying our calculation, we could write

$$\begin{aligned} \int 2x\sqrt{1+x^2}\,dx &= \int \sqrt{1+x^2}\,2x\,dx = \int \sqrt{u}\,du \\ &= \tfrac{2}{3}u^{3/2} + C = \tfrac{2}{3}(1+x^2)^{3/2} + C \end{aligned} \tag{2}$$

But now we can check that we have the correct answer by using the Chain Rule to differentiate the final function of Equation 2:

$$\frac{d}{dx}\left[\tfrac{2}{3}(1+x^2)^{3/2}+C\right]=\tfrac{2}{3}\cdot\tfrac{3}{2}(1+x^2)^{1/2}\cdot 2x=2x\sqrt{1+x^2}$$

In general, this method works whenever we have an integral that we can write in the form $\int f(g(x))\,g'(x)\,dx$. Observe that if $F'=f$, then

$$\boxed{3}\qquad \int F'(g(x))\,g'(x)\,dx=F(g(x))+C$$

because, by the Chain Rule,

$$\frac{d}{dx}[F(g(x))]=F'(g(x))\,g'(x)$$

If we make the "change of variable" or "substitution" $u=g(x)$, then from Equation 3 we have

$$\int F'(g(x))\,g'(x)\,dx=F(g(x))+C=F(u)+C=\int F'(u)\,du$$

or, writing $F'=f$, we get

$$\int f(g(x))\,g'(x)\,dx=\int f(u)\,du$$

Thus we have proved the following rule.

**4 The Substitution Rule** If $u=g(x)$ is a differentiable function whose range is an interval $I$ and $f$ is continuous on $I$, then

$$\int f(g(x))\,g'(x)\,dx=\int f(u)\,du$$

Notice that the Substitution Rule for integration was proved using the Chain Rule for differentiation. Notice also that if $u=g(x)$, then $du=g'(x)\,dx$, so a way to remember the Substitution Rule is to think of $dx$ and $du$ in (4) as differentials.

Thus the Substitution Rule says: **it is permissible to operate with *dx* and *du* after integral signs as if they were differentials.**

**EXAMPLE 1** Find $\int x^3\cos(x^4+2)\,dx$.

**SOLUTION** We make the substitution $u=x^4+2$ because its differential is $du=4x^3\,dx$, which, apart from the constant factor 4, occurs in the integral. Thus, using $x^3\,dx=\frac{1}{4}\,du$ and the Substitution Rule, we have

$$\begin{aligned}\int x^3\cos(x^4+2)\,dx&=\int\cos u\cdot\tfrac{1}{4}\,du=\tfrac{1}{4}\int\cos u\,du\\&=\tfrac{1}{4}\sin u+C\\&=\tfrac{1}{4}\sin(x^4+2)+C\end{aligned}$$

Check the answer by differentiating it.

Notice that at the final stage we had to return to the original variable $x$. ■

The idea behind the Substitution Rule is to replace a relatively complicated integral by a simpler integral. This is accomplished by changing from the original variable $x$ to a new variable $u$ that is a function of $x$. Thus in Example 1 we replaced the integral $\int x^3 \cos(x^4 + 2)\,dx$ by the simpler integral $\frac{1}{4}\int \cos u\,du$.

The main challenge in using the Substitution Rule is to think of an appropriate substitution. You should try to choose $u$ to be some function in the integrand whose differential also occurs (except for a constant factor). This was the case in Example 1. If that is not possible, try choosing $u$ to be some complicated part of the integrand (perhaps the inner function in a composite function). Finding the right substitution is a bit of an art. It's not unusual to guess wrong; if your first guess doesn't work, try another substitution.

**EXAMPLE 2** Evaluate $\displaystyle\int \sqrt{2x + 1}\,dx$.

**SOLUTION 1** Let $u = 2x + 1$. Then $du = 2\,dx$, so $dx = \frac{1}{2}\,du$. Thus the Substitution Rule gives

$$\begin{aligned}\int \sqrt{2x+1}\,dx &= \int \sqrt{u}\,\cdot \tfrac{1}{2}\,du = \tfrac{1}{2}\int u^{1/2}\,du \\ &= \frac{1}{2}\cdot\frac{u^{3/2}}{3/2} + C = \tfrac{1}{3}u^{3/2} + C \\ &= \tfrac{1}{3}(2x+1)^{3/2} + C\end{aligned}$$

**SOLUTION 2** Another possible substitution is $u = \sqrt{2x + 1}$. Then

$$du = \frac{dx}{\sqrt{2x+1}} \qquad \text{so} \qquad dx = \sqrt{2x+1}\,du = u\,du$$

(Or observe that $u^2 = 2x + 1$, so $2u\,du = 2\,dx$.) Therefore

$$\begin{aligned}\int \sqrt{2x+1}\,dx &= \int u \cdot u\,du = \int u^2\,du \\ &= \frac{u^3}{3} + C = \tfrac{1}{3}(2x+1)^{3/2} + C\end{aligned}$$ ■

**EXAMPLE 3** Find $\displaystyle\int \frac{x}{\sqrt{1 - 4x^2}}\,dx$.

**SOLUTION** Let $u = 1 - 4x^2$. Then $du = -8x\,dx$, so $x\,dx = -\frac{1}{8}\,du$ and

$$\begin{aligned}\int \frac{x}{\sqrt{1-4x^2}}\,dx &= -\tfrac{1}{8}\int \frac{1}{\sqrt{u}}\,du = -\tfrac{1}{8}\int u^{-1/2}\,du \\ &= -\tfrac{1}{8}\left(2\sqrt{u}\right) + C = -\tfrac{1}{4}\sqrt{1-4x^2} + C\end{aligned}$$ ■

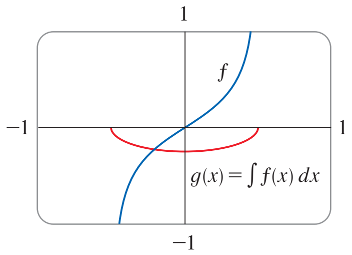

**FIGURE 1**

$f(x) = \dfrac{x}{\sqrt{1-4x^2}}$

$g(x) = \displaystyle\int f(x)\,dx = -\tfrac{1}{4}\sqrt{1-4x^2}$

The answer to Example 3 could be checked by differentiation, but instead let's check it with a graph. In Figure 1 we have used a computer to graph both the integrand $f(x) = x/\sqrt{1 - 4x^2}$ and its indefinite integral $g(x) = -\frac{1}{4}\sqrt{1 - 4x^2}$ (we take the case $C = 0$). Notice that $g(x)$ decreases when $f(x)$ is negative, increases when $f(x)$ is positive, and has its minimum value when $f(x) = 0$. So it seems reasonable, from the graphical evidence, that $g$ is an antiderivative of $f$.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 4** Evaluate $\int \cos 5x\,dx$.

**SOLUTION** If we let $u = 5x$, then $du = 5\,dx$, so $dx = \frac{1}{5}\,du$. Therefore

$$\int \cos 5x\,dx = \tfrac{1}{5}\int \cos u\,du = \tfrac{1}{5}\sin u + C = \tfrac{1}{5}\sin 5x + C \qquad ■$$

**NOTE** With some experience, you might be able to evaluate integrals like those in Examples 1–4 without going to the trouble of making an explicit substitution. By recognizing the pattern in Equation 3, where the integrand on the left side is the product of the derivative of an outer function and the derivative of the inner function, we could work Example 1 as follows:

$$\begin{aligned}\int x^3\cos(x^4+2)\,dx &= \int \cos(x^4+2)\cdot x^3\,dx = \tfrac{1}{4}\int \cos(x^4+2)\cdot(4x^3)\,dx\\ &= \tfrac{1}{4}\int \cos(x^4+2)\cdot\frac{d}{dx}(x^4+2)\,dx = \tfrac{1}{4}\sin(x^4+2)+C\end{aligned}$$

Similarly, the solution to Example 4 could be written like this:

$$\int \cos 5x\,dx = \tfrac{1}{5}\int 5\cos 5x\,dx = \tfrac{1}{5}\int \frac{d}{dx}(\sin 5x)\,dx = \tfrac{1}{5}\sin 5x + C$$

The following example, however, is more complicated and so an explicit substitution is advisable.

**EXAMPLE 5** Find $\int \sqrt{1+x^2}\,x^5\,dx$.

**SOLUTION** An appropriate substitution becomes more apparent if we factor $x^5$ as $x^4 \cdot x$. Let $u = 1 + x^2$. Then $du = 2x\,dx$, so $x\,dx = \frac{1}{2}\,du$. Also $x^2 = u - 1$, so $x^4 = (u-1)^2$:

$$\begin{aligned}\int \sqrt{1+x^2}\,x^5\,dx &= \int \sqrt{1+x^2}\,x^4\cdot x\,dx\\ &= \int \sqrt{u}\,(u-1)^2\cdot\tfrac{1}{2}\,du = \tfrac{1}{2}\int \sqrt{u}\,(u^2-2u+1)\,du\\ &= \tfrac{1}{2}\int (u^{5/2}-2u^{3/2}+u^{1/2})\,du\\ &= \tfrac{1}{2}\left(\tfrac{2}{7}u^{7/2}-2\cdot\tfrac{2}{5}u^{5/2}+\tfrac{2}{3}u^{3/2}\right)+C\\ &= \tfrac{1}{7}(1+x^2)^{7/2}-\tfrac{2}{5}(1+x^2)^{5/2}+\tfrac{1}{3}(1+x^2)^{3/2}+C \qquad ■\end{aligned}$$

## ■ Substitution: Definite Integrals

When evaluating a *definite* integral by substitution, two methods are possible. One method is to evaluate the indefinite integral first and then use the Fundamental Theorem. For instance, using the result of Example 2, we have

$$\begin{aligned}\int_0^4 \sqrt{2x+1}\,dx &= \int \sqrt{2x+1}\,dx\Big]_0^4\\ &= \tfrac{1}{3}(2x+1)^{3/2}\Big]_0^4 = \tfrac{1}{3}(9)^{3/2}-\tfrac{1}{3}(1)^{3/2}\\ &= \tfrac{1}{3}(27-1) = \tfrac{26}{3}\end{aligned}$$

Another method, which is usually preferable, is to change the limits of integration when the variable is changed.

This rule says that when using a substitution in a definite integral, we must put everything in terms of the new variable $u$, not only $x$ and $dx$ but also the limits of integration. The new limits of integration are the values of $u$ that correspond to $x = a$ and $x = b$.

**5 The Substitution Rule for Definite Integrals** If $g'$ is continuous on $[a, b]$ and $f$ is continuous on the range of $u = g(x)$, then

$$\int_a^b f(g(x))\,g'(x)\,dx = \int_{g(a)}^{g(b)} f(u)\,du$$

**PROOF** Let $F$ be an antiderivative of $f$. Then, by (3), $F(g(x))$ is an antiderivative of $f(g(x))\,g'(x)$, so by Part 2 of the Fundamental Theorem, we have

$$\int_a^b f(g(x))\,g'(x)\,dx = F(g(x))\Big]_a^b = F(g(b)) - F(g(a))$$

But, applying FTC2 a second time, we also have

$$\int_{g(a)}^{g(b)} f(u)\,du = F(u)\Big]_{g(a)}^{g(b)} = F(g(b)) - F(g(a))$$ ■

**EXAMPLE 6** Evaluate $\int_0^4 \sqrt{2x + 1}\,dx$ using (5).

**SOLUTION** Using the substitution from Solution 1 of Example 2, we have $u = 2x + 1$ and $dx = \frac{1}{2}\,du$. To find the new limits of integration we note that

when $x = 0$, $u = 2(0) + 1 = 1$ and when $x = 4$, $u = 2(4) + 1 = 9$

Therefore

$$\begin{aligned}\int_0^4 \sqrt{2x + 1}\,dx &= \int_1^9 \tfrac{1}{2}\sqrt{u}\,du \\ &= \tfrac{1}{2} \cdot \tfrac{2}{3}u^{3/2}\Big]_1^9 \\ &= \tfrac{1}{3}(9^{3/2} - 1^{3/2}) = \tfrac{26}{3}\end{aligned}$$ ■

Observe that when using (5) we do *not* return to the variable $x$ after integrating. We simply evaluate the expression in $u$ between the appropriate values of $u$.

Another way of writing the integral given in Example 7 is

$$\int_1^2 \frac{1}{(3 - 5x)^2}\,dx$$

**EXAMPLE 7** Evaluate $\displaystyle\int_1^2 \frac{dx}{(3 - 5x)^2}$.

**SOLUTION** Let $u = 3 - 5x$. Then $du = -5\,dx$, so $dx = -\frac{1}{5}\,du$. When $x = 1$, $u = -2$ and when $x = 2$, $u = -7$. Thus

$$\begin{aligned}\int_1^2 \frac{dx}{(3 - 5x)^2} &= -\frac{1}{5}\int_{-2}^{-7} \frac{du}{u^2} = -\frac{1}{5}\left[-\frac{1}{u}\right]_{-2}^{-7} = \frac{1}{5u}\Bigg]_{-2}^{-7} \\ &= \frac{1}{5}\left(-\frac{1}{7} + \frac{1}{2}\right) = \frac{1}{14}\end{aligned}$$ ■

## ■ Symmetry

The next theorem uses the Substitution Rule for Definite Integrals (5) to simplify the calculation of integrals of functions that possess symmetry properties.

Recall that a function $f$ is even if

$$f(-x) = f(x) \qquad \text{for all } x$$

and $f$ is odd if

$$f(-x) = -f(x) \qquad \text{for all } x$$

**6 Integrals of Symmetric Functions** Suppose $f$ is continuous on $[-a, a]$.

(a) If $f$ is even, then $\int_{-a}^{a} f(x)\,dx = 2\int_{0}^{a} f(x)\,dx$.

(b) If $f$ is odd, then $\int_{-a}^{a} f(x)\,dx = 0$.

**PROOF** We split the integral in two:

$$\boxed{7} \qquad \int_{-a}^{a} f(x)\,dx = \int_{-a}^{0} f(x)\,dx + \int_{0}^{a} f(x)\,dx = -\int_{0}^{-a} f(x)\,dx + \int_{0}^{a} f(x)\,dx$$

In the first integral on the far right side we make the substitution $u = -x$. Then $du = -dx$ and when $x = -a$, $u = a$. Therefore

$$-\int_{0}^{-a} f(x)\,dx = -\int_{0}^{a} f(-u)\,(-du) = \int_{0}^{a} f(-u)\,du$$

and so Equation 7 becomes

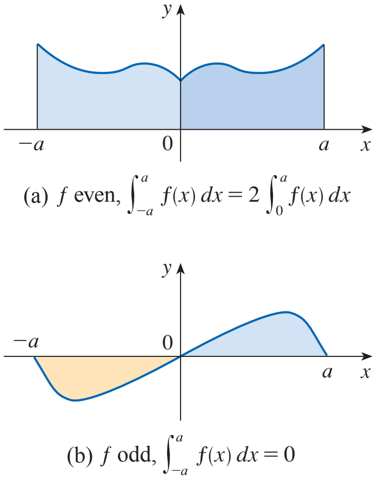
$$\boxed{8} \qquad \int_{-a}^{a} f(x)\,dx = \int_{0}^{a} f(-u)\,du + \int_{0}^{a} f(x)\,dx$$

(a) If $f$ is even, then $f(-u) = f(u)$ so Equation 8 gives

$$\int_{-a}^{a} f(x)\,dx = \int_{0}^{a} f(u)\,du + \int_{0}^{a} f(x)\,dx = 2\int_{0}^{a} f(x)\,dx$$

(b) If $f$ is odd, then $f(-u) = -f(u)$ and so Equation 8 gives

$$\int_{-a}^{a} f(x)\,dx = -\int_{0}^{a} f(u)\,du + \int_{0}^{a} f(x)\,dx = 0$$ ■



(a) $f$ even, $\int_{-a}^{a} f(x)\,dx = 2\int_{0}^{a} f(x)\,dx$

(b) $f$ odd, $\int_{-a}^{a} f(x)\,dx = 0$

**FIGURE 2**

Theorem 6 is illustrated by Figure 2. For the case where $f$ is positive and even, part (a) says that the area under $y = f(x)$ from $-a$ to $a$ is twice the area from 0 to $a$ because of symmetry. Recall that an integral $\int_{a}^{b} f(x)\,dx$ can be expressed as the area above the $x$-axis and below $y = f(x)$ minus the area below the axis and above the curve. So part (b) says the integral is 0 because the areas cancel.

**EXAMPLE 8** Because $f(x) = x^6 + 1$ satisfies $f(-x) = f(x)$, it is even and so

$$\int_{-2}^{2} (x^6 + 1)\,dx = 2\int_{0}^{2} (x^6 + 1)\,dx$$
$$= 2\left[\tfrac{1}{7}x^7 + x\right]_0^2 = 2\left(\tfrac{128}{7} + 2\right) = \tfrac{284}{7}$$ ■

**EXAMPLE 9** Because $f(x) = (\tan x)/(1 + x^2 + x^4)$ satisfies $f(-x) = -f(x)$, it is odd and so

$$\int_{-1}^{1} \frac{\tan x}{1 + x^2 + x^4}\,dx = 0$$ ■

## 4.5 Exercises

**1–8** Evaluate the integral by making the given substitution.

**1.** $\int \cos 2x\, dx, \quad u = 2x$

**2.** $\int x(2x^2 + 3)^4\, dx, \quad u = 2x^2 + 3$

**3.** $\int x^2\sqrt{x^3 + 1}\, dx, \quad u = x^3 + 1$

**4.** $\int \sin^2\theta \cos\theta\, d\theta, \quad u = \sin\theta$

**5.** $\int \frac{x^3}{(x^4 - 5)^2}\, dx, \quad u = x^4 - 5$

**6.** $\int \frac{1}{x^2}\sqrt{1 + \frac{1}{x}}\, dx, \quad u = 1 + \frac{1}{x}$

**7.** $\int \frac{\cos\sqrt{t}}{\sqrt{t}}\, dt, \quad u = \sqrt{t}$

**8.** $\int z\sqrt{z - 1}\, dz, \quad u = z - 1$

**9–32** Evaluate the indefinite integral.

**9.** $\int x\sqrt{1 - x^2}\, dx$

**10.** $\int (5 - 3x)^{10}\, dx$

**11.** $\int x^2\cos(x^3)\, dx$

**12.** $\int \sin t\sqrt{1 + \cos t}\, dt$

**13.** $\int \sin(\pi t/3)\, dt$

**14.** $\int \sec^2 2\theta\, d\theta$

**15.** $\int \sec 3t \tan 3t\, dt$

**16.** $\int y^2(4 - y^3)^{2/3}\, dy$

**17.** $\int \cos(1 + 5t)\, dt$

**18.** $\int \frac{\sin(1/x)}{x^2}\, dx$

**19.** $\int \cos^3\theta \sin\theta\, d\theta$

**20.** $\int \sin x \sin(\cos x)\, dx$

**21.** $\int \left(x - \frac{1}{x^2}\right)\left(x^2 + \frac{2}{x}\right)^5 dx$

**22.** $\int x\sqrt{x + 2}\, dx$

**23.** $\int \frac{a + bx^2}{\sqrt{3ax + bx^3}}\, dx$

**24.** $\int \frac{\sec^2 x}{\tan^2 x}\, dx$

**25.** $\int \frac{z^2}{\sqrt[3]{1 + z^3}}\, dz$

**26.** $\int \frac{dt}{\cos^2 t\sqrt{1 + \tan t}}$

**27.** $\int \sqrt{\cot x}\,\csc^2 x\, dx$

**28.** $\int \frac{\cos(\pi/x)}{x^2}\, dx$

**29.** $\int \sec^3 x \tan x\, dx$

**30.** $\int x^2\sqrt{2 + x}\, dx$

**31.** $\int x(2x + 5)^8\, dx$

**32.** $\int x^3\sqrt{x^2 + 1}\, dx$

**33–36** Evaluate the indefinite integral. Illustrate and check that your answer is reasonable by graphing both the function and its antiderivative (take $C = 0$).

**33.** $\int x(x^2 - 1)^3\, dx$

**34.** $\int \tan^2\theta \sec^2\theta\, d\theta$

**35.** $\int \sin^3 x \cos x\, dx$

**36.** $\int \sin x \cos^4 x\, dx$

**37–52** Evaluate the definite integral.

**37.** $\int_0^1 \cos(\pi t/2)\, dt$

**38.** $\int_0^1 (3t - 1)^{50}\, dt$

**39.** $\int_0^1 \sqrt[3]{1 + 7x}\, dx$

**40.** $\int_{\pi/3}^{2\pi/3} \csc^2\left(\tfrac{1}{2}t\right) dt$

**41.** $\int_0^{\pi/6} \frac{\sin t}{\cos^2 t}\, dt$

**42.** $\int_1^4 \frac{\sqrt{2 + \sqrt{x}}}{\sqrt{x}}\, dx$

**43.** $\int_{-\pi/4}^{\pi/4} (x^3 + x^4\tan x)\, dx$

**44.** $\int_0^{\pi/2} \cos x \sin(\sin x)\, dx$

**45.** $\int_0^{13} \frac{dx}{\sqrt[3]{(1 + 2x)^2}}$

**46.** $\int_0^a x\sqrt{a^2 - x^2}\, dx$

**47.** $\int_0^a x\sqrt{x^2 + a^2}\, dx \quad (a > 0)$

**48.** $\int_{-\pi/3}^{\pi/3} x^4 \sin x\, dx$

**49.** $\int_1^2 x\sqrt{x - 1}\, dx$

**50.** $\int_0^4 \frac{x}{\sqrt{1 + 2x}}\, dx$

**51.** $\int_{1/2}^1 \frac{\cos(x^{-2})}{x^3}\, dx$

**52.** $\int_0^1 \frac{dx}{(1 + \sqrt{x})^4}$

**53–54** Use a graph to give a rough estimate of the area of the region that lies under the given curve. Then find the exact area.

**53.** $y = \sqrt{2x + 1}, \quad 0 \leqslant x \leqslant 1$

**54.** $y = 2\sin x - \sin 2x, \quad 0 \leqslant x \leqslant \pi$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**55.** Evaluate $\int_{-2}^{2} (x + 3)\sqrt{4 - x^2}\, dx$ by writing it as a sum of two integrals and interpreting one of those integrals in terms of an area.

**56.** Evaluate $\int_0^1 x\sqrt{1 - x^4}\, dx$ by making a substitution and interpreting the resulting integral in terms of an area.

**57.** Breathing is cyclic and a full respiratory cycle from the beginning of inhalation to the end of exhalation takes about 5 seconds. The maximum rate of air flow into the lungs is about 0.5 L/s. This explains, in part, why the function $f(t) = \frac{1}{2} \sin(2\pi t/5)$ has often been used to model the rate of air flow into the lungs. Use this model to find the volume of inhaled air in the lungs at time $t$.

**58.** A model for the basal metabolism rate, in kcal/h, of a young man is $R(t) = 85 - 0.18 \cos(\pi t/12)$, where $t$ is the time in hours measured from 5:00 AM. What is the total basal metabolism of this man, $\int_0^{24} R(t)\, dt$, over a 24-hour time period?

**59.** If $f$ is continuous and $\int_0^4 f(x)\, dx = 10$, find $\int_0^2 f(2x)\, dx$.

**60.** If $f$ is continuous and $\int_0^9 f(x)\, dx = 4$, find $\int_0^3 xf(x^2)\, dx$.

**61.** If $f$ is continuous on $\mathbb{R}$, prove that

$$\int_a^b f(-x)\, dx = \int_{-b}^{-a} f(x)\, dx$$

For the case where $f(x) \geqslant 0$ and $0 < a < b$, draw a diagram to interpret this equation geometrically as an equality of areas.

**62.** If $f$ is continuous on $\mathbb{R}$, prove that

$$\int_a^b f(x + c)\, dx = \int_{a+c}^{b+c} f(x)\, dx$$

For the case where $f(x) \geqslant 0$, draw a diagram to interpret this equation geometrically as an equality of areas.

**63.** If $a$ and $b$ are positive numbers, show that

$$\int_0^1 x^a(1 - x)^b\, dx = \int_0^1 x^b(1 - x)^a\, dx$$

**64.** If $f$ is continuous on $[0, \pi]$, use the substitution $u = \pi - x$ to show that

$$\int_0^\pi xf(\sin x)\, dx = \frac{\pi}{2} \int_0^\pi f(\sin x)\, dx$$

**65.** If $f$ is continuous, prove that

$$\int_0^{\pi/2} f(\cos x)\, dx = \int_0^{\pi/2} f(\sin x)\, dx$$

**66.** Use Exercise 65 to evaluate

$$\int_0^{\pi/2} \cos^2 x\, dx \qquad \text{and} \qquad \int_0^{\pi/2} \sin^2 x\, dx$$

---

The following exercises are intended only for those who have already covered Chapter 6.

**67–84** Evaluate the integral.

**67.** $\displaystyle\int \frac{dx}{4x + 7}$

**68.** $\displaystyle\int e^{-5r}\, dr$

**69.** $\displaystyle\int \frac{(\ln x)^2}{x}\, dx$

**70.** $\displaystyle\int \frac{dx}{ax + b} \quad (a \neq 0)$

**71.** $\displaystyle\int e^r(2 + 3e^r)^{3/2}\, dr$

**72.** $\displaystyle\int e^{\cos t} \sin t\, dt$

**73.** $\displaystyle\int \frac{(\arctan x)^2}{x^2 + 1}\, dx$

**74.** $\displaystyle\int \frac{t + 1}{3t^2 + 6t - 5}\, dt$

**75.** $\displaystyle\int \frac{1 + x}{1 + x^2}\, dx$

**76.** $\displaystyle\int \frac{\sin(\ln x)}{x}\, dx$

**77.** $\displaystyle\int \frac{\sin 2x}{1 + \cos^2 x}\, dx$

**78.** $\displaystyle\int \frac{\sin x}{1 + \cos^2 x}\, dx$

**79.** $\displaystyle\int \cot x\, dx$

**80.** $\displaystyle\int \frac{x}{1 + x^4}\, dx$

**81.** $\displaystyle\int_e^{e^4} \frac{dx}{x\sqrt{\ln x}}$

**82.** $\displaystyle\int_0^1 \frac{e^x}{1 + e^{2x}}\, dx$

**83.** $\displaystyle\int_0^1 \frac{e^z + 1}{e^z + z}\, dz$

**84.** $\displaystyle\int_0^2 (x - 1)e^{(x-1)^2}\, dx$

---

**85.** Use Exercise 64 to evaluate the integral

$$\int_0^\pi \frac{x \sin x}{1 + \cos^2 x}\, dx$$

# 4 REVIEW

## CONCEPT CHECK

Answers to the Concept Check are available at StewartCalculus.com.

**1.** (a) Write an expression for a Riemann sum of a function $f$. Explain the meaning of the notation that you use.
   (b) If $f(x) \geqslant 0$, what is the geometric interpretation of a Riemann sum? Illustrate with a diagram.
   (c) If $f(x)$ takes on both positive and negative values, what is the geometric interpretation of a Riemann sum? Illustrate with a diagram.

**2.** (a) Write the definition of the definite integral of a continuous function from $a$ to $b$.
   (b) What is the geometric interpretation of $\int_a^b f(x)\,dx$ if $f(x) \geqslant 0$?
   (c) What is the geometric interpretation of $\int_a^b f(x)\,dx$ if $f(x)$ takes on both positive and negative values? Illustrate with a diagram.

**3.** State the Midpoint Rule.

**4.** State both parts of the Fundamental Theorem of Calculus.

**5.** (a) State the Net Change Theorem.
   (b) If $r(t)$ is the rate at which water flows into a reservoir, what does $\int_{t_1}^{t_2} r(t)\,dt$ represent?

**6.** Suppose a particle moves back and forth along a straight line with velocity $v(t)$, measured in feet per second, and acceleration $a(t)$.
   (a) What is the meaning of $\int_{60}^{120} v(t)\,dt$?
   (b) What is the meaning of $\int_{60}^{120} |v(t)|\,dt$?
   (c) What is the meaning of $\int_{60}^{120} a(t)\,dt$?

**7.** (a) Explain the meaning of the indefinite integral $\int f(x)\,dx$.
   (b) What is the connection between the definite integral $\int_a^b f(x)\,dx$ and the indefinite integral $\int f(x)\,dx$?

**8.** Explain exactly what is meant by the statement that "differentiation and integration are inverse processes."

**9.** State the Substitution Rule. In practice, how do you use it?

## TRUE–FALSE QUIZ

Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

**1.** If $f$ and $g$ are continuous on $[a, b]$, then

$$\int_a^b [f(x) + g(x)]\,dx = \int_a^b f(x)\,dx + \int_a^b g(x)\,dx$$

**2.** If $f$ and $g$ are continuous on $[a, b]$, then

$$\int_a^b [f(x)g(x)]\,dx = \left(\int_a^b f(x)\,dx\right)\left(\int_a^b g(x)\,dx\right)$$

**3.** If $f$ is continuous on $[a, b]$, then

$$\int_a^b 5f(x)\,dx = 5\int_a^b f(x)\,dx$$

**4.** If $f$ is continuous on $[a, b]$, then

$$\int_a^b xf(x)\,dx = x\int_a^b f(x)\,dx$$

**5.** If $f$ is continuous on $[a, b]$ and $f(x) \geqslant 0$, then

$$\int_a^b \sqrt{f(x)}\,dx = \sqrt{\int_a^b f(x)\,dx}$$

**6.** $\int_a^b f(x)\,dx = \int_a^b f(z)\,dz$

**7.** If $f'$ is continuous on $[1, 3]$, then $\int_1^3 f'(v)\,dv = f(3) - f(1)$.

**8.** If $v(t)$ is the velocity at time $t$ of a particle moving along a line, then $\int_a^b v(t)\,dt$ is the distance traveled during the time period $a \leqslant t \leqslant b$.

**9.** $\int_a^b f'(x)\,[f(x)]^4\,dx = \frac{1}{5}[f(x)]^5 + C$

**10.** If $f$ and $g$ are differentiable and $f(x) \geqslant g(x)$ for $a < x < b$, then $f'(x) \geqslant g'(x)$ for $a < x < b$.

**11.** If $f$ and $g$ are continuous and $f(x) \geqslant g(x)$ for $a \leqslant x \leqslant b$, then

$$\int_a^b f(x)\,dx \geqslant \int_a^b g(x)\,dx$$

**12.** $\int_{-5}^5 (ax^2 + bx + c)\,dx = 2\int_0^5 (ax^2 + c)\,dx$

**13.** All continuous functions have derivatives.

**14.** All continuous functions have antiderivatives.

**15.** $\displaystyle\int_\pi^{2\pi} \frac{\sin x}{x}\,dx = \int_\pi^{3\pi} \frac{\sin x}{x}\,dx + \int_{3\pi}^{2\pi} \frac{\sin x}{x}\,dx$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**16.** If $\int_0^1 f(x)\,dx = 0$, then $f(x) = 0$ for $0 \leqslant x \leqslant 1$.

**17.** If $f$ is continuous on $[a, b]$, then

$$\frac{d}{dx}\left(\int_a^b f(x)\,dx\right) = f(x)$$

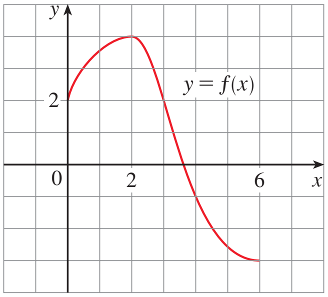
**18.** $\int_0^2 (x - x^3)\,dx$ represents the area under the curve $y = x - x^3$ from $x = 0$ to $x = 2$.

**19.** $\displaystyle\int_{-2}^{1} \frac{1}{x^4}\,dx = -\frac{3}{8}$

**20.** If $f$ has a discontinuity at 0, then $\displaystyle\int_{-1}^{1} f(x)\,dx$ does not exist.

## EXERCISES

**1.** Use the given graph of $f$ to find the Riemann sum with six subintervals. Take the sample points to be (a) left endpoints and (b) midpoints. In each case draw a diagram and explain what the Riemann sum represents.



**2.** (a) Evaluate the Riemann sum for

$$f(x) = x^2 - x \qquad 0 \leqslant x \leqslant 2$$

with four subintervals, taking the sample points to be right endpoints. Explain, with the aid of a diagram, what the Riemann sum represents.

(b) Use the definition of a definite integral (with right endpoints) to calculate the value of the integral

$$\int_0^2 (x^2 - x)\,dx$$

(c) Use the Fundamental Theorem to check your answer to part (b).

(d) Draw a diagram to explain the geometric meaning of the integral in part (b).

**3.** Evaluate

$$\int_0^1 \left(x + \sqrt{1 - x^2}\right) dx$$

by interpreting it in terms of areas.

**4.** Express

$$\lim_{n \to \infty} \sum_{i=1}^{n} \sin x_i\,\Delta x$$

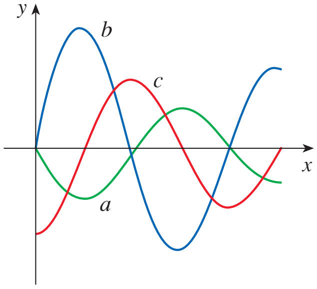
as a definite integral on the interval $[0, \pi]$ and then evaluate the integral.

**5.** If $\int_0^6 f(x)\,dx = 10$ and $\int_0^4 f(x)\,dx = 7$, find $\int_4^6 f(x)\,dx$.

T **6.** (a) Write $\int_1^5 (x + 2x^5)\,dx$ as a limit of Riemann sums, taking the sample points to be right endpoints. Use a computer algebra system to evaluate the sum and to compute the limit.

(b) Use the Fundamental Theorem to check your answer to part (a).

**7.** The figure shows the graphs of $f$, $f'$, and $\int_0^x f(t)\,dt$. Identify each graph, and explain your choices.



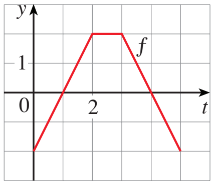
**8.** Evaluate:

(a) $\displaystyle\int_0^{\pi/2} \frac{d}{dx}\left(\sin\frac{x}{2}\cos\frac{x}{3}\right) dx$

(b) $\displaystyle\frac{d}{dx}\int_0^{\pi/2} \sin\frac{x}{2}\cos\frac{x}{3}\,dx$

(c) $\displaystyle\frac{d}{dx}\int_x^{\pi/2} \sin\frac{t}{2}\cos\frac{t}{3}\,dt$

**9.** The graph of $f$ consists of the three line segments shown. If $g(x) = \int_0^x f(t)\,dt$, find $g(4)$ and $g'(4)$.



**10.** If $f$ is the function in Exercise 9, find $g''(4)$.

**11–32** Evaluate the integral, if it exists.

**11.** $\displaystyle\int_{-1}^{0} (x^2 + 5x)\,dx$

**12.** $\displaystyle\int_0^T (x^4 - 8x + 7)\,dx$

**13.** $\displaystyle\int_0^1 (1 - x^9)\,dx$

**14.** $\displaystyle\int_0^1 (1 - x)^9\,dx$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**15.** $\displaystyle\int_1^9 \frac{\sqrt{u} - 2u^2}{u}\,du$

**16.** $\displaystyle\int_0^1 (\sqrt[4]{u} + 1)^2\,du$

**17.** $\displaystyle\int_0^1 y(y^2 + 1)^5\,dy$

**18.** $\displaystyle\int_0^2 y^2\sqrt{1 + y^3}\,dy$

**19.** $\displaystyle\int_1^5 \frac{dt}{(t - 4)^2}$

**20.** $\displaystyle\int_0^1 \sin(3\pi t)\,dt$

**21.** $\displaystyle\int_0^1 v^2\cos(v^3)\,dv$

**22.** $\displaystyle\int_{-1}^1 \frac{\sin x}{1 + x^2}\,dx$

**23.** $\displaystyle\int_{-\pi/4}^{\pi/4} \frac{t^4\tan t}{2 + \cos t}\,dt$

**24.** $\displaystyle\int \frac{x + 2}{\sqrt{x^2 + 4x}}\,dx$

**25.** $\displaystyle\int \sin \pi t\cos \pi t\,dt$

**26.** $\displaystyle\int \sin x\cos(\cos x)\,dx$

**27.** $\displaystyle\int_0^{\pi/8} \sec 2\theta\tan 2\theta\,d\theta$

**28.** $\displaystyle\int_0^{\pi/4} (1 + \tan t)^3\sec^2 t\,dt$

**29.** $\displaystyle\int x(1 - x)^{2/3}\,dx$

**30.** $\displaystyle\int \sec^2\theta\tan^3\theta\,d\theta$

**31.** $\displaystyle\int_0^3 |x^2 - 4|\,dx$

**32.** $\displaystyle\int_0^4 |\sqrt{x} - 1|\,dx$

**33–34** Evaluate the indefinite integral. Illustrate and check that your answer is reasonable by graphing both the function and its antiderivative (take $C = 0$).

**33.** $\displaystyle\int \frac{\cos x}{\sqrt{1 + \sin x}}\,dx$

**34.** $\displaystyle\int \frac{x^3}{\sqrt{x^2 + 1}}\,dx$

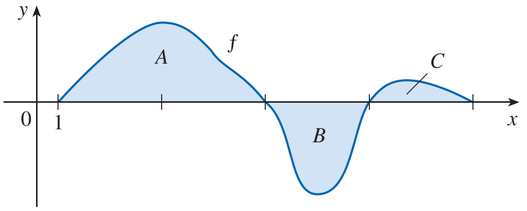
**35.** Use a graph to give a rough estimate of the area of the region that lies under the curve $y = x\sqrt{x}$, $0 \leqslant x \leqslant 4$. Then find the exact area.

**36.** Graph the function $f(x) = \cos^2 x\sin x$ and use the graph to guess the value of the integral $\int_0^{2\pi} f(x)\,dx$. Then evaluate the integral to confirm your guess.

**37.** Find the area under the graph of $y = x^2 + 5$ and above the $x$-axis, between $x = 0$ and $x = 4$.

**38.** Find the area under the graph of $y = \sin x$ and above the $x$-axis, between $x = 0$ and $x = \pi/2$.

**39–40** The regions $A$, $B$, and $C$ bounded by the graph of $f$ and the $x$-axis have areas 3, 2, and 1, respectively. Evaluate the integral.



**39.** (a) $\displaystyle\int_1^5 f(x)\,dx$ (b) $\displaystyle\int_1^5 |f(x)|\,dx$

**40.** (a) $\displaystyle\int_1^4 f(x)\,dx + \int_3^5 f(x)\,dx$

(b) $\displaystyle\int_1^3 2f(x)\,dx + \int_3^5 6f(x)\,dx$

**41–46** Find the derivative of the function.

**41.** $\displaystyle F(x) = \int_0^x \frac{t^2}{1 + t^3}\,dt$

**42.** $\displaystyle F(x) = \int_x^1 \sqrt{t + \sin t}\,dt$

**43.** $\displaystyle g(x) = \int_0^{x^4} \cos(t^2)\,dt$

**44.** $\displaystyle g(x) = \int_1^{\sin x} \frac{1 - t^2}{1 + t^4}\,dt$

**45.** $\displaystyle y = \int_{\sqrt{x}}^x \frac{\cos\theta}{\theta}\,d\theta$

**46.** $\displaystyle y = \int_{2x}^{3x+1} \sin(t^4)\,dt$

**47–48** Use Property 8 of integrals to estimate the value of the integral.

**47.** $\displaystyle\int_1^3 \sqrt{x^2 + 3}\,dx$

**48.** $\displaystyle\int_2^4 \frac{1}{x^3 + 2}\,dx$

**49–50** Use the properties of integrals to verify the inequality.

**49.** $\displaystyle\int_0^1 x^2\cos x\,dx \leqslant \frac{1}{3}$

**50.** $\displaystyle\int_{\pi/4}^{\pi/2} \frac{\sin x}{x}\,dx \leqslant \frac{\sqrt{2}}{2}$

**51.** Use the Midpoint Rule with $n = 6$ to approximate $\int_0^3 \sin(x^3)\,dx$. Round to four decimal places.

**52.** A particle moves along a line with velocity function $v(t) = t^2 - t$, where $v$ is measured in meters per second. Find (a) the displacement and (b) the distance traveled by the particle during the time interval $[0, 5]$.

**53.** Let $r(t)$ be the rate at which the world's oil is consumed, where $t$ is measured in years starting at $t = 0$ on January 1, 2000, and $r(t)$ is measured in barrels per year. What does $\int_{15}^{20} r(t)\,dt$ represent?

**54.** A radar gun was used to record the speed of a runner at the times given in the table. Use the Midpoint Rule to estimate the distance the runner covered during those 5 seconds.

| $t$ (s) | $v$ (m/s) |
|---|---|
| 0 | 0 |
| 0.5 | 4.67 |
| 1.0 | 7.34 |
| 1.5 | 8.86 |
| 2.0 | 9.73 |
| 2.5 | 10.22 |
| 3.0 | 10.51 |
| 3.5 | 10.67 |
| 4.0 | 10.76 |
| 4.5 | 10.81 |
| 5.0 | 10.81 |

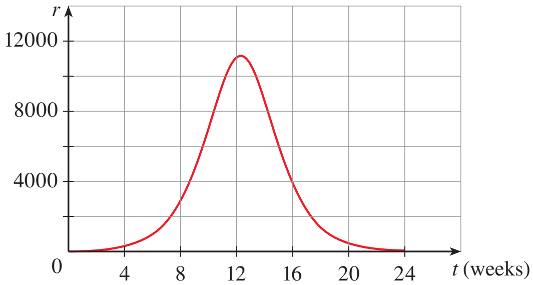
**55.** A population of honeybees increased at a rate of $r(t)$ bees per week, where the graph of $r$ is as shown. Use the Midpoint Rule with six subintervals to estimate the increase in the bee population during the first 24 weeks.



**56.** Let

$$f(x) = \begin{cases} -x - 1 & \text{if } -3 \leqslant x \leqslant 0 \\ -\sqrt{1 - x^2} & \text{if } 0 \leqslant x \leqslant 1 \end{cases}$$

Evaluate $\int_{-3}^{1} f(x)\,dx$ by interpreting the integral as a difference of areas.

**57.** If $f$ is continuous and $\int_0^2 f(x)\,dx = 6$, evaluate

$$\int_0^{\pi/2} f(2 \sin \theta) \cos \theta \, d\theta$$

**58.** The Fresnel function $S(x) = \int_0^x \sin\left(\frac{1}{2}\pi t^2\right) dt$ was introduced in Section 4.3. Fresnel also used the function

$$C(x) = \int_0^x \cos\left(\tfrac{1}{2}\pi t^2\right) dt$$

in his theory of the diffraction of light waves.

(a) On what intervals is $C$ increasing?

(b) On what intervals is $C$ concave upward?

(c) Use a graph to solve the following equation correct to two decimal places:

$$\int_0^x \cos\left(\tfrac{1}{2}\pi t^2\right) dt = 0.7$$

(d) Plot the graphs of $C$ and $S$ on the same screen. How are these graphs related?

**59.** If $f$ is a continuous function such that

$$\int_0^x f(t)\,dt = x \sin x + \int_0^x \frac{f(t)}{1 + t^2}\,dt$$

for all $x$, find an explicit formula for $f(x)$.

**60.** Find a function $f$ and a value of the constant $a$ such that

$$2 \int_a^x f(t)\,dt = 2 \sin x - 1$$

**61.** If $f'$ is continuous on $[a, b]$, show that

$$2 \int_a^b f(x) f'(x)\,dx = [f(b)]^2 - [f(a)]^2$$

**62.** Find

$$\lim_{h \to 0} \frac{1}{h} \int_2^{2+h} \sqrt{1 + t^3}\,dt$$

**63.** If $f$ is continuous on $[0, 1]$, prove that

$$\int_0^1 f(x)\,dx = \int_0^1 f(1 - x)\,dx$$

**64.** Evaluate

$$\lim_{n \to \infty} \frac{1}{n} \left[ \left(\frac{1}{n}\right)^9 + \left(\frac{2}{n}\right)^9 + \left(\frac{3}{n}\right)^9 + \cdots + \left(\frac{n}{n}\right)^9 \right]$$

# Problems Plus

Before you look at the solution of the example, cover it up and first try to solve the problem yourself.

**EXAMPLE** Evaluate $\displaystyle\lim_{x \to 3} \left( \frac{x}{x - 3} \int_3^x \frac{\sin t}{t}\, dt \right)$.

**SOLUTION** Let's start by having a preliminary look at the ingredients of the function. What happens to the first factor, $x/(x - 3)$, when $x$ approaches 3? The numerator approaches 3 and the denominator approaches 0, so we have

$$\frac{x}{x - 3} \to \infty \quad \text{as} \quad x \to 3^+ \qquad \text{and} \qquad \frac{x}{x - 3} \to -\infty \quad \text{as} \quad x \to 3^-$$

The second factor approaches $\int_3^3 (\sin t)/t\, dt$, which is 0. It's not clear what happens to the function as a whole. (One factor is becoming large while the other is becoming small.) So how do we proceed?

**PS** Review the Principles of Problem Solving following Chapter 1.

One of the principles of problem solving is *recognizing something familiar*. Is there a part of the function that reminds us of something we've seen before? Well, the integral

$$\int_3^x \frac{\sin t}{t}\, dt$$

has $x$ as its upper limit of integration and that type of integral occurs in Part 1 of the Fundamental Theorem of Calculus:

$$\frac{d}{dx} \int_a^x f(t)\, dt = f(x)$$

This suggests that differentiation might be involved.

Once we start thinking about differentiation, the denominator $(x - 3)$ reminds us of something else that should be familiar: one of the forms of the definition of the derivative in Chapter 2 is

$$F'(a) = \lim_{x \to a} \frac{F(x) - F(a)}{x - a}$$

and with $a = 3$ this becomes

$$F'(3) = \lim_{x \to 3} \frac{F(x) - F(3)}{x - 3}$$

So what is the function $F$ in our situation? Notice that if we define

$$F(x) = \int_3^x \frac{\sin t}{t}\, dt$$

then $F(3) = 0$. What about the factor $x$ in the numerator? That's just a red herring, so let's factor it out and put together the calculation:

$$\lim_{x \to 3} \left( \frac{x}{x - 3} \int_3^x \frac{\sin t}{t}\, dt \right) = \lim_{x \to 3} x \cdot \lim_{x \to 3} \frac{\displaystyle\int_3^x \frac{\sin t}{t}\, dt}{x - 3} = 3 \lim_{x \to 3} \frac{F(x) - F(3)}{x - 3}$$

$$= 3F'(3) = 3\, \frac{\sin 3}{3} = \sin 3 \qquad \text{(FTC1)} \qquad ■$$

## Problems

1. If $x \sin \pi x = \int_0^{x^2} f(t)\, dt$, where $f$ is a continuous function, find $f(4)$.
2. Find the minimum value of the area of the region under the curve $y = 4x - x^3$ from $x = a$ to $x = a + 1$, for all $a > 0$.
3. If $f$ is a differentiable function such that $f(x)$ is never 0 and $\int_0^x f(t)\, dt = [f(x)]^2$ for all $x$, find $f$.

**4.** (a) Graph several members of the family of functions $f(x) = (2cx - x^2)/c^3$ for $c > 0$ and look at the regions enclosed by these curves and the $x$-axis. Make a conjecture about how the areas of these regions are related.

(b) Prove your conjecture in part (a).

(c) Take another look at the graphs in part (a) and use them to sketch the curve traced out by the vertices (highest points) of the family of functions. Can you guess what kind of curve this is?

(d) Find an equation of the curve you sketched in part (c).

**5.** If $f(x) = \int_0^{g(x)} \frac{1}{\sqrt{1 + t^3}}\, dt$, where $g(x) = \int_0^{\cos x} [1 + \sin(t^2)]\, dt$, find $f'(\pi/2)$.

**6.** If $f(x) = \int_0^x x^2 \sin(t^2)\, dt$, find $f'(x)$.

**7.** Find the interval $[a, b]$ for which the value of the integral $\int_a^b (2 + x - x^2)\, dx$ is a maximum.

**8.** Use an integral to estimate the sum $\sum_{i=1}^{10,000} \sqrt{i}$.

**9.** (a) Evaluate $\int_0^n [\![x]\!]\, dx$, where $n$ is a positive integer.

(b) Evaluate $\int_a^b [\![x]\!]\, dx$, where $a$ and $b$ are real numbers with $0 \leqslant a < b$.

**10.** Find $\frac{d^2}{dx^2} \int_0^x \left( \int_1^{\sin t} \sqrt{1 + u^4}\, du \right) dt$.

**11.** Suppose the coefficients of the cubic polynomial $P(x) = a + bx + cx^2 + dx^3$ satisfy the equation

$$a + \frac{b}{2} + \frac{c}{3} + \frac{d}{4} = 0$$

Show that the equation $P(x) = 0$ has a solution between 0 and 1. Can you generalize this result for an $n$th-degree polynomial?

**12.** A circular disk of radius $r$ is used in an evaporator and is rotated in a vertical plane. If it is to be partially submerged in the liquid so as to maximize the exposed wetted area of the disk, show that the center of the disk should be positioned at a height $r/\sqrt{1 + \pi^2}$ above the surface of the liquid.

**13.** Prove that if $f$ is continuous, then $\int_0^x f(u)(x - u)\, du = \int_0^x \left( \int_0^u f(t)\, dt \right) du$.

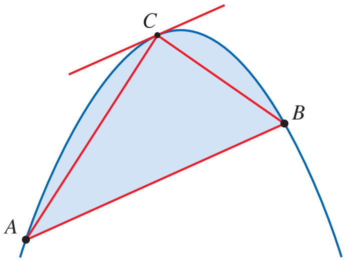


**FIGURE FOR PROBLEM 14**

**14.** The figure shows a parabolic segment, that is, a portion of a parabola cut off by a chord $AB$. It also shows a point $C$ on the parabola with the property that the tangent line at $C$ is parallel to the chord $AB$. Archimedes proved that the area of the parabolic segment is $\frac{4}{3}$ times the area of the inscribed triangle $ABC$. Verify Archimedes' result for the parabola $y = 4 - x^2$ and the line $y = x + 2$.

**15.** Given the point $(a, b)$ in the first quadrant, find the downward-opening parabola that passes through the point $(a, b)$ and the origin such that the area under the parabola is a minimum.

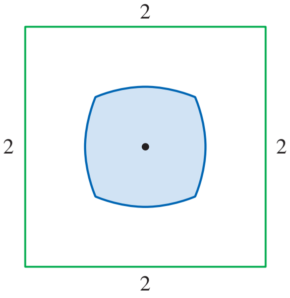

**FIGURE FOR PROBLEM 16**

**16.** The figure shows a region consisting of all points inside a square that are closer to the center than to the sides of the square. Find the area of the region.

**17.** Evaluate $\lim_{n\to\infty} \left( \frac{1}{\sqrt{n}\sqrt{n + 1}} + \frac{1}{\sqrt{n}\sqrt{n + 2}} + \cdots + \frac{1}{\sqrt{n}\sqrt{n + n}} \right)$.

**18.** For any number $c$, we let $f_c(x)$ be the smaller of the two numbers $(x - c)^2$ and $(x - c - 2)^2$. Then we define $g(c) = \int_0^1 f_c(x)\, dx$. Find the maximum and minimum values of $g(c)$ if $-2 \leqslant c \leqslant 2$.

# Applications of Integration

**IN THIS CHAPTER WE EXPLORE** some of the applications of the definite integral by using it to compute areas between curves, volumes of solids, and the work done by a varying force. The common theme is the following general method, which is similar to the one we used to find areas under curves: We break up a quantity $Q$ into a large number of small parts. We next approximate each small part by a quantity of the form $f(x_i^*)\,\Delta x$ and thus approximate $Q$ by a Riemann sum. Then we take the limit and express $Q$ as an integral. Finally we evaluate the integral using the Fundamental Theorem of Calculus or the Midpoint Rule.

## 5.1 Areas Between Curves

In Chapter 4 we defined and calculated areas of regions that lie under the graphs of functions. Here we use integrals to find areas of regions that lie between the graphs of two functions.

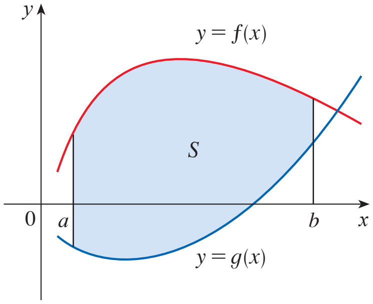

**FIGURE 1**
$S = \{(x, y) \mid a \leqslant x \leqslant b,$ $g(x) \leqslant y \leqslant f(x)\}$

### Area Between Curves: Integrating With Respect to *x*

Consider the region $S$ shown in Figure 1 that lies between two curves $y = f(x)$ and $y = g(x)$ and between the vertical lines $x = a$ and $x = b$, where $f$ and $g$ are continuous functions and $f(x) \geqslant g(x)$ for all $x$ in $[a, b]$.

Just as we did for areas under curves in Section 4.1, we divide $S$ into $n$ strips of equal width and then we approximate the $i$th strip by a rectangle with base $\Delta x$ and height $f(x_i^*) - g(x_i^*)$. (See Figure 2. If we like, we could take all of the sample points to be right endpoints, in which case $x_i^* = x_i$.) The Riemann sum

$$\sum_{i=1}^{n} [f(x_i^*) - g(x_i^*)] \, \Delta x$$

is therefore an approximation to what we intuitively think of as the area of $S$.

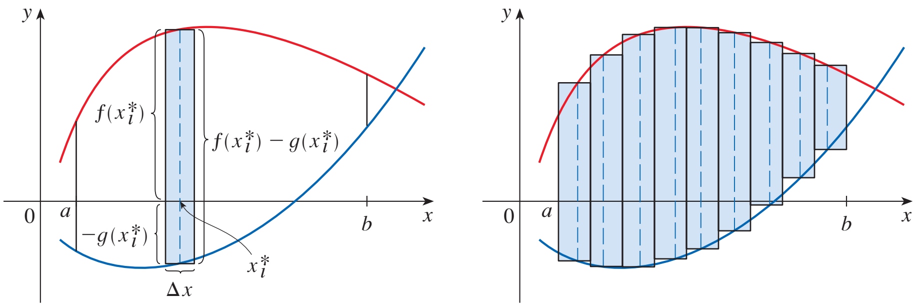

**FIGURE 2**

(a) Typical rectangle (b) Approximating rectangles

This approximation appears to become better and better as $n \to \infty$. Therefore we define the **area** $A$ of the region $S$ as the limiting value of the sum of the areas of these approximating rectangles.

**1**
$$\boxed{A = \lim_{n \to \infty} \sum_{i=1}^{n} [f(x_i^*) - g(x_i^*)] \, \Delta x}$$

We recognize the limit in (1) as the definite integral of $f - g$. Therefore we have the following formula for area.

**2** The area $A$ of the region bounded by the curves $y = f(x)$, $y = g(x)$, and the lines $x = a$, $x = b$, where $f$ and $g$ are continuous and $f(x) \geqslant g(x)$ for all $x$ in $[a, b]$, is

$$A = \int_a^b [f(x) - g(x)] \, dx$$

Notice that in the special case where $g(x) = 0$, $S$ is the region under the graph of $f$ and our general definition of area (1) reduces to our previous definition (Definition 4.1.2).

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

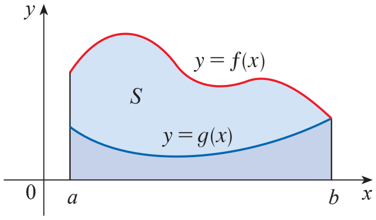

**FIGURE 3**

$A = \int_a^b f(x)dx - \int_a^b g(x)dx$

In the case where both $f$ and $g$ are positive, you can see from Figure 3 why (2) is true:

$$A = [\text{area under } y = f(x)] - [\text{area under } y = g(x)]$$
$$= \int_a^b f(x)\,dx - \int_a^b g(x)\,dx = \int_a^b [f(x) - g(x)]\,dx$$

**EXAMPLE 1** Find the area of the region bounded above by $y = x^2 + 1$, bounded below by $y = x$, and bounded on the sides by $x = 0$ and $x = 1$.

**SOLUTION** The region is shown in Figure 4. The upper boundary curve is $y = x^2 + 1$ and the lower boundary curve is $y = x$. So we use the area formula (2) with $f(x) = x^2 + 1$, $g(x) = x$, $a = 0$, and $b = 1$:

$$A = \int_0^1 [(x^2 + 1) - x]\,dx = \int_0^1 (x^2 - x + 1)\,dx$$
$$= \frac{x^3}{3} - \frac{x^2}{2} + x\Big]_0^1 = \frac{1}{3} - \frac{1}{2} + 1 = \frac{5}{6}$$ ■

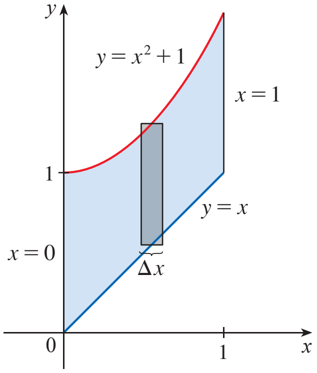

**FIGURE 4**

In Figure 4 we drew a typical approximating rectangle with width $\Delta x$ as a reminder of the procedure by which the area is defined in (1). In general, when we set up an integral for an area, it's helpful to sketch the region to identify the top curve $y_T$, the bottom curve $y_B$, and a typical approximating rectangle as in Figure 5. Then the area of a typical rectangle is $(y_T - y_B)\,\Delta x$ and the equation

$$A = \lim_{n \to \infty} \sum_{i=1}^{n} (y_T - y_B)\,\Delta x = \int_a^b (y_T - y_B)\,dx$$

summarizes the procedure of adding (in a limiting sense) the areas of all the typical rectangles.

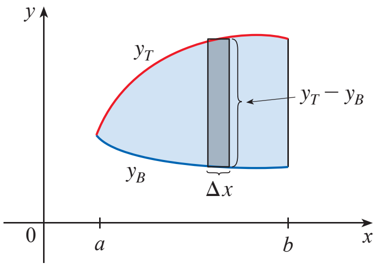

**FIGURE 5**

Notice that in Figure 5 the left-hand boundary reduces to a point, whereas in Figure 3 the right-hand boundary reduces to a point. In the next example both of the side boundaries reduce to a point, so the first step is to find $a$ and $b$.

**EXAMPLE 2** Find the area of the region enclosed by the parabolas $y = x^2$ and $y = 2x - x^2$.

**SOLUTION** We first find the points of intersection of the parabolas by solving their equations simultaneously. This gives $x^2 = 2x - x^2$, or $2x^2 - 2x = 0$. Thus $2x(x - 1) = 0$, so $x = 0$ or $1$. The points of intersection are $(0, 0)$ and $(1, 1)$.

We see from Figure 6 that the top and bottom boundaries are

$$y_T = 2x - x^2 \qquad \text{and} \qquad y_B = x^2$$

The area of a typical rectangle is

$$(y_T - y_B)\,\Delta x = (2x - x^2 - x^2)\,\Delta x = (2x - 2x^2)\,\Delta x$$

and the region lies between $x = 0$ and $x = 1$. So the total area is

$$A = \int_0^1 (2x - 2x^2)\,dx = 2\int_0^1 (x - x^2)\,dx$$
$$= 2\left[\frac{x^2}{2} - \frac{x^3}{3}\right]_0^1 = 2\left(\frac{1}{2} - \frac{1}{3}\right) = \frac{1}{3}$$ ■

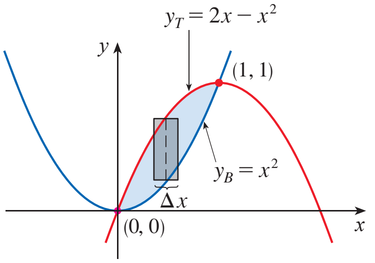

**FIGURE 6**

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Sometimes it's difficult, or even impossible, to find the points of intersection of two curves exactly. As shown in the following example, we can use a graphing calculator or computer to find approximate values for the intersection points and then proceed as before.

**EXAMPLE 3** Find the approximate area of the region bounded by the curves $y = x/\sqrt{x^2+1}$ and $y = x^4 - x$.

**SOLUTION** If we were to try to find the exact intersection points, we would have to solve the equation

$$\frac{x}{\sqrt{x^2+1}} = x^4 - x$$

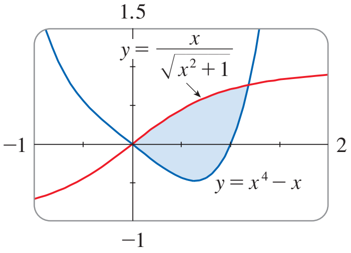

**FIGURE 7**

This looks like a very difficult equation to solve exactly (in fact, it's impossible), so instead we graph the two curves using a computer (see Figure 7). One intersection point is the origin, and we find that the other occurs when $x \approx 1.18$. So an approximation to the area between the curves is

$$A \approx \int_0^{1.18} \left[ \frac{x}{\sqrt{x^2+1}} - (x^4 - x) \right] dx$$

To integrate the first term we use the substitution $u = x^2 + 1$. Then $du = 2x\,dx$, and when $x = 1.18$, we have $u \approx 2.39$; when $x = 0$, $u = 1$. So

$$\begin{aligned} A &\approx \tfrac{1}{2}\int_1^{2.39} \frac{du}{\sqrt{u}} - \int_0^{1.18} (x^4 - x)\,dx \\ &= \sqrt{u}\,\Big]_1^{2.39} - \left[ \frac{x^5}{5} - \frac{x^2}{2} \right]_0^{1.18} \\ &= \sqrt{2.39} - 1 - \frac{(1.18)^5}{5} + \frac{(1.18)^2}{2} \\ &\approx 0.785 \end{aligned}$$

■

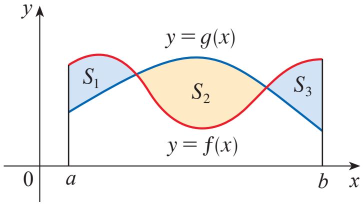

**FIGURE 8**

If we are asked to find the area between the curves $y = f(x)$ and $y = g(x)$ where $f(x) \geqslant g(x)$ for some values of $x$ but $g(x) \geqslant f(x)$ for other values of $x$, then we split the given region $S$ into several regions $S_1, S_2, \ldots$ with areas $A_1, A_2, \ldots$ as shown in Figure 8. We then define the area of the region $S$ to be the sum of the areas of the smaller regions $S_1, S_2, \ldots$, that is, $A = A_1 + A_2 + \cdots$. Since

$$|f(x) - g(x)| = \begin{cases} f(x) - g(x) & \text{when } f(x) \geqslant g(x) \\ g(x) - f(x) & \text{when } g(x) \geqslant f(x) \end{cases}$$

we have the following expression for $A$.

**3** The area between the curves $y = f(x)$ and $y = g(x)$ and between $x = a$ and $x = b$ is

$$A = \int_a^b |f(x) - g(x)|\,dx$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

When evaluating the integral in (3), however, we must still split it into integrals corresponding to $A_1, A_2, \ldots$.

**EXAMPLE 4** Find the area of the region bounded by the curves $y = \sin x$, $y = \cos x$, $x = 0$, and $x = \pi/2$.

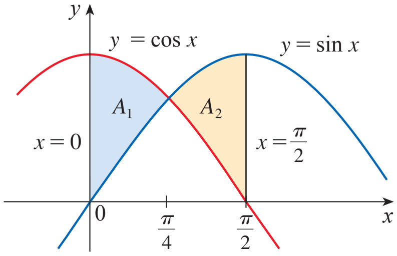

**FIGURE 9**

**SOLUTION** The points of intersection occur when $\sin x = \cos x$, that is, when $x = \pi/4$ (since $0 \leqslant x \leqslant \pi/2$). The region is sketched in Figure 9.

Observe that $\cos x \geqslant \sin x$ when $0 \leqslant x \leqslant \pi/4$ but $\sin x \geqslant \cos x$ when $\pi/4 \leqslant x \leqslant \pi/2$. Therefore the required area is

$$\begin{aligned} A &= \int_0^{\pi/2} |\cos x - \sin x|\, dx = A_1 + A_2 \\ &= \int_0^{\pi/4} (\cos x - \sin x)\, dx + \int_{\pi/4}^{\pi/2} (\sin x - \cos x)\, dx \\ &= \Big[\sin x + \cos x\Big]_0^{\pi/4} + \Big[-\cos x - \sin x\Big]_{\pi/4}^{\pi/2} \\ &= \left(\frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}} - 0 - 1\right) + \left(-0 - 1 + \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{2}}\right) \\ &= 2\sqrt{2} - 2 \end{aligned}$$

In this particular example we could have saved some work by noticing that the region is symmetric about $x = \pi/4$ and so

$$A = 2A_1 = 2\int_0^{\pi/4} (\cos x - \sin x)\, dx \qquad ■$$

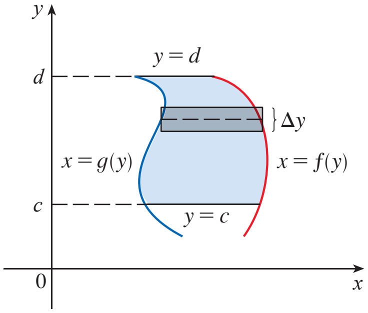

**FIGURE 10**

## ■ Area Between Curves: Integrating With Respect to *y*

Some regions are best treated by regarding $x$ as a function of $y$. If a region is bounded by curves with equations $x = f(y)$, $x = g(y)$, $y = c$, and $y = d$, where $f$ and $g$ are continuous and $f(y) \geqslant g(y)$ for $c \leqslant y \leqslant d$ (see Figure 10), then its area is

$$A = \int_c^d [f(y) - g(y)]\, dy$$

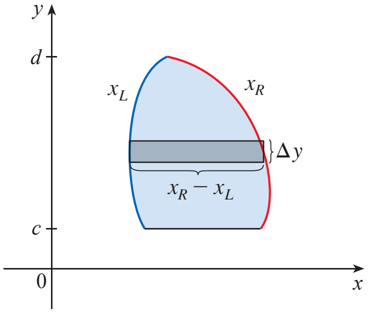

**FIGURE 11**

If we write $x_R$ for the right boundary and $x_L$ for the left boundary, then, as Figure 11 illustrates, we have

$$A = \int_c^d (x_R - x_L)\, dy$$

Here a typical approximating rectangle has dimensions $x_R - x_L$ and $\Delta y$.

**EXAMPLE 5** Find the area enclosed by the line $y = x - 1$ and the parabola $y^2 = 2x + 6$.

**SOLUTION** By solving the two equations simultaneously we find that the points of intersection are $(-1, -2)$ and $(5, 4)$. We solve the equation of the parabola for $x$ and

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

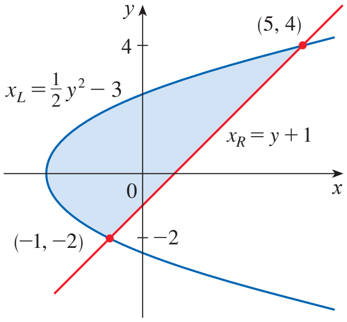

**FIGURE 12**

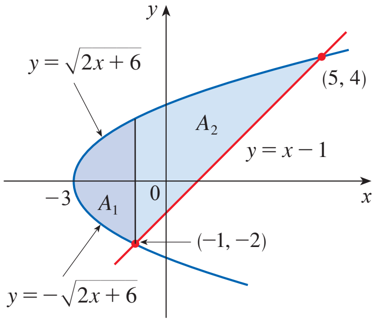

**FIGURE 13**

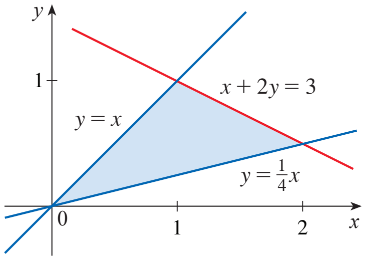

**FIGURE 14**

notice from Figure 12 that the left and right boundary curves are

$$x_L = \tfrac{1}{2}y^2 - 3 \qquad \text{and} \qquad x_R = y + 1$$

We must integrate between the appropriate $y$-values, $y = -2$ and $y = 4$. Thus

$$\begin{aligned} A &= \int_{-2}^{4} (x_R - x_L)\, dy = \int_{-2}^{4} \left[(y + 1) - \left(\tfrac{1}{2}y^2 - 3\right)\right] dy \\ &= \int_{-2}^{4} \left(-\tfrac{1}{2}y^2 + y + 4\right) dy \\ &= -\frac{1}{2}\left(\frac{y^3}{3}\right) + \frac{y^2}{2} + 4y \Bigg]_{-2}^{4} \\ &= -\tfrac{1}{6}(64) + 8 + 16 - \left(\tfrac{4}{3} + 2 - 8\right) = 18 \end{aligned}$$

■

**NOTE** We could have found the area in Example 5 by integrating with respect to $x$ instead of $y$, but the calculation is much more involved. Because the bottom boundary consists of two different curves, it would have meant splitting the region in two and computing the areas labeled $A_1$ and $A_2$ in Figure 13. The method we used in Example 5 is much easier.

**EXAMPLE 6** Find the area of the region enclosed by the curves $x + 2y = 3$, $y = x$, and $y = \frac{1}{4}x$, using (a) $x$ as the variable of integration and (b) $y$ as the variable of integration.

**SOLUTION** The region is graphed in Figure 14.

(a) If we integrate with respect to $x$, we must split the region into two parts because the top boundary consists of two separate curves, as shown in Figure 15(a). We compute the area as

$$\begin{aligned} A = A_1 + A_2 &= \int_0^1 \left(x - \tfrac{1}{4}x\right) dx + \int_1^2 \left(-\tfrac{1}{2}x + \tfrac{3}{2} - \tfrac{1}{4}x\right) dx \\ &= \left[\tfrac{3}{8}x^2\right]_0^1 + \left[-\tfrac{3}{8}x^2 + \tfrac{3}{2}x\right]_1^2 = \tfrac{3}{4} \end{aligned}$$

(b) If we integrate with respect to $y$, we also need to divide the region into two parts because the right boundary consists of two separate curves, as shown in Figure 15(b). We compute the area as

$$\begin{aligned} A = A_1 + A_2 &= \int_0^{1/2} (4y - y)\, dy + \int_{1/2}^{1} (3 - 2y - y)\, dy \\ &= \left[\tfrac{3}{2}y^2\right]_0^{1/2} + \left[3y - \tfrac{3}{2}y^2\right]_{1/2}^{1} = \tfrac{3}{4} \end{aligned}$$

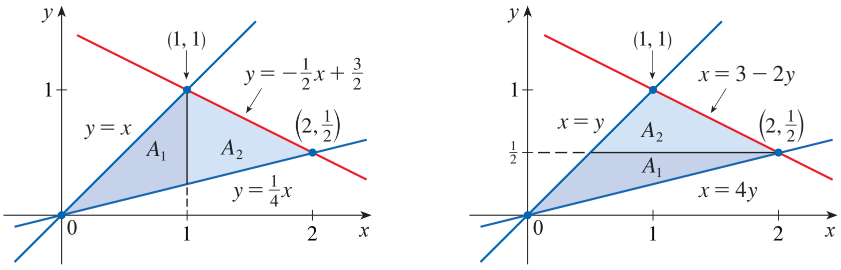

**FIGURE 15**

## Applications

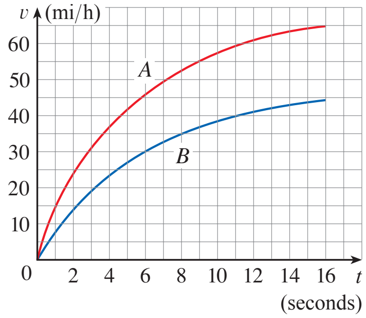

**FIGURE 16**

**EXAMPLE 7** Figure 16 shows velocity curves for two cars, A and B, that start side by side and move along the same road. What does the area between the curves represent? Use the Midpoint Rule to estimate it.

**SOLUTION** We know from Section 4.4 that the area under the velocity curve $A$ represents the distance traveled by car A during the first 16 seconds. Similarly, the area under curve $B$ is the distance traveled by car B during that time period. So the area between these curves, which is the difference of the areas under the curves, is the distance between the cars after 16 seconds. We read the velocities from the graph and convert them to feet per second ($1 \text{ mi/h} = \frac{5280}{3600} \text{ ft/s}$).

| $t$ | 0 | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 |
|---|---|---|---|---|---|---|---|---|---|
| $v_A$ | 0 | 34 | 54 | 67 | 76 | 84 | 89 | 92 | 95 |
| $v_B$ | 0 | 21 | 34 | 44 | 51 | 56 | 60 | 63 | 65 |
| $v_A - v_B$ | 0 | 13 | 20 | 23 | 25 | 28 | 29 | 29 | 30 |

We use the Midpoint Rule with $n = 4$ intervals, so that $\Delta t = 4$. The midpoints of the intervals are $\bar{t}_1 = 2$, $\bar{t}_2 = 6$, $\bar{t}_3 = 10$, and $\bar{t}_4 = 14$. We estimate the distance between the cars after 16 seconds as follows:

$$\begin{aligned}\int_0^{16} (v_A - v_B)\, dt &\approx \Delta t\,[13 + 23 + 28 + 29] \\ &= 4(93) = 372 \text{ ft}\end{aligned}$$

■

**EXAMPLE 8** Figure 17 is an example of a *pathogenesis curve* for a measles infection. It shows how the disease develops in an individual with no immunity after the measles virus spreads to the bloodstream from the respiratory tract.

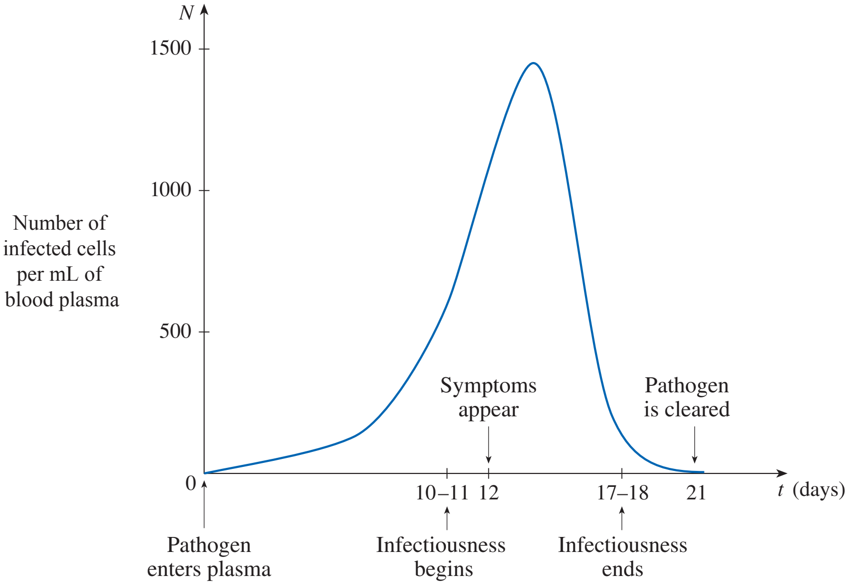

**FIGURE 17**

Measles pathogenesis curve

*Source:* J. M. Heffernan et al., "An In-Host Model of Acute Infection: Measles as a Case Study," *Theoretical Population Biology* 73 (2008): 134–47.

The patient becomes infectious to others once the concentration of infected cells becomes great enough and remains infectious until the immune system manages to prevent further transmission. However, symptoms don't develop until the "amount of

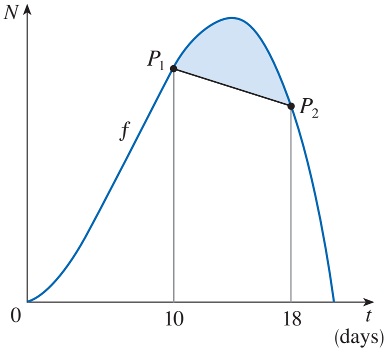

**FIGURE 18**

infection" reaches a particular threshold. The amount of infection needed to develop symptoms depends on both the concentration of infected cells and time, and corresponds to the area under the pathogenesis curve until symptoms appear. (See Exercise 4.1.15.)

(a) The pathogenesis curve in Figure 17 has been modeled by $f(t) = -t(t - 21)(t + 1)$. If infectiousness begins on day $t_1 = 10$ and ends on day $t_2 = 18$, what are the corresponding concentration levels of infected cells?

(b) The *level of infectiousness* for an infected person is the area between $N = f(t)$ and the line through the points $P_1(t_1, f(t_1))$ and $P_2(t_2, f(t_2))$, measured in (cells/mL) • days. (See Figure 18.) Compute the level of infectiousness for this particular patient.

**SOLUTION**

(a) Infectiousness begins when the concentration reaches $f(10) = 1210$ cells/mL and ends when the concentration reduces to $f(18) = 1026$ cells/mL.

(b) The line through $P_1$ and $P_2$ has slope $\frac{1026 - 1210}{18 - 10} = -\frac{184}{8} = -23$ and equation $N - 1210 = -23(t - 10) \iff N = -23t + 1440$. The area between $f$ and this line is

$$\begin{aligned}\int_{10}^{18} [f(t) - (-23t + 1440)]\,dt &= \int_{10}^{18} (-t^3 + 20t^2 + 21t + 23t - 1440)\,dt \\ &= \int_{10}^{18} (-t^3 + 20t^2 + 44t - 1440)\,dt \\ &= \left[-\frac{t^4}{4} + 20\,\frac{t^3}{3} + 44\,\frac{t^2}{2} - 1440t\right]_{10}^{18} \\ &= -6156 - \left(-8033\tfrac{1}{3}\right) \approx 1877\end{aligned}$$

Thus the level of infectiousness for this patient is about 1877 (cells/mL) • days. ■

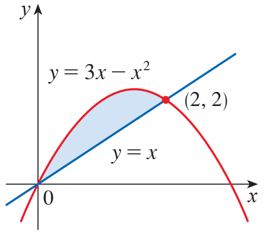
## 5.1 Exercises

**1–4**

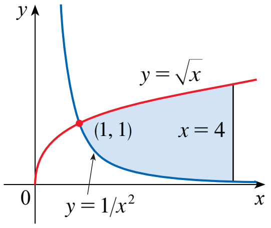
(a) Set up an integral for the area of the shaded region.

(b) Evaluate the integral to find the area.

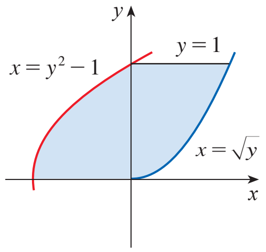
**1.**



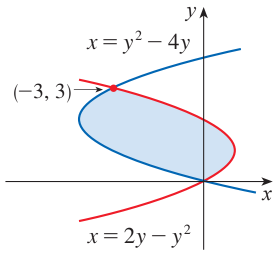
**2.**



**3.**

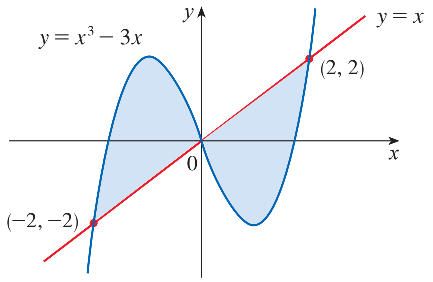


**4.**



**5–6** Find the area of the shaded region.

**5.**



**6.**

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**7–10** Set up, but do not evaluate, an integral representing the area of the region enclosed by the given curves.

**7.** $y = 1/x, \quad y = 1/x^2, \quad x = 2$

**8.** $y = \tan x, \quad y = \sin x, \quad x = 1$

**9.** $y = 2 - x, \quad y = 2x - x^2$

**10.** $x = y^4, \quad x = 2 - y^2$

**11–18** Sketch the region enclosed by the given curves. Decide whether to integrate with respect to $x$ or $y$. Draw a typical approximating rectangle and label its height and width. Then find the area of the region.

**11.** $y = x^2 + 2, \quad y = -x - 1, \quad x = 0, \quad x = 1$

**12.** $y = 1 + x^3, \quad y = 2 - x, \quad x = -1, \quad x = 0$

**13.** $y = (x - 2)^2, \quad y = x$

**14.** $y = x^2 - 4x, \quad y = 2x$

**15.** $y = \sqrt{x + 3}, \quad y = (x + 3)/2$

**16.** $y = \sin x, \quad y = 2x/\pi, \quad x \geqslant 0$

**17.** $x = 1 - y^2, \quad x = y^2 - 1$

**18.** $4x + y^2 = 12, \quad x = y$

**19–34** Sketch the region enclosed by the given curves and find its area.

**19.** $y = 12 - x^2, \quad y = x^2 - 6$

**20.** $y = x^2, \quad y = 4x - x^2$

**21.** $x = 2y^2, \quad x = 4 + y^2$

**22.** $y = \sqrt{x - 1}, \quad x - y = 1$

**23.** $y = \sqrt[3]{2x}, \quad y = \frac{1}{2}x$

**24.** $y = x^3, \quad y = x$

**25.** $y = \sqrt{x}, \quad y = \frac{1}{3}x, \quad 0 \leqslant x \leqslant 16$

**26.** $y = \cos x, \quad y = 2 - \cos x, \quad 0 \leqslant x \leqslant 2\pi$

**27.** $y = \cos x, \quad y = \sin 2x, \quad 0 \leqslant x \leqslant \pi/2$

**28.** $y = \cos x, \quad y = 1 - \cos x, \quad 0 \leqslant x \leqslant \pi$

**29.** $y = \sec^2 x, \quad y = 8\cos x, \quad -\pi/3 \leqslant x \leqslant \pi/3$

**30.** $y = x^4 - 3x^2, \quad y = x^2$

**31.** $y = x^4, \quad y = 2 - |x|$

**32.** $y = 1/x^2, \quad y = x, \quad y = \frac{1}{8}x$

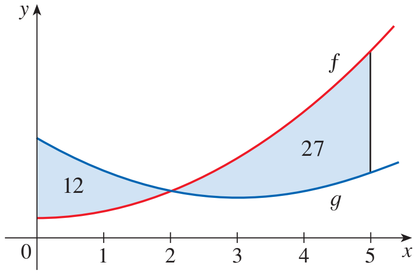
**33.** $y = \sin(\pi x/2), \quad y = x^3$

**34.** $y = \frac{1}{4}x^2, \quad y = 2x^2, \quad x + y = 3, \quad x \geqslant 0$

**35.** The graphs of two functions are shown with the areas of the regions between the curves indicated.

(a) What is the total area between the curves for $0 \leqslant x \leqslant 5$?

(b) What is the value of $\int_0^5 [f(x) - g(x)]\,dx$?



**36–38** Sketch the region enclosed by the given curves and find its area.

**36.** $y = \dfrac{x}{\sqrt{1 + x^2}}, \quad y = \dfrac{x}{\sqrt{9 - x^2}}, \quad x \geqslant 0$

**37.** $y = \cos^2 x \sin x, \quad y = \sin x, \quad 0 \leqslant x \leqslant \pi$

**38.** $y = x\sqrt{x^2 + 1}, \quad y = x^2\sqrt{x^3 + 1}$

**39–40** Use calculus to find the area of the triangle with the given vertices.

**39.** $(0, 0), \quad (3, 1), \quad (1, 2)$

**40.** $(2, 0), \quad (0, 2), \quad (-1, 1)$

**41–42** Evaluate the integral and interpret it as the area of a region. Sketch the region.

**41.** $\displaystyle\int_0^{\pi/2} |\sin x - \cos 2x|\,dx$ **42.** $\displaystyle\int_0^4 \left|\sqrt{x + 2} - x\right|\,dx$

**43–46** Use a graph to find approximate $x$-coordinates of the points of intersection of the given curves. Then find (approximately) the area of the region bounded by the curves.

**43.** $y = x\sin(x^2), \quad y = x^4, \quad x \geqslant 0$

**44.** $y = \dfrac{x}{(x^2 + 1)^2}, \quad y = x^5 - x, \quad x \geqslant 0$

**45.** $y = 3x^2 - 2x, \quad y = x^3 - 3x + 4$

**46.** $y = x - \cos x, \quad y = 2 - x^2$

T **47–50** Graph the region between the curves and compute the area correct to five decimal places.

**47.** $y = \dfrac{2}{1 + x^4}, \quad y = x^2$ **48.** $y = x^6, \quad y = \sqrt{2 - x^4}$

**49.** $y = \tan^2 x, \quad y = \sqrt{x}$

**50.** $y = \cos x, \quad y = x + 2\sin^4 x$

T **51.** Use a computer algebra system to find the exact area enclosed by the curves $y = x^5 - 6x^3 + 4x$ and $y = x$.

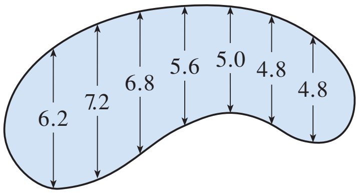
**52.** Sketch the region in the $xy$-plane defined by the inequalities $x - 2y^2 \geqslant 0$, $1 - x - |y| \geqslant 0$ and find its area.

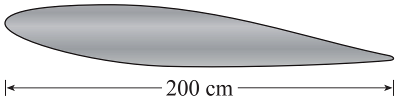
**53.** Racing cars driven by Chris and Kelly are side by side at the start of a race. The table shows the velocities of each car (in miles per hour) during the first ten seconds of the race. Use the Midpoint Rule to estimate how much farther Kelly travels than Chris does during the first ten seconds.

| $t$ | $v_C$ | $v_K$ | $t$ | $v_C$ | $v_K$ |
|---|---|---|---|---|---|
| 0 | 0 | 0 | 6 | 69 | 80 |
| 1 | 20 | 22 | 7 | 75 | 86 |
| 2 | 32 | 37 | 8 | 81 | 93 |
| 3 | 46 | 52 | 9 | 86 | 98 |
| 4 | 54 | 61 | 10 | 90 | 102 |
| 5 | 62 | 71 | | | |

**54.** The widths (in meters) of a kidney-shaped swimming pool were measured at 2-meter intervals as indicated in the figure. Use the Midpoint Rule to estimate the area of the pool.



**55.** A cross-section of an airplane wing is shown. Measurements of the thickness of the wing, in centimeters, at 20-centimeter intervals are 5.8, 20.3, 26.7, 29.0, 27.6, 27.3, 23.8, 20.5, 15.1, 8.7, and 2.8. Use the Midpoint Rule to estimate the area of the wing's cross-section.



**56.** If the birth rate of a population is

$$b(t) = 2200 + 52.3t + 0.74t^2 \quad \text{people per year}$$

and the death rate is

$$d(t) = 1460 + 28.8t \quad \text{people per year}$$

find the area between these curves for $0 \leqslant t \leqslant 10$. What does this area represent?

**57.** In Example 8, we modeled a measles pathogenesis curve by a function $f$. A patient infected with the measles virus who has some immunity to the virus has a pathogenesis curve that can be modeled by, for instance, $g(t) = 0.9f(t)$.

(a) If the same threshold concentration of the virus is required for infectiousness to begin as in Example 8, on what day does this occur?

(b) Let $P_3$ be the point on the graph of $g$ where infectiousness begins. It has been shown that infectiousness ends at a point $P_4$ on the graph of $g$ where the line through $P_3$, $P_4$ has the same slope as the line through $P_1$, $P_2$ in Example 8(b). On what day does infectiousness end?

(c) Compute the level of infectiousness for this patient.

**58.** The rates at which rain fell, in inches per hour, in two different locations $t$ hours after the start of a storm were modeled by $f(t) = 0.73t^3 - 2t^2 + t + 0.6$ and $g(t) = 0.17t^2 - 0.5t + 1.1$. Compute the area between the graphs for $0 \leqslant t \leqslant 2$ and interpret your result in this context.

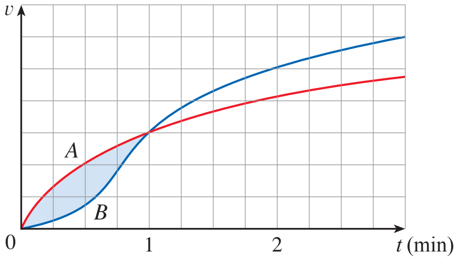
**59.** Two cars, A and B, start side by side and accelerate from rest. The figure shows the graphs of their velocity functions.

(a) Which car is ahead after one minute? Explain.

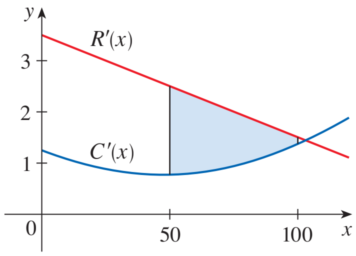
(b) What is the meaning of the area of the shaded region?

(c) Which car is ahead after two minutes? Explain.

(d) Estimate the time at which the cars are again side by side.



**60.** The figure shows graphs of the marginal revenue function $R'$ and the marginal cost function $C'$ for a manufacturer. [Recall from Section 3.7 that $R(x)$ and $C(x)$ represent the revenue and cost when $x$ units are manufactured. Assume that $R$ and $C$ are measured in thousands of dollars.] What is the meaning of the area of the shaded region? Use the Midpoint Rule to estimate the value of this quantity.



**61.** The curve with equation $y^2 = x^2(x + 3)$ is called **Tschirnhausen's cubic**. If you graph this curve you will see that part of the curve forms a loop. Find the area enclosed by the loop.

**62.** Find the area of the region bounded by the parabola $y = x^2$, the tangent line to this parabola at $(1, 1)$, and the $x$-axis.

**63.** Find the number $b$ such that the line $y = b$ divides the region bounded by the curves $y = x^2$ and $y = 4$ into two regions with equal area.

**64.** (a) Find the number $a$ such that the line $x = a$ bisects the area under the curve $y = 1/x^2$, $1 \leqslant x \leqslant 4$.

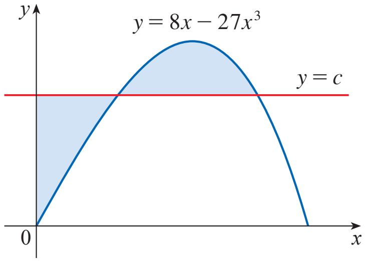
(b) Find the number $b$ such that the line $y = b$ bisects the area in part (a).

**65.** Find the values of $c$ such that the area of the region bounded by the parabolas $y = x^2 - c^2$ and $y = c^2 - x^2$ is 576.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**66.** Suppose that $0 < c < \pi/2$. For what value of $c$ is the area of the region enclosed by the curves $y = \cos x$, $y = \cos(x - c)$, and $x = 0$ equal to the area of the region enclosed by the curves $y = \cos(x - c)$, $x = \pi$, and $y = 0$?

**67.** The figure shows a horizontal line $y = c$ intersecting the curve $y = 8x - 27x^3$. Find the number $c$ such that the areas of the shaded regions are equal.



The following exercises are intended only for those who have already covered Chapter 6.

**68–71** Sketch the region bounded by the given curves and find the area of the region.

**68.** $y = \sin x, \quad y = e^x, \quad x = 0, \quad x = \pi/2$

**69.** $y = \tan x, \quad y = 2 \sin x, \quad -\pi/3 \leqslant x \leqslant \pi/3$

**70.** $y = x^2, \quad y = \dfrac{32}{x^2 + 4}$

**71.** $y = 1/x, \quad y = x, \quad y = \frac{1}{4}x, \quad x > 0$

**72.** For what values of $m$ do the line $y = mx$ and the curve $y = x/(x^2 + 1)$ enclose a region? Find the area of the region.

## APPLIED PROJECT | THE GINI INDEX

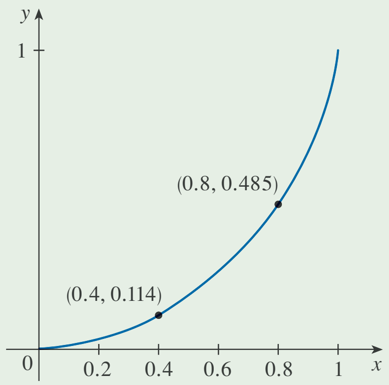


**FIGURE 1**
Lorenz curve for the United States in 2016

How is it possible to measure the distribution of income among the inhabitants of a given country? One such measure is the *Gini index*, named after the Italian economist Corrado Gini, who first devised it in 1912.

We first rank all households in a country by income and then we compute the percentage of households whose total income is a given percentage of the country's total income. We define a **Lorenz curve** $y = L(x)$ on the interval $[0, 1]$ by plotting the point $(a/100, b/100)$ on the curve if the bottom $a\%$ of households receive $b\%$ of the total income. For instance, in Figure 1 the point $(0.4, 0.114)$ is on the Lorenz curve for the United States in 2016 because the poorest 40% of the population received just 11.4% of the total income. Likewise, the bottom 80% of the population received 48.5% of the total income, so the point $(0.8, 0.485)$ lies on the Lorenz curve. (The Lorenz curve is named after the American economist Max Lorenz.)

Figure 2 shows some typical Lorenz curves. They all pass through the points $(0, 0)$ and $(1, 1)$ and are concave upward. In the extreme case $L(x) = x$, society is perfectly egalitarian: the poorest $a\%$ of the population receives $a\%$ of the total income and so everybody receives the same income. The area between a Lorenz curve $y = L(x)$ and the line $y = x$ measures how much the income distribution differs from absolute equality. The **Gini index** (sometimes called the **Gini coefficient** or the **coefficient of inequality**) is the area between the Lorenz curve and the line $y = x$ (shaded in Figure 3) divided by the area under $y = x$.

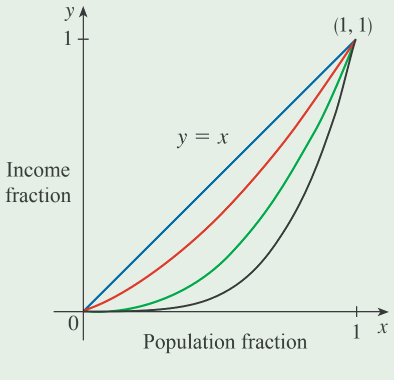

**FIGURE 2**

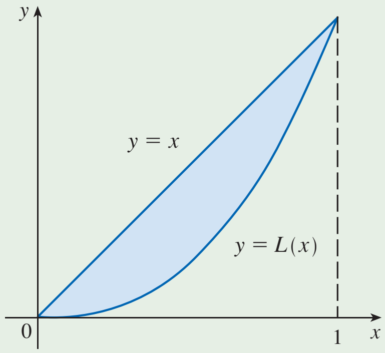

**FIGURE 3**

**1.** (a) Show that the Gini index $G$ is twice the area between the Lorenz curve and the line $y = x$, that is,

$$G = 2\int_0^1 [x - L(x)]\,dx$$

(b) What is the value of $G$ for a perfectly egalitarian society (everybody has the same income)? What is the value of $G$ for a perfectly totalitarian society (a single person receives all the income)?

**2.** The following table (derived from data supplied by the US Census Bureau) shows values of the Lorenz function for income distribution in the United States for the year 2016.

| $x$ | 0.0 | 0.2 | 0.4 | 0.6 | 0.8 | 1.0 |
|---|---|---|---|---|---|---|
| $L(x)$ | 0.000 | 0.031 | 0.114 | 0.256 | 0.485 | 1.000 |

(a) What percentage of the total US income was received by the richest 20% of the population in 2016?

T (b) Use a calculator or computer to fit a quadratic function to the data in the table. Graph the data points and the quadratic function. Is the quadratic model a reasonable fit?

(c) Use the quadratic model for the Lorenz function to estimate the Gini index for the United States in 2016.

**3.** The following table gives values for the Lorenz function in the years 1980, 1990, 2000, and 2010. Use the method of Problem 2 to estimate the Gini index for the United States for those years and compare with your answer to Problem 2(c). Do you notice a trend?

| $x$ | 0.0 | 0.2 | 0.4 | 0.6 | 0.8 | 1.0 |
|---|---|---|---|---|---|---|
| 1980 | 0.000 | 0.042 | 0.144 | 0.312 | 0.559 | 1.000 |
| 1990 | 0.000 | 0.038 | 0.134 | 0.293 | 0.533 | 1.000 |
| 2000 | 0.000 | 0.036 | 0.125 | 0.273 | 0.503 | 1.000 |
| 2010 | 0.000 | 0.033 | 0.118 | 0.264 | 0.498 | 1.000 |

T **4.** A power model often provides a more accurate fit than a quadratic model for a Lorenz function. Use a calculator or computer to fit a power function ($y = ax^k$) to the data in Problem 2 and use it to estimate the Gini index for the United States in 2016. Compare with your answer to parts (b) and (c) of Problem 2.

## 5.2 Volumes

In trying to find the volume of a solid we face the same type of problem as in finding areas. We have an intuitive idea of what volume means, but we must make this idea precise by using calculus to give an exact definition of volume.

### Definition of Volume

We start with a simple type of solid called a **cylinder** (or, more precisely, a *right cylinder*). As illustrated in Figure 1(a), a cylinder is bounded by a plane region $B_1$, called the

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**base**, and a congruent region $B_2$ in a parallel plane. The cylinder consists of all points on line segments that are perpendicular to the base and join $B_1$ to $B_2$. If the area of the base is $A$ and the height of the cylinder (the distance from $B_1$ to $B_2$) is $h$, then the volume $V$ of the cylinder is defined as

$$V = Ah$$

In particular, if the base is a circle with radius $r$, then the cylinder is a circular cylinder with volume $V = \pi r^2 h$ [see Figure 1(b)], and if the base is a rectangle with length $l$ and width $w$, then the cylinder is a rectangular box (also called a *rectangular parallelepiped*) with volume $V = lwh$ [see Figure 1(c)].

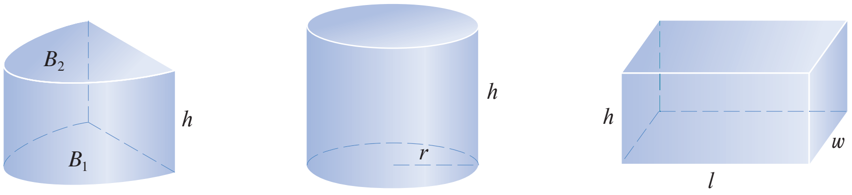

**FIGURE 1** (a) Cylinder $V = Ah$ (b) Circular cylinder $V = \pi r^2 h$ (c) Rectangular box $V = lwh$

For a solid $S$ that isn't a cylinder we first "cut" $S$ into pieces and approximate each piece by a cylinder. We estimate the volume of $S$ by adding the volumes of the cylinders. We arrive at the exact volume of $S$ through a limiting process in which the number of pieces becomes large.

We start by intersecting $S$ with a plane and obtaining a plane region that is called a **cross-section** of $S$. Let $A(x)$ be the area of the cross-section of $S$ in a plane $P_x$ perpendicular to the $x$-axis and passing through the point $x$, where $a \leqslant x \leqslant b$. (See Figure 2. Think of slicing $S$ with a knife through $x$ and computing the area of this slice.) The cross-sectional area $A(x)$ will vary as $x$ increases from $a$ to $b$.

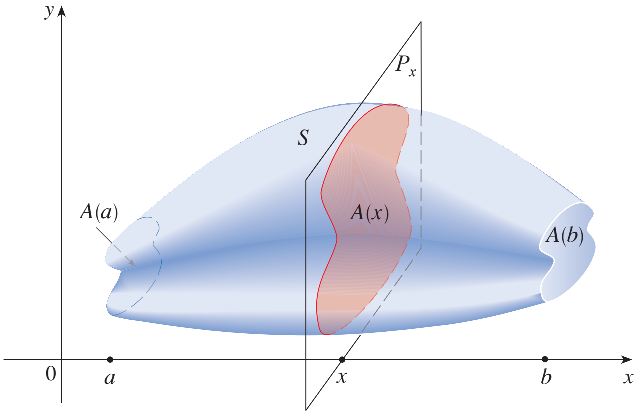

**FIGURE 2**

Let's divide $S$ into $n$ "slabs" of equal width $\Delta x$ by using the planes $P_{x_1}, P_{x_2}, \ldots$ to slice the solid. (Think of slicing a loaf of bread.) If we choose sample points $x_i^*$ in $[x_{i-1}, x_i]$, we can approximate the $i$th slab $S_i$ (the part of $S$ that lies between the planes $P_{x_{i-1}}$ and $P_{x_i}$) by a cylinder with base area $A(x_i^*)$ and "height" $\Delta x$. (See Figure 3.)

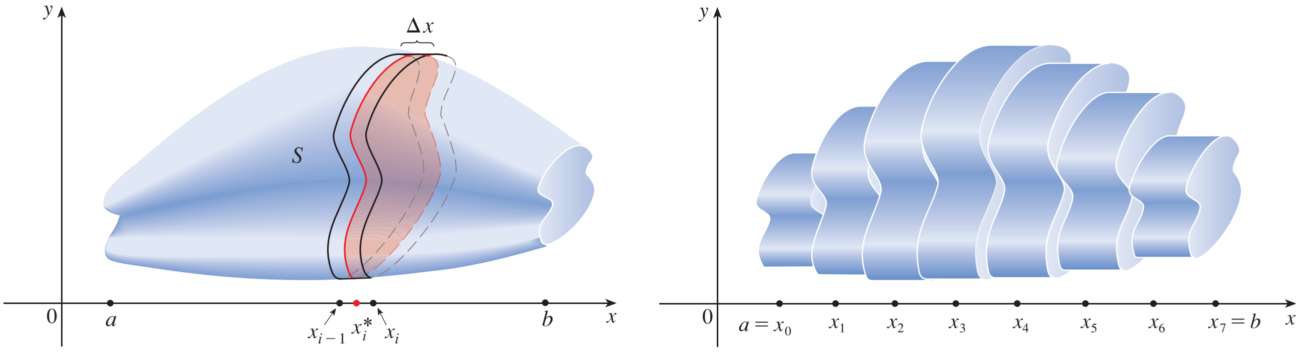

**FIGURE 3**

The volume of this cylinder is $A(x_i^*)\,\Delta x$, so an approximation to our intuitive conception of the volume of the $i$th slab $S_i$ is

$$V(S_i) \approx A(x_i^*)\,\Delta x$$

Adding the volumes of these slabs, we get an approximation to the total volume (that is, what we think of intuitively as the volume):

$$V \approx \sum_{i=1}^{n} A(x_i^*)\,\Delta x$$

This approximation appears to become better and better as $n \to \infty$. (Think of the slices as becoming thinner and thinner.) Therefore we *define* the volume as the limit of these sums as $n \to \infty$. But we recognize the limit of Riemann sums as a definite integral and so we have the following definition.

It can be proved that this definition is independent of how $S$ is situated with respect to the $x$-axis. In other words, no matter how we slice $S$ with parallel planes, we always get the same answer for $V$.

**Definition of Volume** Let $S$ be a solid that lies between $x = a$ and $x = b$. If the cross-sectional area of $S$ in the plane $P_x$, through $x$ and perpendicular to the $x$-axis, is $A(x)$, where $A$ is a continuous function, then the **volume** of $S$ is

$$V = \lim_{n\to\infty} \sum_{i=1}^{n} A(x_i^*)\,\Delta x = \int_a^b A(x)\,dx$$

When we use the volume formula $V = \int_a^b A(x)\,dx$, it is important to remember that $A(x)$ is the area of a moving cross-section obtained by slicing through $x$ perpendicular to the $x$-axis.

Notice that, for a cylinder, the cross-sectional area is constant: $A(x) = A$ for all $x$. So our definition of volume gives $V = \int_a^b A\,dx = A(b - a)$; this agrees with the formula $V = Ah$.

**EXAMPLE 1** Show that the volume of a sphere of radius $r$ is $V = \frac{4}{3}\pi r^3$.

**SOLUTION** If we place the sphere so that its center is at the origin, then the plane $P_x$ intersects the sphere in a circle whose radius (from the Pythagorean Theorem) is

$y = \sqrt{r^2 - x^2}$. (See Figure 4.) So the cross-sectional area is

$$A(x) = \pi y^2 = \pi(r^2 - x^2)$$

Using the definition of volume with $a = -r$ and $b = r$, we have

$$V = \int_{-r}^{r} A(x)\,dx = \int_{-r}^{r} \pi(r^2 - x^2)\,dx$$

$$= 2\pi \int_0^r (r^2 - x^2)\,dx \qquad \text{(The integrand is even.)}$$

$$= 2\pi \left[ r^2 x - \frac{x^3}{3} \right]_0^r = 2\pi\left(r^3 - \frac{r^3}{3}\right) = \tfrac{4}{3}\pi r^3 \qquad \blacksquare$$

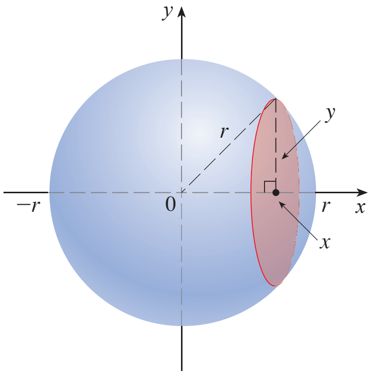

**FIGURE 4**

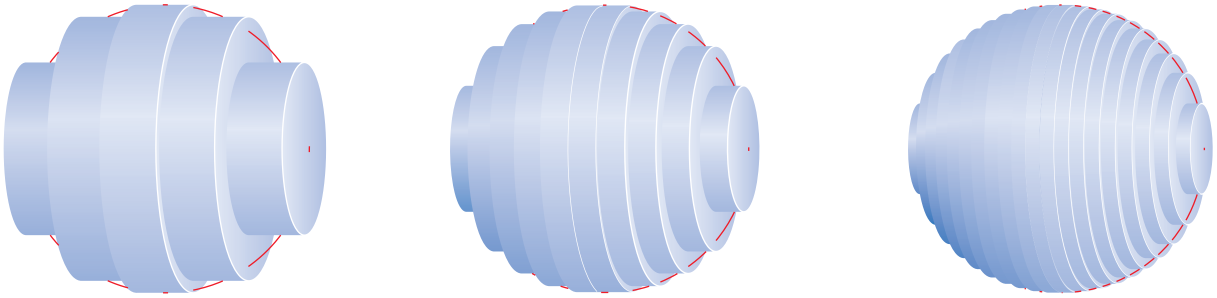
Figure 5 illustrates the definition of volume when the solid is a sphere with radius $r = 1$. From the result of Example 1, we know that the volume of the sphere is $\frac{4}{3}\pi$, which is approximately 4.18879. Here the slabs are circular cylinders, or *disks*, and the three parts of Figure 5 show the geometric interpretations of the Riemann sums

$$\sum_{i=1}^{n} A(\bar{x}_i)\,\Delta x = \sum_{i=1}^{n} \pi(1^2 - \bar{x}_i^2)\,\Delta x$$

when $n = 5$, 10, and 20 if we choose the sample points $x_i^*$ to be the midpoints $\bar{x}_i$. Notice that as we increase the number of approximating cylinders, the corresponding Riemann sums become closer to the true volume.



(a) Using 5 disks, $V \approx 4.2726$ (b) Using 10 disks, $V \approx 4.2097$ (c) Using 20 disks, $V \approx 4.1940$

**FIGURE 5** Approximating the volume of a sphere with radius 1

## Volumes of Solids of Revolution

If we revolve a region about a line, we obtain a **solid of revolution**. In the following examples we see that for such a solid, cross-sections perpendicular to the axis of rotation are circular.

**EXAMPLE 2** Find the volume of the solid obtained by rotating about the $x$-axis the region under the curve $y = \sqrt{x}$ from 0 to 1. Illustrate the definition of volume by sketching a typical approximating cylinder.

**SOLUTION** The region is shown in Figure 6(a) on the following page. If we rotate about the $x$-axis, we get the solid shown in Figure 6(b). When we slice through the point $x$, we get a disk with radius $\sqrt{x}$. The area of this cross-section is

$$A(x) = \pi\underbrace{(\sqrt{x})}_{\text{radius}}{}^2 = \pi x$$

and the volume of the approximating cylinder (a disk with thickness $\Delta x$) is

$$A(x)\,\Delta x = \pi x\,\Delta x$$

The solid lies between $x = 0$ and $x = 1$, so its volume is

$$V = \int_0^1 A(x)\,dx = \int_0^1 \pi x\,dx = \pi \frac{x^2}{2}\bigg]_0^1 = \frac{\pi}{2}$$

Did we get a reasonable answer in Example 2? As a check on our work, let's replace the given region by a square with base $[0, 1]$ and height 1. If we rotate this square, we get a cylinder with radius 1, height 1, and volume $\pi \cdot 1^2 \cdot 1 = \pi$. We computed that the given solid has half this volume. That seems about right.

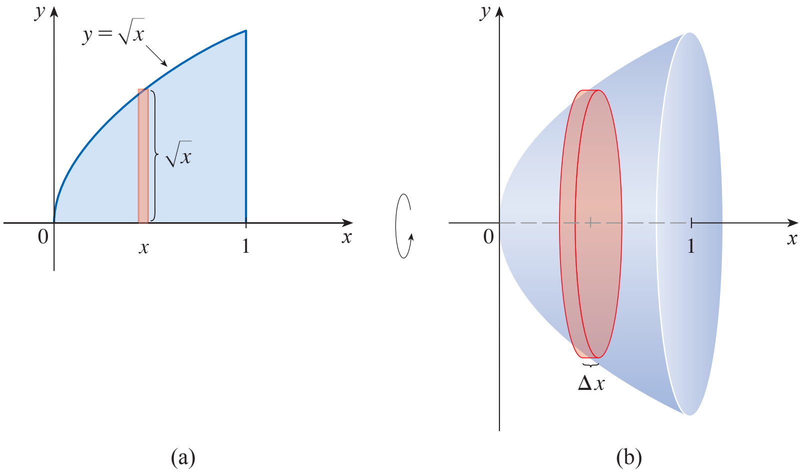

**FIGURE 6**

(a) (b) ■

**EXAMPLE 3** Find the volume of the solid obtained by rotating the region bounded by $y = x^3$, $y = 8$, and $x = 0$ about the $y$-axis.

**SOLUTION** The region is shown in Figure 7(a) and the resulting solid is shown in Figure 7(b). Because the region is rotated about the $y$-axis, it makes sense to slice the solid perpendicular to the $y$-axis (obtaining circular cross-sections) and therefore to integrate with respect to $y$. If we slice at height $y$, we get a circular disk with radius $x$, where $x = \sqrt[3]{y}$. So the area of a cross-section through $y$ is

$$A(y) = \pi \underbrace{(x)}_{\text{radius}}{}^2 = \pi \underbrace{(\sqrt[3]{y})}_{\text{radius}}{}^2 = \pi y^{2/3}$$

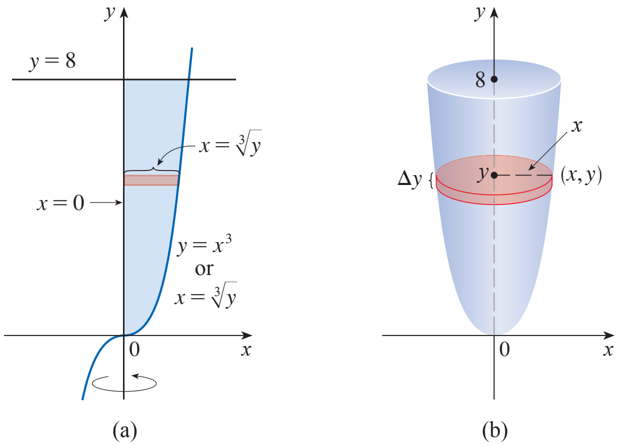

**FIGURE 7**

(a) (b)

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

and the volume of the approximating cylinder pictured in Figure 7(b) is

$$A(y)\,\Delta y = \pi y^{2/3}\,\Delta y$$

Since the solid lies between $y = 0$ and $y = 8$, its volume is

$$V = \int_0^8 A(y)\,dy = \int_0^8 \pi y^{2/3}\,dy = \pi\Big[\tfrac{3}{5}y^{5/3}\Big]_0^8 = \frac{96\pi}{5}$$ ■

In the following examples we see that some solids of revolution have a hollow core surrounding the axis of revolution.

**EXAMPLE 4** The region $\mathscr{R}$ enclosed by the curves $y = x$ and $y = x^2$ is rotated about the $x$-axis. Find the volume of the resulting solid.

**SOLUTION** The curves $y = x$ and $y = x^2$ intersect at the points $(0, 0)$ and $(1, 1)$. The region between them, the solid of rotation, and a cross-section perpendicular to the $x$-axis are shown in Figure 8. A cross-section in the plane $P_x$ has the shape of a *washer* (an annular ring) with inner radius $x^2$ and outer radius $x$ [see Figure 8(c)], so we find the cross-sectional area by subtracting the area of the inner circle from the area of the outer circle:

$$A(x) = \pi(\underbrace{x}_{\text{outer radius}})^2 - \pi(\underbrace{x^2}_{\text{inner radius}})^2 = \pi(x^2 - x^4)$$

Therefore we have

$$V = \int_0^1 A(x)\,dx = \int_0^1 \pi(x^2 - x^4)\,dx$$

$$= \pi\left[\frac{x^3}{3} - \frac{x^5}{5}\right]_0^1 = \frac{2\pi}{15}$$

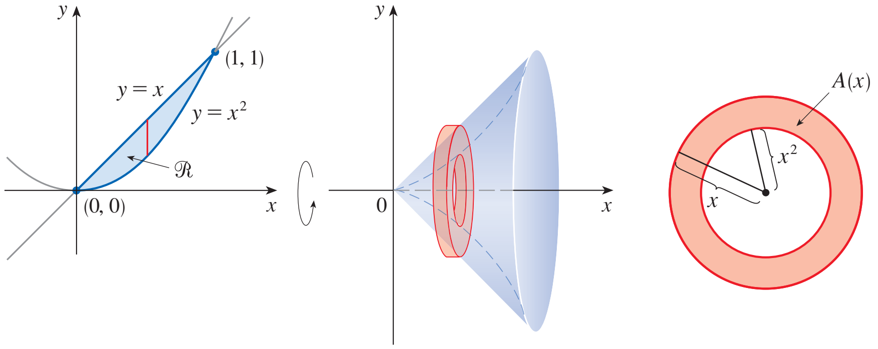

**FIGURE 8** (a) (b) (c) ■

The next example shows that when a solid of revolution is created by rotating about an axis *other* than a coordinate axis, we must determine the radii of cross-sections carefully.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 5** Find the volume of the solid obtained by rotating the region in Example 4 about the line $y = 2$.

**SOLUTION** The solid and a cross-section are shown in Figure 9. Again the cross-section is a washer, but this time the inner radius is $2 - x$ and the outer radius is $2 - x^2$.

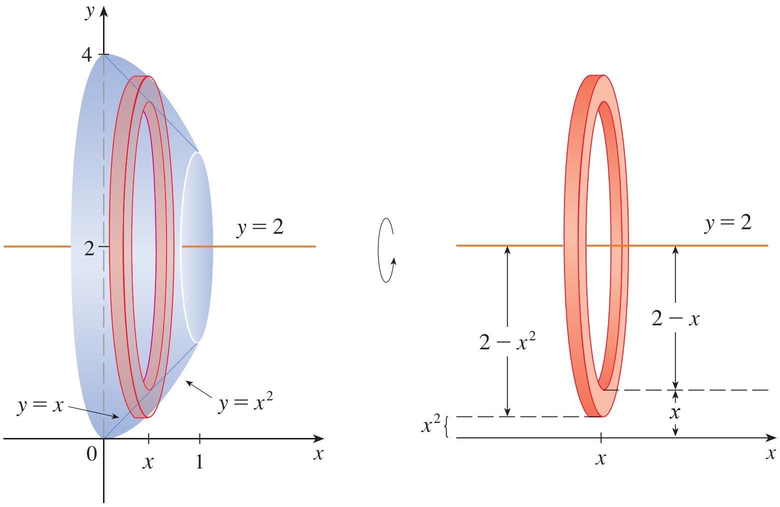

**FIGURE 9**

The cross-sectional area is

$$A(x) = \pi\underbrace{(2 - x^2)^2}_{\text{outer radius}} - \pi\underbrace{(2 - x)^2}_{\text{inner radius}}$$

and so the volume of $S$ is

$$\begin{aligned} V &= \int_0^1 A(x)\,dx \\ &= \pi \int_0^1 [(2 - x^2)^2 - (2 - x)^2]\,dx \\ &= \pi \int_0^1 (x^4 - 5x^2 + 4x)\,dx \\ &= \pi \left[ \frac{x^5}{5} - 5\frac{x^3}{3} + 4\frac{x^2}{2} \right]_0^1 = \frac{8\pi}{15} \end{aligned}$$

■

**NOTE** In general, we calculate the volume of a solid of revolution by using the basic defining formula

$$V = \int_a^b A(x)\,dx \qquad \text{or} \qquad V = \int_c^d A(y)\,dy$$

and we find the cross-sectional area $A(x)$ or $A(y)$ in one of the following ways:

- If the cross-section is a disk (as in Examples 1–3), we find the radius of the disk (in terms of $x$ or $y$) and use

$$A = \pi(\text{radius})^2$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

- If the cross-section is a washer (as in Examples 4 and 5), we find the inner radius $r_{\text{in}}$ and outer radius $r_{\text{out}}$ from a sketch (as in Figures 8, 9, and 10) and compute the area of the washer by subtracting the area of the inner disk from the area of the outer disk:

$$A = \pi(\text{outer radius})^2 - \pi(\text{inner radius})^2$$

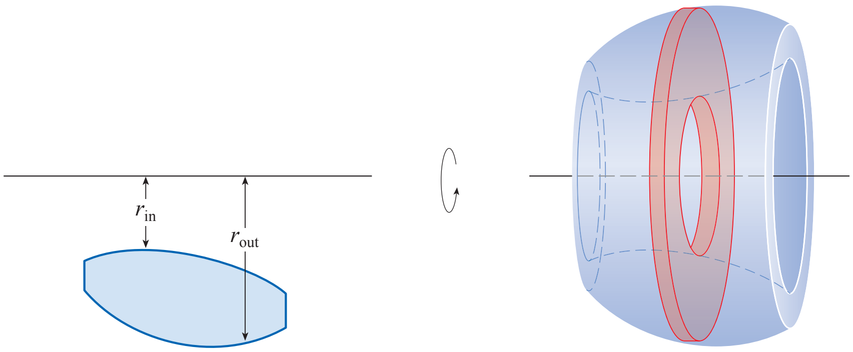

**FIGURE 10**

The next example gives a further illustration of the procedure.

**EXAMPLE 6** Find the volume of the solid obtained by rotating the region in Example 4 about the line $x = -1$.

**SOLUTION** Figure 11 shows a horizontal cross-section. It is a washer with inner radius $1 + y$ and outer radius $1 + \sqrt{y}$, so the cross-sectional area is

$$\begin{aligned} A(y) &= \pi(\text{outer radius})^2 - \pi(\text{inner radius})^2 \\ &= \pi\left(1 + \sqrt{y}\right)^2 - \pi(1 + y)^2 \end{aligned}$$

The volume is

$$\begin{aligned} V &= \int_0^1 A(y)\,dy = \pi \int_0^1 \left[\left(1 + \sqrt{y}\right)^2 - (1 + y)^2\right] dy \\ &= \pi \int_0^1 \left(2\sqrt{y} - y - y^2\right) dy = \pi \left[\frac{4y^{3/2}}{3} - \frac{y^2}{2} - \frac{y^3}{3}\right]_0^1 = \frac{\pi}{2} \end{aligned}$$

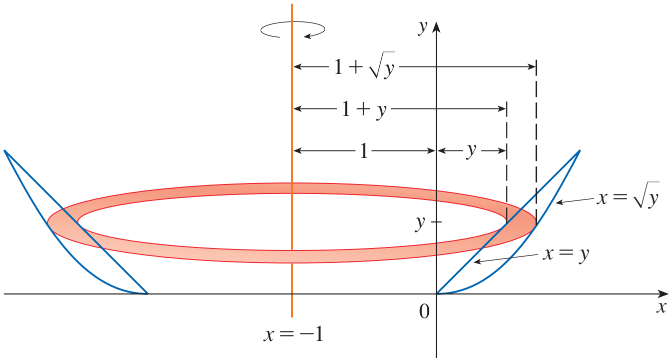

**FIGURE 11**

■

## Finding Volume Using Cross-Sectional Area

We now find the volumes of solids that are not solids of revolution but whose cross-sections have areas that are readily computable.

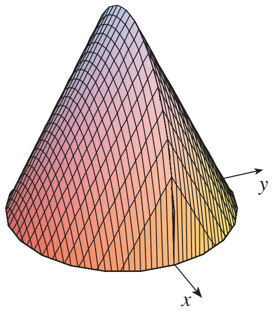

**FIGURE 12**
Computer-generated picture of the solid in Example 7

**EXAMPLE 7** Figure 12 shows a solid with a circular base of radius 1. Parallel cross-sections perpendicular to the base are equilateral triangles. Find the volume of the solid.

**SOLUTION** Let's take the circle to be $x^2 + y^2 = 1$. The solid, its base, and a typical cross-section at a distance $x$ from the origin are shown in Figure 13.

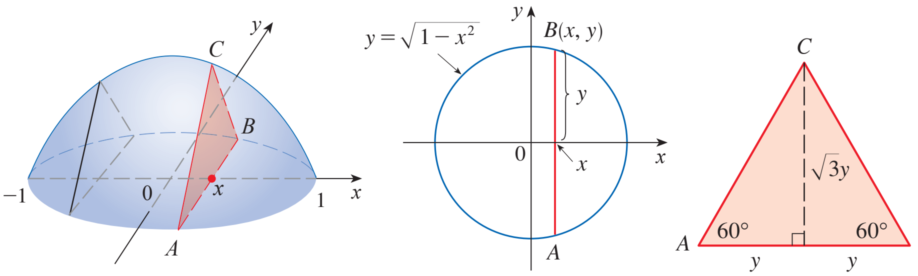

**FIGURE 13**

(a) The solid (b) Its base (c) A cross-section

Since $B$ lies on the circle, we have $y = \sqrt{1 - x^2}$ and so the base of the triangle $ABC$ is $|AB| = 2y = 2\sqrt{1 - x^2}$. Since the triangle is equilateral, we see from Figure 13(c) that its height is $\sqrt{3}\,y = \sqrt{3}\sqrt{1 - x^2}$. The cross-sectional area is therefore

$$A(x) = \tfrac{1}{2} \cdot 2\sqrt{1 - x^2} \cdot \sqrt{3}\sqrt{1 - x^2} = \sqrt{3}\,(1 - x^2)$$

and the volume of the solid is

$$V = \int_{-1}^{1} A(x)\,dx = \int_{-1}^{1} \sqrt{3}\,(1 - x^2)\,dx$$

$$= 2\int_{0}^{1} \sqrt{3}\,(1 - x^2)\,dx = 2\sqrt{3}\left[x - \frac{x^3}{3}\right]_0^1 = \frac{4\sqrt{3}}{3}$$ ■

**EXAMPLE 8** Find the volume of a pyramid whose base is a square with side $L$ and whose height is $h$.

**SOLUTION** We place the origin $O$ at the vertex of the pyramid and the $x$-axis along its central axis as in Figure 14. Any plane $P_x$ that passes through $x$ and is perpendicular to

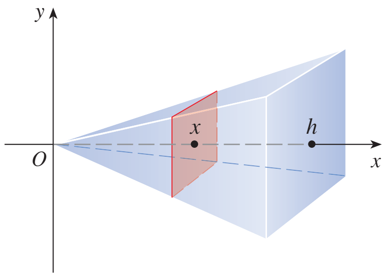

**FIGURE 14**

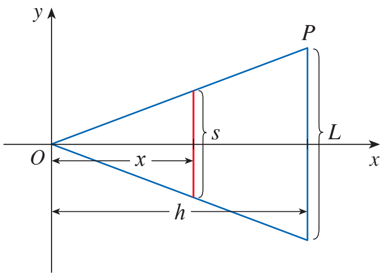

**FIGURE 15**

the $x$-axis intersects the pyramid in a square with side of length $s$, say. We can express $s$ in terms of $x$ by observing from the similar triangles in Figure 15 that

$$\frac{x}{h} = \frac{s/2}{L/2} = \frac{s}{L}$$

and so $s = Lx/h$. [Another method is to observe that the line $OP$ has slope $L/(2h)$ and so its equation is $y = Lx/(2h)$.] Therefore the cross-sectional area is

$$A(x) = s^2 = \frac{L^2}{h^2}x^2$$

The pyramid lies between $x = 0$ and $x = h$, so its volume is

$$V = \int_0^h A(x)\,dx = \int_0^h \frac{L^2}{h^2}x^2\,dx$$

$$= \frac{L^2}{h^2}\frac{x^3}{3}\bigg]_0^h = \frac{L^2h}{3}$$ ■

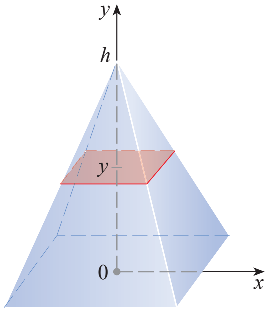

**FIGURE 16**

**NOTE** We didn't need to place the vertex of the pyramid at the origin in Example 8; we did so merely to make the equations simple. If, instead, we had placed the center of the base at the origin and the vertex on the positive $y$-axis, as in Figure 16, you can verify that we would have obtained the integral

$$V = \int_0^h \frac{L^2}{h^2}(h - y)^2\,dy = \frac{L^2h}{3}$$

**EXAMPLE 9** A wedge is cut out of a circular cylinder of radius 4 by two planes. One plane is perpendicular to the axis of the cylinder. The other intersects the first at an angle of 30° along a diameter of the cylinder. Find the volume of the wedge.

**SOLUTION** If we place the $x$-axis along the diameter where the planes meet, then the base of the solid is a semicircle with equation $y = \sqrt{16 - x^2}$, $-4 \leqslant x \leqslant 4$. A cross-section perpendicular to the $x$-axis at a distance $x$ from the origin is a triangle $ABC$, as shown in Figure 17, whose base is $y = \sqrt{16 - x^2}$ and whose height is $|BC| = y\tan 30° = \sqrt{16 - x^2}/\sqrt{3}$. So the cross-sectional area is

$$A(x) = \tfrac{1}{2}\sqrt{16 - x^2}\cdot\frac{1}{\sqrt{3}}\sqrt{16 - x^2}$$

$$= \frac{16 - x^2}{2\sqrt{3}}$$

and the volume is

$$V = \int_{-4}^{4} A(x)\,dx = \int_{-4}^{4}\frac{16 - x^2}{2\sqrt{3}}\,dx$$

$$= \frac{1}{\sqrt{3}}\int_0^4 (16 - x^2)\,dx = \frac{1}{\sqrt{3}}\left[16x - \frac{x^3}{3}\right]_0^4 = \frac{128}{3\sqrt{3}}$$

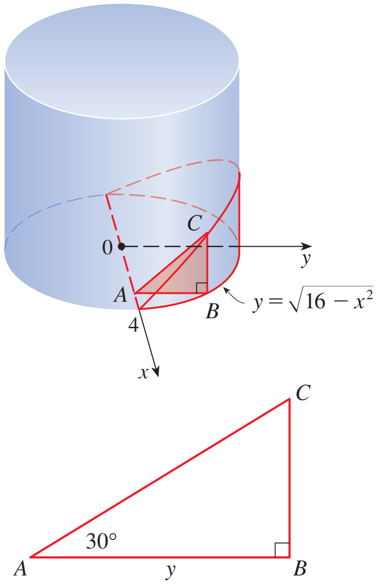

**FIGURE 17**

For another method see Exercise 77. ■

## 5.2 Exercises

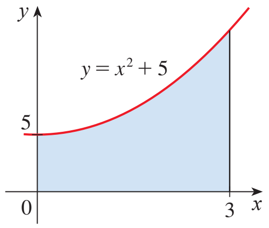
**1–4** A solid is obtained by revolving the shaded region about the specified line.

(a) Sketch the solid and a typical disk or washer.

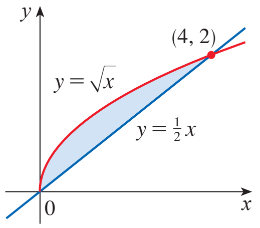
(b) Set up an integral for the volume of the solid.

(c) Evaluate the integral to find the volume of the solid.

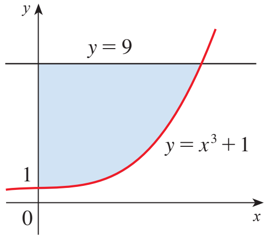
**1.** About the $x$-axis



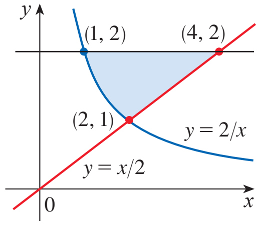
**2.** About the $x$-axis



**3.** About the $y$-axis



**4.** About the $y$-axis



---

**5–10** Set up, but do not evaluate, an integral for the volume of the solid obtained by rotating the region bounded by the given curves about the specified line.

**5.** $y = 1 - 1/x,\ y = 0,\ x = 3;$ about the $x$-axis

**6.** $x = \sqrt{5 - y},\ y = 0,\ x = 0;$ about the $y$-axis

**7.** $8y = x^2,\ y = \sqrt{x};$ about the $y$-axis

**8.** $y = (x - 2)^2,\ y = x + 10;$ about the $x$-axis

**9.** $y = \sin x,\ y = 0,\ 0 \leqslant x \leqslant \pi;$ about $y = -2$

**10.** $y = \sqrt{x},\ y = 0,\ x = 4;$ about $x = 6$

---

**11–28** Find the volume of the solid obtained by rotating the region bounded by the given curves about the specified line. Sketch the region, the solid, and a typical disk or washer.

**11.** $y = x + 1,\ y = 0,\ x = 0,\ x = 2;$ about the $x$-axis

**12.** $y = 1/x,\ y = 0,\ x = 1,\ x = 4;$ about the $x$-axis

**13.** $y = \sqrt{x - 1},\ y = 0,\ x = 5;$ about the $x$-axis

**14.** $y = \sqrt{25 - x^2},\ y = 0,\ x = 2,\ x = 4;$ about the $x$-axis

**15.** $x = 2\sqrt{y},\ x = 0,\ y = 9;$ about the $y$-axis

**16.** $2x = y^2,\ x = 0,\ y = 4;$ about the $y$-axis

**17.** $y = x^2,\ y = 2x;$ about the $y$-axis

**18.** $y = 6 - x^2,\ y = 2;$ about the $x$-axis

**19.** $y = x^3,\ y = \sqrt{x};$ about the $x$-axis

**20.** $x = 2 - y^2,\ x = y^4;$ about the $y$-axis

**21.** $y = x^2,\ x = y^2;$ about $y = 1$

**22.** $y = x^3,\ y = 1,\ x = 2;$ about $y = -3$

**23.** $y = 3,\ y = 1 + \sec x,\ -\pi/3 \leqslant x \leqslant \pi/3;$ about $y = 1$

**24.** $y = \sin x,\ y = \cos x,\ 0 \leqslant x \leqslant \pi/4;$ about $y = -1$

**25.** $y = x^3,\ y = 0,\ x = 1;$ about $x = 2$

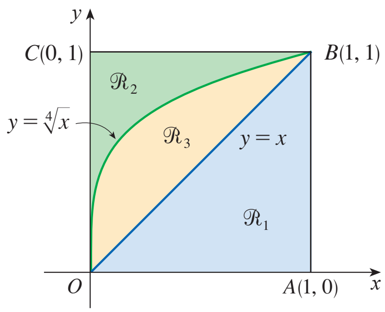
**26.** $y = x^2,\ x = y^2;$ about $x = -1$

**27.** $x = y^2,\ x = 1 - y^2;$ about $x = 3$

**28.** $y = x,\ y = 0,\ x = 2,\ x = 4;$ about $x = 1$

---

**29–40** Refer to the figure and find the volume generated by rotating the given region about the specified line.



**29.** $\mathcal{R}_1$ about $OA$

**30.** $\mathcal{R}_1$ about $OC$

**31.** $\mathcal{R}_1$ about $AB$

**32.** $\mathcal{R}_1$ about $BC$

**33.** $\mathcal{R}_2$ about $OA$

**34.** $\mathcal{R}_2$ about $OC$

**35.** $\mathcal{R}_2$ about $AB$

**36.** $\mathcal{R}_2$ about $BC$

**37.** $\mathcal{R}_3$ about $OA$

**38.** $\mathcal{R}_3$ about $OC$

**39.** $\mathcal{R}_3$ about $AB$

**40.** $\mathcal{R}_3$ about $BC$

---

T **41–44** Set up an integral for the volume of the solid obtained by rotating the region bounded by the given curves about the specified line. Then use a calculator or computer to evaluate the integral correct to five decimal places.

**41.** $y = \tan x,\ y = 0,\ x = \pi/4$
  (a) About the $x$-axis (b) About $y = -1$

**42.** $y = 0,\ y = \cos^2 x,\ -\pi/2 \leqslant x \leqslant \pi/2$
  (a) About the $x$-axis (b) About $y = 1$

**43.** $x^2 + 4y^2 = 4$
  (a) About $y = 2$ (b) About $x = 2$

**44.** $y = x^2,\ x^2 + y^2 = 1,\ y \geqslant 0$
(a) About the $x$-axis (b) About the $y$-axis

---

T **45–46** Use a graph to find approximate $x$-coordinates of the points of intersection of the given curves. Then use a calculator or computer to find (approximately) the volume of the solid obtained by rotating about the $x$-axis the region bounded by these curves.

**45.** $y = 1 + x^4, \quad y = \sqrt{3 - x^3}$

**46.** $y = \sqrt[3]{2x - x^2}, \quad y = x^2/(x^2 + 1)$

---

T **47–48** Use a computer algebra system to find the exact volume of the solid obtained by rotating the region bounded by the given curves about the specified line.

**47.** $y = \sin^2 x,\ y = 0,\ 0 \leqslant x \leqslant \pi;\quad$ about $y = -1$

**48.** $y = x^2 - 2x,\ y = x\cos(\pi x/4);\quad$ about $y = 2$

---

**49–54** Each integral represents the volume of a solid of revolution. Describe the solid.

**49.** $\pi \int_0^{\pi/2} \sin^2 x\, dx$

**50.** $\pi \int_0^{\pi} \sin x\, dx$

**51.** $\pi \int_0^1 (x^4 - x^6)\, dx$

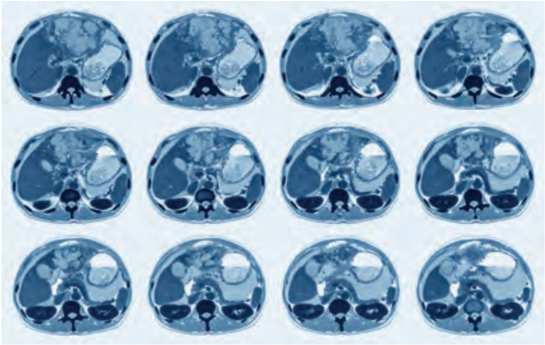
**52.** $\pi \int_{-1}^1 (1 - y^2)^2\, dy$

**53.** $\pi \int_0^4 y\, dy$

**54.** $\pi \int_1^4 \left[3^2 - \left(3 - \sqrt{x}\,\right)^2\right] dx$

---

**55.** A CAT scan produces equally spaced cross-sectional views of a human organ that provide information about the organ otherwise obtained only by surgery. Suppose that a CAT scan of a human liver shows cross-sections spaced 1.5 cm apart. The liver is 15 cm long and the cross-sectional areas, in square centimeters, are 0, 18, 58, 79, 94, 106, 117, 128, 63, 39, and 0. Use the Midpoint Rule to estimate the volume of the liver.

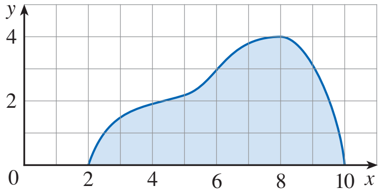


Suttha Burawonk / Shutterstock.com

**56.** A log 10 m long is cut at 1-meter intervals and its cross-sectional areas $A$ (at a distance $x$ from the end of the log) are listed in the table. Use the Midpoint Rule with $n = 5$ to estimate the volume of the log.

| $x$ (m) | $A$ (m$^2$) | $x$ (m) | $A$ (m$^2$) |
|---|---|---|---|
| 0 | 0.68 | 6 | 0.53 |
| 1 | 0.65 | 7 | 0.55 |
| 2 | 0.64 | 8 | 0.52 |
| 3 | 0.61 | 9 | 0.50 |
| 4 | 0.58 | 10 | 0.48 |
| 5 | 0.59 | | |

**57.** (a) If the region shown in the figure is rotated about the $x$-axis to form a solid, use the Midpoint Rule with $n = 4$ to estimate the volume of the solid.



(b) Estimate the volume if the region is rotated about the $y$-axis. Again use the Midpoint Rule with $n = 4$.

T **58.** (a) A model for the shape of a bird's egg is obtained by rotating about the $x$-axis the region under the graph of

$$f(x) = (ax^3 + bx^2 + cx + d)\sqrt{1 - x^2}$$

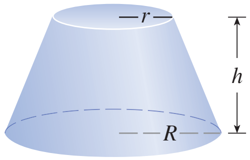
Use a computer algebra system to find the volume of such an egg.

(b) For a red-throated loon, $a = -0.06$, $b = 0.04$, $c = 0.1$, and $d = 0.54$. Graph $f$ and find the volume of an egg of this species.

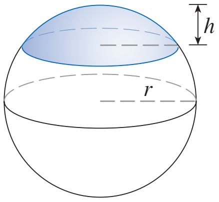
**59–74** Find the volume of the described solid $S$.

**59.** A right circular cone with height $h$ and base radius $r$

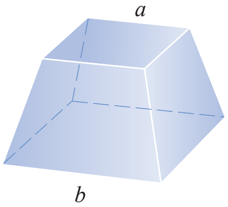
**60.** A frustum of a right circular cone with height $h$, lower base radius $R$, and top radius $r$



**61.** A cap of a sphere with radius $r$ and height $h$



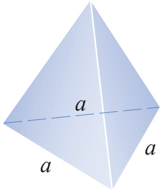
**62.** A frustum of a pyramid with square base of side $b$, square top of side $a$, and height $h$



What happens if $a = b$? What happens if $a = 0$?

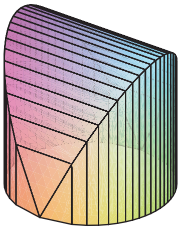
**63.** A pyramid with height $h$ and rectangular base with dimensions $b$ and $2b$

**64.** A pyramid with height $h$ and base an equilateral triangle with side $a$ (a tetrahedron)



**65.** A tetrahedron with three mutually perpendicular faces and three mutually perpendicular edges with lengths 3 cm, 4 cm, and 5 cm

**66.** The base of $S$ is a circular disk with radius $r$. Parallel cross-sections perpendicular to the base are squares.



**67.** The base of $S$ is an elliptical region with boundary curve $9x^2 + 4y^2 = 36$. Cross-sections perpendicular to the $x$-axis are isosceles right triangles with hypotenuse in the base.

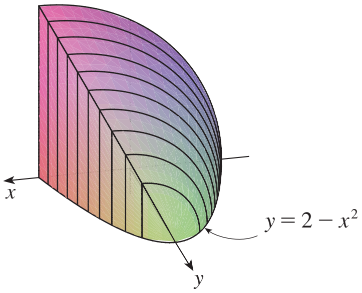
**68.** The base of $S$ is the triangular region with vertices (0, 0), (1, 0), and (0, 1). Cross-sections perpendicular to the $y$-axis are equilateral triangles.

**69.** The base of $S$ is the same base as in Exercise 68, but cross-sections perpendicular to the $x$-axis are squares.

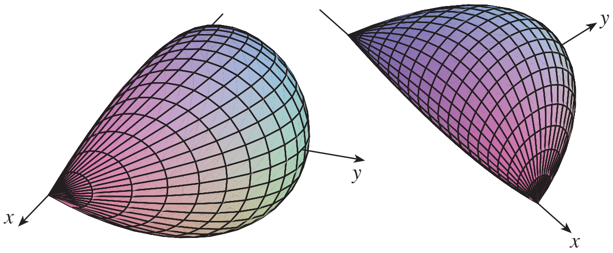
**70.** The base of $S$ is the region enclosed by the parabola $y = 1 - x^2$ and the $x$-axis. Cross-sections perpendicular to the $y$-axis are squares.

**71.** The base of $S$ is the same base as in Exercise 70, but cross-sections perpendicular to the $x$-axis are isosceles triangles with height equal to the base.

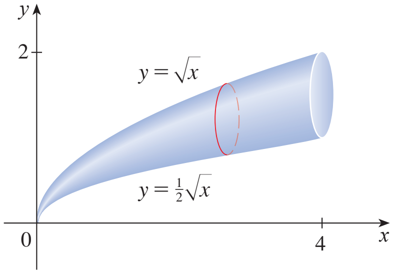
**72.** The base of $S$ is the region enclosed by $y = 2 - x^2$ and the $x$-axis. Cross-sections perpendicular to the $y$-axis are quarter-circles.



**73.** The solid $S$ is bounded by circles that are perpendicular to the $x$-axis, intersect the $x$-axis, and have centers on the parabola $y = \frac{1}{2}(1 - x^2)$, $-1 \leqslant x \leqslant 1$.



**74.** Cross-sections of the solid $S$ in planes perpendicular to the $x$-axis are circles with diameters extending from the curve $y = \frac{1}{2}\sqrt{x}$ to the curve $y = \sqrt{x}$ for $0 \leqslant x \leqslant 4$.



**75.** (a) Set up an integral for the volume of a solid *torus* (the donut-shaped solid shown in the figure) with radii $r$ and $R$.

(b) By interpreting the integral as an area, find the volume of the torus.

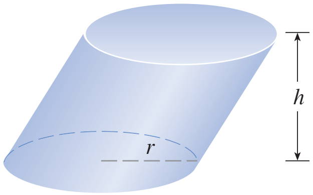
**76.** The base of a solid $S$ is a circular disk with radius $r$. Parallel cross-sections perpendicular to the base are isosceles triangles with height $h$ and unequal side in the base.
(a) Set up an integral for the volume of $S$.
(b) By interpreting the integral as an area, find the volume of $S$.

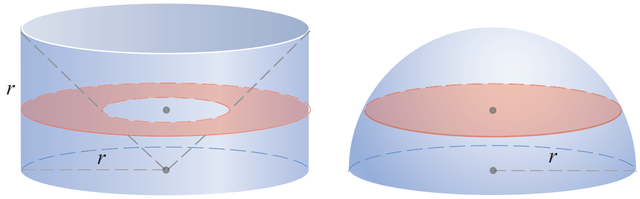
**77.** Solve Example 9 taking cross-sections to be parallel to the line of intersection of the two planes.

**78–79 Cavalieri's Principle** Cavalieri's Principle states that if a family of parallel planes gives equal cross-sectional areas for two solids $S_1$ and $S_2$, then the volumes of $S_1$ and $S_2$ are equal.

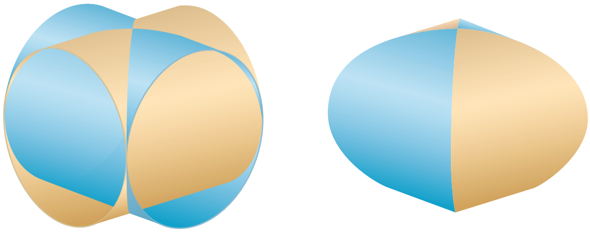
**78.** (a) Prove Cavalieri's Principle.
(b) Use Cavalieri's Principle to find the volume of the oblique cylinder shown in the figure.



**79.** Use Cavalieri's Principle to show that the volume of a solid hemisphere of radius $r$ is equal to the volume of a cylinder of radius $r$ and height $r$ with a cone removed, as shown in the figure.



**80.** Find the volume common to two circular cylinders, each with radius $r$, if the axes of the cylinders intersect at right angles.



**81.** Find the volume common to two spheres, each with radius $r$, if the center of each sphere lies on the surface of the other sphere.

**82.** A bowl is shaped like a hemisphere with diameter 30 cm. A heavy ball with diameter 10 cm is placed in the bowl and water is poured into the bowl to a depth of $h$ centimeters. Find the volume of water in the bowl.

**83.** A hole of radius $r$ is bored through the middle of a cylinder of radius $R > r$ at right angles to the axis of the cylinder. Set up, but do not evaluate, an integral for the volume that is cut out.

**84.** A hole of radius $r$ is bored through the center of a sphere of radius $R > r$. Find the volume of the remaining portion of the sphere.

**85.** Some of the pioneers of calculus, such as Kepler and Newton, were inspired by the problem of finding the volumes of wine barrels. (Kepler published a book *Stereometria doliorum* in 1615 devoted to methods for finding the volumes of barrels.) They often approximated the shape of the sides by parabolas.
(a) A barrel with height $h$ and maximum radius $R$ is constructed by rotating about the $x$-axis the parabola $y = R - cx^2$, $-h/2 \leqslant x \leqslant h/2$, where $c$ is a positive constant. Show that the radius of each end of the barrel is $r = R - d$, where $d = ch^2/4$.
(b) Show that the volume enclosed by the barrel is

$$V = \tfrac{1}{3}\pi h\left(2R^2 + r^2 - \tfrac{2}{5}d^2\right)$$

**86.** Suppose that a region $\mathcal{R}$ has area $A$ and lies above the $x$-axis. When $\mathcal{R}$ is rotated about the $x$-axis, it sweeps out a solid with volume $V_1$. When $\mathcal{R}$ is rotated about the line $y = -k$ (where $k$ is a positive number), it sweeps out a solid with volume $V_2$. Express $V_2$ in terms of $V_1$, $k$, and $A$.

**87.** A *dilation* of the plane with scaling factor $c$ is a transformation that maps the point $(x, y)$ to the point $(cx, cy)$. Applying a dilation to a region in the plane produces a geometrically similar shape. A manufacturer wants to produce a 5-liter (5000 cm$^3$) terra-cotta pot whose shape is geometrically similar to the solid obtained by rotating the region $\mathcal{R}_1$ shown in the figure about the $y$-axis.
(a) Find the volume $V_1$ of the pot obtained by rotating the region $\mathcal{R}_1$.
(b) Show that applying a dilation with scaling factor $c$ transforms the region $\mathcal{R}_1$ into the region $\mathcal{R}_2$.
(c) Show that the volume $V_2$ of the pot obtained by rotating the region $\mathcal{R}_2$ is $c^3V_1$.
(d) Find the scaling factor $c$ that produces a 5-liter pot.

## 5.3 Volumes by Cylindrical Shells

Some volume problems are very difficult to handle by the methods of the preceding section. For instance, let's consider the problem of finding the volume of the solid obtained by rotating about the $y$-axis the region bounded by $y = 2x^2 - x^3$ and $y = 0$. (See Figure 1.) If we slice perpendicular to the $y$-axis, we get a washer. But to compute the inner radius and the outer radius of the washer, we'd have to solve the cubic equation $y = 2x^2 - x^3$ for $x$ in terms of $y$; that's not easy.

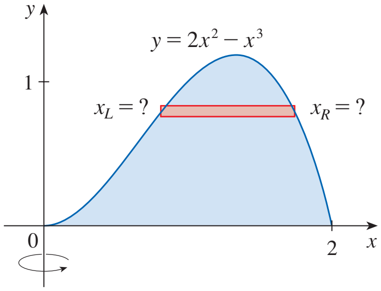

**FIGURE 1**

### The Method of Cylindrical Shells

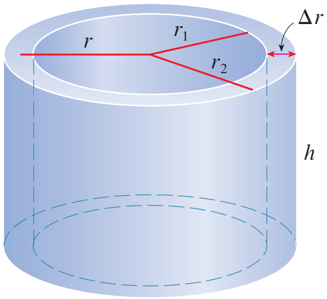

**FIGURE 2**

There is a method, called the *method of cylindrical shells*, that is easier to use in a case like the one shown in Figure 1. Figure 2 shows a cylindrical shell with inner radius $r_1$, outer radius $r_2$, and height $h$. Its volume $V$ is calculated by subtracting the volume $V_1$ of the inner cylinder from the volume $V_2$ of the outer cylinder:

$$\begin{aligned} V &= V_2 - V_1 \\ &= \pi r_2^2 h - \pi r_1^2 h = \pi(r_2^2 - r_1^2)h \\ &= \pi(r_2 + r_1)(r_2 - r_1)h \\ &= 2\pi \frac{r_2 + r_1}{2} h(r_2 - r_1) \end{aligned}$$

If we let $\Delta r = r_2 - r_1$ (the thickness of the shell) and $r = \frac{1}{2}(r_2 + r_1)$ (the average radius of the shell), then this formula for the volume of a cylindrical shell becomes

$$\boxed{1} \qquad \boxed{V = 2\pi rh\,\Delta r}$$

and it can be remembered as

$$V = [\text{circumference}][\text{height}][\text{thickness}]$$

Now let $S$ be the solid obtained by rotating about the $y$-axis the region bounded by $y = f(x)$ [where $f(x) \geqslant 0$], $y = 0$, $x = a$, and $x = b$, where $b > a \geqslant 0$. (See Figure 3.)

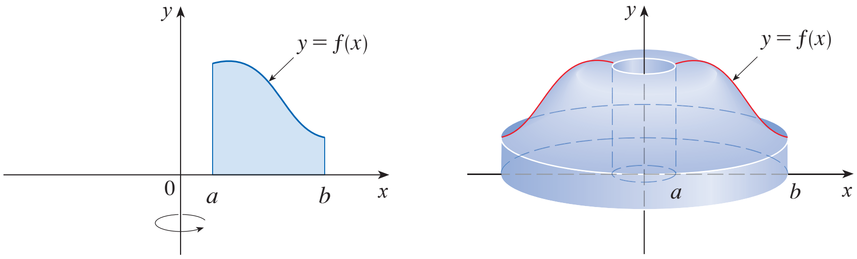

**FIGURE 3**

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We divide the interval $[a, b]$ into $n$ subintervals $[x_{i-1}, x_i]$ of equal width $\Delta x$ and let $\bar{x}_i$ be the midpoint of the $i$th subinterval. If the rectangle with base $[x_{i-1}, x_i]$ and height $f(\bar{x}_i)$ is rotated about the $y$-axis, then the result is a cylindrical shell with average radius $\bar{x}_i$, height $f(\bar{x}_i)$, and thickness $\Delta x$. (See Figure 4.) So by Formula 1 its volume is

$$V_i = (2\pi \bar{x}_i)[f(\bar{x}_i)]\,\Delta x$$

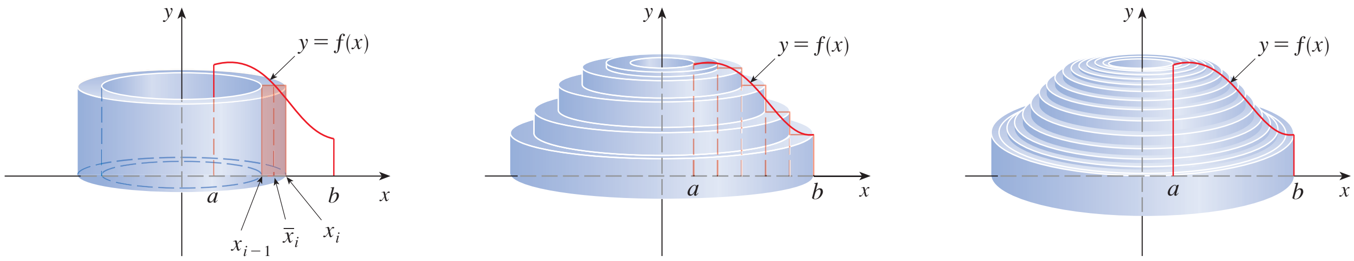

**FIGURE 4**

Therefore an approximation to the volume $V$ of $S$ is given by the sum of the volumes of these shells:

$$V \approx \sum_{i=1}^{n} V_i = \sum_{i=1}^{n} 2\pi \bar{x}_i f(\bar{x}_i)\,\Delta x$$

This approximation appears to become better as $n \to \infty$. But, from the definition of an integral, we know that

$$\lim_{n\to\infty} \sum_{i=1}^{n} 2\pi \bar{x}_i f(\bar{x}_i)\,\Delta x = \int_a^b 2\pi x\, f(x)\,dx$$

Thus the following formula appears plausible:

**2** The volume of the solid in Figure 3, obtained by rotating about the $y$-axis the region under the curve $y = f(x)$ from $a$ to $b$, is

$$V = \int_a^b 2\pi x f(x)\,dx \qquad \text{where } 0 \leqslant a < b$$

The argument using cylindrical shells makes Formula 2 seem reasonable, but later we will be able to prove it (see Exercise 7.1.81).

The best way to remember Formula 2 is to think of a typical shell, cut and flattened as in Figure 5, with radius $x$, circumference $2\pi x$, height $f(x)$, and thickness $\Delta x$ or $dx$:

$$V = \int_a^b \underbrace{(2\pi x)}_{\text{circumference}}\ \underbrace{[f(x)]}_{\text{height}}\ \underbrace{dx}_{\text{thickness}}$$

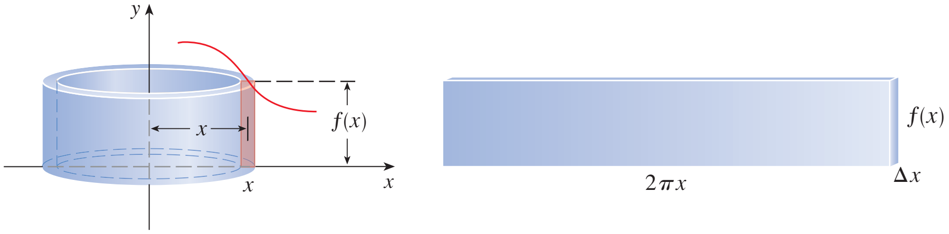

**FIGURE 5**

This type of reasoning will be helpful in other situations, such as when we rotate regions about lines other than the $y$-axis.

**EXAMPLE 1** Find the volume of the solid obtained by rotating about the $y$-axis the region bounded by $y = 2x^2 - x^3$ and $y = 0$.

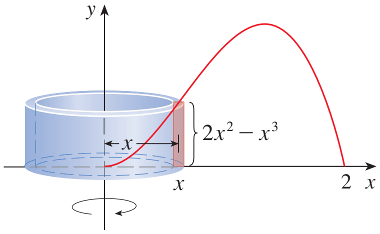

**FIGURE 6**

**SOLUTION** From the sketch in Figure 6 we see that a typical shell has radius $x$, circumference $2\pi x$, and height $f(x) = 2x^2 - x^3$. So, by the shell method, the volume is

$$V = \int_0^2 \underbrace{(2\pi x)}_{\text{circumference}} \underbrace{(2x^2 - x^3)}_{\text{height}} \underbrace{dx}_{\text{thickness}}$$

$$= 2\pi \int_0^2 (2x^3 - x^4)\,dx = 2\pi\Big[\tfrac{1}{2}x^4 - \tfrac{1}{5}x^5\Big]_0^2$$

$$= 2\pi\left(8 - \tfrac{32}{5}\right) = \tfrac{16}{5}\pi$$

It can be verified that the shell method gives the same answer as slicing. ■

Figure 7 shows a computer-generated picture of the solid whose volume we computed in Example 1.

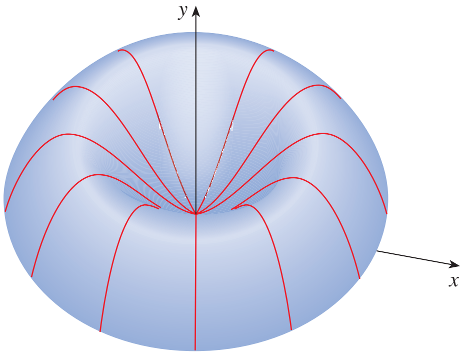

**FIGURE 7**

**NOTE** Comparing the solution of Example 1 with the remarks at the beginning of this section, we see that the method of cylindrical shells is much easier than the washer method for this problem. We did not have to find the coordinates of the local maximum and we did not have to solve the equation of the curve for $x$ in terms of $y$. However, in other examples the methods of the preceding section may be easier.

**EXAMPLE 2** Find the volume of the solid obtained by rotating about the $y$-axis the region between $y = x$ and $y = x^2$.

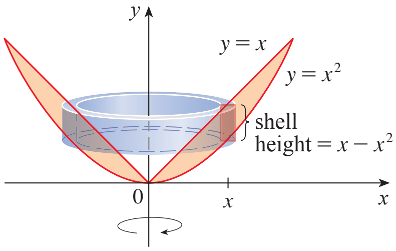

**FIGURE 8**

**SOLUTION** The region and a typical shell are shown in Figure 8. We see that the shell has radius $x$, circumference $2\pi x$, and height $x - x^2$. So the volume is

$$V = \int_0^1 (2\pi x)(x - x^2)\,dx = 2\pi \int_0^1 (x^2 - x^3)\,dx$$

$$= 2\pi\left[\frac{x^3}{3} - \frac{x^4}{4}\right]_0^1 = \frac{\pi}{6}$$ ■

As the following example shows, the shell method works just as well if we rotate a region about the $x$-axis. We simply have to draw a diagram to identify the radius and height of a shell.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 3** Use cylindrical shells to find the volume of the solid obtained by rotating about the $x$-axis the region under the curve $y = \sqrt{x}$ from 0 to 1.

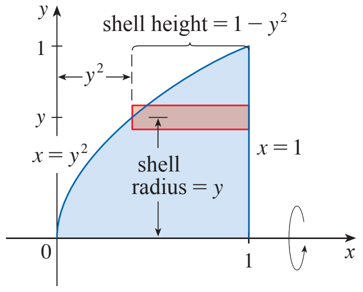

**FIGURE 9**

**SOLUTION** This problem was solved using disks in Example 5.2.2. To use shells we relabel the curve $y = \sqrt{x}$ (in the figure in that example) as $x = y^2$ in Figure 9. For rotation about the $x$-axis we see that a typical shell has radius $y$, circumference $2\pi y$, and height $1 - y^2$. So the volume is

$$V = \int_0^1 (2\pi y)(1 - y^2)\,dy = 2\pi \int_0^1 (y - y^3)\,dy$$

$$= 2\pi \left[ \frac{y^2}{2} - \frac{y^4}{4} \right]_0^1 = \frac{\pi}{2}$$

In this problem the disk method was simpler. ■

**EXAMPLE 4** Find the volume of the solid obtained by rotating the region bounded by $y = x - x^2$ and $y = 0$ about the line $x = 2$.

**SOLUTION** Figure 10 shows the region and a cylindrical shell formed by rotation about the line $x = 2$. It has radius $2 - x$, circumference $2\pi(2 - x)$, and height $x - x^2$.

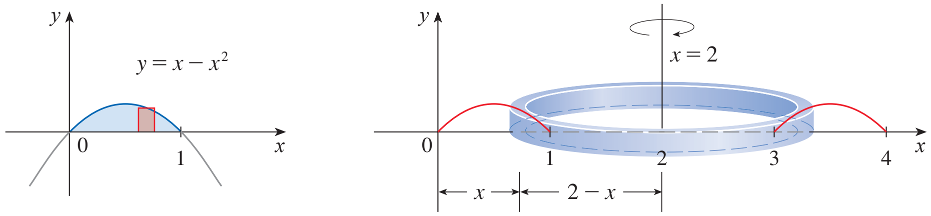

**FIGURE 10**

The volume of the given solid is

$$V = \int_0^1 2\pi(2 - x)(x - x^2)\,dx$$

$$= 2\pi \int_0^1 (x^3 - 3x^2 + 2x)\,dx$$

$$= 2\pi \left[ \frac{x^4}{4} - x^3 + x^2 \right]_0^1 = \frac{\pi}{2}$$ ■

## ■ Disks and Washers versus Cylindrical Shells

When computing the volume of a solid of revolution, how do we know whether to use disks (or washers) or cylindrical shells? There are several considerations to take into account: Is the region more easily described by top and bottom boundary curves of the form $y = f(x)$, or by left and right boundaries $x = g(y)$? Which choice is easier to work with? Are the limits of integration easier to find for one variable versus the other? Does the region require two separate integrals when using $x$ as the variable but only one integral in $y$? Are we able to evaluate the integral we set up with our choice of variable?

If we decide that one variable is easier to work with than the other, then this dictates which method to use. Draw a sample rectangle in the region, corresponding to a cross-section of the solid. The thickness of the rectangle, either $\Delta x$ or $\Delta y$, corresponds to the integration variable. If you imagine the rectangle revolving, it becomes either a disk (washer) or a shell. Sometimes either method works, as in the next example.

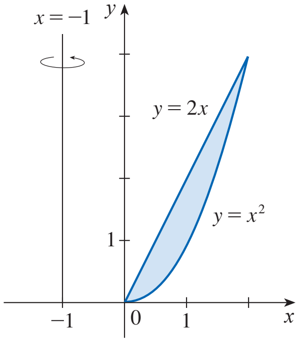

**FIGURE 11**

**EXAMPLE 5** Figure 11 shows the region in the first quadrant bounded by the curves $y = x^2$ and $y = 2x$. A solid is formed by rotating the region about the line $x = -1$. Find the volume of the solid using (a) $x$ as the variable of integration and (b) $y$ as the variable of integration.

**SOLUTION** The solid is shown in Figure 12(a).

(a) To find the volume using $x$ as the variable of integration, we draw the sample rectangle vertically, as in Figure 12(b). Rotating the region about the line $x = -1$ produces cylindrical shells, so the volume is

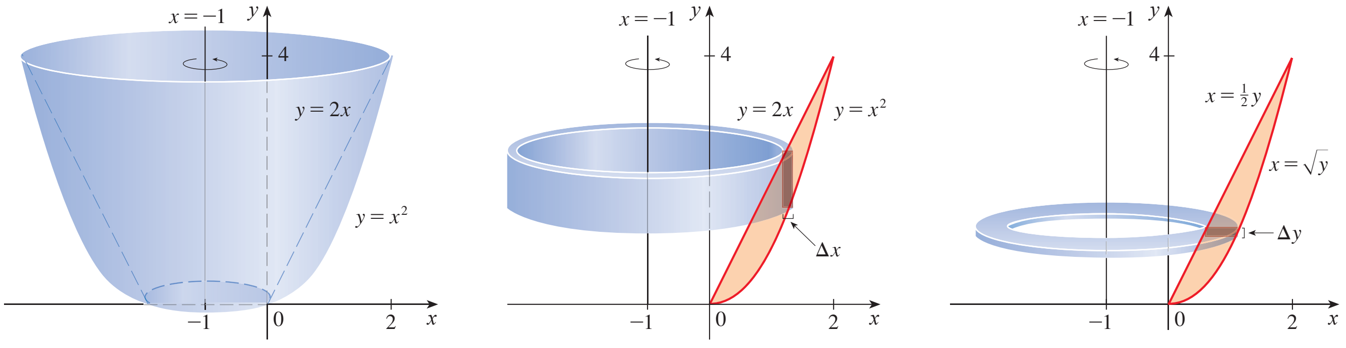
$$V = \int_0^2 2\pi(x+1)(2x-x^2)\,dx = 2\pi\int_0^2 (x^2+2x-x^3)\,dx$$

$$= 2\pi\left[\frac{x^3}{3}+x^2-\frac{x^4}{4}\right]_0^2 = \frac{16\pi}{3}$$

(b) To find the volume using $y$ as the variable of integration, we draw the sample rectangle horizontally as in Figure 12(c). Rotating the region about the line produces washer-shaped cross-sections, so the volume is

$$V = \int_0^4 \left[\pi\left(\sqrt{y}+1\right)^2 - \pi\left(\tfrac{1}{2}y+1\right)^2\right] dy = \pi\int_0^4 \left(2\sqrt{y}-\tfrac{1}{4}y^2\right) dy$$

$$= \pi\left[\tfrac{4}{3}y^{3/2} - \tfrac{1}{12}y^3\right]_0^4 = \frac{16\pi}{3}$$



(a) (b) (c)

**FIGURE 12**

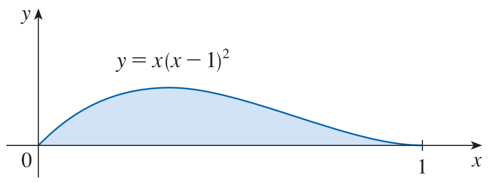
## 5.3 Exercises

**1.** Let $S$ be the solid obtained by rotating the region shown in the figure about the $y$-axis. Explain why it is awkward to use the washer method to find the volume $V$ of $S$. Sketch a typical approximating shell. What are its circumference and height? Use shells to find $V$.



**2.** Let $S$ be the solid obtained by rotating the region shown in the figure about the $y$-axis. Sketch a typical cylindrical shell and find its circumference and height. Use shells to find the volume of $S$. Is this method preferable to using washers?

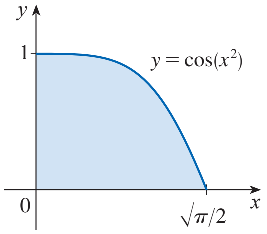
**3–4** A solid is obtained by rotating the shaded region about the specified line.

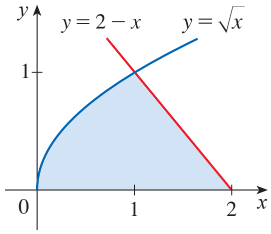
(a) Set up an integral using the method of cylindrical shells for the volume of the solid.

(b) Evaluate the integral to find the volume of the solid.

**3.** About the $y$-axis



**4.** About the $x$-axis



---

**5–8** Set up, but do not evaluate, an integral for the volume of the solid obtained by rotating the region bounded by the given curves about the specified line.

**5.** $y = \sqrt[4]{x}$, $y = 0$, $x = 2$; about the $y$-axis

**6.** $y = x^3$, $y = 8$, $x = 0$; about the $x$-axis

**7.** $y = \sqrt{x + 4}$, $y = 0$, $x = 0$; about $y = 3$

**8.** $y = 4x - x^2$, $y = x$; about $x = 7$

---

**9–14** Use the method of cylindrical shells to find the volume generated by rotating the region bounded by the given curves about the $y$-axis.

**9.** $y = \sqrt{x}$, $y = 0$, $x = 4$

**10.** $y = x^3$, $y = 0$, $x = 1$, $x = 2$

**11.** $y = 1/x$, $y = 0$, $x = 1$, $x = 4$

**12.** $y = x^2$, $0 \leqslant x \leqslant 2$, $y = 4$, $x = 0$

**13.** $y = \sqrt{5 + x^2}$, $y = 0$, $x = 0$, $x = 2$

**14.** $y = 4x - x^2$, $y = x$

---

**15–20** Use the method of cylindrical shells to find the volume of the solid obtained by rotating the region bounded by the given curves about the $x$-axis.

**15.** $xy = 1$, $x = 0$, $y = 1$, $y = 3$

**16.** $y = \sqrt{x}$, $x = 0$, $y = 2$

**17.** $y = x^{3/2}$, $y = 8$, $x = 0$

**18.** $x = -3y^2 + 12y - 9$, $x = 0$

**19.** $x = 1 + (y - 2)^2$, $x = 2$

**20.** $x + y = 4$, $x = y^2 - 4y + 4$

---

**21–22** The region bounded by the given curves is rotated about the specified axis. Find the volume of the resulting solid using (a) $x$ as the variable of integration and (b) $y$ as the variable of integration.

**21.** $y = x^2$, $y = 8\sqrt{x}$; about the $y$-axis

**22.** $y = x^3$, $y = 4x^2$; about the $x$-axis

---

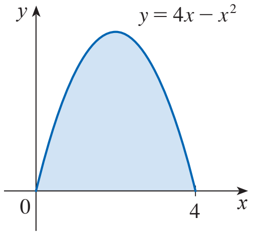
**23–24** A solid is obtained by rotating the shaded region about the specified axis.

(a) Sketch the solid and a typical approximating cylindrical shell.

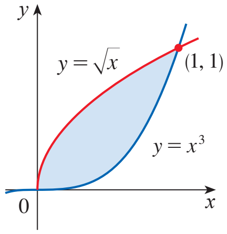
(b) Use the method of cylindrical shells to set up an integral for the volume of the solid.

(c) Evaluate the integral to find the volume.

**23.** About $x = -2$



**24.** About $y = -1$



---

**25–30** Use the method of cylindrical shells to find the volume generated by rotating the region bounded by the given curves about the specified axis.

**25.** $y = x^3$, $y = 8$, $x = 0$; about $x = 3$

**26.** $y = 4 - 2x$, $y = 0$, $x = 0$; about $x = -1$

**27.** $y = 4x - x^2$, $y = 3$; about $x = 1$

**28.** $y = \sqrt{x}$, $x = 2y$; about $x = 5$

**29.** $x = 2y^2$, $y \geqslant 0$, $x = 2$; about $y = 2$

**30.** $x = 2y^2$, $x = y^2 + 1$; about $y = -2$

---

**31–36**

(a) Set up an integral for the volume of the solid obtained by rotating the region bounded by the given curve about the specified axis.

**T** (b) Use a calculator or computer to evaluate the integral correct to five decimal places.

**31.** $y = \sin x$, $y = 0$, $x = 2\pi$, $x = 3\pi$; about the $y$-axis

**32.** $y = \tan x$, $y = 0$, $x = \pi/4$; about $x = \pi/2$

**33.** $y = \cos^4 x$, $y = -\cos^4 x$, $-\pi/2 \leqslant x \leqslant \pi/2$; about $x = \pi$

**34.** $y = x$, $y = 2x/(1 + x^3)$; about $x = -1$

**35.** $x = \sqrt{\sin y}$, $0 \leqslant y \leqslant \pi$, $x = 0$; about $y = 4$

**36.** $x^2 - y^2 = 7$, $x = 4$; about $y = 5$

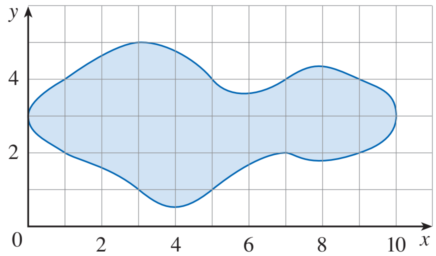
**37.** Use the Midpoint Rule with $n = 5$ to estimate the volume obtained by rotating about the $y$-axis the region under the curve $y = \sqrt{1 + x^3}$, $0 \leqslant x \leqslant 1$.

**38.** If the region shown in the figure is rotated about the $y$-axis to form a solid, use the Midpoint Rule with $n = 5$ to estimate the volume of the solid.



**39–42** Each integral represents the volume of a solid. Describe the solid.

**39.** $\int_0^3 2\pi x^5\,dx$

**40.** $\int_1^5 2\pi y\sqrt{y - 1}\,dy$

**41.** $2\pi \int_1^4 \dfrac{y + 2}{y^2}\,dy$

**42.** $\int_0^{\pi/2} 2\pi(x + 1)(2x - \sin x)\,dx$

---

**T** **43–44** Use a graph to estimate the $x$-coordinates of the points of intersection of the given curves. Then use this information and a calculator or computer to estimate the volume of the solid obtained by rotating about the $y$-axis the region enclosed by these curves.

**43.** $y = x^2 - 2x, \quad y = \dfrac{x}{x^2 + 1}$

**44.** $y = 3\sin x, \quad y = x^2 - 4x + 5$

---

**T** **45–46** Use a computer algebra system to find the exact volume of the solid obtained by rotating the region bounded by the given curves about the specified line.

**45.** $y = \sin^2 x,\ y = \sin^4 x,\ 0 \leqslant x \leqslant \pi;$ about $x = \pi/2$

**46.** $y = x^3 \sin x,\ y = 0,\ 0 \leqslant x \leqslant \pi;$ about $x = -1$

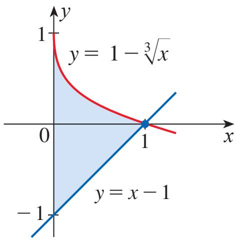
---

**47–52** A solid is obtained by rotating the shaded region about the specified line.

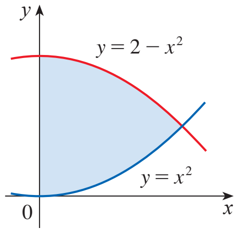
(a) Set up an integral using any method to find the volume of the solid.

(b) Evaluate the integral to find the volume of the solid.

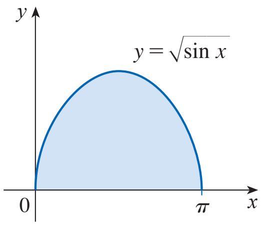
**47.** About the $y$-axis



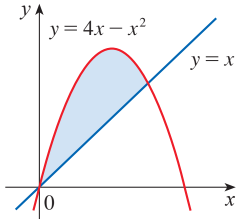
**48.** About the $x$-axis



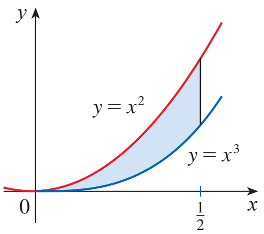
**49.** About the $x$-axis



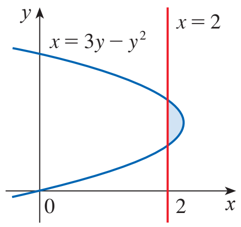
**50.** About the $y$-axis



**51.** About the line $x = -2$



**52.** About the line $y = 3$



---

**53–59** The region bounded by the given curves is rotated about the specified axis. Find the volume of the resulting solid by any method.

**53.** $y = -x^2 + 6x - 8,\ y = 0;$ about the $y$-axis

**54.** $y = -x^2 + 6x - 8,\ y = 0;$ about the $x$-axis

**55.** $y^2 - x^2 = 1,\ y = 2;$ about the $x$-axis

**56.** $y^2 - x^2 = 1,\ y = 2;$ about the $y$-axis

**57.** $x^2 + (y - 1)^2 = 1;$ about the $y$-axis

**58.** $x = (y - 3)^2,\ x = 4;$ about $y = 1$

**59.** $x = (y - 1)^2,\ x - y = 1;$ about $x = -1$

---

**60.** Let $T$ be the triangular region with vertices $(0, 0)$, $(1, 0)$, and $(1, 2)$, and let $V$ be the volume of the solid generated when $T$ is rotated about the line $x = a$, where $a > 1$. Express $a$ in terms of $V$.

**61–63** Use cylindrical shells to find the volume of the solid.

**61.** A sphere of radius $r$

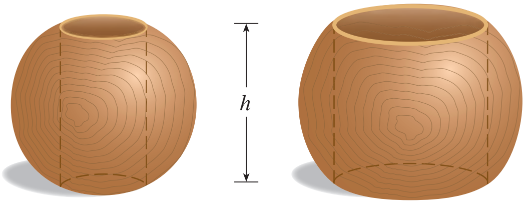
**62.** The solid torus of Exercise 5.2.75

**63.** A right circular cone with height $h$ and base radius $r$

**64.** Suppose you make napkin rings by drilling holes with different diameters through two wooden balls (which also have different diameters). You discover that both napkin rings have the same height $h$, as shown in the figure.

(a) Guess which ring has more wood in it.

(b) Check your guess: use cylindrical shells to compute the volume of a napkin ring created by drilling a hole with radius $r$ through the center of a sphere of radius $R$ and express the answer in terms of $h$.



## 5.4 Work

The term *work* is used in everyday language to mean the total amount of effort required to perform a task. In physics it has a technical meaning that depends on the idea of a *force*. Intuitively, you can think of a force as describing a push or pull on an object—for example, a horizontal push of a book across a table or the downward pull of the earth's gravity on a ball. In general, if an object moves along a straight line with position function $s(t)$, then the **force** $F$ on the object (in the same direction) is given by Newton's Second Law of Motion as the product of its mass $m$ and its acceleration $a$:

$$\boxed{1} \qquad F = ma = m\frac{d^2s}{dt^2}$$

In the SI metric system, the mass is measured in kilograms (kg), the displacement in meters (m), the time in seconds (s), and the force in newtons ($\text{N} = \text{kg}\cdot\text{m/s}^2$). Thus a force of 1 N acting on a mass of 1 kg produces an acceleration of 1 $\text{m/s}^2$. In the US Customary system the fundamental unit is chosen to be the unit of force, which is the pound.

In the case of constant acceleration, the force $F$ is also constant and the work done is defined to be the product of the force $F$ and the distance $d$ that the object moves:

$$\boxed{2} \qquad W = Fd \qquad \text{work} = \text{force} \times \text{distance}$$

If $F$ is measured in newtons and $d$ in meters, then the unit for $W$ is a newton-meter, which is called a joule (J). If $F$ is measured in pounds and $d$ in feet, then the unit for $W$ is a foot-pound (ft-lb), which is about 1.36 J.

### EXAMPLE 1

(a) How much work is done in lifting a 1.2-kg book off the floor to put it on a desk that is 0.7 m high? Use the fact that the acceleration due to gravity is $g = 9.8\ \text{m/s}^2$.

(b) How much work is done in lifting a 20-lb weight 6 ft off the ground?

**SOLUTION**

(a) The force exerted is equal and opposite to that exerted by gravity, so Equation 1 gives

$$F = mg = (1.2)(9.8) = 11.76\ \text{N}$$

and then Equation 2 gives the work done as

$$W = Fd = (11.76\ \text{N})(0.7\ \text{m}) \approx 8.2\ \text{J}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(b) Here the force is given as $F = 20$ lb, so the work done is

$$W = Fd = (20 \text{ lb})(6 \text{ ft}) = 120 \text{ ft-lb}$$

Notice that in part (b), unlike part (a), we did not have to multiply by $g$ because we were given the *weight* (which is a force) and not the mass of the object. ■

Equation 2 defines work as long as the force is constant, but what happens if the force is variable? Let's suppose that the object moves along the $x$-axis in the positive direction, from $x = a$ to $x = b$, and at each point $x$ between $a$ and $b$ a force $f(x)$ acts on the object, where $f$ is a continuous function. We divide the interval $[a, b]$ into $n$ subintervals with endpoints $x_0, x_1, \ldots, x_n$ and equal width $\Delta x$. We choose a sample point $x_i^*$ in the $i$th subinterval $[x_{i-1}, x_i]$. Then the force at that point is $f(x_i^*)$. If $n$ is large, then $\Delta x$ is small, and since $f$ is continuous, the values of $f$ don't change very much over the interval $[x_{i-1}, x_i]$. In other words, $f$ is almost constant on the interval and so the work $W_i$ that is done in moving the particle from $x_{i-1}$ to $x_i$ is approximately given by Equation 2:

$$W_i \approx f(x_i^*)\,\Delta x$$

Thus we can approximate the total work by

**3** $$W \approx \sum_{i=1}^{n} f(x_i^*)\,\Delta x$$

It seems that this approximation becomes better as we make $n$ larger. Therefore we define the **work done in moving the object from *a* to *b*** as the limit of this quantity as $n \to \infty$. Since the right side of (3) is a Riemann sum, we recognize its limit as being a definite integral and so

**4** $$\boxed{W = \lim_{n\to\infty} \sum_{i=1}^{n} f(x_i^*)\,\Delta x = \int_a^b f(x)\,dx}$$

**EXAMPLE 2** When a particle is located a distance $x$ feet from the origin, a force of $x^2 + 2x$ pounds acts on it. How much work is done in moving it from $x = 1$ to $x = 3$?

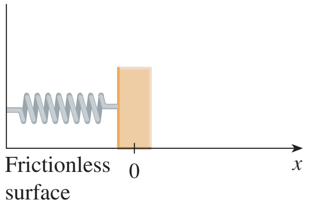
**SOLUTION** $$W = \int_1^3 (x^2 + 2x)\,dx = \frac{x^3}{3} + x^2 \Big]_1^3 = \frac{50}{3}$$

The work done is $16\frac{2}{3}$ ft-lb. ■

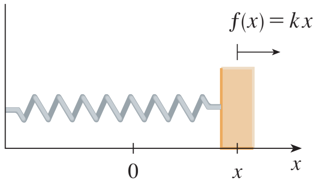
In the next example we use a law from physics. **Hooke's Law** states that the force required to maintain a spring stretched $x$ units beyond its natural length is proportional to $x$:

$$f(x) = kx$$

where $k$ is a positive constant called the **spring constant** (see Figure 1). Hooke's Law holds provided that $x$ is not too large.



(a) Natural position of spring



(b) Stretched position of spring

**FIGURE 1**
Hooke's Law

**EXAMPLE 3** A force of 40 N is required to hold a spring that has been stretched from its natural length of 10 cm to a length of 15 cm. How much work is done in stretching the spring from 15 cm to 18 cm?

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**SOLUTION** According to Hooke's Law, the force required to hold the spring stretched $x$ meters beyond its natural length is $f(x) = kx$. When the spring is stretched from 10 cm to 15 cm, the amount stretched is 5 cm = 0.05 m. This means that $f(0.05) = 40$, so

$$0.05k = 40 \qquad k = \frac{40}{0.05} = 800$$

Thus $f(x) = 800x$ and the work done in stretching the spring from 15 cm to 18 cm is

$$W = \int_{0.05}^{0.08} 800x\,dx = 800\,\frac{x^2}{2}\bigg]_{0.05}^{0.08}$$

$$= 400[(0.08)^2 - (0.05)^2] = 1.56 \text{ J}$$

■

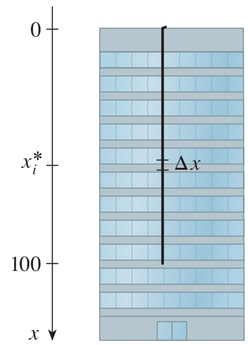


**FIGURE 2**

**EXAMPLE 4** A 200-lb cable is 100 ft long and hangs vertically from the top of a tall building.

(a) How much work is required to lift the cable to the top of the building?

(b) How much work is required to pull up only 20 feet of the cable?

**SOLUTION**

(a) One method is to use an argument similar to the one that led to Definition 4. [For another method, see Exercise 14(b).]

Let's place the origin at the top of the building and the $x$-axis pointing downward as in Figure 2. We divide the cable into small parts with length $\Delta x$. If $x_i^*$ is a point in the $i$th such interval, then all points in the interval are lifted by approximately the same amount, namely $x_i^*$. The cable weighs 2 pounds per foot, so the weight of the $i$th part is (2 lb/ft)($\Delta x$ ft) = $2\,\Delta x$ lb. Thus the work done on the $i$th part, in foot-pounds, is

$$\underbrace{(2\,\Delta x)}_{\text{force}} \cdot \underbrace{x_i^*}_{\text{distance}} = 2x_i^*\,\Delta x$$

We get the total work done by adding all these approximations and letting the number of parts become large (so $\Delta x \to 0$):

$$W = \lim_{n\to\infty} \sum_{i=1}^{n} 2x_i^*\,\Delta x = \int_0^{100} 2x\,dx$$

$$= x^2\Big]_0^{100} = 10{,}000 \text{ ft-lb}$$

If we had placed the origin at the bottom of the cable and the $x$-axis upward, we would have gotten

$$W = \int_0^{100} 2(100 - x)\,dx$$

which gives the same answer.

(b) The work required to move the top 20 ft of cable to the top of the building is computed in the same manner as part (a):

$$W_1 = \int_0^{20} 2x\,dx = x^2\Big]_0^{20} = 400 \text{ ft-lb}$$

Every part of the lower 80 ft of cable moves the same distance, namely 20 ft, so the work done is

$$W_2 = \lim_{n\to\infty} \sum_{i=1}^{n} \Bigg(\underbrace{20}_{\text{distance}} \cdot \underbrace{2\,\Delta x}_{\text{force}}\Bigg) = \int_{20}^{100} 40\,dx = 3200 \text{ ft-lb}$$

(Alternatively, we can observe that the lower 80 ft of cable weighs 80 · 2 = 160 lb and moves uniformly 20 ft, so the work done is 160 · 20 = 3200 ft-lb.)

The total work done is $W_1 + W_2 = 400 + 3200 = 3600$ ft-lb. ■

**EXAMPLE 5** A tank has the shape of an inverted circular cone with height 10 m and base radius 4 m. It is filled with water to a height of 8 m. Find the work required to empty the tank by pumping all of the water to the top of the tank. (The density of water is 1000 kg/m$^3$.)

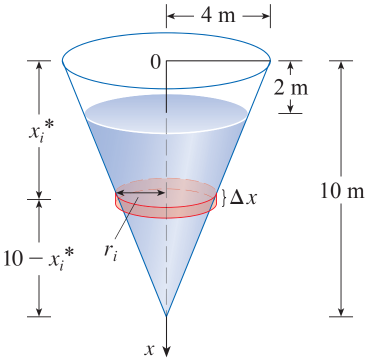

**FIGURE 3**

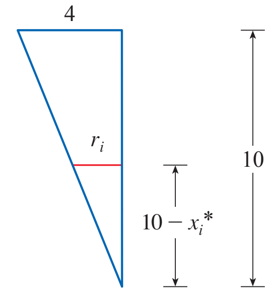

**FIGURE 4**

**SOLUTION** Let's measure depths from the top of the tank by introducing a vertical coordinate line as in Figure 3. The water extends from a depth of 2 m to a depth of 10 m and so we divide the interval $[2, 10]$ into $n$ subintervals with endpoints $x_0, x_1, \ldots, x_n$ and choose $x_i^*$ in the $i$th subinterval. This divides the water into $n$ layers. The $i$th layer is approximated by a circular cylinder with radius $r_i$ and height $\Delta x$. We can compute $r_i$ from similar triangles, using Figure 4, as follows:

$$\frac{r_i}{10 - x_i^*} = \frac{4}{10} \qquad\qquad r_i = \tfrac{2}{5}(10 - x_i^*)$$

Thus an approximation to the volume of the $i$th layer of water is

$$V_i \approx \pi r_i^2 \, \Delta x = \frac{4\pi}{25}(10 - x_i^*)^2 \, \Delta x$$

and so its mass is

$$\begin{aligned} m_i &= \text{density} \times \text{volume} \\ &\approx 1000 \cdot \frac{4\pi}{25}(10 - x_i^*)^2 \, \Delta x = 160\pi(10 - x_i^*)^2 \, \Delta x \end{aligned}$$

The force required to raise this layer must overcome the force of gravity and so

$$\begin{aligned} F_i = m_i g &\approx (9.8)160\pi(10 - x_i^*)^2 \, \Delta x \\ &= 1568\pi(10 - x_i^*)^2 \, \Delta x \end{aligned}$$

Each particle in the layer must travel a distance upward of approximately $x_i^*$. The work $W_i$ done to raise this layer to the top is approximately the product of the force $F_i$ and the distance $x_i^*$:

$$W_i \approx F_i x_i^* \approx 1568\pi x_i^*(10 - x_i^*)^2 \, \Delta x$$

To find the total work done in emptying the entire tank, we add the contributions of each of the $n$ layers and then take the limit as $n \to \infty$:

$$\begin{aligned} W &= \lim_{n\to\infty} \sum_{i=1}^{n} 1568\pi x_i^*(10 - x_i^*)^2 \, \Delta x = \int_2^{10} 1568\pi x(10 - x)^2 \, dx \\ &= 1568\pi \int_2^{10} (100x - 20x^2 + x^3)\, dx = 1568\pi \left[ 50x^2 - \frac{20x^3}{3} + \frac{x^4}{4} \right]_2^{10} \\ &= 1568\pi\left(\tfrac{2048}{3}\right) \approx 3.4 \times 10^6 \text{ J} \end{aligned}$$

■

## 5.4 Exercises

**1.** How much work is done when a weight lifter lifts 200 kg from 1.5 m to 2.0 m above the ground?

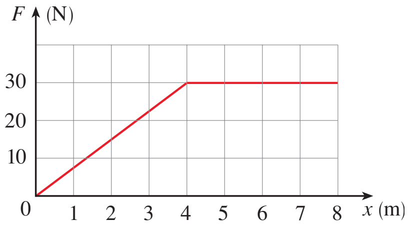
**2.** Compute the work done in hoisting an 1100-lb grand piano from the ground up to the third floor, 35 feet above the ground.

**3.** A variable force of $5x^{-2}$ pounds moves an object along a straight line when it is $x$ feet from the origin. Calculate the work done in moving the object from $x = 1$ ft to $x = 10$ ft.

**4.** A variable force of $4\sqrt{x}$ newtons moves a particle along a straight path when it is $x$ meters from the origin. Calculate the work done in moving the particle from $x = 4$ to $x = 16$.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**5.** Shown is the graph of a force function (in newtons) that increases to its maximum value and then remains constant. How much work is done by the force in moving an object a distance of 8 m?



**6.** The table shows values of a force function $f(x)$, where $x$ is measured in meters and $f(x)$ in newtons. Use the Midpoint Rule to estimate the work done by the force in moving an object from $x = 4$ to $x = 20$.

| $x$ | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 |
|---|---|---|---|---|---|---|---|---|---|
| $f(x)$ | 5 | 5.8 | 7.0 | 8.8 | 9.6 | 8.2 | 6.7 | 5.2 | 4.1 |

**7.** A force of 10 lb is required to hold a spring stretched 4 in. beyond its natural length. How much work is done in stretching it from its natural length to 6 in. beyond its natural length?

**8.** A spring has a natural length of 40 cm. If a 60-N force is required to keep the spring compressed 10 cm, how much work is done during this compression? How much work is required to compress the spring to a length of 25 cm?

**9.** Suppose that 2 J of work is needed to stretch a spring from its natural length of 30 cm to a length of 42 cm.

(a) How much work is needed to stretch the spring from 35 cm to 40 cm?

(b) How far beyond its natural length will a force of 30 N keep the spring stretched?

**10.** If the work required to stretch a spring 1 ft beyond its natural length is 12 ft-lb, how much work is needed to stretch it 9 in. beyond its natural length?

**11.** A spring has natural length 20 cm. Compare the work $W_1$ done in stretching the spring from 20 cm to 30 cm with the work $W_2$ done in stretching it from 30 cm to 40 cm. How are $W_2$ and $W_1$ related?

**12.** If 6 J of work is needed to stretch a spring from 10 cm to 12 cm and another 10 J is needed to stretch it from 12 cm to 14 cm, what is the natural length of the spring?

**13–22** Show how to approximate the required work by a Riemann sum. Then express the work as an integral and evaluate it.

**13.** A heavy rope, 50 ft long, weighs 0.5 lb/ft and hangs over the edge of a building 120 ft high.

(a) How much work is done in pulling the rope to the top of the building?

(b) How much work is done in pulling half the rope to the top of the building?

**14.** A thick cable, 60 ft long and weighing 180 lb, hangs from a winch on a crane. Compute in two different ways the work done if the winch winds up 25 ft of the cable.

(a) Follow the method of Example 4.

(b) Write a function for the weight of the remaining cable after $x$ feet has been wound up by the winch. Estimate the amount of work done when the winch pulls up $\Delta x$ feet of cable.

**15.** A cable that weighs 2 lb/ft is used to lift 800 lb of coal up a mine shaft 500 ft deep. Find the work done.

**16.** A chain lying on the ground is 10 m long and its mass is 80 kg. How much work is required to raise one end of the chain to a height of 6 m?

**17.** A 10-ft chain weighs 25 lb and hangs from a ceiling. Find the work done in lifting the lower end of the chain to the ceiling so that it is level with the upper end.

**18.** A 0.4-kg model rocket is loaded with 0.75 kg of rocket fuel. After launch, the rocket rises at a constant rate of 4 m/s but the rocket fuel is dissipated at a rate of 0.15 kg/s. Find the work done in propelling the rocket 20 m above the ground.

**19.** A leaky 10-kg bucket is lifted from the ground to a height of 12 m at a constant speed with a rope that weighs 0.8 kg/m. Initially the bucket contains 36 kg of water, but the water leaks at a constant rate and finishes draining just as the bucket reaches the 12-m level. How much work is done?

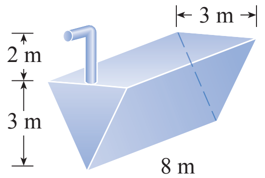
**20.** A circular swimming pool has a diameter of 24 ft, the sides are 5 ft high, and the depth of the water is 4 ft. How much work is required to pump all of the water out over the side? (Use the fact that water weighs 62.5 lb/ft$^3$.)

**21.** An aquarium 2 m long, 1 m wide, and 1 m deep is full of water. Find the work needed to pump half of the water out of the aquarium. (Use the fact that the density of water is 1000 kg/m$^3$.)

**22.** A spherical water tank, 24 ft in diameter, sits atop a 60-ft-tall tower. The tank is filled by a hose attached to the bottom of the sphere. If a 1.5-horsepower pump is used to deliver water up to the tank, how long will it take to fill the tank? (One horsepower = 550 ft-lb of work per second.)

**23–26** A tank is full of water. Find the work required to pump the water out of the spout. In Exercises 25 and 26 use the fact that water weighs 62.5 lb/ft$^3$.

**23.**



**24.**

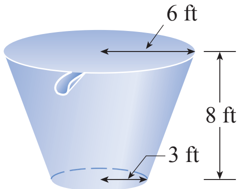
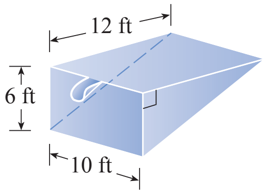
**25.**



frustum of a cone

**26.**

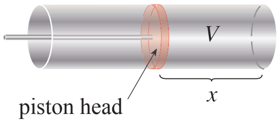


**27.** Suppose that for the tank in Exercise 23 the pump breaks down after $4.7 \times 10^5$ J of work has been done. What is the depth of the water remaining in the tank?

**28.** Solve Exercise 24 if the tank is half full of oil that has a density of $900 \text{ kg/m}^3$.

**29.** When gas expands in a cylinder with radius $r$, the pressure at any given time is a function of the volume: $P = P(V)$. The force exerted by the gas on the piston (see the figure) is the product of the pressure and the area: $F = \pi r^2 P$. Show that the work done by the gas when the volume expands from volume $V_1$ to volume $V_2$ is

$$W = \int_{V_1}^{V_2} P \, dV$$



**30.** In a steam engine the pressure $P$ and volume $V$ of steam satisfy the equation $PV^{1.4} = k$, where $k$ is a constant. (This is true for adiabatic expansion, that is, expansion in which there is no heat transfer between the cylinder and its surroundings.) Use Exercise 29 to calculate the work done by the engine during a cycle when the steam starts at a pressure of $160 \text{ lb/in}^2$ and a volume of $100 \text{ in}^3$ and expands to a volume of $800 \text{ in}^3$.

**31–33 Work-Energy Theorem** The kinetic energy KE of an object of mass $m$ moving with velocity $v$ is defined as $\text{KE} = \frac{1}{2}mv^2$. If a force $f(x)$ acts on the object, moving it along the $x$-axis from $x_1$ to $x_2$, the *Work-Energy Theorem* states that the net work done is equal to the change in kinetic energy: $\frac{1}{2}mv_2^2 - \frac{1}{2}mv_1^2$, where $v_1$ is the velocity at $x_1$ and $v_2$ is the velocity at $x_2$.

**31.** Let $x = s(t)$ be the position function of the object at time $t$ and $v(t)$, $a(t)$ the velocity and acceleration functions. Prove the Work-Energy Theorem by first using the Substitution Rule for Definite Integrals (4.5.5) to show that

$$W = \int_{x_1}^{x_2} f(x)\, dx = \int_{t_1}^{t_2} f(s(t))\ v(t)\, dt$$

Then use Newton's Second Law of Motion (force = mass × acceleration) and the substitution $u = v(t)$ to evaluate the integral.

**32.** How much work (in ft-lb) is required to hurl a 12-lb bowling ball at 20 mi/h? (*Note:* Divide the weight in pounds by $32 \text{ ft/s}^2$, the acceleration due to gravity, to find the mass, measured in slugs.)

**33.** Suppose that when launching an 800-kg roller coaster car an electromagnetic propulsion system exerts a force of $(5.7x^2 + 1.5x)$ newtons on the car at a distance $x$ meters along the track. Use Exercise 31 to find the speed of the car when it has traveled 60 meters.

**34.** When a particle is located a distance $x$ meters from the origin, a force of $\cos(\pi x/3)$ newtons acts on it. How much work is done in moving the particle from $x = 1$ to $x = 2$? Interpret your answer by considering the work done from $x = 1$ to $x = 1.5$ and from $x = 1.5$ to $x = 2$.

**35.** (a) Newton's Law of Gravitation states that two bodies with masses $m_1$ and $m_2$ attract each other with a force

$$F = G\frac{m_1 m_2}{r^2}$$

where $r$ is the distance between the bodies and $G$ is the gravitational constant. If one of the bodies is fixed, find the work needed to move the other from $r = a$ to $r = b$.

(b) Compute the work required to launch a 1000-kg satellite vertically to a height of 1000 km. You may assume that the earth's mass is $5.98 \times 10^{24}$ kg and is concentrated at its center. Take the radius of the earth to be $6.37 \times 10^6$ m and $G = 6.67 \times 10^{-11} \text{ N}\cdot\text{m}^2/\text{kg}^2$.

**36.** The Pyramid of Khufu was built of limestone in Egypt over a 20-year time period from 2580 BC to 2560 BC. Its base is a square with side length 756 ft and its height when built was 481 ft. (It was the tallest man-made structure in the world for more than 3800 years.) The density of the limestone is about $150 \text{ lb/ft}^3$.

(a) Estimate the total work done in building the pyramid.

(b) If each laborer worked 10 hours a day for 20 years, for 340 days a year, and did 200 ft-lb/h of work in lifting the limestone blocks into place, about how many laborers were needed to construct the pyramid?

## 5.5 Average Value of a Function

It is easy to calculate the average value of finitely many numbers $y_1, y_2, \ldots, y_n$:

$$y_{\text{avg}} = \frac{y_1 + y_2 + \cdots + y_n}{n}$$

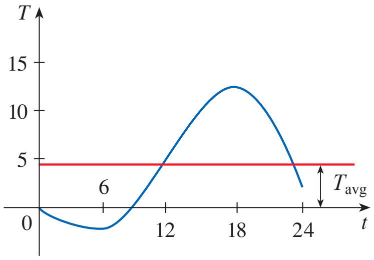

**FIGURE 1**

But how do we compute the average temperature during a day if infinitely many temperature readings are possible? Figure 1 shows the graph of a temperature function $T(t)$, where $t$ is measured in hours and $T$ in °C, and a guess at the average temperature, $T_{\text{avg}}$.

In general, let's try to compute the average value of a function $y = f(x)$, $a \leqslant x \leqslant b$. We start by dividing the interval $[a, b]$ into $n$ equal subintervals, each with length $\Delta x = (b - a)/n$. Then we choose points $x_1^*, \ldots, x_n^*$ in successive subintervals and calculate the average of the numbers $f(x_1^*), \ldots, f(x_n^*)$:

$$\frac{f(x_1^*) + \cdots + f(x_n^*)}{n}$$

(For example, if $f$ represents a temperature function and $n = 24$, this means that we take temperature readings every hour and then average them.) Since $\Delta x = (b - a)/n$, we can write $n = (b - a)/\Delta x$ and the average value becomes

$$\begin{aligned}\frac{f(x_1^*) + \cdots + f(x_n^*)}{\dfrac{b - a}{\Delta x}} &= \frac{1}{b - a}\left[f(x_1^*) + \cdots + f(x_n^*)\right]\Delta x \\ &= \frac{1}{b - a}\left[f(x_1^*)\,\Delta x + \cdots + f(x_n^*)\,\Delta x\right] \\ &= \frac{1}{b - a}\sum_{i=1}^{n} f(x_i^*)\,\Delta x\end{aligned}$$

If we let $n$ increase, we would be computing the average value of a large number of closely spaced values. (For example, we would be averaging temperature readings taken every minute or even every second.) The limiting value is

$$\lim_{n \to \infty} \frac{1}{b - a}\sum_{i=1}^{n} f(x_i^*)\,\Delta x = \frac{1}{b - a}\int_a^b f(x)\,dx$$

by the definition of a definite integral.

Therefore we define the **average value of *f*** on the interval $[a, b]$ as

$$\boxed{f_{\text{avg}} = \frac{1}{b - a}\int_a^b f(x)\,dx}$$

For a positive function, we can think of this definition as saying

$$\frac{\text{area}}{\text{width}} = \text{average height}$$

**EXAMPLE 1** Find the average value of the function $f(x) = 1 + x^2$ on the interval $[-1, 2]$.

**SOLUTION** With $a = -1$ and $b = 2$ we have

$$f_{\text{avg}} = \frac{1}{b - a}\int_a^b f(x)\,dx = \frac{1}{2 - (-1)}\int_{-1}^{2} (1 + x^2)\,dx = \frac{1}{3}\left[x + \frac{x^3}{3}\right]_{-1}^{2} = 2 \quad ■$$

If $T(t)$ is the temperature at time $t$, we might wonder if there is a specific time when the temperature is the same as the average temperature. For the temperature function

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

graphed in Figure 1, we see that there are two such times—just before noon and just before midnight. In general, is there a number $c$ at which the value of a function $f$ is exactly equal to the average value of the function, that is, $f(c) = f_{\text{avg}}$? The following theorem says that this is true for continuous functions.

**The Mean Value Theorem for Integrals** If $f$ is continuous on $[a, b]$, then there exists a number $c$ in $[a, b]$ such that

$$f(c) = f_{\text{avg}} = \frac{1}{b-a}\int_a^b f(x)\,dx$$

that is,

$$\int_a^b f(x)\,dx = f(c)(b-a)$$

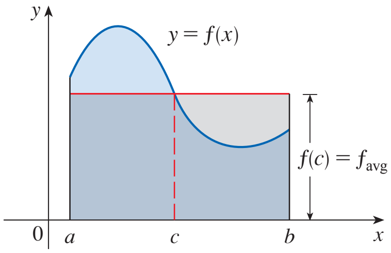

**FIGURE 2**

You can always chop off the top of a (two-dimensional) mountain at a certain height (namely, $f_{\text{avg}}$) and use it to fill in the valleys so that the mountain becomes completely flat.

The Mean Value Theorem for Integrals is a consequence of the Mean Value Theorem for derivatives and the Fundamental Theorem of Calculus. The proof is outlined in Exercise 26.

The geometric interpretation of the Mean Value Theorem for Integrals is that, for *positive* functions $f$, there is a number $c$ such that the rectangle with base $[a, b]$ and height $f(c)$ has the same area as the region under the graph of $f$ from $a$ to $b$. (See Figure 2 and the more picturesque interpretation in the margin note.)

**EXAMPLE 2** Since $f(x) = 1 + x^2$ is continuous on the interval $[-1, 2]$, the Mean Value Theorem for Integrals says there is a number $c$ in $[-1, 2]$ such that

$$\int_{-1}^{2} (1 + x^2)\,dx = f(c)[2 - (-1)]$$

In this particular case we can find $c$ explicitly. From Example 1 we know that $f_{\text{avg}} = 2$, so the value of $c$ satisfies

$$f(c) = f_{\text{avg}} = 2$$

Therefore $\qquad 1 + c^2 = 2 \qquad$ so $\qquad c^2 = 1$

So in this case there happen to be two numbers $c = \pm 1$ in the interval $[-1, 2]$ that work in the Mean Value Theorem for Integrals. ■

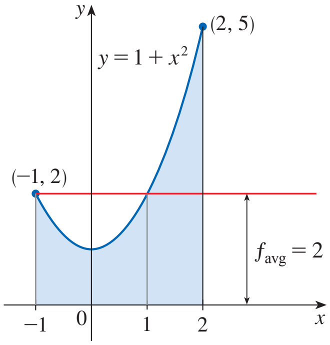

**FIGURE 3**

Examples 1 and 2 are illustrated by Figure 3.

**EXAMPLE 3** Show that the average velocity of a car over a time interval $[t_1, t_2]$ is the same as the average of its velocities during the trip.

**SOLUTION** If $s(t)$ is the displacement of the car at time $t$, then, by definition, the average velocity of the car over the interval is

$$\frac{\Delta s}{\Delta t} = \frac{s(t_2) - s(t_1)}{t_2 - t_1}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

On the other hand, the average value of the velocity function on the interval is

$$\begin{aligned} v_{\text{avg}} &= \frac{1}{t_2 - t_1}\int_{t_1}^{t_2} v(t)\,dt = \frac{1}{t_2 - t_1}\int_{t_1}^{t_2} s'(t)\,dt \\ &= \frac{1}{t_2 - t_1}\left[s(t_2) - s(t_1)\right] \qquad \text{(by the Net Change Theorem)} \\ &= \frac{s(t_2) - s(t_1)}{t_2 - t_1} = \text{average velocity} \end{aligned}$$

■

## 5.5 Exercises

**1–8** Find the average value of the function on the given interval.

**1.** $f(x) = 3x^2 + 8x, \quad [-1, 2]$

**2.** $f(x) = \sqrt{x}, \quad [0, 4]$

**3.** $g(x) = 3\cos x, \quad [-\pi/2, \pi/2]$

**4.** $g(t) = \dfrac{t}{\sqrt{3 + t^2}}, \quad [1, 3]$

**5.** $f(t) = t^2(1 + t^3)^4, \quad [0, 2]$

**6.** $f(x) = \dfrac{x^2}{(x^3 + 3)^2}, \quad [-1, 1]$

**7.** $h(x) = \cos^4 x \sin x, \quad [0, \pi]$

**8.** $h(t) = (1 + \sin t)^2 \cos t, \quad [\pi/2, 3\pi/2]$

---

**9–12**

(a) Find the average value of $f$ on the given interval.

(b) Find $c$ in the given interval such that $f_{\text{avg}} = f(c)$.

(c) Sketch the graph of $f$ and a rectangle whose base is the given interval and whose area is the same as the area under the graph of $f$.

**9.** $f(t) = 1/t^2, \quad [1, 3]$

**10.** $g(x) = (x + 1)^3, \quad [0, 2]$

**11.** $f(x) = 2\sin x - \sin 2x, \quad [0, \pi]$

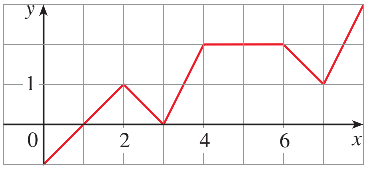
**12.** $f(x) = x\sqrt{4 - x^2}, \quad [0, 2]$

---

**13.** If $f$ is continuous and $\int_1^3 f(x)\,dx = 8$, show that $f$ takes on the value 4 at least once on the interval $[1, 3]$.

**14.** Find the numbers $b$ such that the average value of $f(x) = 2 + 6x - 3x^2$ on the interval $[0, b]$ is equal to 3.

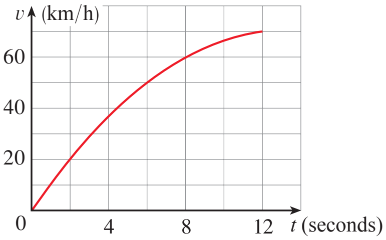
**15.** Find the average value of $f$ on $[0, 8]$.



**16.** The velocity graph of an accelerating car is shown.

(a) Use the Midpoint Rule to estimate the average velocity of the car during the first 12 seconds.

(b) At what time was the instantaneous velocity equal to the average velocity?



**17.** In a certain city the temperature (in °F) $t$ hours after 9 AM was modeled by the function

$$T(t) = 50 + 14 \sin \frac{\pi t}{12}$$

Find the average temperature during the period from 9 AM to 9 PM.

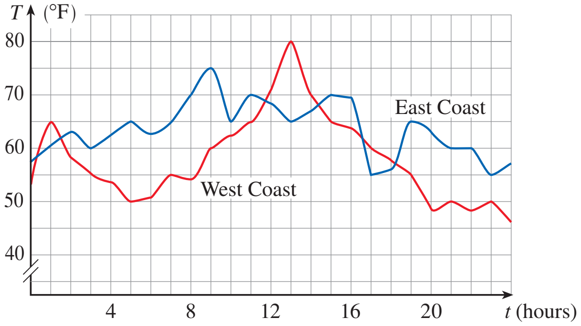
**18.** The figure shows graphs of the temperatures for a city on the East Coast and a city on the West Coast during a 24-hour period starting at midnight. Which city had the highest temperature that day? Find the average temperature during this time period for each city using the Midpoint Rule with $n = 12$. Interpret your results; which city was "warmer" overall that day?



**19.** The linear density in a rod 8 m long is $12/\sqrt{x+1}$ kg/m, where $x$ is measured in meters from one end of the rod. Find the average density of the rod.

**20.** The velocity $v$ of blood that flows in a blood vessel with radius $R$ and length $l$ at a distance $r$ from the central axis is

$$v(r) = \frac{P}{4\eta l}(R^2 - r^2)$$

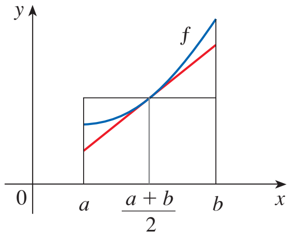
where $P$ is the pressure difference between the ends of the vessel and $\eta$ is the viscosity of the blood (see Example 2.7.7). Find the average velocity (with respect to $r$) over the interval $0 \leqslant r \leqslant R$. Compare the average velocity with the maximum velocity.

**21.** Use the result of Exercise 4.5.57 to compute the average volume of inhaled air in the lungs in one respiratory cycle.

**22.** If a freely falling body starts from rest, then its displacement is given by $s = \frac{1}{2}gt^2$. Let the velocity after a time $T$ be $v_T$. Show that if we compute the average of the velocities with respect to $t$ we get $v_{\text{avg}} = \frac{1}{2}v_T$, but if we compute the average of the velocities with respect to $s$ we get $v_{\text{avg}} = \frac{2}{3}v_T$.

**23.** Use the diagram to show that if $f$ is concave upward on $[a, b]$, then

$$f_{\text{avg}} > f\left(\frac{a+b}{2}\right)$$



**24–25** Let $f_{\text{avg}}[a, b]$ denote the average value of $f$ on the interval $[a, b]$.

**24.** Show that if $a < c < b$, then

$$f_{\text{avg}}[a, b] = \left(\frac{c-a}{b-a}\right) f_{\text{avg}}[a, c] + \left(\frac{b-c}{b-a}\right) f_{\text{avg}}[c, b]$$

**25.** Show that if $f$ is continuous, then

$$\lim_{h \to 0^+} f_{\text{avg}}[a, a+h] = f(a)$$

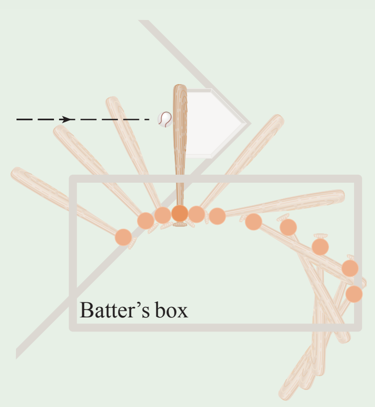
---

**26.** Prove the Mean Value Theorem for Integrals by applying the Mean Value Theorem for derivatives (see Section 3.2) to the function $F(x) = \int_a^x f(t)\, dt$.

## APPLIED PROJECT | CALCULUS AND BASEBALL

In this project we explore three of the many applications of calculus to baseball. The physical interactions of the game, especially the collision of ball and bat, are quite complex and their models are discussed in detail in a book by Robert Adair, *The Physics of Baseball,* 3d ed. (New York, 2002).

1. It may surprise you to learn that the collision of baseball and bat lasts only about a thousandth of a second. Here we calculate the average force on the bat during this collision by first computing the change in the ball's momentum.



An overhead view of the position of a baseball bat, shown every fiftieth of a second during a typical swing.
(Adapted from *The Physics of Baseball*)

The *momentum* $p$ of an object is the product of its mass $m$ and its velocity $v$, that is, $p = mv$. Suppose an object, moving along a straight line, is acted on by a force $F = F(t)$ that is a continuous function of time.

(a) Show that the change in momentum over a time interval $[t_0, t_1]$ is equal to the integral of $F$ from $t_0$ to $t_1$; that is, show that

$$p(t_1) - p(t_0) = \int_{t_0}^{t_1} F(t)\, dt$$

This integral is called the *impulse* of the force over the time interval.

(b) A pitcher throws a 90-mi/h fastball to a batter, who hits a line drive directly back to the pitcher. The ball is in contact with the bat for 0.001 s and leaves the bat with velocity 110 mi/h. A baseball weighs 5 oz and, in US Customary units, its mass is measured in slugs: $m = w/g$, where $g = 32\text{ ft/s}^2$.

(i) Find the change in the ball's momentum.
(ii) Find the average force on the bat.

**2.** In this problem we calculate the work required for a pitcher to throw a 90-mi/h fastball by first considering kinetic energy.

The *kinetic energy* $K$ of an object of mass $m$ and velocity $v$ is given by $K = \frac{1}{2}mv^2$. Suppose an object of mass $m$, moving in a straight line, is acted on by a force $F = F(s)$ that depends on its position $s$. According to Newton's Second Law

$$F(s) = ma = m\frac{dv}{dt}$$

where $a$ and $v$ denote the acceleration and velocity of the object.

(a) Show that the work done in moving the object from a position $s_0$ to a position $s_1$ is equal to the change in the object's kinetic energy; that is, show that

$$W = \int_{s_0}^{s_1} F(s)\, ds = \tfrac{1}{2}mv_1^2 - \tfrac{1}{2}mv_0^2$$

where $v_0 = v(s_0)$ and $v_1 = v(s_1)$ are the velocities of the object at the positions $s_0$ and $s_1$. *Hint:* By the Chain Rule,

$$m\frac{dv}{dt} = m\frac{dv}{ds}\frac{ds}{dt} = mv\frac{dv}{ds}$$

(b) How many foot-pounds of work does it take to throw a baseball at a speed of 90 mi/h?

**NOTE** Another application of calculus to baseball can be found in Problem 16 of the Problems Plus following Chapter 9.

# 5 REVIEW

## CONCEPT CHECK

Answers to the Concept Check are available at StewartCalculus.com.

**1.** (a) Draw two typical curves $y = f(x)$ and $y = g(x)$, where $f(x) \geqslant g(x)$ for $a \leqslant x \leqslant b$. Show how to approximate the area between these curves by a Riemann sum and sketch the corresponding approximating rectangles. Then write an expression for the exact area.

(b) Explain how the situation changes if the curves have equations $x = f(y)$ and $x = g(y)$, where $f(y) \geqslant g(y)$ for $c \leqslant y \leqslant d$.

**2.** Suppose that Sue runs faster than Kathy throughout a 1500-meter race. What is the physical meaning of the area between their velocity curves for the first minute of the race?

**3.** (a) Suppose $S$ is a solid with known cross-sectional areas. Explain how to approximate the volume of $S$ by a Riemann sum. Then write an expression for the exact volume.

(b) If $S$ is a solid of revolution, how do you find the cross-sectional areas?

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**4.** (a) What is the volume of a cylindrical shell?
(b) Explain how to use cylindrical shells to find the volume of a solid of revolution.
(c) Why might you want to use the shell method instead of the disk or washer method?

**5.** Suppose that you push a book across a 6-meter-long table by exerting a force $f(x)$ at each point from $x = 0$ to $x = 6$. What does $\int_0^6 f(x)\,dx$ represent? If $f(x)$ is measured in newtons, what are the units for the integral?

**6.** (a) What is the average value of a function $f$ on an interval $[a, b]$?
(b) What does the Mean Value Theorem for Integrals say? What is its geometric interpretation?

## TRUE-FALSE QUIZ

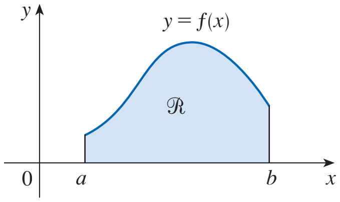
Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

**1.** The area between the curves $y = f(x)$ and $y = g(x)$ for $a \leqslant x \leqslant b$ is $A = \int_a^b [f(x) - g(x)]\,dx$.

**2.** A cube is a solid of revolution.

**3.** If the region bounded by the curves $y = \sqrt{x}$ and $y = x$ is revolved about the $x$-axis, then the volume of the resulting solid is $V = \int_0^1 \pi(\sqrt{x} - x)^2\,dx$.

**4–9** Let $\mathscr{R}$ be the region shown.



**4.** If $\mathscr{R}$ is revolved about the $y$-axis, then the volume of the resulting solid is $V = \int_a^b 2\pi x\, f(x)\,dx$.

**5.** If $\mathscr{R}$ is revolved about the $x$-axis, then the volume of the resulting solid is $V = \int_a^b \pi[f(x)]^2\,dx$.

**6.** If $\mathscr{R}$ is revolved about the $x$-axis, then vertical cross-sections perpendicular to the $x$-axis of the resulting solid are disks.

**7.** If $\mathscr{R}$ is revolved about the $y$-axis, then horizontal cross-sections of the resulting solid are cylindrical shells.

**8.** The volume of the solid obtained by revolving $\mathscr{R}$ about the line $x = -2$ is the same as the volume of the solid obtained by revolving $\mathscr{R}$ about the $y$-axis.

**9.** If $\mathscr{R}$ is the base of a solid $S$ and cross-sections of $S$ perpendicular to the $x$-axis are squares, then the volume of $S$ is $V = \int_a^b [f(x)]^2\,dx$.

**10.** A cable hangs vertically from a winch located at the top of a tall building. The work required for the winch to pull up the top half of the cable is half of the work required to pull up the entire cable.

**11.** If $\int_2^5 f(x)\,dx = 12$, then the average value of $f$ on $[2, 5]$ is 4.

## EXERCISES

**1–6** Find the area of the region bounded by the given curves.

**1.** $y = x^2, \quad y = 8x - x^2$

**2.** $y = \sqrt{x}, \quad y = -\sqrt[3]{x}, \quad y = x - 2$

**3.** $y = 1 - 2x^2, \quad y = |x|$

**4.** $x + y = 0, \quad x = y^2 + 3y$

**5.** $y = \sin(\pi x/2), \quad y = x^2 - 2x$

**6.** $y = \sqrt{x}, \quad y = x^2, \quad x = 2$

**7–11** Find the volume of the solid obtained by rotating the region bounded by the given curves about the specified axis.

**7.** $y = 2x,\ y = x^2$; about the $x$-axis

**8.** $x = 1 + y^2,\ y = x - 3$; about the $y$-axis

**9.** $x = 0,\ x = 9 - y^2$; about $x = -1$

**10.** $y = x^2 + 1,\ y = 9 - x^2$; about $y = -1$

**11.** $x^2 - y^2 = a^2,\ x = a + h$ (where $a > 0, h > 0$); about the $y$-axis

**12–14** Set up, but do not evaluate, an integral for the volume of the solid obtained by rotating the region bounded by the given curves about the specified axis.

**12.** $y = \tan x,\ y = x,\ x = \pi/3$; about the $y$-axis

**13.** $y = \cos^2 x,\ |x| \leqslant \pi/2,\ y = \frac{1}{4}$; about $x = \pi/2$

**14.** $y = 1/x,\ y = 0,\ x = 1,\ x = 3$; about $y = -2$

**15–16** The region bounded by the given curves is rotated about the specified axis. Find the volume of the solid using (a) $x$ as the variable of integration and (b) $y$ as the variable of integration.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**15.** $y = x^3$, $y = 3x^2$; about $x = -1$

**16.** $y = \sqrt{x}$, $y = x^2$; about $y = 3$

**17.** Find the volumes of the solids obtained by rotating the region bounded by the curves $y = x$ and $y = x^2$ about the following lines.

(a) The $x$-axis (b) The $y$-axis (c) $y = 2$

**18.** Let $\mathcal{R}$ be the region in the first quadrant bounded by the curves $y = x^3$ and $y = 2x - x^2$. Calculate the following quantities.

(a) The area of $\mathcal{R}$
(b) The volume obtained by rotating $\mathcal{R}$ about the $x$-axis
(c) The volume obtained by rotating $\mathcal{R}$ about the $y$-axis

**19.** Let $\mathcal{R}$ be the region bounded by the curves $y = \tan(x^2)$, $x = 1$, and $y = 0$. Use the Midpoint Rule with $n = 4$ to estimate the following quantities.

(a) The area of $\mathcal{R}$
(b) The volume obtained by rotating $\mathcal{R}$ about the $x$-axis

**20.** Let $\mathcal{R}$ be the region bounded by the curves $y = 1 - x^2$ and $y = x^6 - x + 1$. Estimate the following quantities.

(a) The $x$-coordinates of the points of intersection of the curves
(b) The area of $\mathcal{R}$
(c) The volume generated when $\mathcal{R}$ is rotated about the $x$-axis
(d) The volume generated when $\mathcal{R}$ is rotated about the $y$-axis

**21–24** Each integral represents the volume of a solid. Describe the solid.

**21.** $\displaystyle\int_0^{\pi/2} 2\pi x \cos x\,dx$

**22.** $\displaystyle\int_0^{\pi/2} 2\pi \cos^2 x\,dx$

**23.** $\displaystyle\int_0^{\pi} \pi(2 - \sin x)^2\,dx$

**24.** $\displaystyle\int_0^{4} 2\pi(6 - y)(4y - y^2)\,dy$

**25.** The base of a solid is a circular disk with radius 3. Find the volume of the solid if parallel cross-sections perpendicular to the base are isosceles right triangles with hypotenuse lying along the base.

**26.** The base of a solid is the region bounded by the parabolas $y = x^2$ and $y = 2 - x^2$. Find the volume of the solid if the cross-sections perpendicular to the $x$-axis are squares with one side lying along the base.

**27.** The height of a monument is 20 m. A horizontal cross-section at a distance $x$ meters from the top is an equilateral triangle with side $\frac{1}{4}x$ meters. Find the volume of the monument.

**28.** (a) The base of a solid is a square with vertices located at $(1, 0)$, $(0, 1)$, $(-1, 0)$, and $(0, -1)$. Each cross-section perpendicular to the $x$-axis is a semicircle. Find the volume of the solid.

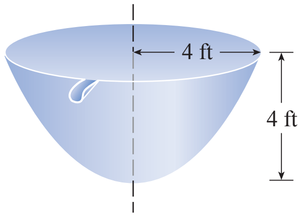
(b) Show that the volume of the solid of part (a) can be computed more simply by first cutting the solid and rearranging it to form a cone.

**29.** A force of 30 N is required to maintain a spring stretched from its natural length of 12 cm to a length of 15 cm. How much work is done in stretching the spring from 12 cm to 20 cm?

**30.** A 1600-lb elevator is suspended by a 200-ft cable that weighs 10 lb/ft. How much work is required to raise the elevator from the basement to the third floor, a distance of 30 ft?

**31.** A tank full of water has the shape of a paraboloid of revolution as shown in the figure; that is, its shape is obtained by rotating a parabola about a vertical axis.

(a) If its height is 4 ft and the radius at the top is 4 ft, find the work required to pump the water out of the tank.
(b) After 4000 ft-lb of work has been done, what is the depth of the water remaining in the tank?



**32.** A steel tank has the shape of a circular cylinder oriented vertically with diameter 4 m and height 5 m. The tank is currently filled to a level of 3 m with cooking oil that has a density of 920 kg/m$^3$. Compute the work required to pump the oil out through a 1-m spout at the top of the tank.

**33.** Find the average value of the function $f(t) = \sec^2 t$ on the interval $[0, \pi/4]$.

**34.** (a) Find the average value of the function $f(x) = 1/\sqrt{x}$ on the interval $[1, 4]$.

(b) Find the value $c$ guaranteed by the Mean Value Theorem for Integrals such that $f_{\text{avg}} = f(c)$.
(c) Sketch the graph of $f$ on $[1, 4]$ and a rectangle with base $[1, 4]$ whose area is the same as the area under the graph of $f$.

**35.** Let $\mathcal{R}_1$ be the region bounded by $y = x^2$, $y = 0$, and $x = b$, where $b > 0$. Let $\mathcal{R}_2$ be the region bounded by $y = x^2$, $x = 0$, and $y = b^2$.

(a) Is there a value of $b$ such that $\mathcal{R}_1$ and $\mathcal{R}_2$ have the same area?
(b) Is there a value of $b$ such that $\mathcal{R}_1$ sweeps out the same volume when rotated about the $x$-axis and the $y$-axis?
(c) Is there a value of $b$ such that $\mathcal{R}_1$ and $\mathcal{R}_2$ sweep out the same volume when rotated about the $x$-axis?
(d) Is there a value of $b$ such that $\mathcal{R}_1$ and $\mathcal{R}_2$ sweep out the same volume when rotated about the $y$-axis?

# Problems Plus

**1.** A solid is generated by rotating about the $x$-axis the region under the curve $y = f(x)$, where $f$ is a positive function and $x \geqslant 0$. The volume generated by the part of the curve from $x = 0$ to $x = b$ is $b^2$ for all $b > 0$. Find the function $f$.

**2.** There is a line through the origin that divides the region bounded by the parabola $y = x - x^2$ and the $x$-axis into two regions with equal area. What is the slope of that line?

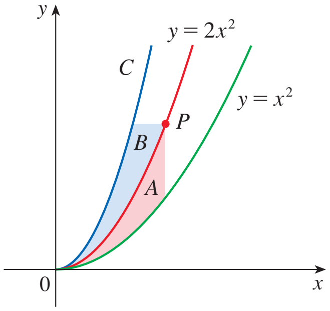

**FIGURE FOR PROBLEM 3**

**3.** The figure shows a curve $C$ with the property that, for every point $P$ on the middle curve $y = 2x^2$, the areas $A$ and $B$ are equal. Find an equation for $C$.

**4.** A cylindrical glass of radius $r$ and height $L$ is filled with water and then tilted until the water remaining in the glass exactly covers its base.

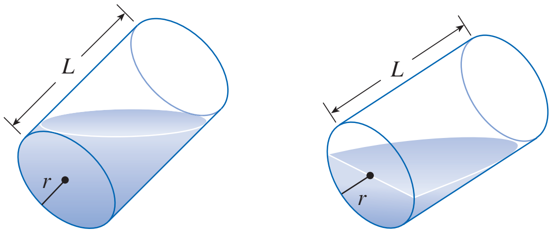
(a) Determine a way to "slice" the water into parallel rectangular cross-sections and then *set up* a definite integral for the volume of the water in the glass.

(b) Determine a way to "slice" the water into parallel cross-sections that are trapezoids and then *set up* a definite integral for the volume of the water.

(c) Find the volume of water in the glass by evaluating one of the integrals in part (a) or part (b).

(d) Find the volume of the water in the glass from purely geometric considerations.

(e) Suppose the glass is tilted until the water exactly covers half the base. In what direction can you "slice" the water into triangular cross-sections? Rectangular cross-sections? Cross-sections that are segments of circles? Find the volume of water in the glass.



**5.** Water in an open bowl evaporates at a rate proportional to the area of the surface of the water. (This means that the rate of decrease of the volume is proportional to the area of the surface.) Show that the depth of the water decreases at a constant rate, regardless of the shape of the bowl.

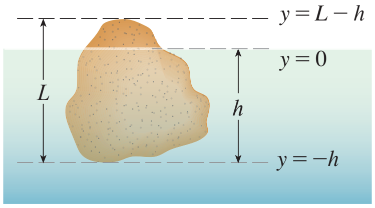


**FIGURE FOR PROBLEM 6**

**6.** Archimedes' Principle states that the buoyant force on an object partially or fully submerged in a fluid is equal to the weight of the fluid that the object displaces. Thus, for an object of density $\rho_0$ floating partly submerged in a fluid of density $\rho_f$, the buoyant force is given by $F = \rho_f g \int_{-h}^{0} A(y)\,dy$, where $g$ is the acceleration due to gravity and $A(y)$ is the area of a typical cross-section of the object (see the figure). The weight of the object is given by

$$W = \rho_0 g \int_{-h}^{L-h} A(y)\,dy$$

(a) Show that the percentage of the volume of the object above the surface of the liquid is

$$100\,\frac{\rho_f - \rho_0}{\rho_f}$$

(b) The density of ice is 917 kg/m$^3$ and the density of seawater is 1030 kg/m$^3$. What percentage of the volume of an iceberg is above water?

(c) An ice cube floats in a glass filled to the brim with water. Does the water overflow when the ice melts?

(d) A sphere of radius 0.4 m and having negligible weight is floating in a large freshwater lake. How much work is required to completely submerge the sphere? The density of the water is 1000 kg/m$^3$.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

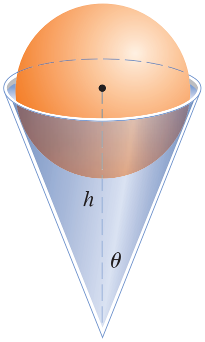

**FIGURE FOR PROBLEM 8**

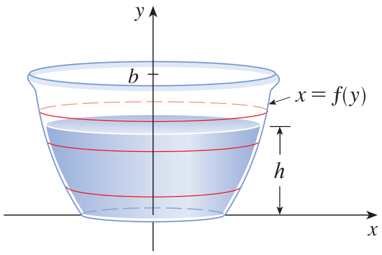

**FIGURE FOR PROBLEM 9**

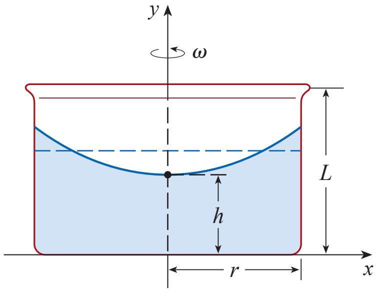

**FIGURE FOR PROBLEM 10**

**7.** A sphere of radius 1 overlaps a smaller sphere of radius $r$ in such a way that their intersection is a circle of radius $r$. (In other words, they intersect in a great circle of the small sphere.) Find $r$ so that the volume inside the small sphere and outside the large sphere is as large as possible.

**8.** A paper drinking cup filled with water has the shape of a cone with height $h$ and semivertical angle $\theta$. (See the figure.) A ball is placed carefully in the cup, thereby displacing some of the water and making it overflow. What is the radius of the ball that causes the greatest volume of water to spill out of the cup?

**9.** A *clepsydra*, or water clock, is a glass container with a small hole in the bottom through which water can flow. The "clock" is calibrated for measuring time by placing markings on the container corresponding to water levels at equally spaced times. Let $x = f(y)$ be continuous on the interval $[0, b]$ and assume that the container is formed by rotating the graph of $f$ about the $y$-axis. Let $V$ denote the volume of water and $h$ the height of the water level at time $t$. (See the figure.)

(a) Determine $V$ as a function of $h$.

(b) Show that

$$\frac{dV}{dt} = \pi[f(h)]^2 \frac{dh}{dt}$$

(c) Suppose that $A$ is the area of the hole in the bottom of the container. It follows from Torricelli's Law that the rate of change of the volume of the water is given by

$$\frac{dV}{dt} = kA\sqrt{h}$$

where $k$ is a negative constant. Determine a formula for the function $f$ such that $dh/dt$ is a constant $C$. What is the advantage in having $dh/dt = C$?

**10.** A cylindrical container of radius $r$ and height $L$ is partially filled with a liquid whose volume is $V$. If the container is rotated about its axis of symmetry with constant angular speed $\omega$, then the container will induce a rotational motion in the liquid around the same axis. Eventually, the liquid will be rotating at the same angular speed as the container. The surface of the liquid will be convex, as indicated in the figure, because the centrifugal force on the liquid particles increases with the distance from the axis of the container. It can be shown that the surface of the liquid is a paraboloid of revolution generated by rotating the parabola

$$y = h + \frac{\omega^2 x^2}{2g}$$

about the $y$-axis, where $g$ is the acceleration due to gravity.

(a) Determine $h$ as a function of $\omega$.

(b) At what angular speed will the surface of the liquid touch the bottom? At what speed will it spill over the top?

(c) Suppose the radius of the container is 2 ft, the height is 7 ft, and the container and liquid are rotating at the same constant angular speed. The surface of the liquid is 5 ft below the top of the tank at the central axis and 4 ft below the top of the tank 1 ft out from the central axis.

  (i) Determine the angular speed of the container and the volume of the fluid.

  (ii) How far below the top of the tank is the liquid at the wall of the container?

**11.** Suppose the graph of a cubic polynomial intersects the parabola $y = x^2$ when $x = 0$, $x = a$, and $x = b$, where $0 < a < b$. If the two regions between the curves have the same area, how is $b$ related to $a$?

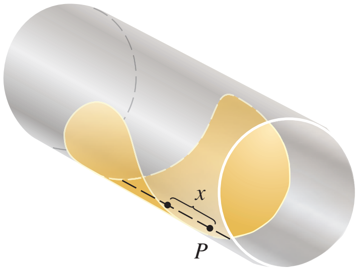
T **12.** Suppose we are planning to make a taco from a round tortilla with diameter 8 inches by bending the tortilla so that it is shaped as if it is partially wrapped around a circular cylinder. We will fill the tortilla to the edge (but no more) with meat, cheese, and other ingredients. Our problem is to decide how to curve the tortilla in order to maximize the volume of food it can hold.

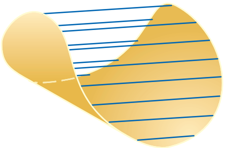
(a) We start by placing a circular cylinder of radius $r$ along a diameter of the tortilla and folding the tortilla around the cylinder. Let $x$ represent the distance from the center of the tortilla to a point $P$ on the diameter (see the figure). Show that the cross-sectional area of the filled taco in the plane through $P$ perpendicular to the axis of the cylinder is

$$A(x) = r\sqrt{16 - x^2} - \tfrac{1}{2}r^2 \sin\left(\frac{2}{r}\sqrt{16 - x^2}\right)$$

and write an expression for the volume of the filled taco.

(b) Determine (approximately) the value of $r$ that maximizes the volume of the taco. (Use a graphical approach.)





**13.** If the tangent at a point $P$ on the curve $y = x^3$ intersects the curve again at $Q$, let $A$ be the area of the region bounded by the curve and the line segment $PQ$. Let $B$ be the area of the region defined in the same way starting with $Q$ instead of $P$. What is the relationship between $A$ and $B$?

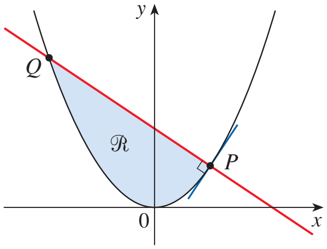


**FIGURE FOR PROBLEM 14**

**14.** Let $P(a, a^2)$, $a > 0$, be any point on the part of the parabola $y = x^2$ in the first quadrant, and let $\mathcal{R}$ be the region bounded by the parabola and the normal line through $P$. (See the figure.) Show that the area of $\mathcal{R}$ is smallest when $a = \frac{1}{2}$. (See also Problem 9 in Problems Plus following Chapter 3.)

# Inverse Functions

## Exponential, Logarithmic, and Inverse Trigonometric Functions

**THE COMMON THEME THAT LINKS** the functions of this chapter is that they occur as pairs of inverse functions. In particular, two of the most important functions that occur in mathematics and its applications are the exponential function $f(x) = b^x$ and its inverse function, the logarithmic function $g(x) = \log_b x$. In this chapter we investigate their properties, compute their derivatives, and use them to describe exponential growth and decay in biology, physics, chemistry, and other sciences. We also study the inverses of trigonometric and hyperbolic functions. Finally, we look at a method (l'Hospital's Rule) for computing difficult limits and apply it to sketching curves.

There are two possible ways of defining the exponential and logarithmic functions and developing their properties and derivatives. One is to start with the exponential function (defined as in algebra or precalculus courses) and then define the logarithm as its inverse. That is the approach taken in Sections 6.2, 6.3, and 6.4 and is probably the most intuitive method. The other way is to start by defining the logarithm as an integral and then define the exponential function as its inverse. This approach is followed in Sections 6.2*, 6.3*, and 6.4* and, although it is less intuitive, many instructors prefer it because it is more rigorous and the properties follow more easily. You need to read only one of these two approaches (whichever your instructor recommends).

# 6.1 Inverse Functions and Their Derivatives

## Inverse Functions

Table 1 gives data from an experiment in which a biologist started a bacteria culture with 100 bacteria in a limited nutrient medium; the size of the bacteria population was recorded at hourly intervals. The number of bacteria $N$ is a function of the time $t$: $N = f(t)$.

Suppose, however, that the biologist changes her point of view and becomes interested in the time required for the population to reach various levels. In other words, she is thinking of $t$ as a function of $N$. This function is called the *inverse function* of $f$, denoted by $f^{-1}$, and read "$f$ inverse." Here $t = f^{-1}(N)$ is the time required for the population level to reach $N$. The values of $f^{-1}$ can be found by reading Table 1 from right to left or by consulting Table 2. For instance, $f^{-1}(550) = 6$ because $f(6) = 550$.

**Table 1** ***N* as a function of *t***

| $t$ (hours) | $N = f(t)$ = population at time $t$ |
|---|---|
| 0 | 100 |
| 1 | 168 |
| 2 | 259 |
| 3 | 358 |
| 4 | 445 |
| 5 | 509 |
| 6 | 550 |
| 7 | 573 |
| 8 | 586 |

**Table 2** ***t* as a function of *N***

| $N$ | $t = f^{-1}(N)$ = time to reach $N$ bacteria |
|---|---|
| 100 | 0 |
| 168 | 1 |
| 259 | 2 |
| 358 | 3 |
| 445 | 4 |
| 509 | 5 |
| 550 | 6 |
| 573 | 7 |
| 586 | 8 |

Not all functions possess inverses. Let's compare the functions $f$ and $g$ whose arrow diagrams are shown in Figure 1. Note that $f$ never takes on the same value twice (any two inputs in $A$ have different outputs), whereas $g$ does take on the same value twice (both 2 and 3 have the same output, 4). In symbols,

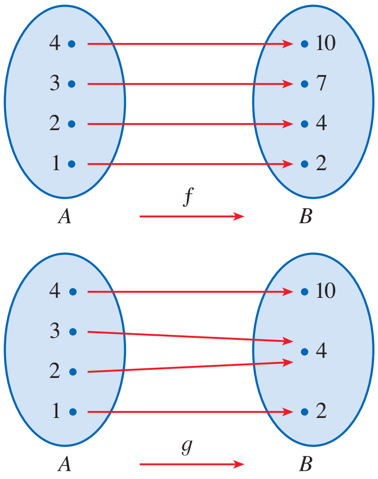

**FIGURE 1**
$f$ is one-to-one; $g$ is not.

$$g(2) = g(3)$$

but $$f(x_1) \neq f(x_2) \qquad \text{whenever } x_1 \neq x_2$$

Functions that share this property with $f$ are called *one-to-one functions*.

In the language of inputs and outputs, Definition 1 says that $f$ is one-to-one if each output corresponds to only one input.

**1 Definitio** A function $f$ is called a **one-to-one function** if it never takes on the same value twice; that is,

$$f(x_1) \neq f(x_2) \qquad \text{whenever } x_1 \neq x_2$$

If a horizontal line intersects the graph of $f$ in more than one point, then we see from Figure 2 that there are numbers $x_1$ and $x_2$ such that $f(x_1) = f(x_2)$. This means that $f$ is not one-to-one. Therefore we have the following geometric method for determining whether a function is one-to-one.

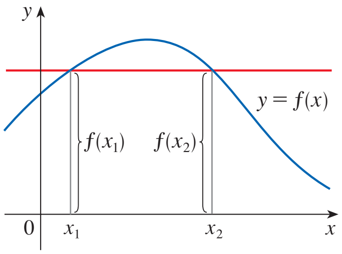

**FIGURE 2**
This function is not one-to-one because $f(x_1) = f(x_2)$.

**Horizontal Line Test** A function is one-to-one if and only if no horizontal line intersects its graph more than once.

**EXAMPLE 1** Is the function $f(x) = x^3$ one-to-one?

**SOLUTION 1** If $x_1 \neq x_2$, then $x_1^3 \neq x_2^3$ (two different numbers can't have the same cube). Therefore, by Definition 1, $f(x) = x^3$ is one-to-one.

**SOLUTION 2** From Figure 3 we see that no horizontal line intersects the graph of $f(x) = x^3$ more than once. Therefore, by the Horizontal Line Test, $f$ is one-to-one. ■

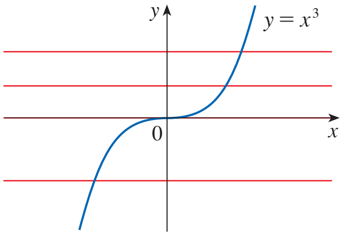

**FIGURE 3**
$f(x) = x^3$ is one-to-one.

**EXAMPLE 2** Is the function $g(x) = x^2$ one-to-one?

**SOLUTION 1** This function is not one-to-one because, for instance,

$$g(1) = 1 = g(-1)$$

and so 1 and $-1$ have the same output.

**SOLUTION 2** From Figure 4 we see that there are horizontal lines that intersect the graph of $g$ more than once. Therefore, by the Horizontal Line Test, $g$ is not one-to-one. ■

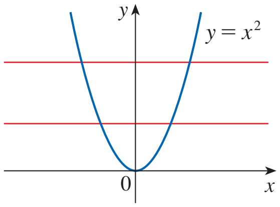

**FIGURE 4**
$g(x) = x^2$ is not one-to-one.

One-to-one functions are important because they are precisely the functions that possess inverse functions according to the following definition.

**2 Definitio** Let $f$ be a one-to-one function with domain $A$ and range $B$. Then its **inverse function** $f^{-1}$ has domain $B$ and range $A$ and is defined by

$$f^{-1}(y) = x \iff f(x) = y$$

for any $y$ in $B$.

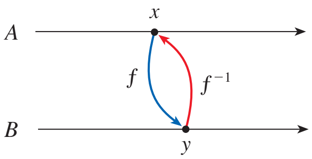

**FIGURE 5**

This definition says that if $f$ maps $x$ into $y$, then $f^{-1}$ maps $y$ back into $x$. (If $f$ were not one-to-one, then $f^{-1}$ would not be uniquely defined.) The arrow diagram in Figure 5 indicates that $f^{-1}$ reverses the effect of $f$. Note that

$$\text{domain of } f^{-1} = \text{range of } f$$

$$\text{range of } f^{-1} = \text{domain of } f$$

For example, the inverse function of $f(x) = x^3$ is $f^{-1}(x) = x^{1/3}$ because if $y = x^3$, then

$$f^{-1}(y) = f^{-1}(x^3) = (x^3)^{1/3} = x$$

**CAUTION** Do not mistake the $-1$ in $f^{-1}$ for an exponent. Thus

$$f^{-1}(x) \quad \text{does } \textit{not} \text{ mean} \quad \frac{1}{f(x)}$$

The reciprocal $1/f(x)$ could be written as $[f(x)]^{-1}$.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 3** If $f$ is a one-to-one function and $f(1) = 5$, $f(3) = 7$, and $f(8) = -10$, find $f^{-1}(7)$, $f^{-1}(5)$, and $f^{-1}(-10)$.

**SOLUTION** From the definition of $f^{-1}$ we have

$$\begin{aligned} f^{-1}(7) &= 3 &\quad\text{because}\quad& f(3) = 7 \\ f^{-1}(5) &= 1 &\quad\text{because}\quad& f(1) = 5 \\ f^{-1}(-10) &= 8 &\quad\text{because}\quad& f(8) = -10 \end{aligned}$$

The diagram in Figure 6 makes it clear how $f^{-1}$ reverses the effect of $f$ in this case. ■

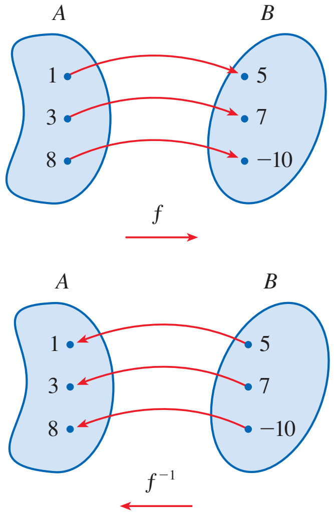

**FIGURE 6**
The inverse function reverses inputs and outputs.

The letter $x$ is traditionally used as the independent variable, so when we concentrate on $f^{-1}$ rather than on $f$, we usually reverse the roles of $x$ and $y$ in Definition 2 and write

**3**
$$\boxed{f^{-1}(x) = y \iff f(y) = x}$$

By substituting for $y$ in Definition 2 and substituting for $x$ in (3), we get the following **cancellation equations**:

**4**
$$\boxed{\begin{aligned} f^{-1}(f(x)) &= x \quad \text{for every } x \text{ in } A \\ f(f^{-1}(x)) &= x \quad \text{for every } x \text{ in } B \end{aligned}}$$

The first cancellation equation says that if we start with $x$, apply $f$, and then apply $f^{-1}$, we arrive back at $x$, where we started (see the machine diagram in Figure 7). Thus $f^{-1}$ undoes what $f$ does. The second equation says that $f$ undoes what $f^{-1}$ does.

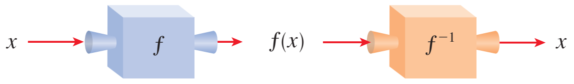

**FIGURE 7**

For example, if $f(x) = x^3$, then $f^{-1}(x) = x^{1/3}$ and so the cancellation equations become

$$f^{-1}(f(x)) = (x^3)^{1/3} = x$$

$$f(f^{-1}(x)) = (x^{1/3})^3 = x$$

These equations simply say that the cube function and the cube root function cancel each other when applied in succession.

Now let's see how to compute inverse functions. If we have a function $y = f(x)$ and are able to solve this equation for $x$ in terms of $y$, then according to Definition 2 we must have $x = f^{-1}(y)$. If we want to call the independent variable $x$, we then interchange $x$ and $y$ and arrive at the equation $y = f^{-1}(x)$.

### 5 How to Find the Inverse Function of a One-to-One Function $f$

**STEP 1** Write $y = f(x)$.

**STEP 2** Solve this equation for $x$ in terms of $y$ (if possible).

**STEP 3** To express $f^{-1}$ as a function of $x$, interchange $x$ and $y$.
The resulting equation is $y = f^{-1}(x)$.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 4** Find the inverse function of $f(x) = x^3 + 2$.

**SOLUTION** According to (5) we first write

$$y = x^3 + 2$$

Then we solve this equation for $x$:

$$x^3 = y - 2$$
$$x = \sqrt[3]{y - 2}$$

Finally, we interchange $x$ and $y$:

$$y = \sqrt[3]{x - 2}$$

Therefore the inverse function is $f^{-1}(x) = \sqrt[3]{x - 2}$. ■

In Example 4, notice how $f^{-1}$ reverses the effect of $f$. The function $f$ is the rule "Cube, then add 2"; $f^{-1}$ is the rule "Subtract 2, then take the cube root."

The principle of interchanging $x$ and $y$ to find the inverse function also gives us the method for obtaining the graph of $f^{-1}$ from the graph of $f$. Since $f(a) = b$ if and only if $f^{-1}(b) = a$, the point $(a, b)$ is on the graph of $f$ if and only if the point $(b, a)$ is on the graph of $f^{-1}$. But we get the point $(b, a)$ from $(a, b)$ by reflecting about the line $y = x$. (See Figure 8.)

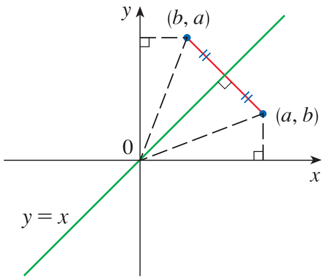

**FIGURE 8**

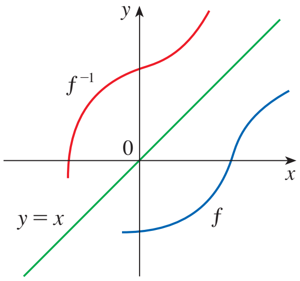

**FIGURE 9**

Therefore, as illustrated by Figure 9:

The graph of $f^{-1}$ is obtained by reflecting the graph of $f$ about the line $y = x$.

**EXAMPLE 5** Sketch the graphs of $f(x) = \sqrt{-1 - x}$ and its inverse function using the same coordinate axes.

**SOLUTION** First we sketch the curve $y = \sqrt{-1 - x}$ (the top half of the parabola $y^2 = -1 - x$, or $x = -y^2 - 1$) and then we reflect about the line $y = x$ to get the graph of $f^{-1}$. (See Figure 10.) As a check on our graph, notice that the expression for $f^{-1}$ is $f^{-1}(x) = -x^2 - 1$, $x \geqslant 0$. So the graph of $f^{-1}$ is the right half of the parabola $y = -x^2 - 1$ and this seems reasonable from Figure 10. ■

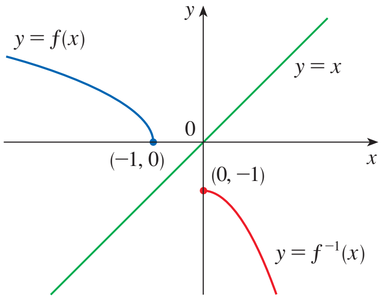

**FIGURE 10**

## ■ Derivatives of Inverse Functions

Now let's look at inverse functions from the point of view of calculus. Suppose that $f$ is both one-to-one and continuous. We think of a continuous function as one whose graph has no break in it. (It consists of just one piece.) Since the graph of $f^{-1}$ is obtained from the graph of $f$ by reflecting about the line $y = x$, the graph of $f^{-1}$ has no break in it either (see Figure 9). Thus we might expect that $f^{-1}$ is also a continuous function.

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

This geometric argument does not prove the following theorem but at least it makes the theorem plausible. A proof can be found in Appendix F.

**6 Theorem** If $f$ is a one-to-one continuous function defined on an interval, then its inverse function $f^{-1}$ is also continuous.

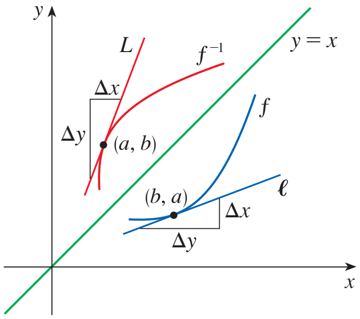

**FIGURE 11**

Now suppose that $f$ is a one-to-one differentiable function. Geometrically we can think of a differentiable function as one whose graph has no corner or cusp. We obtain the graph of $f^{-1}$ by reflecting the graph of $f$ about the line $y = x$, so the graph of $f^{-1}$ has no corner or cusp either. We therefore expect that $f^{-1}$ is also differentiable (except where its tangents are vertical). In fact, we can predict the value of the derivative of $f^{-1}$ at a given point by a geometric argument. In Figure 11 the graphs of $f$ and its inverse $f^{-1}$ are shown. If $f(b) = a$, then $f^{-1}(a) = b$ and $(f^{-1})'(a)$ is the slope of the tangent line $L$ to the graph of $f^{-1}$ at $(a, b)$, which is $\Delta y/\Delta x$. Reflecting in the line $y = x$ has the effect of interchanging the $x$- and $y$-coordinates. So the slope of the reflected line $\ell$ [the tangent to the graph of $f$ at $(b, a)$] is $\Delta x/\Delta y$. Thus the slope of $L$ is the reciprocal of the slope of $\ell$, that is,

$$(f^{-1})'(a) = \frac{\Delta y}{\Delta x} = \frac{1}{\Delta x/\Delta y} = \frac{1}{f'(b)}$$

**7 Theorem** If $f$ is a one-to-one differentiable function with inverse function $f^{-1}$ and $f'(f^{-1}(a)) \neq 0$, then the inverse function is differentiable at $a$ and

$$(f^{-1})'(a) = \frac{1}{f'(f^{-1}(a))}$$

**PROOF** Write the definition of derivative as in Equation 2.1.5:

$$(f^{-1})'(a) = \lim_{x \to a} \frac{f^{-1}(x) - f^{-1}(a)}{x - a}$$

If $f(b) = a$, then $f^{-1}(a) = b$. And if we let $y = f^{-1}(x)$, then $f(y) = x$. Since $f$ is differentiable, it is continuous, so $f^{-1}$ is continuous by Theorem 6. Thus if $x \to a$, then $f^{-1}(x) \to f^{-1}(a)$, that is, $y \to b$. Therefore

Note that $x \neq a \Rightarrow f(y) \neq f(b)$ because $f$ is one-to-one.

$$\begin{aligned}(f^{-1})'(a) &= \lim_{x \to a} \frac{f^{-1}(x) - f^{-1}(a)}{x - a} = \lim_{y \to b} \frac{y - b}{f(y) - f(b)} \\ &= \lim_{y \to b} \frac{1}{\dfrac{f(y) - f(b)}{y - b}} \\ &= \frac{1}{\displaystyle\lim_{y \to b} \frac{f(y) - f(b)}{y - b}} \\ &= \frac{1}{f'(b)} = \frac{1}{f'(f^{-1}(a))}\end{aligned}$$

**NOTE 1** Replacing $a$ by the general number $x$ in the formula of Theorem 7, we get

$$\boxed{8} \qquad (f^{-1})'(x) = \frac{1}{f'(f^{-1}(x))}$$

If we write $y = f^{-1}(x)$, then $f(y) = x$, so Equation 8, when expressed in Leibniz notation, becomes

$$\frac{dy}{dx} = \frac{1}{\dfrac{dx}{dy}}$$

**NOTE 2** If it is known in advance that $f^{-1}$ is differentiable, then its derivative can be computed more easily than in the proof of Theorem 7 by using implicit differentiation. If $y = f^{-1}(x)$, then $f(y) = x$. Differentiating the equation $f(y) = x$ implicitly with respect to $x$, remembering that $y$ is a function of $x$, and using the Chain Rule, we get

$$f'(y)\frac{dy}{dx} = 1$$

Therefore

$$\frac{dy}{dx} = \frac{1}{f'(y)} = \frac{1}{\dfrac{dx}{dy}}$$

**EXAMPLE 6** Although the function $y = x^2$, $x \in \mathbb{R}$, is not one-to-one and therefore does not have an inverse function, we can turn it into a one-to-one function by restricting its domain. For instance, the function $f(x) = x^2$, $0 \leqslant x \leqslant 2$, is one-to-one (by the Horizontal Line Test) and has domain $[0, 2]$ and range $[0, 4]$. (See Figure 12.) Thus $f$ has an inverse function $f^{-1}$ with domain $[0, 4]$ and range $[0, 2]$.

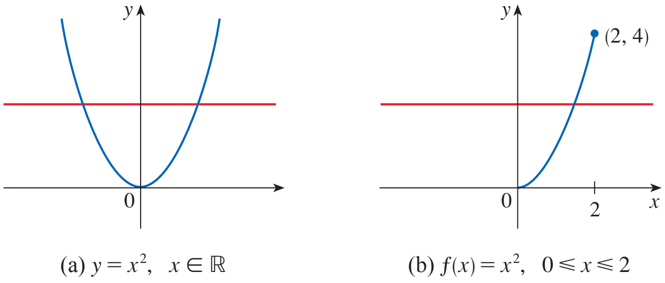

**FIGURE 12**

(a) $y = x^2$, $x \in \mathbb{R}$ (b) $f(x) = x^2$, $0 \leqslant x \leqslant 2$

Without computing a formula for $(f^{-1})'$ we can still calculate $(f^{-1})'(1)$. Since $f(1) = 1$, we have $f^{-1}(1) = 1$. Also $f'(x) = 2x$. So by Theorem 7 we have

$$(f^{-1})'(1) = \frac{1}{f'(f^{-1}(1))} = \frac{1}{f'(1)} = \frac{1}{2}$$

In this case it is easy to find $f^{-1}$ explicitly. In fact, $f^{-1}(x) = \sqrt{x}$, $0 \leqslant x \leqslant 4$. [In general, we could use the method given by (5).] Then $(f^{-1})'(x) = 1/(2\sqrt{x})$, so $(f^{-1})'(1) = \frac{1}{2}$, which agrees with the preceding computation. The functions $f$ and $f^{-1}$ are graphed in Figure 13. ■

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 7** If $f(x) = 2x + \cos x$, find $(f^{-1})'(1)$.

**SOLUTION** Notice that $f$ is one-to-one because

$$f'(x) = 2 - \sin x > 0$$

and so $f$ is increasing. To use Theorem 7 we need to know $f^{-1}(1)$ and we can find it by inspection:

$$f(0) = 1 \quad \Rightarrow \quad f^{-1}(1) = 0$$

Therefore $$(f^{-1})'(1) = \frac{1}{f'(f^{-1}(1))} = \frac{1}{f'(0)} = \frac{1}{2 - \sin 0} = \frac{1}{2}$$ ■

## 6.1 Exercises

**1.** (a) What is a one-to-one function?
(b) How can you tell from the graph of a function whether it is one-to-one?

**2.** (a) Suppose $f$ is a one-to-one function with domain $A$ and range $B$. How is the inverse function $f^{-1}$ defined? What is the domain of $f^{-1}$? What is the range of $f^{-1}$?
(b) If you are given a formula for $f$, how do you find a formula for $f^{-1}$?
(c) If you are given the graph of $f$, how do you find the graph of $f^{-1}$?

**3–16** A function is given by a table of values, a graph, a formula, or a verbal description. Determine whether it is one-to-one.

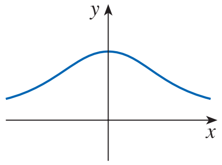
**3.**

| $x$ | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|
| $f(x)$ | 1.5 | 2.0 | 3.6 | 5.3 | 2.8 | 2.0 |

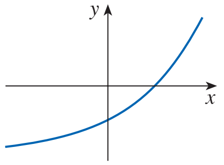
**4.**

| $x$ | 1 | 2 | 3 | 4 | 5 | 6 |
|---|---|---|---|---|---|---|
| $f(x)$ | 1.0 | 1.9 | 2.8 | 3.5 | 3.1 | 2.9 |

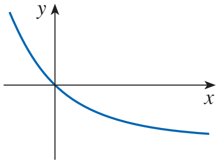
**5.**



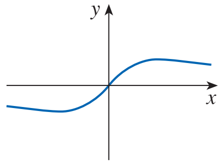
**6.**



**7.**



**8.**



**9.** $f(x) = 2x - 3$

**10.** $f(x) = x^4 - 16$

**11.** $r(t) = t^3 + 4$

**12.** $g(x) = \sqrt[3]{x}$

**13.** $g(x) = 1 - \sin x$

**14.** $f(x) = x^4 - 1, \quad 0 \leqslant x \leqslant 10$

**15.** $f(t)$ is the height of a football $t$ seconds after kickoff.

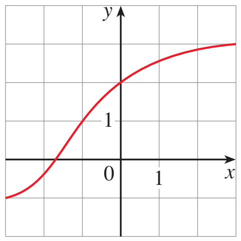
**16.** $f(t)$ is your height at age $t$.

**17.** Assume that $f$ is a one-to-one function.
(a) If $f(6) = 17$, what is $f^{-1}(17)$?
(b) If $f^{-1}(3) = 2$, what is $f(2)$?

**18.** If $f(x) = x^5 + x^3 + x$, find $f^{-1}(3)$ and $f(f^{-1}(2))$.

**19.** If $h(x) = x + \sqrt{x}$, find $h^{-1}(6)$.

**20.** The graph of $f$ is given.
(a) Why is $f$ one-to-one?
(b) What are the domain and range of $f^{-1}$?
(c) What is the value of $f^{-1}(2)$?
(d) Estimate the value of $f^{-1}(0)$.



**21.** The formula $C = \frac{5}{9}(F - 32)$, where $F \geqslant -459.67$, expresses the Celsius temperature $C$ as a function of the Fahrenheit temperature $F$. Find a formula for the inverse function and interpret it. What is the domain of the inverse function?

**22.** In the theory of relativity, the mass of a particle with speed $v$ is

$$m = f(v) = \frac{m_0}{\sqrt{1 - v^2/c^2}}$$

where $m_0$ is the rest mass of the particle and $c$ is the speed of light in a vacuum. Find the inverse function of $f$ and explain its meaning.

**23–30** Find a formula for the inverse of the function.

**23.** $f(x) = 5 - 4x$

**24.** $h(x) = \dfrac{6 - 3x}{5x + 7}$

**25.** $f(x) = 1 - x^2, \quad x \geqslant 0$

**26.** $g(x) = x^2 - 2x, \quad x \geqslant 1$

**27.** $g(x) = 2 + \sqrt{x + 1}$

**28.** $f(x) = 1 + \sqrt{2 + 3x}$

**29.** $y = \left(2 + \sqrt[3]{x}\right)^5$

**30.** $y = \dfrac{1 - \sqrt{x}}{1 + \sqrt{x}}$

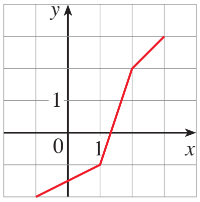
**31–32** Find an explicit formula for $f^{-1}$ and use it to graph $f^{-1}$, $f$, and the line $y = x$ on the same screen. To check your work, see whether the graphs of $f$ and $f^{-1}$ are reflections about the line.

**31.** $f(x) = \sqrt{4x + 3}$

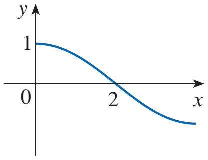
**32.** $f(x) = 2 - x^4, \ x \geqslant 0$

**33–34** Use the given graph of $f$ to sketch the graph of $f^{-1}$.

**33.**



**34.**



**35.** Let $f(x) = \sqrt{1 - x^2}, \ 0 \leqslant x \leqslant 1$.
(a) Find $f^{-1}$. How is it related to $f$?
(b) Identify the graph of $f$ and explain your answer to part (a).

**36.** Let $g(x) = \sqrt[3]{1 - x^3}$.
(a) Find $g^{-1}$. How is it related to $g$?
(b) Graph $g$. How do you explain your answer to part (a)?

**37–40**
(a) Show that $f$ is one-to-one.
(b) Use Theorem 7 to find $(f^{-1})'(a)$.
(c) Calculate $f^{-1}(x)$ and state the domain and range of $f^{-1}$.
(d) Calculate $(f^{-1})'(a)$ from the formula in part (c) and check that it agrees with the result of part (b).
(e) Sketch the graphs of $f$ and $f^{-1}$ on the same axes.

**37.** $f(x) = x^3, \quad a = 8$

**38.** $f(x) = \sqrt{x - 2}, \quad a = 2$

**39.** $f(x) = 9 - x^2, \quad 0 \leqslant x \leqslant 3, \quad a = 8$

**40.** $f(x) = 1/(x - 1), \quad x > 1, \quad a = 2$

**41–44** Find $(f^{-1})'(a)$.

**41.** $f(x) = 3x^3 + 4x^2 + 6x + 5, \quad a = 5$

**42.** $f(x) = x^3 + 3 \sin x + 2 \cos x, \quad a = 2$

**43.** $f(x) = 3 + x^2 + \tan(\pi x/2), \quad -1 < x < 1, \quad a = 3$

**44.** $f(x) = \sqrt{x^3 + 4x + 4}, \quad a = 3$

**45.** Suppose $f^{-1}$ is the inverse function of a differentiable function $f$ and $f(4) = 5$, $f'(4) = \frac{2}{3}$. Find $(f^{-1})'(5)$.

**46.** If $g$ is an increasing function such that $g(2) = 8$ and $g'(2) = 5$, calculate $(g^{-1})'(8)$.

**47.** If $f(x) = \int_3^x \sqrt{1 + t^3}\, dt$, find $(f^{-1})'(0)$.

**48.** Suppose $f^{-1}$ is the inverse function of a differentiable function $f$ and let $G(x) = 1/f^{-1}(x)$. If $f(3) = 2$ and $f'(3) = \frac{1}{9}$, find $G'(2)$.

T **49.** Graph the function $f(x) = \sqrt{x^3 + x^2 + x + 1}$ and explain why it is one-to-one. Then use a computer algebra system to find an explicit expression for $f^{-1}(x)$. (Your CAS will produce three possible expressions. Explain why two of them are irrelevant in this context.)

**50.** Show that $h(x) = \sin x$, $x \in \mathbb{R}$, is not one-to-one, but its restriction $f(x) = \sin x$, $-\pi/2 \leqslant x \leqslant \pi/2$, is one-to-one. Compute the derivative of $f^{-1} = \sin^{-1}$ by the method of Note 2.

**51.** (a) If we shift a curve to the left, what happens to its reflection about the line $y = x$? In view of this geometric principle, find an expression for the inverse of $g(x) = f(x + c)$, where $f$ is a one-to-one function.
(b) Find an expression for the inverse of $h(x) = f(cx)$, where $c \neq 0$.

**52.** (a) If $f$ is a one-to-one, twice differentiable function with inverse function $g$, show that

$$g''(x) = -\frac{f''(g(x))}{[f'(g(x))]^3}$$

(b) Deduce that if $f$ is increasing and concave upward, then its inverse function is concave downward.

# 6.2 Exponential Functions and Their Derivatives

The function $f(x) = 2^x$ is called an *exponential function* because the variable, $x$, is the exponent. It should not be confused with the power function $g(x) = x^2$, in which the variable is the base.

## Exponential Functions and Their Properties

In general, an **exponential function** is a function of the form

$$f(x) = b^x$$

where $b$ is a positive constant. Let's recall what this means.

If your instructor has assigned Sections 6.2*, 6.3*, and 6.4*, you don't need to read Sections 6.2–6.4.

If $x = n$, a positive integer, then

$$b^n = \underbrace{b \cdot b \cdot \cdots \cdot b}_{n \text{ factors}}$$

If $x = 0$, then $b^0 = 1$, and if $x = -n$, where $n$ is a positive integer, then

$$b^{-n} = \frac{1}{b^n}$$

If $x$ is a rational number, $x = p/q$, where $p$ and $q$ are integers and $q > 0$, then

$$b^x = b^{p/q} = \sqrt[q]{b^p} = \left(\sqrt[q]{b}\right)^p$$

But what is the meaning of $b^x$ if $x$ is an irrational number? For instance, what is meant by $2^{\sqrt{3}}$ or $5^{\pi}$?

To help us answer this question we first look at the graph of the function $y = 2^x$, where $x$ is rational. A representation of this graph is shown in Figure 1. We want to enlarge the domain of $y = 2^x$ to include both rational and irrational numbers.

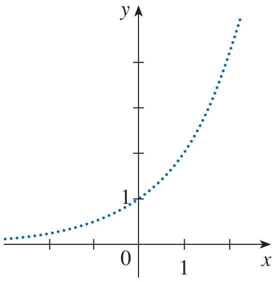

**FIGURE 1**
Representation of $y = 2^x$, $x$ rational

There are holes in the graph in Figure 1 corresponding to irrational values of $x$. We want to fill in the holes by defining $f(x) = 2^x$, where $x \in \mathbb{R}$, so that $f$ is an increasing function. In particular, since the irrational number $\sqrt{3}$ satisfies

$$1.7 < \sqrt{3} < 1.8$$

we must have

$$2^{1.7} < 2^{\sqrt{3}} < 2^{1.8}$$

and we know what $2^{1.7}$ and $2^{1.8}$ mean because 1.7 and 1.8 are rational numbers. Similarly, if we use better approximations for $\sqrt{3}$, we obtain better approximations for $2^{\sqrt{3}}$:

$$\begin{array}{rcl}
1.73 < \sqrt{3} < 1.74 & \Rightarrow & 2^{1.73} < 2^{\sqrt{3}} < 2^{1.74} \\
1.732 < \sqrt{3} < 1.733 & \Rightarrow & 2^{1.732} < 2^{\sqrt{3}} < 2^{1.733} \\
1.7320 < \sqrt{3} < 1.7321 & \Rightarrow & 2^{1.7320} < 2^{\sqrt{3}} < 2^{1.7321} \\
1.73205 < \sqrt{3} < 1.73206 & \Rightarrow & 2^{1.73205} < 2^{\sqrt{3}} < 2^{1.73206} \\
\vdots \qquad \vdots & & \vdots \qquad \vdots
\end{array}$$

A proof of this fact is given in J. Marsden and A. Weinstein, *Calculus Unlimited* (Menlo Park, CA: Benjamin/Cummings, 1981).

It can be shown that there is exactly one number that is greater than all of the numbers

$$2^{1.7}, \quad 2^{1.73}, \quad 2^{1.732}, \quad 2^{1.7320}, \quad 2^{1.73205}, \quad \ldots$$

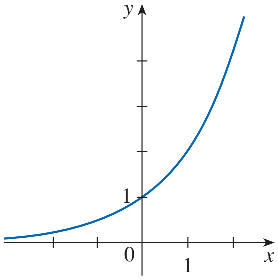

**FIGURE 2**
$y = 2^x$, $x$ real

and less than all of the numbers

$$2^{1.8}, \quad 2^{1.74}, \quad 2^{1.733}, \quad 2^{1.7321}, \quad 2^{1.73206}, \quad \ldots$$

We define $2^{\sqrt{3}}$ to be this number. Using the preceding approximation process we can compute it correct to six decimal places:

$$2^{\sqrt{3}} \approx 3.321997$$

Similarly, we can define $2^x$ (or $b^x$, if $b > 0$) where $x$ is any irrational number. Figure 2 shows how all the holes in Figure 1 have been filled to complete the graph of the function $f(x) = 2^x$, $x \in \mathbb{R}$.

In general, if $b$ is any positive number, we define

**1**
$$\boxed{b^x = \lim_{r \to x} b^r \qquad r \text{ rational}}$$

This definition makes sense because any irrational number can be approximated as closely as we like by a rational number. For instance, because $\sqrt{3}$ has the decimal representation $\sqrt{3} = 1.7320508\ldots$, Definition 1 says that $2^{\sqrt{3}}$ is the limit of the sequence of numbers

$$2^{1.7}, \quad 2^{1.73}, \quad 2^{1.732}, \quad 2^{1.7320}, \quad 2^{1.73205}, \quad 2^{1.732050}, \quad 2^{1.7320508}, \quad \ldots$$

Similarly, $5^{\pi}$ is the limit of the sequence of numbers

$$5^{3.1}, \quad 5^{3.14}, \quad 5^{3.141}, \quad 5^{3.1415}, \quad 5^{3.14159}, \quad 5^{3.141592}, \quad 5^{3.1415926}, \quad \ldots$$

It can be shown that Definition 1 uniquely specifies $b^x$ and makes the function $f(x) = b^x$ continuous.

The graphs of members of the family of functions $y = b^x$ are shown in Figure 3 for various values of the base $b$. Notice that all of these graphs pass through the same point $(0, 1)$ because $b^0 = 1$ for $b \neq 0$. Notice also that as the base $b$ gets larger, the exponential function grows more rapidly (for $x > 0$).

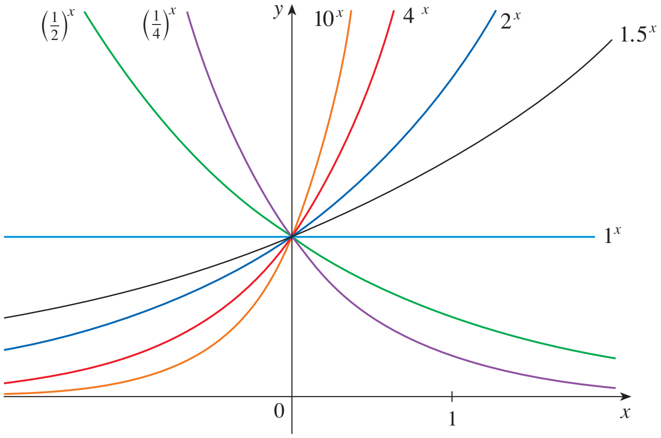

**FIGURE 3**
Members of the family of exponential functions

You can see from Figure 3 that there are basically three kinds of exponential functions $y = b^x$. If $0 < b < 1$, the exponential function decreases; if $b = 1$, it is a constant; and

if $b > 1$, it increases. These three cases are illustrated in Figure 4. Observe that if $b \neq 1$, then the exponential function $y = b^x$ has domain $\mathbb{R}$ and range $(0, \infty)$. Notice also that, since $(1/b)^x = 1/b^x = b^{-x}$, the graph of $y = (1/b)^x$ is just the reflection of the graph of $y = b^x$ about the $y$-axis.

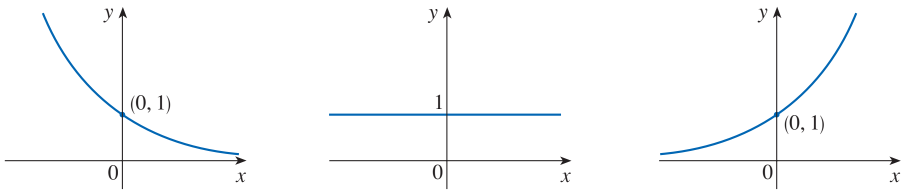

**FIGURE 4**

(a) $y = b^x$, $0 < b < 1$ (b) $y = 1^x$ (c) $y = b^x$, $b > 1$

The properties of the exponential function are summarized in the following theorem.

**2 Theorem** If $b > 0$ and $b \neq 1$, then $f(x) = b^x$ is a continuous function with domain $\mathbb{R}$ and range $(0, \infty)$. In particular, $b^x > 0$ for all $x$. If $0 < b < 1$, $f(x) = b^x$ is a decreasing function; if $b > 1$, $f$ is an increasing function. If $a, b > 0$ and $x, y \in \mathbb{R}$, then

**1.** $b^{x+y} = b^x b^y$ **2.** $b^{x-y} = \dfrac{b^x}{b^y}$ **3.** $(b^x)^y = b^{xy}$ **4.** $(ab)^x = a^x b^x$

**www.StewartCalculus.com**
For review and practice using the Laws of Exponents, click on *Review of Algebra.*

The reason for the importance of the exponential function lies in properties 1–4, which are called the **Laws of Exponents**. If $x$ and $y$ are rational numbers, then these laws are well known from elementary algebra. For arbitrary real numbers $x$ and $y$ these laws can be deduced from the special case where the exponents are rational by using Equation 1.

The following limits can be read from the graphs shown in Figure 4 or proved from the definition of a limit at infinity. (See Exercise 6.3.61.)

**3** If $b > 1$, then $\lim_{x \to \infty} b^x = \infty$ and $\lim_{x \to -\infty} b^x = 0$

If $0 < b < 1$, then $\lim_{x \to \infty} b^x = 0$ and $\lim_{x \to -\infty} b^x = \infty$

In particular, if $b \neq 1$, then the $x$-axis is a horizontal asymptote of the graph of the exponential function $y = b^x$.

### EXAMPLE 1

(a) Find $\lim_{x \to \infty} (2^{-x} - 1)$.
(b) Sketch the graph of the function $y = 2^{-x} - 1$.

### SOLUTION

(a)

$$\begin{aligned} \lim_{x \to \infty} (2^{-x} - 1) &= \lim_{x \to \infty} \left[ \left(\tfrac{1}{2}\right)^x - 1 \right] \\ &= 0 - 1 \qquad \left[\text{by (3) with } b = \tfrac{1}{2} < 1\right] \\ &= -1 \end{aligned}$$

(b) We write $y = \left(\frac{1}{2}\right)^x - 1$ as in part (a). The graph of $y = \left(\frac{1}{2}\right)^x$ is shown in Figure 3,

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

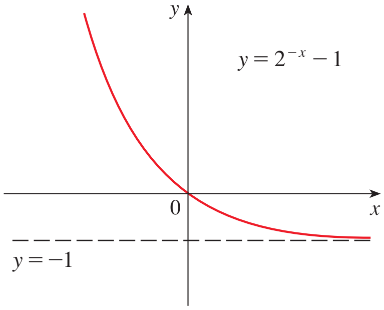

**FIGURE 5**

so we shift it down one unit to obtain the graph of $y = \left(\frac{1}{2}\right)^x - 1$ shown in Figure 5. (For a review of shifting graphs, see Section 1.3.) Part (a) shows that the line $y = -1$ is a horizontal asymptote. ■

**EXAMPLE 2** Use a graphing calculator or computer to compare the exponential function $f(x) = 2^x$ and the power function $g(x) = x^2$. Which function grows more quickly when $x$ is large?

**SOLUTION** Figure 6 shows both functions graphed in the viewing rectangle $[-2, 6]$ by $[0, 40]$. We see that the graphs intersect three times, but for $x > 4$ the graph of $f(x) = 2^x$ stays above the graph of $g(x) = x^2$. Figure 7 gives a more global view and shows that for large values of $x$, the exponential function $f(x) = 2^x$ grows far more rapidly than the power function $g(x) = x^2$.

Example 2 shows that $y = 2^x$ increases more quickly than $y = x^2$. To demonstrate just how quickly $f(x) = 2^x$ increases, let's perform the following thought experiment. Suppose we start with a piece of paper a thousandth of an inch thick and we fold it in half 50 times. Each time we fold the paper in half, the thickness of the paper doubles, so the thickness of the resulting paper would be $2^{50}/1000$ inches. How thick do you think that is? It works out to be more than 17 million miles!

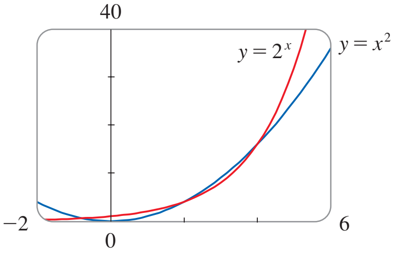

**FIGURE 6**

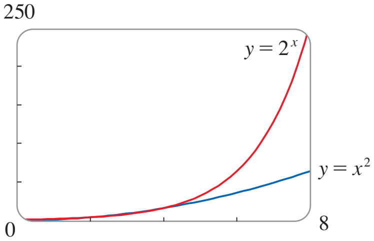

**FIGURE 7** ■

## ■ Applications of Exponential Functions

The exponential function occurs very frequently in mathematical models of nature and society. Here we indicate briefly how it arises in the description of increasing population or decreasing viral loads. In Section 6.5 we will pursue these and other applications in greater detail.

In Section 2.7 we considered a bacteria population that doubles every hour and saw that if the initial population is $n_0$, then the population after $t$ hours is given by the function $f(t) = n_0 2^t$. This population function is a constant multiple of the exponential function $y = 2^t$, so it exhibits the rapid growth that we observed in Figures 2 and 7. Under ideal conditions (unlimited space and nutrition and absence of disease) this exponential growth is typical of what actually occurs in nature. We look at the human population in the next example.

**Table 1 World Population**

| $t$ (years since 1900) | Population $P$ (millions) |
|---|---|
| 0 | 1650 |
| 10 | 1750 |
| 20 | 1860 |
| 30 | 2070 |
| 40 | 2300 |
| 50 | 2560 |
| 60 | 3040 |
| 70 | 3710 |
| 80 | 4450 |
| 90 | 5280 |
| 100 | 6080 |
| 110 | 6870 |

**EXAMPLE 3** Table 1 shows data for the population of the world in the 20th century and Figure 8 (on page 424) shows the corresponding scatter plot.

The pattern of the data points in Figure 8 suggests exponential growth, so we use a graphing calculator (or computer) with exponential regression capability to apply the method of least squares and obtain the exponential model

$$P(t) = (1.43653 \times 10^9) \cdot (1.01395)^t$$

where $t = 0$ corresponds to 1900. Figure 9 (on page 424) shows the graph of this exponential function together with the original data points. We see that the exponential

curve fits the data reasonably well. The period of relatively slow population growth is explained by the two world wars and the Great Depression of the 1930s.

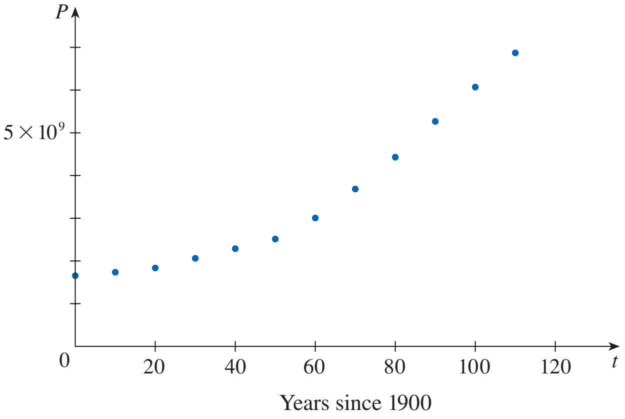

**FIGURE 8** Scatter plot for world population growth

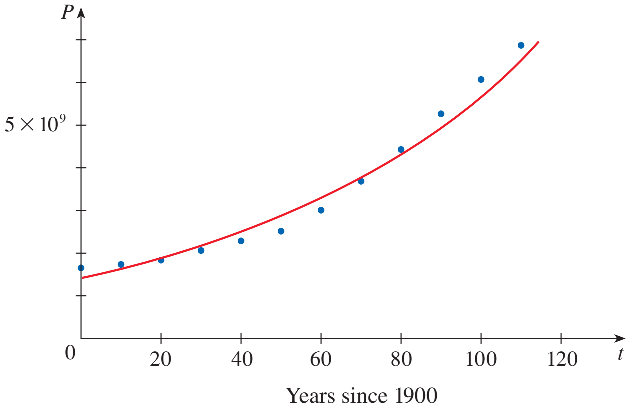

**FIGURE 9** Exponential model for world population growth ■

**Table 2**

| $t$ (days) | $V(t)$ |
|---|---|
| 1 | 76.0 |
| 4 | 53.0 |
| 8 | 18.0 |
| 11 | 9.4 |
| 15 | 5.2 |
| 22 | 3.6 |

**EXAMPLE 4** In 1995 a research article was published that detailed the effect of the protease inhibitor ABT-538 on the human immunodeficiency virus HIV-1.[1] Table 2 shows values of the plasma viral load $V(t)$ of patient 303, measured in RNA copies per mL, $t$ days after ABT-538 treatment was begun. The corresponding scatter plot is shown in Figure 10.

The rather dramatic decline of the viral load that we see in Figure 10 reminds us of the graphs of the exponential function $y = b^x$ in Figures 3 and 4(a) for the case where the base $b$ is less than 1. So let's model the function $V(t)$ by an exponential function. Using a graphing calculator or computer to fit the data in Table 2 with an exponential function of the form $y = a \cdot b^t$, we obtain the model

$$V = 96.39785 \cdot (0.818656)^t$$

In Figure 11 we graph this exponential function with the data points and observe that the model represents the viral load reasonably well for the first month of treatment.

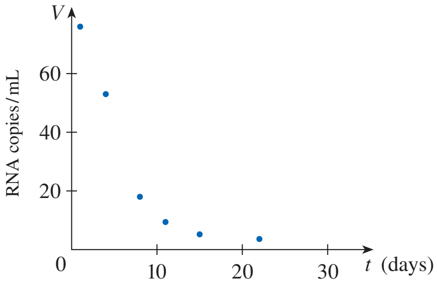

**FIGURE 10**
Plasma viral load in patient 303

## Derivatives and Integrals of Exponential Functions

Let's try to compute the derivative of the exponential function $f(x) = b^x$ using the definition of a derivative:

$$\begin{aligned} f'(x) &= \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{b^{x+h} - b^x}{h} \\ &= \lim_{h \to 0} \frac{b^x b^h - b^x}{h} = \lim_{h \to 0} \frac{b^x (b^h - 1)}{h} \end{aligned}$$

The factor $b^x$ doesn't depend on $h$, so we can take it in front of the limit:

$$f'(x) = b^x \lim_{h \to 0} \frac{b^h - 1}{h}$$

Notice that the limit is the value of the derivative of $f$ at 0, that is,

$$\lim_{h \to 0} \frac{b^h - 1}{h} = f'(0)$$

Therefore we have shown that if the exponential function $f(x) = b^x$ is differentiable at 0, then it is differentiable everywhere and

$$\boxed{4} \qquad f'(x) = f'(0)\, b^x$$

This equation says that *the rate of change of any exponential function is proportional to the function itself*. (The slope is proportional to the height.)

| $h$ | $\dfrac{2^h - 1}{h}$ | $\dfrac{3^h - 1}{h}$ |
|---|---|---|
| 0.1 | 0.71773 | 1.16123 |
| 0.01 | 0.69556 | 1.10467 |
| 0.001 | 0.69339 | 1.09922 |
| 0.0001 | 0.69317 | 1.09867 |
| 0.00001 | 0.69315 | 1.09862 |

Numerical evidence for the existence of $f'(0)$ is given in the table at the left for the cases $b = 2$ and $b = 3$. (Values are stated correct to five decimal places.) It appears that the limits exist and

$$\text{for } b = 2, \quad f'(0) = \lim_{h \to 0} \frac{2^h - 1}{h} \approx 0.693$$

$$\text{for } b = 3, \quad f'(0) = \lim_{h \to 0} \frac{3^h - 1}{h} \approx 1.099$$

In fact, it can be proved that these limits exist and, correct to six decimal places, the values are

$$\boxed{5} \qquad \frac{d}{dx}(2^x)\bigg|_{x=0} \approx 0.693147 \qquad \frac{d}{dx}(3^x)\bigg|_{x=0} \approx 1.098612$$

Thus, from Equation 4 we have

$$\boxed{6} \qquad \frac{d}{dx}(2^x) \approx (0.693)2^x \qquad \frac{d}{dx}(3^x) \approx (1.099)3^x$$

Of all possible choices for the base $b$ in Equation 4, the simplest differentiation formula occurs when $f'(0) = 1$. In view of the estimates of $f'(0)$ for $b = 2$ and $b = 3$, it seems reasonable that there is a number $b$ between 2 and 3 for which $f'(0) = 1$. It is traditional to denote this value by the letter $e$. Thus we have the following definition.

**7 Definition of the Number *e***

$$e \text{ is the number such that } \quad \lim_{h \to 0} \frac{e^h - 1}{h} = 1$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Geometrically, this means that of all possible exponential functions $y = b^x$, the function $f(x) = e^x$ is the one whose tangent line at (0, 1) has a slope $f'(0)$ that is exactly 1. (See Figures 12 and 13.) We call the function $f(x) = e^x$ the **natural exponential function**.

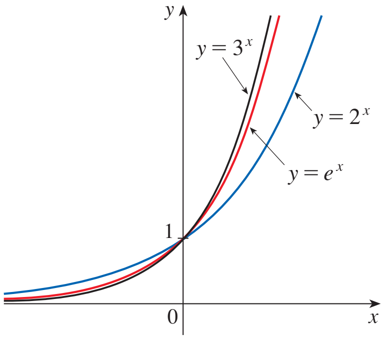

**FIGURE 12**

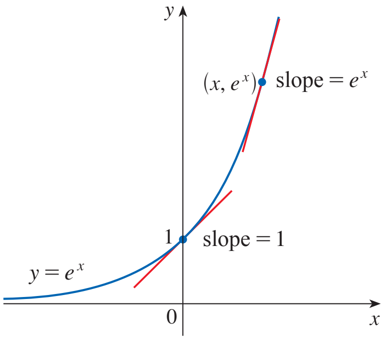

**FIGURE 13**

If we put $b = e$ and, therefore, $f'(0) = 1$ in Equation 4, it becomes the following important differentiation formula.

**8** **Derivative of the Natural Exponential Function**

$$\frac{d}{dx}(e^x) = e^x$$

Thus the exponential function $f(x) = e^x$ has the property that it is its own derivative. The geometric significance of this fact is that the slope of a tangent line to the curve $y = e^x$ at a point $(x, e^x)$ is equal to the $y$-coordinate of the point (see Figure 13).

**EXAMPLE 5** Differentiate the function $y = e^{\tan x}$.

**SOLUTION** To use the Chain Rule, we let $u = \tan x$. Then we have $y = e^u$, so

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = e^u \frac{du}{dx} = e^{\tan x} \sec^2 x$$ ■

In general, if we combine Formula 8 with the Chain Rule, as in Example 5, we get

**9**
$$\boxed{\frac{d}{dx}(e^u) = e^u \frac{du}{dx}}$$

**EXAMPLE 6** Find $y'$ if $y = e^{-4x} \sin 5x$.

**SOLUTION** Using Formula 9 and the Product Rule, we have

$$y' = e^{-4x}(\cos 5x)(5) + (\sin 5x)e^{-4x}(-4) = e^{-4x}(5 \cos 5x - 4 \sin 5x)$$ ■

We have seen that $e$ is a number that lies somewhere between 2 and 3, but we can use Equation 4 to estimate the numerical value of $e$ more accurately. Let $e = 2^c$. Then

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

$e^x = 2^{cx}$. If $f(x) = 2^x$, then from Equation 4 we have $f'(x) = k2^x$, where the value of $k$ is $f'(0) \approx 0.693147$ (see Equations 5). Thus, by the Chain Rule,

$$e^x = \frac{d}{dx}(e^x) = \frac{d}{dx}(2^{cx}) = k2^{cx}\frac{d}{dx}(cx) = ck2^{cx}$$

Putting $x = 0$, we have $1 = ck$, so $c = 1/k$ and

$$e = 2^{1/k} \approx 2^{1/0.693147} \approx 2.71828$$

It can be shown that the approximate value to 20 decimal places is

$$e \approx 2.71828182845904523536$$

The decimal expansion of $e$ is nonrepeating because $e$ is an irrational number.

**EXAMPLE 7** In Example 2.7.6 we considered a population of bacteria cells in a homogeneous nutrient medium. We showed that if the population doubles every hour, then the population after $t$ hours is

$$n = n_0 2^t$$

where $n_0$ is the initial population. Now we can use (4) and (5) to compute the growth rate:

The rate of growth is proportional to the size of the population.

$$\frac{dn}{dt} \approx n_0(0.693147)2^t$$

For instance, if the initial population is $n_0 = 1000$ cells, then the growth rate after two hours is

$$\left.\frac{dn}{dt}\right|_{t=2} \approx (1000)(0.693147)2^t\big|_{t=2}$$
$$= (4000)(0.693147) \approx 2773 \text{ cells/h}$$

■

**EXAMPLE 8** Find the absolute maximum value of the function $f(x) = xe^{-x}$.

**SOLUTION** We differentiate to find any critical numbers:

$$f'(x) = xe^{-x}(-1) + e^{-x}(1) = e^{-x}(1 - x)$$

Since exponential functions are always positive, we see that $f'(x) > 0$ when $1 - x > 0$, that is, when $x < 1$. Similarly, $f'(x) < 0$ when $x > 1$. By the First Derivative Test for Absolute Extreme Values, $f$ has an absolute maximum value when $x = 1$ and the value is

$$f(1) = (1)e^{-1} = \frac{1}{e} \approx 0.37$$

■

Because the exponential function $y = e^x$ has a simple derivative, its integral is also simple:

**10**
$$\boxed{\int e^x\,dx = e^x + C}$$

**EXAMPLE 9** Evaluate $\int x^2 e^{x^3}\,dx$.

**SOLUTION** We substitute $u = x^3$. Then $du = 3x^2\,dx$, so $x^2\,dx = \frac{1}{3}du$ and

$$\int x^2 e^{x^3}\,dx = \tfrac{1}{3}\int e^u\,du = \tfrac{1}{3}e^u + C = \tfrac{1}{3}e^{x^3} + C$$

■

**EXAMPLE 10** Find the area under the curve $y = e^{-3x}$ from 0 to 1.

**SOLUTION** The area is

$$A = \int_0^1 e^{-3x}\,dx = -\tfrac{1}{3}e^{-3x}\Big]_0^1 = \tfrac{1}{3}(1 - e^{-3}) \qquad \blacksquare$$

## Exponential Graphs

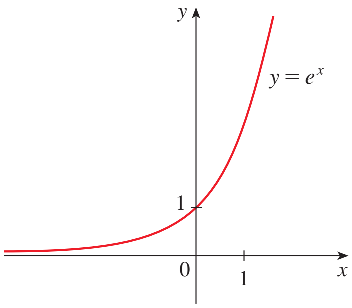

**FIGURE 14**
The natural exponential function

The exponential function $f(x) = e^x$ is one of the most frequently occurring functions in calculus and its applications, so it is important to be familiar with its graph (Figure 14) and properties. We summarize these properties as follows, using the fact that this function is just a special case of the exponential functions considered in Theorem 2 but with base $b = e > 1$.

**11 Properties of the Natural Exponential Function** The exponential function $f(x) = e^x$ is an increasing continuous function with domain $\mathbb{R}$ and range $(0, \infty)$. Thus $e^x > 0$ for all $x$. Also

$$\lim_{x \to -\infty} e^x = 0 \qquad \lim_{x \to \infty} e^x = \infty$$

So the $x$-axis is a horizontal asymptote of $f(x) = e^x$.

**EXAMPLE 11** Find $\displaystyle\lim_{x \to \infty} \frac{e^{2x}}{e^{2x} + 1}$.

**SOLUTION** We divide numerator and denominator by $e^{2x}$:

$$\lim_{x \to \infty} \frac{e^{2x}}{e^{2x} + 1} = \lim_{x \to \infty} \frac{1}{1 + e^{-2x}} = \frac{1}{1 + \displaystyle\lim_{x \to \infty} e^{-2x}}$$

$$= \frac{1}{1 + 0} = 1$$

We have used the fact that $t = -2x \to -\infty$ as $x \to \infty$ and so

$$\lim_{x \to \infty} e^{-2x} = \lim_{t \to -\infty} e^t = 0 \qquad \blacksquare$$

**EXAMPLE 12** Use the first and second derivatives of $f(x) = e^{1/x}$, together with asymptotes, to sketch its graph.

**SOLUTION** Notice that the domain of $f$ is $\{x \mid x \neq 0\}$, so we check for vertical asymptotes by computing the left and right limits as $x \to 0$. As $x \to 0^+$, we know that $t = 1/x \to \infty$, so

$$\lim_{x \to 0^+} e^{1/x} = \lim_{t \to \infty} e^t = \infty$$

and this shows that $x = 0$ is a vertical asymptote. As $x \to 0^-$, we have $t = 1/x \to -\infty$, so

$$\lim_{x \to 0^-} e^{1/x} = \lim_{t \to -\infty} e^t = 0$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

As $x \to \pm\infty$, we have $1/x \to 0$ and so

$$\lim_{x \to \pm\infty} e^{1/x} = e^0 = 1$$

This shows that $y = 1$ is a horizontal asymptote (to both the left and right).

Now let's compute the derivative. The Chain Rule gives

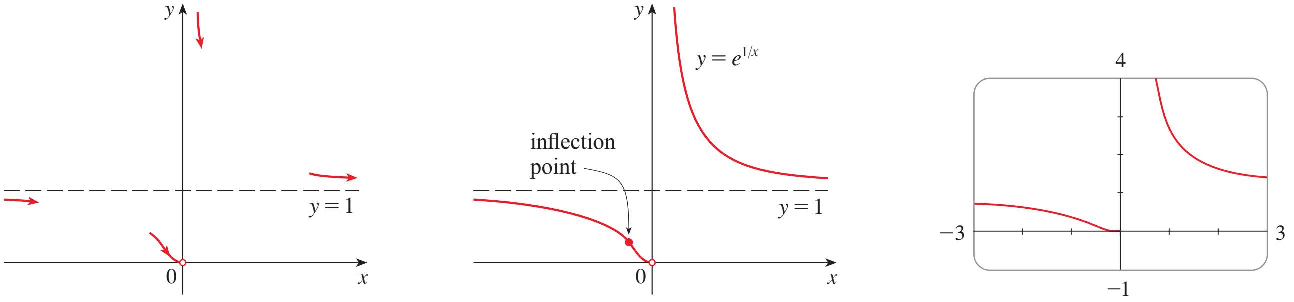
$$f'(x) = -\frac{e^{1/x}}{x^2}$$

Since $e^{1/x} > 0$ and $x^2 > 0$ for all $x \neq 0$, we have $f'(x) < 0$ for all $x \neq 0$. Thus $f$ is decreasing on $(-\infty, 0)$ and on $(0, \infty)$. There is no critical number, so the function has no local maximum or minimum. The second derivative is

$$f''(x) = -\frac{x^2 e^{1/x}(-1/x^2) - e^{1/x}(2x)}{x^4} = \frac{e^{1/x}(2x + 1)}{x^4}$$

Since $e^{1/x} > 0$ and $x^4 > 0$, we have $f''(x) > 0$ when $x > -\frac{1}{2}$ $(x \neq 0)$ and $f''(x) < 0$ when $x < -\frac{1}{2}$. So the curve is concave downward on $\left(-\infty, -\frac{1}{2}\right)$ and concave upward on $\left(-\frac{1}{2}, 0\right)$ and on $(0, \infty)$. There is one inflection point: $\left(-\frac{1}{2}, e^{-2}\right)$.

To sketch the graph of $f$ we first draw the horizontal asymptote $y = 1$ (as a dashed line), together with the parts of the curve near the asymptotes in a preliminary sketch [Figure 15(a)]. These parts reflect the information concerning limits and the fact that $f$ is decreasing on both $(-\infty, 0)$ and $(0, \infty)$. Notice that we have indicated that $f(x) \to 0$ as $x \to 0^-$ even though $f(0)$ does not exist. In Figure 15(b) we finish the sketch by incorporating the information concerning concavity and the inflection point. In Figure 15(c) we check our work with a computer.



(a) Preliminary sketch (b) Finished sketch (c) Computer confirmation

**FIGURE 15**

■

## 6.2 Exercises

**1.** (a) Write an equation that defines the exponential function with base $b > 0$.
  (b) What is the domain of this function?
  (c) If $b \neq 1$, what is the range of this function?
  (d) Sketch the general shape of the graph of the exponential function for each of the following cases.
    (i) $b > 1$
    (ii) $b = 1$
    (iii) $0 < b < 1$

**2.** (a) How is the number $e$ defined?
  (b) What is an approximate value for $e$?
  (c) What is the natural exponential function?

**3–6** Graph the given functions on a common screen. How are these graphs related?

**3.** $y = 2^x, \quad y = e^x, \quad y = 5^x, \quad y = 20^x$

**4.** $y = e^x, \quad y = e^{-x}, \quad y = 8^x, \quad y = 8^{-x}$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**5.** $y = 3^x, \quad y = 10^x, \quad y = \left(\frac{1}{3}\right)^x, \quad y = \left(\frac{1}{10}\right)^x$

**6.** $y = 0.9^x, \quad y = 0.6^x, \quad y = 0.3^x, \quad y = 0.1^x$

---

**7–12** Make a rough sketch by hand of the graph of the function. Use the graphs given in Figures 3 and 14 and, if necessary, the transformations of Section 1.3.

**7.** $g(x) = 3^x + 1$

**8.** $h(x) = 2\left(\frac{1}{2}\right)^x - 3$

**9.** $y = -e^{-x}$

**10.** $y = 4^{x+2}$

**11.** $y = 1 - \frac{1}{2}e^{-x}$

**12.** $y = e^{|x|}$

---

**13.** Starting with the graph of $y = e^x$, write the equation of the graph that results from
(a) shifting 2 units downward.
(b) shifting 2 units to the right.
(c) reflecting about the $x$-axis.
(d) reflecting about the $y$-axis.
(e) reflecting about the $x$-axis and then about the $y$-axis.

**14.** Starting with the graph of $y = e^x$, find the equation of the graph that results from
(a) reflecting about the line $y = 4$.
(b) reflecting about the line $x = 2$.

**15–16** Find the domain of each function.

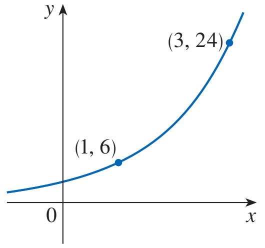
**15.** (a) $f(x) = \dfrac{1 - e^{x^2}}{1 - e^{1-x^2}}$ (b) $f(x) = \dfrac{1 + x}{e^{\cos x}}$

**16.** (a) $g(t) = \sqrt{10^t - 100}$ (b) $g(t) = \sin(e^t - 1)$

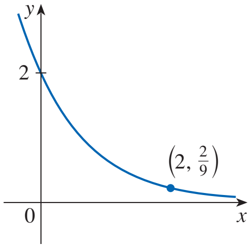
---

**17–18** Find the exponential function $f(x) = Cb^x$ whose graph is given.

**17.**



**18.**



---

**19.** Suppose the graphs of $f(x) = x^2$ and $g(x) = 2^x$ are drawn on a coordinate grid where the unit of measurement is 1 inch. Show that at a distance 2 ft to the right of the origin, the height of the graph of $f$ is 48 ft but the height of the graph of $g$ is about 265 mi.

**20.** Compare the functions $f(x) = x^5$ and $g(x) = 5^x$ by graphing both functions in several viewing rectangles. Find all points of intersection of the graphs correct to one decimal place. Which function grows more rapidly when $x$ is large?

**21.** Compare the functions $f(x) = x^{10}$ and $g(x) = e^x$ by graphing both functions in several viewing rectangles. When does the graph of $g$ finally surpass the graph of $f$?

**22.** Use a graph to estimate the values of $x$ such that $e^x > 1{,}000{,}000{,}000$.

**23–30** Find the limit.

**23.** $\lim\limits_{x \to \infty} (1.001)^x$

**24.** $\lim\limits_{x \to -\infty} (1.001)^x$

**25.** $\lim\limits_{x \to \infty} \dfrac{e^{3x} - e^{-3x}}{e^{3x} + e^{-3x}}$

**26.** $\lim\limits_{x \to \infty} e^{-x^2}$

**27.** $\lim\limits_{x \to 2^+} e^{3/(2-x)}$

**28.** $\lim\limits_{x \to 2^-} e^{3/(2-x)}$

**29.** $\lim\limits_{x \to \infty} (e^{-2x} \cos x)$

**30.** $\lim\limits_{x \to (\pi/2)^+} e^{\sec x}$

---

**31–50** Differentiate the function.

**31.** $f(t) = -2e^t$

**32.** $k(r) = e^r + r^e$

**33.** $f(x) = (3x^2 - 5x)e^x$

**34.** $y = \dfrac{e^x}{1 - e^x}$

**35.** $y = e^{ax^3}$

**36.** $g(x) = e^{x^2 - x}$

**37.** $y = e^{\tan \theta}$

**38.** $y = \sqrt[3]{e^x + 1}$

**39.** $f(x) = \dfrac{x^2 e^x}{x^2 + e^x}$

**40.** $A(r) = \sqrt{r} \cdot e^{r^2+1}$

**41.** $y = x^2 e^{-3x}$

**42.** $f(t) = \tan(1 + e^{2t})$

**43.** $f(t) = e^{at} \sin bt$

**44.** $f(z) = e^{z/(z-1)}$

**45.** $F(t) = e^{t \sin 2t}$

**46.** $y = e^{\sin 2x} + \sin(e^{2x})$

**47.** $g(u) = e^{\sqrt{\sec u^2}}$

**48.** $f(t) = e^{1/t}\sqrt{t^2 - 1}$

**49.** $g(x) = \sin\left(\dfrac{e^x}{1 + e^x}\right)$

**50.** $f(x) = e^{\sin^2(x^2)}$

---

**51–52** Find an equation of the tangent line to the curve at the given point.

**51.** $y = e^x \cos x + \sin x, \quad (0, 1)$

**52.** $y = \dfrac{1 + x}{1 + e^x}, \quad \left(0, \frac{1}{2}\right)$

---

**53.** Find $y'$ if $e^{x/y} = x - y$.

**54.** Find an equation of the tangent line to the curve $xe^y + ye^x = 1$ at the point $(0, 1)$.

**55.** Show that the function $y = e^x + e^{-x/2}$ satisfies the differential equation $2y'' - y' - y = 0$.

**56.** Show that the function $y = Ae^{-x} + Bxe^{-x}$ satisfies the differential equation $y'' + 2y' + y = 0$.

**57.** For what values of $r$ does the function $y = e^{rx}$ satisfy the differential equation $y'' + 6y' + 8y = 0$?

**58.** Find the values of $\lambda$ for which $y = e^{\lambda x}$ satisfies the differential equation $y + y' = y''$.

**59.** If $f(x) = e^{2x}$, find a formula for $f^{(n)}(x)$.

**60.** Find the thousandth derivative of $f(x) = xe^{-x}$.

**61.** (a) Use the Intermediate Value Theorem to show that there is a solution of the equation $e^x + x = 0$.
(b) Use Newton's method to find the solution of the equation in part (a) correct to six decimal places.

**62.** Verify the linear approximation

$$\frac{2}{1 + e^x} \approx 1 - \tfrac{1}{2}x$$

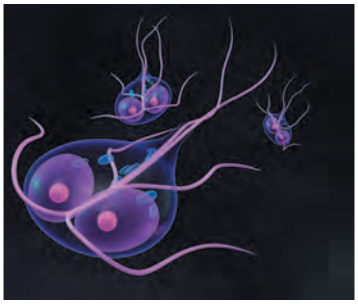
at $a = 0$. Then determine the values of $x$ for which the linear approximation is accurate to within 0.1.

**63.** In Example 4, the patient's viral load $V$ was 76.0 RNA copies per mL after one day of treatment. Use the graph of $V$ in Figure 11 to estimate the additional time required for the viral load to decrease to half that amount.

**64.** A researcher is trying to determine the doubling time for a population of the bacterium *Giardia lamblia*. He starts a culture in a nutrient solution and estimates the bacteria count every four hours. His data are shown in the table.

| Time (hours) | 0 | 4 | 8 | 12 | 16 | 20 | 24 |
|---|---|---|---|---|---|---|---|
| Bacteria count (CFU/mL) | 37 | 47 | 63 | 78 | 105 | 130 | 173 |

(a) Make a scatter plot of the data.
(b) Use a calculator or computer to find an exponential curve $f(t) = a \cdot b^t$ that models the bacteria population $t$ hours later.
(c) Graph the model from part (b) together with the scatter plot in part (a). Use the graph to estimate how long it takes for the bacteria count to double.



Sebastian Kaulitzki / Shutterstock.com

*G. lamblia*

**65.** Under certain circumstances a rumor spreads according to the equation

$$p(t) = \frac{1}{1 + ae^{-kt}}$$

where $p(t)$ is the proportion of the population that has heard the rumor at time $t$ and $a$ and $k$ are positive constants. [In Section 9.4 we will see that this is a reasonable equation for $p(t)$.]
(a) Find $\lim_{t\to\infty} p(t)$ and interpret your answer.
(b) Find the rate of spread of the rumor.
(c) Graph $p$ for the case $a = 10$, $k = 0.5$ with $t$ measured in hours. Use the graph to estimate how long it will take for 80% of the population to have heard the rumor.

**66.** An object is attached to the end of a vibrating spring and its displacement from its equilibrium position is $y = 8e^{-t/2}\sin 4t$, where $t$ is measured in seconds and $y$ is measured in centimeters.
(a) Graph the displacement function together with the functions $y = 8e^{-t/2}$ and $y = -8e^{-t/2}$. How are these graphs related? Can you explain why?
(b) Use the graph to estimate the maximum value of the displacement. Does it occur when the graph touches the graph of $y = 8e^{-t/2}$?
(c) What is the velocity of the object when it first returns to its equilibrium position?
(d) Use the graph to estimate the time after which the displacement is no more than 2 cm from equilibrium.

**67–68** Find the absolute maximum and absolute minimum values of $f$ on the given interval.

**67.** $f(x) = \dfrac{e^x}{1 + x^2}$, $[0, 3]$

**68.** $f(x) = xe^{x/2}$, $[-3, 1]$

---

**69.** Find the absolute maximum value of the function $f(x) = x - e^x$.

**70.** Find the absolute minimum value of the function $g(x) = e^x/x$, $x > 0$.

**71–72** Find (a) the intervals of increase or decrease, (b) the intervals of concavity, and (c) the points of inflection.

**71.** $f(x) = xe^{2x}$

**72.** $f(x) = \dfrac{e^x}{x^2}$

---

**73–75** Discuss the curve using the guidelines of Section 3.5.

**73.** $y = e^{-1/(x+1)}$

**74.** $y = e^{-x}\sin x$, $0 \leqslant x \leqslant 2\pi$

**75.** $y = 1/(1 + e^{-x})$

**76–77** Draw a graph of $f$ that shows all the important aspects of the curve. Estimate the local maximum and minimum values and then use calculus to find these values exactly. Use a graph of $f''$ to estimate the inflection points.

**76.** $f(x) = e^{\cos x}$ **77.** $f(x) = e^{x^3 - x}$

---

**78.** A *drug response curve* describes the level of medication in the bloodstream after a drug is administered. A surge function $S(t) = At^p e^{-kt}$ is often used to model the response curve, reflecting an initial surge in the drug level and then a more gradual decline. If, for a particular drug, $A = 0.01$, $p = 4$, $k = 0.07$, and $t$ is measured in minutes, estimate the times corresponding to the inflection points and explain their significance. Then graph the drug response curve.

**79.** After an alcoholic beverage is consumed, the concentration of alcohol in the bloodstream (blood alcohol concentration, or BAC) surges as the alcohol is absorbed, followed by a gradual decline as the alcohol is metabolized. The function

$$C(t) = 0.135te^{-2.802t}$$

models the average BAC, measured in g/dL, of a group of eight male subjects $t$ hours after rapid consumption of 15 mL of ethanol (corresponding to one alcoholic drink). What is the maximum average BAC during the first 3 hours? When does it occur?

*Source:* Adapted from P. Wilkinson et al., "Pharmacokinetics of Ethanol after Oral Administration in the Fasting State," *Journal of Pharmacokinetics and Biopharmaceutics* 5 (1977): 207–24.

**80. Normal Density Functions** The family of bell-shaped curves

$$y = \frac{1}{\sigma\sqrt{2\pi}}\, e^{-(x-\mu)^2/(2\sigma^2)}$$

occurs in probability and statistics, where it is called the *normal density function.* The constant $\mu$ is called the *mean* and the positive constant $\sigma$ is called the *standard deviation.* For simplicity, let's scale the function so as to remove the factor $1/(\sigma\sqrt{2\pi})$ and let's analyze the special case where $\mu = 0$. So we study the function

$$f(x) = e^{-x^2/(2\sigma^2)}$$

(a) Find the asymptote, maximum value, and inflection points of $f$.
(b) What role does $\sigma$ play in the shape of the curve?
(c) Illustrate by graphing four members of this family on the same screen.

**81–92** Evaluate the integral.

**81.** $\displaystyle\int_0^1 (x^e + e^x)\,dx$ **82.** $\displaystyle\int_{-5}^5 e\,dx$

**83.** $\displaystyle\int_0^2 \frac{dx}{e^{\pi x}}$ **84.** $\displaystyle\int t^3 e^{-t^4}\,dt$

**85.** $\displaystyle\int e^x\sqrt{1 + e^x}\,dx$ **86.** $\displaystyle\int \frac{(1 + e^x)^2}{e^x}\,dx$

**87.** $\displaystyle\int (e^x + e^{-x})^2\,dx$ **88.** $\displaystyle\int e^x(4 + e^x)^5\,dx$

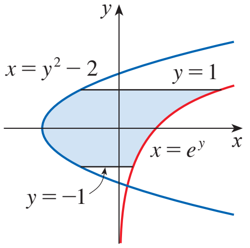
**89.** $\displaystyle\int \frac{e^u}{(1 - e^u)^2}\,du$ **90.** $\displaystyle\int e^{\sin\theta}\cos\theta\,d\theta$

**91.** $\displaystyle\int_1^2 \frac{e^{1/x}}{x^2}\,dx$ **92.** $\displaystyle\int_0^1 \frac{\sqrt{1 + e^{-x}}}{e^x}\,dx$

---

**93.** Find the average value of $f(x) = 2xe^{-x^2}$ on the interval $[0, 2]$.

**94.** Find the area of the shaded region.



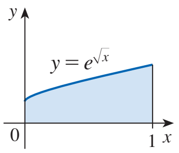
**95.** Find, correct to three decimal places, the area of the region bounded by the curves $y = e^x$, $y = e^{3x}$, and $x = 1$.

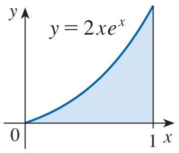
**96.** Find $f(x)$ if $f''(x) = 3e^x + 5\sin x$, $f(0) = 1$, and $f'(0) = 2$.

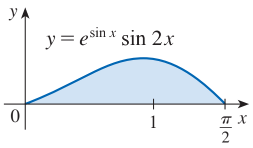
**97.** Find the volume of the solid obtained by rotating about the $x$-axis the region bounded by the curves $y = e^x$, $y = 0$, $x = 0$, and $x = 1$.

**98.** Find the volume of the solid obtained by rotating about the $y$-axis the region bounded by the curves $y = e^{-x^2}$, $y = 0$, $x = 0$, and $x = 1$.

**99.** Which of the following areas are equal? Why?







**100.** A bacteria population starts with 400 bacteria and grows at a rate of $r(t) = (450.268)e^{1.12567t}$ bacteria per hour. How many bacteria will there be after three hours?

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**101.** An oil storage tank ruptures at time $t = 0$ and oil leaks from the tank at a rate of $r(t) = 100e^{-0.01t}$ liters per minute. How much oil leaks out during the first hour?

**102.** The rate of growth of a fish population was modeled by the equation

$$G(t) = \frac{60{,}000e^{-0.6t}}{(1 + 5e^{-0.6t})^2}$$

where $t$ is the number of years since 2000 and $G$ is measured in kilograms per year. If the biomass was 25,000 kg in the year 2000, what is the predicted biomass for the year 2020?

**103.** Dialysis treatment removes urea and other waste products from a patient's blood by diverting some of the bloodflow externally through a machine called a dialyzer. The rate at which urea is removed from the blood (in mg/min) is often well described by the equation

$$u(t) = \frac{r}{V} C_0 e^{-rt/V}$$

where $r$ is the rate of flow of blood through the dialyzer (in mL/min), $V$ is the volume of the patient's blood (in mL), and $C_0$ is the amount of urea in the blood (in mg) at time $t = 0$. Evaluate the integral $\int_0^{30} u(t)\,dt$ and interpret it.

**104. The Error Function** The *error function*

$$\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2}\,dt$$

is used in probability, statistics, and engineering.

(a) Show that $\int_a^b e^{-t^2}\,dt = \frac{1}{2}\sqrt{\pi}\,[\operatorname{erf}(b) - \operatorname{erf}(a)]$.

(b) Show that the function $y = e^{x^2}\operatorname{erf}(x)$ satisfies the differential equation $y' = 2xy + 2/\sqrt{\pi}$.

**105.** If $f(x) = 3 + x + e^x$, find $(f^{-1})'(4)$.

**106.** Evaluate $\displaystyle\lim_{x\to\pi} \frac{e^{\sin x} - 1}{x - \pi}$.

**107.** If you graph the function

$$f(x) = \frac{1 - e^{1/x}}{1 + e^{1/x}}$$

you'll see that $f$ appears to be an odd function. Prove it.

**108.** Graph several members of the family of functions

$$f(x) = \frac{1}{1 + ae^{bx}}$$

where $a > 0$. How does the graph change when $b$ changes? How does it change when $a$ changes?

## 6.3 Logarithmic Functions

### ■ Logarithmic Functions and Their Properties

If $b > 0$ and $b \neq 1$, the exponential function $f(x) = b^x$ is either increasing or decreasing and so it is one-to-one by the Horizontal Line Test. It therefore has an inverse function $f^{-1}$, which is called the **logarithmic function with base *b*** and is denoted by $\log_b$. If we use the formulation of an inverse function given by (6.1.3),

$$f^{-1}(x) = y \iff f(y) = x$$

then we have

$$\boxed{\log_b x = y \iff b^y = x} \tag{1}$$

Thus, if $x > 0$, then $\log_b x$ is the exponent to which the base $b$ must be raised to give $x$.

**EXAMPLE 1** Evaluate (a) $\log_3 81$, (b) $\log_{25} 5$, and (c) $\log_{10} 0.001$.

**SOLUTION**

(a) $\log_3 81 = 4$ because $3^4 = 81$

(b) $\log_{25} 5 = \frac{1}{2}$ because $25^{1/2} = 5$

(c) $\log_{10} 0.001 = -3$ because $10^{-3} = 0.001$ ■

The cancellation equations (6.1.4), when applied to the functions $f(x) = b^x$ and $f^{-1}(x) = \log_b x$, become

**2**

$$\boxed{\begin{aligned} \log_b(b^x) &= x \quad \text{for every } x \in \mathbb{R} \\ b^{\log_b x} &= x \quad \text{for every } x > 0 \end{aligned}}$$

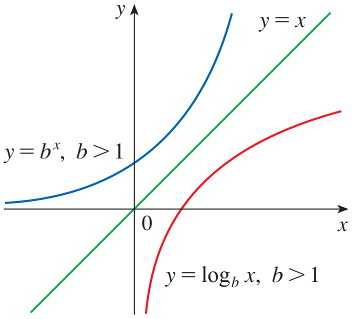


**FIGURE 1**

The logarithmic function $\log_b$ has domain $(0, \infty)$ and range $\mathbb{R}$ and is continuous since it is the inverse of a continuous function, namely, the exponential function. Its graph is the reflection of the graph of $y = b^x$ about the line $y = x$.

Figure 1 shows the case where $b > 1$. (The most important logarithmic functions have base $b > 1$.) The fact that $y = b^x$ is a very rapidly increasing function for $x > 0$ is reflected in the fact that $y = \log_b x$ is a very slowly increasing function for $x > 1$.

Figure 2 shows the graphs of $y = \log_b x$ with various values of the base $b > 1$. Because $\log_b 1 = 0$, the graphs of all logarithmic functions pass through the point $(1, 0)$.

The following theorem summarizes the properties of logarithmic functions.

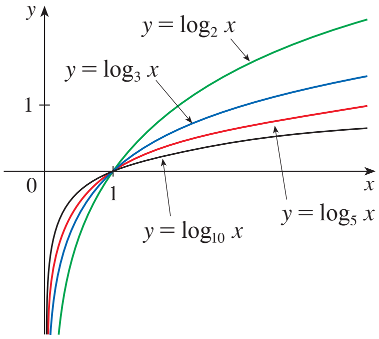

**FIGURE 2**

**3 Theorem** If $b > 1$, the function $f(x) = \log_b x$ is a one-to-one, continuous, increasing function with domain $(0, \infty)$ and range $\mathbb{R}$. If $x, y > 0$ and $r$ is any real number, then

1. $\log_b(xy) = \log_b x + \log_b y$

2. $\log_b\left(\dfrac{x}{y}\right) = \log_b x - \log_b y$

3. $\log_b(x^r) = r \log_b x$

Properties 1, 2, and 3 are called the **Laws of Logarithms** and follow from the corresponding laws of exponents given in Theorem 6.2.2.

**EXAMPLE 2** Use the laws of logarithms in Theorem 3 to evaluate the following.
(a) $\log_4 2 + \log_4 32$ (b) $\log_2 80 - \log_2 5$

**SOLUTION**

(a) Using Law 1 in Theorem 3, we have

$$\log_4 2 + \log_4 32 = \log_4(2 \cdot 32) = \log_4 64 = 3$$

because $4^3 = 64$.

(b) Using Law 2 we have

$$\log_2 80 - \log_2 5 = \log_2\left(\tfrac{80}{5}\right) = \log_2 16 = 4$$

because $2^4 = 16$. ■

The limits of exponential functions given in Section 6.2 are reflected in the following limits of logarithmic functions. (Compare with Figure 1.)

**4** If $b > 1$, then

$$\lim_{x \to \infty} \log_b x = \infty \qquad \text{and} \qquad \lim_{x \to 0^+} \log_b x = -\infty$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

In particular, the $y$-axis is a vertical asymptote of the curve $y = \log_b x$.

**EXAMPLE 3** Find $\lim_{x \to 0} \log_{10}(\tan^2 x)$.

**SOLUTION** As $x \to 0$, we know that $t = \tan^2 x \to \tan^2 0 = 0$ and the values of $t$ are positive. So by (4) with $b = 10 > 1$, we have

$$\lim_{x \to 0} \log_{10}(\tan^2 x) = \lim_{t \to 0^+} \log_{10} t = -\infty$$ ■

## ■ The Natural Logarithmic Function

**Notation for Logarithms**
Most textbooks in calculus and the sciences, as well as calculators, use the notation $\ln x$ for the natural logarithm and $\log x$ for the "common logarithm," $\log_{10} x$. In the more advanced mathematical and scientific literature and in computer languages, however, the notation $\log x$ usually denotes the natural logarithm.

Of all possible bases $b$ for logarithms, we will see in Section 6.4 that the most convenient choice of a base is the number $e$, which was defined in Section 6.2. The logarithm with base $e$ is called the **natural logarithm** and has a special notation:

$$\boxed{\log_e x = \ln x}$$

If we set $b = e$ and replace $\log_e$ with "ln" in (1) and (2), then the defining properties of the natural logarithm function become

**5** $$\boxed{\ln x = y \iff e^y = x}$$

**6** $$\boxed{\begin{array}{ll} \ln(e^x) = x & x \in \mathbb{R} \\ e^{\ln x} = x & x > 0 \end{array}}$$

In particular, if we set $x = 1$, we get

$$\boxed{\ln e = 1}$$

Combining Property 6 with Law 3 of Theorem 3 allows us to write

$$x^r = e^{\ln(x^r)} = e^{r \ln x} \qquad x > 0$$

Thus a power of $x$ can be expressed in an equivalent exponential form.

**7** $$\boxed{x^r = e^{r \ln x}}$$

**EXAMPLE 4** Find $x$ if $\ln x = 5$.

**SOLUTION 1** From (5) we see that

$$\ln x = 5 \qquad \text{means} \qquad e^5 = x$$

Therefore $x = e^5$.

(If you have trouble working with the "ln" notation, just replace it by $\log_e$. Then the equation becomes $\log_e x = 5$; so, by the definition of logarithm, $e^5 = x$.)

**SOLUTION 2** Start with the equation

$$\ln x = 5$$

and apply the exponential function to both sides of the equation:

$$e^{\ln x} = e^5$$

But the second cancellation equation in (6) says that $e^{\ln x} = x$. Therefore $x = e^5$. ■

**EXAMPLE 5** Solve the equation $e^{5-3x} = 10$.

**SOLUTION** We take natural logarithms of both sides of the equation and use (6):

$$\begin{aligned} \ln(e^{5-3x}) &= \ln 10 \\ 5 - 3x &= \ln 10 \\ 3x &= 5 - \ln 10 \\ x &= \tfrac{1}{3}(5 - \ln 10) \end{aligned}$$

Using a calculator, we can approximate the solution: to four decimal places, $x \approx 0.8991$.

■

The laws of logarithms allow us to expand logarithms of products and quotients as sums and differences of logarithms. These same laws also allow us to combine sums and differences of logarithms into a single logarithmic expression. These processes are illustrated in Examples 6 and 7.

**EXAMPLE 6** Use the laws of logarithms to expand $\ln \dfrac{x^2\sqrt{x^2+2}}{3x+1}$.

**SOLUTION** Using Laws 1, 2, and 3 of logarithms, we have

$$\begin{aligned} \ln \frac{x^2\sqrt{x^2+2}}{3x+1} &= \ln x^2 + \ln \sqrt{x^2+2} - \ln(3x+1) \\ &= 2\ln x + \tfrac{1}{2}\ln(x^2+2) - \ln(3x+1) \end{aligned}$$ ■

**EXAMPLE 7** Express $\ln a + \frac{1}{2}\ln b$ as a single logarithm.

**SOLUTION** Using Laws 3 and 1 of logarithms, we have

$$\begin{aligned} \ln a + \tfrac{1}{2}\ln b &= \ln a + \ln b^{1/2} \\ &= \ln a + \ln\sqrt{b} \\ &= \ln\left(a\sqrt{b}\,\right) \end{aligned}$$ ■

The following formula shows that logarithms with any base can be expressed in terms of the natural logarithm.

**8** **Change of Base Formula** For any positive number $b$ ($b \neq 1$), we have

$$\log_b x = \frac{\ln x}{\ln b}$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**PROOF** Let $y = \log_b x$. Then, from (1), we have $b^y = x$. Taking natural logarithms of both sides of this equation, we get $y \ln b = \ln x$. Therefore

$$y = \frac{\ln x}{\ln b} \qquad \blacksquare$$

Formula 8 enables us to use a calculator to compute a logarithm with any base (as shown in the following example). Similarly, Formula 8 allows us to graph any logarithmic function on a graphing calculator or computer (see Exercises 14–16).

**EXAMPLE 8** Evaluate $\log_8 5$ correct to six decimal places.

**SOLUTION** Formula 8 gives

$$\log_8 5 = \frac{\ln 5}{\ln 8} \approx 0.773976 \qquad \blacksquare$$

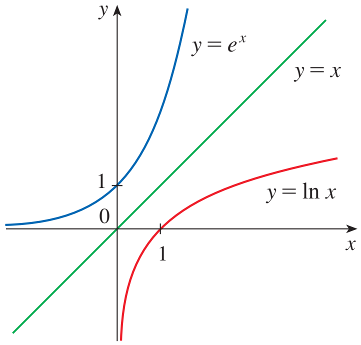

**FIGURE 3**
The graph of $y = \ln x$ is the reflection of the graph of $y = e^x$ about the line $y = x$.

## Graph and Growth of the Natural Logarithm Function

The graphs of the exponential function $y = e^x$ and its inverse function, the natural logarithm function, are shown in Figure 3. Because the curve $y = e^x$ crosses the $y$-axis with a slope of 1, it follows that the reflected curve $y = \ln x$ crosses the $x$-axis with a slope of 1. In common with all other logarithmic functions with base greater than 1, the natural logarithm is a continuous, increasing function defined on $(0, \infty)$ and the $y$-axis is a vertical asymptote.

If we put $b = e$ in (4), then we have the following limits:

**9**
$$\boxed{\lim_{x \to \infty} \ln x = \infty \qquad \lim_{x \to 0^+} \ln x = -\infty}$$

**EXAMPLE 9** Sketch the graph of the function $y = \ln(x - 2) - 1$.

**SOLUTION** We start with the graph of $y = \ln x$ as given in Figure 3. Using the transformations of Section 1.3, we shift it 2 units to the right to get the graph of $y = \ln(x - 2)$ and then we shift it 1 unit downward to get the graph of $y = \ln(x - 2) - 1$. (See Figure 4.)

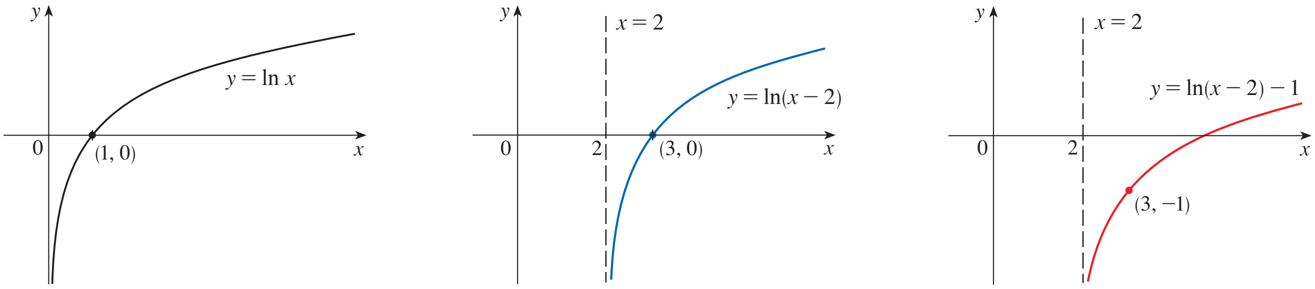

**FIGURE 4**

Notice that the line $x = 2$ is a vertical asymptote since

$$\lim_{x \to 2^+} [\ln(x - 2) - 1] = -\infty \qquad \blacksquare$$

We have seen that $\ln x \to \infty$ as $x \to \infty$. But this happens *very* slowly. In fact, $\ln x$ grows more slowly than any positive power of $x$. To illustrate this fact, we graph $y = \ln x$

and $y = x^{1/2} = \sqrt{x}$ in Figures 5 and 6. You can see that the graphs initially grow at comparable rates, but eventually the root function far surpasses the logarithm. In fact, we will be able to show in Section 6.8 that

$$\lim_{x \to \infty} \frac{\ln x}{x^p} = 0$$

for any positive power $p$. So for large $x$, the values of $\ln x$ are very small compared with $x^p$.

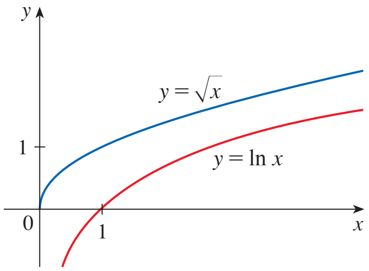

**FIGURE 5**

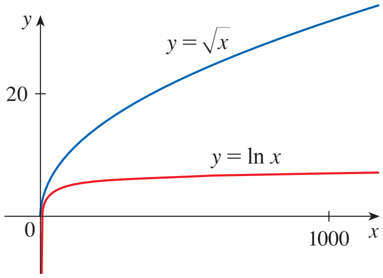

**FIGURE 6**

## 6.3 Exercises

**1.** (a) How is the logarithmic function $y = \log_b x$ defined?
(b) What is the domain of this function?
(c) What is the range of this function?
(d) Sketch the general shape of the graph of the function $y = \log_b x$ if $b > 1$.

**2.** (a) What is the natural logarithm?
(b) What is the common logarithm?
(c) Sketch the graphs of the natural logarithm function and the natural exponential function with a common set of axes.

**3–6** Find the exact value of each expression.

**3.** (a) $\log_3 81$ (b) $\log_3\left(\frac{1}{81}\right)$ (c) $\log_9 3$

**4.** (a) $\ln \dfrac{1}{e^2}$ (b) $\ln \sqrt{e}$ (c) $\ln(\ln e^{e^{50}})$

**5.** (a) $\log_2 30 - \log_2 15$
(b) $\log_3 10 - \log_3 5 - \log_3 18$
(c) $2 \log_5 100 - 4 \log_5 50$

**6.** (a) $e^{3 \ln 2}$ (b) $e^{-2 \ln 5}$ (c) $e^{\ln(\ln e^3)}$

**7–8** Use the laws of logarithms to expand each expression.

**7.** (a) $\log_{10}(x^2 y^3 z)$ (b) $\ln\left(\dfrac{x^4}{\sqrt{x^2 - 4}}\right)$

**8.** (a) $\ln \sqrt{\dfrac{3x}{x - 3}}$ (b) $\log_2\left[(x^3 + 1)\sqrt[3]{(x - 3)^2}\right]$

**9–11** Express as a single logarithm.

**9.** (a) $\log_{10} 20 - \frac{1}{3} \log_{10} 1000$ (b) $\ln a - 2 \ln b + 3 \ln c$

**10.** (a) $\ln 10 + 2 \ln 5$
(b) $\log_{10} 4 + \log_{10} a - \frac{1}{3} \log_{10}(a + 1)$

**11.** (a) $3 \ln(x - 2) - \ln(x^2 - 5x + 6) + 2 \ln(x - 3)$
(b) $c \log_a x - d \log_a y + \log_a z$

**12–13** Use Formula 8 to evaluate each logarithm correct to six decimal places.

**12.** (a) $\log_5 10$ (b) $\log_{15} 12$

**13.** (a) $\log_3 12$ (b) $\log_{12} 6$

**14–16** Use Formula 8 to graph the given functions on a common screen. How are these graphs related?

**14.** $y = \log_2 x, \quad y = \log_4 x, \quad y = \log_6 x, \quad y = \log_8 x$

**15.** $y = \log_{1.5} x, \quad y = \ln x, \quad y = \log_{10} x, \quad y = \log_{50} x$

**16.** $y = \ln x, \quad y = \log_8 x, \quad y = e^x, \quad y = 8^x$

**17.** Suppose that the graph of $y = \log_2 x$ is drawn on a coordinate grid where the unit of measurement is an inch. How many miles to the right of the origin do we have to move before the height of the curve reaches 3 ft?

**18.** Compare the functions $f(x) = x^{0.1}$ and $g(x) = \ln x$ by graphing both functions in several viewing rectangles. When does the graph of $f$ finally surpass the graph of $g$?

**19–20** Make a rough sketch by hand of the graph of each function. Use the graphs given in Figures 2 and 3 and, if necessary, the transformations of Section 1.3.

**19.** (a) $y = \log_{10}(x + 5)$ (b) $y = -\ln x$

**20.** (a) $y = \ln(-x)$ (b) $y = \ln |x|$

---

**21–22**

(a) What are the domain and range of $f$?

(b) What is the $x$-intercept of the graph of $f$?

(c) Sketch the graph of $f$.

**21.** $f(x) = \ln x + 2$ **22.** $f(x) = \ln(x - 1) - 1$

---

**23–26** Solve each equation for $x$. Give both an exact value and a decimal approximation, correct to three decimal places.

**23.** (a) $\ln(4x + 2) = 3$ (b) $e^{2x-3} = 12$

**24.** (a) $\log_2(x^2 - x - 1) = 2$ (b) $1 + e^{4x+1} = 20$

**25.** (a) $\ln x + \ln(x - 1) = 0$ (b) $5^{1-2x} = 9$

**26.** (a) $\ln(\ln x) = 0$ (b) $\dfrac{60}{1 + e^{-x}} = 4$

---

**27–28** Solve each equation for $x$.

**27.** (a) $e^{2x} - 3e^x + 2 = 0$ (b) $e^{e^x} = 10$

**28.** (a) $e^{3x+1} = k$ (b) $\log_2(mx) = c$

---

**29–30** Find the solution of the equation correct to four decimal places.

**29.** (a) $\ln(1 + x^3) - 4 = 0$ (b) $2e^{1/x} = 42$

**30.** (a) $2^{1-3x} = 99$ (b) $\ln\left(\dfrac{x + 1}{x}\right) = 2$

---

**31–32** Solve each inequality for $x$.

**31.** (a) $\ln x < 0$ (b) $e^x > 5$

**32.** (a) $1 < e^{3x-1} < 2$ (b) $1 - 2 \ln x < 3$

---

**33.** The geologist C. F. Richter defined the magnitude of an earthquake to be $\log_{10}(I/S)$, where $I$ is the intensity of the quake (measured by the amplitude of a seismograph 100 km from the epicenter) and $S$ is the intensity of a "standard" earthquake (where the amplitude is only 1 micron $= 10^{-4}$ cm). The 1989 Loma Prieta earthquake that shook San Francisco had a magnitude of 7.1 on the Richter scale. The 1906 San Francisco earthquake was 16 times as intense. What was its magnitude on the Richter scale?

**34.** A sound so faint that it can just be heard has intensity $I_0 = 10^{-12}$ watt/m$^2$ at a frequency of 1000 hertz (Hz). The loudness, in decibels (dB), of a sound with intensity $I$ is then defined to be $L = 10 \log_{10}(I/I_0)$. Amplified rock music is measured at 120 dB, whereas the noise from a motor-driven lawn mower is measured at 106 dB. Find the ratio of the intensity of the rock music to that of the mower.

**35.** If a bacteria population starts with 100 bacteria and doubles every three hours, then the number of bacteria after $t$ hours is $n = f(t) = 100 \cdot 2^{t/3}$.

(a) Find the inverse of this function and explain its meaning.

(b) When will the population reach 50,000?

**36.** The National Ignition Facility at the Lawrence Livermore National Laboratory maintains the world's largest laser facility. The lasers, which are used to start a nuclear fusion reaction, are powered by a capacitor bank that stores a total of about 400 megajoules of energy. When the lasers are fired the capacitors discharge completely and then immediately begin recharging. The charge $Q$ of the capacitors $t$ seconds after the discharge is given by

$$Q(t) = Q_0(1 - e^{-t/a})$$

(The maximum charge capacity is $Q_0$ and $t$ is measured in seconds.)

(a) Find a formula for the inverse of this function and explain its meaning.

(b) How long does it take to recharge the capacitors to 90% of capacity if $a = 50$?

**37–42** Find the limit.

**37.** $\lim_{x \to 1^+} \ln(\sqrt{x} - 1)$ **38.** $\lim_{x \to 2^-} \log_5(8x - x^4)$

**39.** $\lim_{x \to 0} \ln(\cos x)$ **40.** $\lim_{x \to 0^+} \ln(\sin x)$

**41.** $\lim_{x \to \infty} [\ln(1 + x^2) - \ln(1 + x)]$

**42.** $\lim_{x \to \infty} [\ln(2 + x) - \ln(1 + x)]$

---

**43–44** Find the domain of the function.

**43.** $f(x) = \ln(4 - x^2)$ **44.** $g(x) = \log_2(x^2 + 3x)$

---

**45–47** Find (a) the domain of $f$ and (b) $f^{-1}$ and its domain.

**45.** $f(x) = \sqrt{3 - e^{2x}}$ **46.** $f(x) = \ln(2 + \ln x)$

**47.** $f(x) = \ln(e^x - 3)$

---

**48.** (a) What are the values of $e^{\ln 300}$ and $\ln(e^{300})$?

(b) Use your calculator to evaluate $e^{\ln 300}$ and $\ln(e^{300})$. What do you notice? Can you explain why the calculator has trouble?

**49–54** Find a formula for the inverse of the function.

**49.** $y = 3 \ln(x - 2)$ **50.** $g(x) = \log_4(x^3 + 2)$

**51.** $y = e^{1-x}$

**52.** $y = (\ln x)^2, \quad x \geqslant 1$

**53.** $y = 3^{2x-4}$

**54.** $y = \dfrac{1 - e^{-x}}{1 + e^{-x}}$

---

**55.** On what interval is the function $f(x) = e^{3x} - e^x$ increasing?

**56.** On what interval is the curve $y = 2e^x - e^{-3x}$ concave downward?

**57.** (a) Show that the function $f(x) = \ln\left(x + \sqrt{x^2 + 1}\right)$ is an odd function.
(b) Find the inverse function of $f$.

**58.** Find an equation of the tangent to the curve $y = e^{-x}$ that is perpendicular to the line $2x - y = 8$.

**59.** Show that the equation $x^{1/\ln x} = 2$ has no solution. What can you say about the function $f(x) = x^{1/\ln x}$?

**60.** Any function of the form $f(x) = [g(x)]^{h(x)}$, where $g(x) > 0$, can be analyzed as a power of $e$ by using Equation 7 to write $f(x) = e^{h(x)\ln g(x)}$. Express $f$ in this form to help find the limit.

(a) $\lim_{x \to \infty} x^{\ln x}$
(b) $\lim_{x \to 0^+} x^{-\ln x}$
(c) $\lim_{x \to 0^+} x^{1/x}$
(d) $\lim_{x \to \infty} (\ln 2x)^{-\ln x}$

**61.** Let $b > 1$. Prove, using Definitions 3.4.6 and 3.4.7, that

(a) $\lim_{x \to -\infty} b^x = 0$
(b) $\lim_{x \to \infty} b^x = \infty$

**62.** The velocity of a particle that moves in a straight line under the influence of viscous forces is $v(t) = ce^{-kt}$, where $c$ and $k$ are positive constants.
(a) Show that the acceleration is proportional to the velocity.
(b) Explain the significance of the number $c$.
(c) At what time is the velocity equal to half the initial velocity?

**63.** Solve the inequality $\ln(x^2 - 2x - 2) \leqslant 0$.

**64.** A **prime number** is a positive integer that has no factors other than 1 and itself. The first few primes are 2, 3, 5, 7, 11, 13, 17, . . . . We denote by $\pi(n)$ the number of primes that are less than or equal to $n$. For instance, $\pi(15) = 6$ because there are six primes smaller than 15.

(a) Calculate the numbers $\pi(25)$ and $\pi(100)$.
[*Hint:* To find $\pi(100)$, first compile a list of the primes up to 100 using the *sieve of Eratosthenes:* Write the numbers from 2 to 100 and cross out all multiples of 2. Then cross out all multiples of 3. The next remaining number is 5, so cross out all remaining multiples of it, and so on.]

(b) By inspecting tables of prime numbers and tables of logarithms, the great mathematician K. F. Gauss made the guess in 1792 (when he was 15) that the number of primes up to $n$ is approximately $n/\ln n$ when $n$ is large. More precisely, he conjectured that

$$\lim_{n \to \infty} \frac{\pi(n)}{n/\ln n} = 1$$

This was finally proved, a hundred years later, by Jacques Hadamard and Charles de la Vallée Poussin and is called the **Prime Number Theorem**. Provide evidence for the truth of this theorem by computing the ratio of $\pi(n)$ to $n/\ln n$ for $n = 100, 1000, 10^4, 10^5, 10^6$, and $10^7$. Use the following data: $\pi(1000) = 168$, $\pi(10^4) = 1229$, $\pi(10^5) = 9592$, $\pi(10^6) = 78{,}498$, $\pi(10^7) = 664{,}579$.

(c) Use the Prime Number Theorem to estimate the number of primes up to a billion.

## 6.4 Derivatives of Logarithmic Functions

In this section we find the derivatives of the logarithmic functions $y = \log_b x$ and the exponential functions $y = b^x$.

### Derivative of the Natural Logarithm Function

We start with the natural logarithmic function $y = \ln x$. We know that it is differentiable because it is the inverse of the differentiable function $y = e^x$.

**1 Derivative of the Natural Logarithm Function**

$$\frac{d}{dx}(\ln x) = \frac{1}{x}$$

**PROOF** Let $y = \ln x$. Then

$$e^y = x$$

Differentiating this equation implicitly with respect to $x$, we get

$$e^y \frac{dy}{dx} = 1$$

and so $$\frac{dy}{dx} = \frac{1}{e^y} = \frac{1}{x}$$ ■

**EXAMPLE 1** Differentiate $y = \ln(x^3 + 1)$.

**SOLUTION** To use the Chain Rule, we let $u = x^3 + 1$. Then $y = \ln u$, so

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = \frac{1}{u}\frac{du}{dx} = \frac{1}{x^3 + 1}(3x^2) = \frac{3x^2}{x^3 + 1}$$ ■

In general, if we combine Formula 1 with the Chain Rule as in Example 1, we get

**2** $$\boxed{\frac{d}{dx}(\ln u) = \frac{1}{u}\frac{du}{dx}} \quad \text{or} \quad \boxed{\frac{d}{dx}[\ln g(x)] = \frac{g'(x)}{g(x)}}$$

**EXAMPLE 2** Find $\dfrac{d}{dx}\ln(\sin x)$.

**SOLUTION** Using (2), we have

$$\frac{d}{dx}\ln(\sin x) = \frac{1}{\sin x}\frac{d}{dx}(\sin x) = \frac{1}{\sin x}\cos x = \cot x$$ ■

**EXAMPLE 3** Differentiate $f(x) = \sqrt{\ln x}$.

**SOLUTION** This time the logarithm is the inner function, so the Chain Rule gives

$$f'(x) = \tfrac{1}{2}(\ln x)^{-1/2}\frac{d}{dx}(\ln x) = \frac{1}{2\sqrt{\ln x}} \cdot \frac{1}{x} = \frac{1}{2x\sqrt{\ln x}}$$ ■

Figure 1 shows the graph of the function $f$ of Example 4 together with the graph of its derivative. It gives a visual check on our calculation. Notice that $f'(x)$ is large negative when $f$ is rapidly decreasing and $f'(x) = 0$ when $f$ has a minimum.

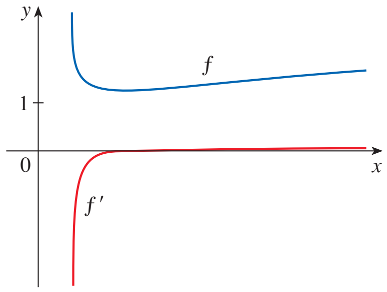

**FIGURE 1**

**EXAMPLE 4** Find $\dfrac{d}{dx}\ln\dfrac{x + 1}{\sqrt{x - 2}}$.

**SOLUTION 1**

$$\begin{aligned}\frac{d}{dx}\ln\frac{x + 1}{\sqrt{x - 2}} &= \frac{1}{\dfrac{x + 1}{\sqrt{x - 2}}}\,\frac{d}{dx}\frac{x + 1}{\sqrt{x - 2}} \\ &= \frac{\sqrt{x - 2}}{x + 1}\,\frac{\sqrt{x - 2} \cdot 1 - (x + 1)\left(\frac{1}{2}\right)(x - 2)^{-1/2}}{x - 2} \\ &= \frac{x - 2 - \frac{1}{2}(x + 1)}{(x + 1)(x - 2)} \\ &= \frac{x - 5}{2(x + 1)(x - 2)}\end{aligned}$$

**SOLUTION 2** If we first expand the given function using the laws of logarithms, then the differentiation becomes easier:

$$\frac{d}{dx}\ln\frac{x+1}{\sqrt{x-2}} = \frac{d}{dx}\left[\ln(x+1) - \tfrac{1}{2}\ln(x-2)\right]$$

$$= \frac{1}{x+1} - \frac{1}{2}\left(\frac{1}{x-2}\right)$$

(This answer can be left as written, but if we used a common denominator we would see that it gives the same answer as in Solution 1.) ■

**EXAMPLE 5** Find the absolute minimum value of $f(x) = x^2 \ln x$.

**SOLUTION** The domain is $(0, \infty)$ and the Product Rule gives

$$f'(x) = x^2 \cdot \frac{1}{x} + 2x\ln x = x(1 + 2\ln x)$$

Therefore $f'(x) = 0$ when $2\ln x = -1$, that is, $\ln x = -\frac{1}{2}$, or $x = e^{-1/2}$. Also, $f'(x) > 0$ when $x > e^{-1/2}$ and $f'(x) < 0$ for $0 < x < e^{-1/2}$. So, by the First Derivative Test for Absolute Extreme Values, $f\left(1/\sqrt{e}\right) = -1/(2e)$ is the absolute minimum. ■

**EXAMPLE 6** Discuss the curve $y = \ln(4 - x^2)$ using the guidelines of Section 3.5.

**A. Domain** The domain is

$$\{x \mid 4 - x^2 > 0\} = \{x \mid x^2 < 4\} = \{x \mid |x| < 2\} = (-2, 2)$$

**B. Intercepts** The $y$-intercept is $f(0) = \ln 4$. To find the $x$-intercept we set

$$y = \ln(4 - x^2) = 0$$

We know that $\ln 1 = \log_e 1 = 0$ (since $e^0 = 1$), so we have $4 - x^2 = 1 \Rightarrow x^2 = 3$ and therefore the $x$-intercepts are $\pm\sqrt{3}$.

**C. Symmetry** Since $f(-x) = f(x)$, $f$ is even and the curve is symmetric about the $y$-axis.

**D. Asymptotes** We look for vertical asymptotes at the endpoints of the domain. Since $4 - x^2 \to 0^+$ as $x \to 2^-$ and also as $x \to -2^+$, we have

$$\lim_{x\to 2^-} \ln(4 - x^2) = -\infty \qquad \lim_{x\to -2^+} \ln(4 - x^2) = -\infty$$

by (6.3.9). Thus the lines $x = 2$ and $x = -2$ are vertical asymptotes.

**E. Intervals of Increase or Decrease**

$$f'(x) = \frac{-2x}{4 - x^2}$$

Since $f'(x) > 0$ when $-2 < x < 0$ and $f'(x) < 0$ when $0 < x < 2$, $f$ is increasing on $(-2, 0)$ and decreasing on $(0, 2)$.

**F. Local Maximum or Minimum Values** The only critical number is $x = 0$. Since $f'$ changes from positive to negative at 0, $f(0) = \ln 4$ is a local maximum by the First Derivative Test.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

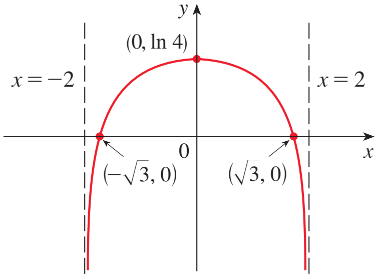

**FIGURE 2**
$y = \ln(4 - x^2)$

**G. Concavity and Points of Inflection**

$$f''(x) = \frac{(4 - x^2)(-2) + 2x(-2x)}{(4 - x^2)^2} = \frac{-8 - 2x^2}{(4 - x^2)^2}$$

Since $f''(x) < 0$ for all $x$, the curve is concave downward on $(-2, 2)$ and has no inflection point.

**H. Sketch the Curve** Using this information, we sketch the curve in Figure 2. ■

**EXAMPLE 7** Find $f'(x)$ if $f(x) = \ln|x|$.

**SOLUTION** Since

$$f(x) = \begin{cases} \ln x & \text{if } x > 0 \\ \ln(-x) & \text{if } x < 0 \end{cases}$$

it follows that

$$f'(x) = \begin{cases} \dfrac{1}{x} & \text{if } x > 0 \\[2ex] \dfrac{1}{-x}(-1) = \dfrac{1}{x} & \text{if } x < 0 \end{cases}$$

Thus $f'(x) = 1/x$ for all $x \neq 0$. ■

Figure 3 shows the graph of the function $f(x) = \ln|x|$ in Example 7 and its derivative $f'(x) = 1/x$. Notice that when $x$ is small, the graph of $y = \ln|x|$ is steep and so $f'(x)$ is large (positive or negative).

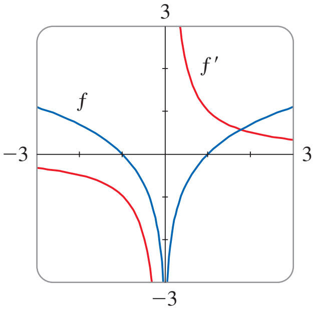

**FIGURE 3**

The result of Example 7 is worth remembering:

**3**
$$\boxed{\frac{d}{dx} \ln|x| = \frac{1}{x}}$$

## Integrals involving the Natural Logarithm

Formula 3 leads to the following integration formula.

**4**
$$\boxed{\int \frac{1}{x}\, dx = \ln|x| + C}$$

We understand that Formula 4 is valid on any interval not containing 0. Notice that this fills the gap in the rule for integrating power functions:

$$\int x^n\, dx = \frac{x^{n+1}}{n + 1} + C \qquad \text{if } n \neq -1$$

The missing case $(n = -1)$ is supplied by Formula 4.

**EXAMPLE 8** Find, correct to three decimal places, the area of the region under the hyperbola $xy = 1$ from $x = 1$ to $x = 2$.

**SOLUTION** The given region is shown in Figure 4. Using Formula 4 (without the absolute value sign, since $x > 0$), we see that the area is

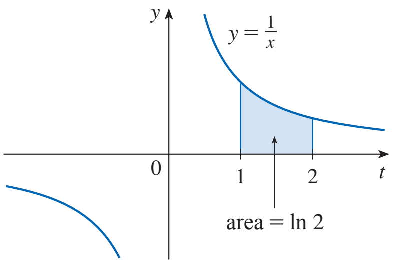

**FIGURE 4**

$$A = \int_1^2 \frac{1}{x}\, dx = \ln x \Big]_1^2$$
$$= \ln 2 - \ln 1 = \ln 2 \approx 0.693$$ ■

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 9** Evaluate $\int \frac{x}{x^2+1}\,dx$.

**SOLUTION** We make the substitution $u = x^2 + 1$ because the differential $du = 2x\,dx$ occurs (except for the constant factor 2). Thus $x\,dx = \frac{1}{2}\,du$ and

$$\begin{aligned}\int \frac{x}{x^2+1}\,dx &= \tfrac{1}{2}\int \frac{du}{u} = \tfrac{1}{2}\ln|u| + C\\ &= \tfrac{1}{2}\ln|x^2+1| + C = \tfrac{1}{2}\ln(x^2+1) + C\end{aligned}$$

Notice that we removed the absolute value bars because $x^2 + 1 > 0$ for all $x$. We could use the laws of logarithms to write the answer as

$$\ln\sqrt{x^2+1} + C$$

but this isn't necessary. ■

Because the function $f(x) = (\ln x)/x$ in Example 10 is positive for $x > 1$, the integral represents the area of the shaded region in Figure 5.

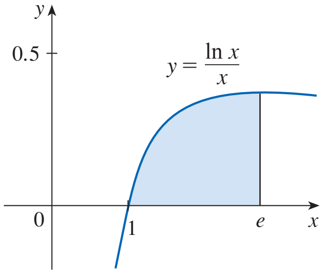

**FIGURE 5**

**EXAMPLE 10** Evaluate $\int_1^e \frac{\ln x}{x}\,dx$.

**SOLUTION** We let $u = \ln x$ because its differential $du = (1/x)\,dx$ occurs in the integral. When $x = 1$, $u = \ln 1 = 0$; when $x = e$, $u = \ln e = 1$. Thus

$$\int_1^e \frac{\ln x}{x}\,dx = \int_0^1 u\,du = \frac{u^2}{2}\bigg]_0^1 = \frac{1}{2}$$ ■

**EXAMPLE 11** Evaluate $\int \tan x\,dx$.

**SOLUTION** First we write tangent in terms of sine and cosine:

$$\int \tan x\,dx = \int \frac{\sin x}{\cos x}\,dx$$

This suggests that we should substitute $u = \cos x$, since then $du = -\sin x\,dx$ and so $\sin x\,dx = -du$:

$$\begin{aligned}\int \tan x\,dx &= \int \frac{\sin x}{\cos x}\,dx = -\int \frac{1}{u}\,du\\ &= -\ln|u| + C = -\ln|\cos x| + C\end{aligned}$$ ■

Notice that $-\ln|\cos x| = \ln(|\cos x|^{-1}) = \ln(1/|\cos x|) = \ln|\sec x|$, so the result of Example 11 can also be written as

**5** $$\boxed{\int \tan x\,dx = \ln|\sec x| + C}$$

## ■ General Logarithmic and Exponential Functions

Formula 6.3.8 expresses a logarithmic function with base $b$ in terms of the natural logarithmic function:

$$\log_b x = \frac{\ln x}{\ln b}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Since ln $b$ is a constant, we can differentiate as follows:

$$\frac{d}{dx}(\log_b x) = \frac{d}{dx}\frac{\ln x}{\ln b} = \frac{1}{\ln b}\frac{d}{dx}(\ln x) = \frac{1}{x \ln b}$$

**6**
$$\boxed{\frac{d}{dx}(\log_b x) = \frac{1}{x \ln b}}$$

**EXAMPLE 12** Differentiate $f(x) = \log_{10}(2 + \sin x)$.

**SOLUTION** Using Formula 6 with $b = 10$ and the Chain Rule, we get

$$\begin{aligned} f'(x) &= \frac{d}{dx}\log_{10}(2 + \sin x) \\ &= \frac{1}{(2 + \sin x)\ln 10}\frac{d}{dx}(2 + \sin x) \\ &= \frac{\cos x}{(2 + \sin x)\ln 10} \end{aligned}$$ ■

From Formula 6 we see one of the main reasons that natural logarithms (logarithms with base $e$) are used in calculus: the differentiation formula is simplest when $b = e$ because $\ln e = 1$.

**Exponential Functions with Base *b*** In Section 6.2 we showed that the derivative of the general exponential function $f(x) = b^x$, $b > 0$, is a constant multiple of itself:

$$f'(x) = f'(0)b^x \qquad \text{where} \qquad f'(0) = \lim_{h \to 0}\frac{b^h - 1}{h}$$

We are now in a position to show that the value of the constant is $f'(0) = \ln b$.

**7**
$$\boxed{\frac{d}{dx}(b^x) = b^x \ln b}$$

**PROOF** We use the fact that $e^{\ln b} = b$:

$$\begin{aligned} \frac{d}{dx}(b^x) &= \frac{d}{dx}(e^{\ln b})^x = \frac{d}{dx}e^{(\ln b)x} = e^{(\ln b)x}\frac{d}{dx}(\ln b)x \\ &= (e^{\ln b})^x(\ln b) = b^x \ln b \end{aligned}$$ ■

In Example 2.7.6 we considered a population of bacteria cells that doubles every hour and we saw that the population after $t$ hours is $n = n_0 2^t$, where $n_0$ is the initial population. Formula 7 enables us to find the growth rate:

$$\frac{dn}{dt} = n_0 2^t \ln 2$$

**EXAMPLE 13** Combining Formula 7 with the Chain Rule, we have

$$\frac{d}{dx}\left(10^{x^2}\right) = 10^{x^2}(\ln 10)\frac{d}{dx}(x^2) = (2\ln 10)x10^{x^2}$$ ■

The integration formula that follows from Formula 7 is

$$\boxed{\int b^x\,dx = \frac{b^x}{\ln b} + C \qquad b \neq 1}$$

**EXAMPLE 14**

$$\int_0^5 2^x\,dx = \frac{2^x}{\ln 2}\bigg]_0^5 = \frac{2^5}{\ln 2} - \frac{2^0}{\ln 2} = \frac{31}{\ln 2}$$ ■

## ■ Logarithmic Differentiation

The calculation of derivatives of complicated functions involving products, quotients, or powers can often be simplified by taking logarithms. The method used in the following example is called **logarithmic differentiation**.

**EXAMPLE 15** Differentiate $y = \dfrac{x^{3/4}\sqrt{x^2+1}}{(3x+2)^5}$.

**SOLUTION** We take logarithms of both sides of the equation and use the laws of logarithms to simplify:

$$\ln y = \tfrac{3}{4}\ln x + \tfrac{1}{2}\ln(x^2+1) - 5\ln(3x+2)$$

Differentiating implicitly with respect to $x$ gives

$$\frac{1}{y}\frac{dy}{dx} = \frac{3}{4}\cdot\frac{1}{x} + \frac{1}{2}\cdot\frac{2x}{x^2+1} - 5\cdot\frac{3}{3x+2}$$

Solving for $dy/dx$, we get

$$\frac{dy}{dx} = y\left(\frac{3}{4x} + \frac{x}{x^2+1} - \frac{15}{3x+2}\right)$$

If we hadn't used logarithmic differentiation in Example 15, we would have had to use both the Quotient Rule and the Product Rule. The resulting calculation would have been horrendous.

Because we have an explicit expression for $y$, we can substitute and write

$$\frac{dy}{dx} = \frac{x^{3/4}\sqrt{x^2+1}}{(3x+2)^5}\left(\frac{3}{4x} + \frac{x}{x^2+1} - \frac{15}{3x+2}\right)$$ ■

### Steps in Logarithmic Differentiation

1. Take natural logarithms of both sides of an equation $y = f(x)$ and use the laws of logarithms to expand the expression.
2. Differentiate implicitly with respect to $x$.
3. Solve the resulting equation for $y'$ and replace $y$ by $f(x)$.

If $f(x) < 0$ for some values of $x$, then $\ln f(x)$ is not defined, but we can still use logarithmic differentiation by first writing $|y| = |f(x)|$ and then using Equation 3. We illustrate this procedure by proving the general version of the Power Rule, as promised in

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Section 2.3. Recall that the general version of the Power Rule states that if $n$ is any real number and $f(x) = x^n$, then $f'(x) = nx^{n-1}$.

**PROOF OF THE POWER RULE (GENERAL VERSION)** Let $y = x^n$ and use logarithmic differentiation:

If $x = 0$, we can show that $f'(0) = 0$ for $n > 1$ directly from the definition of a derivative.

$$\ln|y| = \ln|x|^n = n\ln|x| \qquad x \neq 0$$

Therefore
$$\frac{y'}{y} = \frac{n}{x}$$

Hence
$$y' = n\frac{y}{x} = n\frac{x^n}{x} = nx^{n-1}$$ ■

You should distinguish carefully between the Power Rule $[(d/dx)x^n = nx^{n-1}]$, where the base is variable and the exponent is constant, and the rule for differentiating exponential functions $[(d/dx)b^x = b^x \ln b]$, where the base is constant and the exponent is variable.

In general there are four cases for exponents and bases:

Constant base, constant exponent

**1.** $\dfrac{d}{dx}(b^n) = 0 \qquad$ ($b$ and $n$ are constants)

Variable base, constant exponent

**2.** $\dfrac{d}{dx}[f(x)]^n = n[f(x)]^{n-1}f'(x)$

Constant base, variable exponent

**3.** $\dfrac{d}{dx}[b^{g(x)}] = b^{g(x)}(\ln b)g'(x)$

Variable base, variable exponent

**4.** To find $(d/dx)\,[f(x)]^{g(x)}$, logarithmic differentiation can be used, as in the next example.

**EXAMPLE 16** Differentiate $y = x^{\sqrt{x}}$.

**SOLUTION 1** Since both the base and the exponent are variable, we use logarithmic differentiation:

$$\ln y = \ln x^{\sqrt{x}} = \sqrt{x}\,\ln x$$

$$\frac{y'}{y} = \sqrt{x}\cdot\frac{1}{x} + (\ln x)\frac{1}{2\sqrt{x}}$$

$$y' = y\left(\frac{1}{\sqrt{x}} + \frac{\ln x}{2\sqrt{x}}\right) = x^{\sqrt{x}}\left(\frac{2 + \ln x}{2\sqrt{x}}\right)$$

Figure 6 illustrates Example 16 by showing the graphs of $f(x) = x^{\sqrt{x}}$ and its derivative.

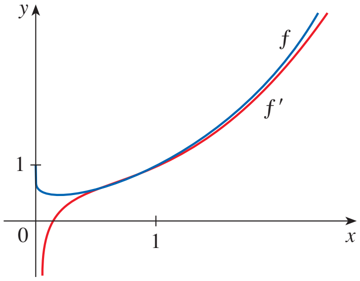

**FIGURE 6**

**SOLUTION 2** Another method is to use Equation 6.3.7 to write $x^{\sqrt{x}} = e^{\sqrt{x}\,\ln x}$:

$$\frac{d}{dx}\left(x^{\sqrt{x}}\right) = \frac{d}{dx}\left(e^{\sqrt{x}\,\ln x}\right) = e^{\sqrt{x}\,\ln x}\frac{d}{dx}\left(\sqrt{x}\,\ln x\right)$$

$$= x^{\sqrt{x}}\left(\frac{2 + \ln x}{2\sqrt{x}}\right) \qquad \text{(as in Solution 1)}$$ ■

## The Number $e$ as a Limit

We have shown that if $f(x) = \ln x$, then $f'(x) = 1/x$. Thus $f'(1) = 1$. We now use this fact to express the number $e$ as a limit.

From the definition of a derivative as a limit, we have

$$\begin{aligned} f'(1) &= \lim_{h\to 0}\frac{f(1+h)-f(1)}{h} = \lim_{x\to 0}\frac{f(1+x)-f(1)}{x} \\ &= \lim_{x\to 0}\frac{\ln(1+x)-\ln 1}{x} = \lim_{x\to 0}\frac{1}{x}\ln(1+x) \\ &= \lim_{x\to 0}\ln(1+x)^{1/x} \end{aligned}$$

Because $f'(1) = 1$, we have

$$\lim_{x\to 0}\ln(1+x)^{1/x} = 1$$

Then, by Theorem 1.8.8 and the continuity of the exponential function, we have

$$e = e^1 = e^{\lim_{x\to 0}\ln(1+x)^{1/x}} = \lim_{x\to 0} e^{\ln(1+x)^{1/x}} = \lim_{x\to 0}(1+x)^{1/x}$$

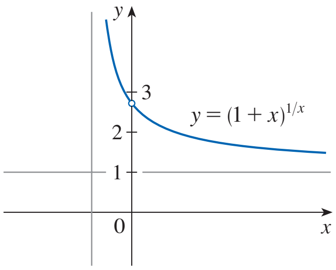

**FIGURE 7**

| $x$ | $(1+x)^{1/x}$ |
|---|---|
| 0.1 | 2.59374246 |
| 0.01 | 2.70481383 |
| 0.001 | 2.71692393 |
| 0.0001 | 2.71814593 |
| 0.00001 | 2.71826824 |
| 0.000001 | 2.71828047 |
| 0.0000001 | 2.71828169 |
| 0.00000001 | 2.71828181 |

**8**

$$\boxed{e = \lim_{x\to 0}(1+x)^{1/x}}$$

Formula 8 is illustrated by the graph of the function $y = (1+x)^{1/x}$ in Figure 7 and a table of values for small values of $x$. This illustrates the fact that, correct to seven decimal places,

$$e \approx 2.7182818$$

If we put $n = 1/x$ in Formula 8, then $n \to \infty$ as $x \to 0^+$ and so an alternative expression for $e$ is

**9**

$$\boxed{e = \lim_{n\to\infty}\left(1+\frac{1}{n}\right)^n}$$

## 6.4 Exercises

**1.** Explain why the natural logarithmic function $y = \ln x$ is used much more frequently in calculus than the other logarithmic functions $y = \log_b x$.

**2–28** Differentiate the function.

**2.** $g(t) = \ln(3 + t^2)$

**3.** $f(x) = \ln(x^2 + 3x + 5)$

**4.** $f(x) = x\ln x - x$

**5.** $f(x) = \sin(\ln x)$

**6.** $f(x) = \ln(\sin^2 x)$

**7.** $f(x) = \ln\dfrac{1}{x}$

**8.** $y = \dfrac{1}{\ln x}$

**9.** $g(x) = \ln(xe^{-2x})$

**10.** $g(t) = \sqrt{1 + \ln t}$

**11.** $F(t) = (\ln t)^2 \sin t$

**12.** $p(t) = \ln\sqrt{t^2 + 1}$

**13.** $y = \log_8(x^2 + 3x)$

**14.** $y = \log_{10}\sec x$

**15.** $f(u) = \dfrac{\ln u}{1 + \ln(2u)}$

**16.** $y = \ln(\csc x - \cot x)$

**17.** $f(x) = x^5 + 5^x$

**18.** $g(x) = x\sin(2^x)$

**19.** $T(z) = 2^z\log_2 z$

**20.** $g(x) = e^{x^2\ln x}$

**21.** $g(t) = \ln\dfrac{t(t^2+1)^4}{\sqrt[3]{2t-1}}$

**22.** $y = \ln\sqrt{\dfrac{1+2x}{1-2x}}$

**23.** $y = \ln|3 - 2x^5|$

**24.** $y = \ln(e^{-x} + xe^{-x})$

**25.** $y = \tan[\ln(ax + b)]$ **26.** $y = \log_2(x \log_5 x)$

**27.** $G(x) = 4^{C/x}$ **28.** $F(t) = 3^{\cos 2t}$

**29.** Show that $\dfrac{d}{dx} \ln\left(x + \sqrt{x^2 + 1}\right) = \dfrac{1}{\sqrt{x^2 + 1}}$.

**30.** Show that $\dfrac{d}{dx} \ln \sqrt{\dfrac{1 - \cos x}{1 + \cos x}} = \csc x$.

**31–34** Find $y'$ and $y''$.

**31.** $y = \sqrt{x} \ln x$ **32.** $y = \dfrac{\ln x}{1 + \ln x}$

**33.** $y = \ln|\sec x|$ **34.** $y = \ln(1 + \ln x)$

**35–38** Differentiate $f$ and find the domain of $f$.

**35.** $f(x) = \dfrac{x}{1 - \ln(x - 1)}$ **36.** $f(x) = \sqrt{2 + \ln x}$

**37.** $f(x) = \ln(x^2 - 2x)$ **38.** $f(x) = \ln \ln \ln x$

**39.** If $f(x) = \ln(x + \ln x)$, find $f'(1)$.

**40.** If $f(x) = \cos(\ln x^2)$, find $f'(1)$.

**41–42** Find an equation of the tangent line to the curve at the given point.

**41.** $y = \ln(x^2 - 3x + 1)$, $(3, 0)$

**42.** $y = x^2 \ln x$, $(1, 0)$

**43.** If $f(x) = \sin x + \ln x$, find $f'(x)$. Check that your answer is reasonable by comparing the graphs of $f$ and $f'$.

**44.** Find equations of the tangent lines to the curve $y = (\ln x)/x$ at the points $(1, 0)$ and $(e, 1/e)$. Illustrate by graphing the curve and its tangent lines.

**45.** Let $f(x) = cx + \ln(\cos x)$. For what value of $c$ is $f'(\pi/4) = 6$?

**46.** Let $f(x) = \log_b(3x^2 - 2)$. For what value of $b$ is $f'(1) = 3$?

**47–58** Use logarithmic differentiation to find the derivative of the function.

**47.** $y = (x^2 + 2)^2(x^4 + 4)^4$ **48.** $y = \dfrac{e^{-x}\cos^2 x}{x^2 + x + 1}$

**49.** $y = \sqrt{\dfrac{x - 1}{x^4 + 1}}$ **50.** $y = \sqrt{x}\, e^{x^2 - x}(x + 1)^{2/3}$

**51.** $y = x^x$ **52.** $y = x^{1/x}$

**53.** $y = x^{\sin x}$ **54.** $y = \left(\sqrt{x}\right)^x$

**55.** $y = (\cos x)^x$ **56.** $y = (\sin x)^{\ln x}$

**57.** $y = x^{\ln x}$ **58.** $y = (\ln x)^{\cos x}$

**59.** Find $y'$ if $y = \ln(x^2 + y^2)$.

**60.** Find $y'$ if $x^y = y^x$.

**61.** Find a formula for $f^{(n)}(x)$ if $f(x) = \ln(x - 1)$.

**62.** Find $\dfrac{d^9}{dx^9}(x^8 \ln x)$.

**63.** Find the intervals of concavity and the inflection points of the function $f(x) = (\ln x)/\sqrt{x}$.

**64.** Find the absolute minimum value of the function $f(x) = x \ln x$.

**65–68** Discuss the curve under the guidelines of Section 3.5.

**65.** $y = \ln(\sin x)$ **66.** $y = \ln(\tan^2 x)$

**67.** $y = \ln(1 + x^2)$ **68.** $y = \ln(1 + x^3)$

T **69.** If $f(x) = \ln(2x + x \sin x)$, use a computer algebra system to compute $f'$ and $f''$. Then use the graphs of $f$, $f'$, and $f''$ to estimate the intervals of increase and the inflection points of $f$ on the interval $(0, 15]$.

**70.** Investigate the family of curves $f(x) = \ln(x^2 + c)$. What happens to the inflection points and asymptotes as $c$ changes? Graph several members of the family to illustrate what you discover.

**71–72** Use a graph to estimate the solutions of the equation correct to one decimal place. Then use these estimates as the initial approximations in Newton's method to find the solutions correct to six decimal places.

**71.** $(x - 4)^2 = \ln x$ **72.** $\ln(4 - x^2) = x$

**73.** (a) Find the linear approximation to $f(x) = \ln x$ near 1.
(b) Illustrate part (a) by graphing $f$ and its linearization.
(c) For what values of $x$ is the linear approximation accurate to within 0.1?

**74.** The table gives the US population from 1790 to 1860.

| Year | Population | Year | Population |
|---|---|---|---|
| 1790 | 3,929,000 | 1830 | 12,861,000 |
| 1800 | 5,308,000 | 1840 | 17,063,000 |
| 1810 | 7,240,000 | 1850 | 23,192,000 |
| 1820 | 9,639,000 | 1860 | 31,443,000 |

T (a) Fit an exponential function to the data. Graph the data points and the exponential model. How good is the fit?
(b) Estimate the rates of population growth in 1800 and 1850 by averaging slopes of secant lines.
(c) Use the exponential model in part (a) to estimate the rates of growth in 1800 and 1850. Compare these estimates with the ones in part (b).
(d) Use the exponential model to predict the population in 1870. Compare with the actual population of 38,558,000. Can you explain the discrepancy?

**75–86** Evaluate the integral.

**75.** $\int_2^4 \frac{3}{x}\,dx$

**76.** $\int_0^3 \frac{dx}{5x+1}$

**77.** $\int_1^2 \frac{dt}{8-3t}$

**78.** $\int_4^9 \left(\sqrt{x} + \frac{1}{\sqrt{x}}\right)^2 dx$

**79.** $\int_1^3 \left(\frac{3x^2+4x+1}{x}\right) dx$

**80.** $\int \frac{\cos(\ln t)}{t}\,dt$

**81.** $\int \frac{(\ln x)^2}{x}\,dx$

**82.** $\int \frac{z^2}{z^3+1}\,dz$

**83.** $\int \frac{\sin 2x}{1+\cos^2 x}\,dx$

**84.** $\int \frac{e^x}{e^x+1}\,dx$

**85.** $\int_0^4 2^s\,ds$

**86.** $\int x2^{x^2}\,dx$

---

**87.** Show that $\int \cot x\,dx = \ln|\sin x| + C$ by (a) differentiating the right side of the equation and (b) using the method of Example 11.

**88.** Sketch the region enclosed by the curves

$$y = \frac{\ln x}{x} \quad \text{and} \quad y = \frac{(\ln x)^2}{x}$$

and find its area.

**89.** Find the volume of the solid obtained by rotating the region under the curve

$$y = \frac{1}{\sqrt{x+1}}$$

from 0 to 1 about the $x$-axis.

**90.** Find the volume of the solid obtained by rotating the region under the curve

$$y = \frac{1}{x^2+1}$$

from 0 to 3 about the $y$-axis.

**91.** The work done by a gas when it expands from volume $V_1$ to volume $V_2$ is $W = \int_{V_1}^{V_2} P\,dV$, where $P = P(V)$ is the pressure as a function of the volume $V$. (See Exercise 5.4.29.) Boyle's Law states that when a quantity of gas expands at constant temperature, $PV = C$, where $C$ is a constant. If the initial volume is 600 cm$^3$ and the initial pressure is 150 kPa, find the work done by the gas when it expands at constant temperature to 1000 cm$^3$.

**92.** Find $f$ if $f''(x) = x^{-2}$, $x > 0$, $f(1) = 0$, and $f(2) = 0$.

**93.** If $g$ is the inverse function of $f(x) = 2x + \ln x$, find $g'(2)$.

**94.** If $f(x) = e^x + \ln x$ and $h(x) = f^{-1}(x)$, find $h'(e)$.

**95.** For what values of $m$ do the line $y = mx$ and the curve $y = x/(x^2+1)$ enclose a region? Find the area of the region.

**96.** Show that $\lim_{n\to\infty}\left(1 + \frac{x}{n}\right)^n = e^x$ for any $x > 0$.

**97.** Use the definition of a derivative to prove that

$$\lim_{x\to 0}\frac{\ln(1+x)}{x} = 1$$

**98.** The difficulty of "acquiring a target" (such as using a mouse to click on an icon on a computer screen) depends on the ratio between the distance $D$ to the target and width $W$ of the target. According to *Fitts' law*, the index $I$ of difficulty is modeled by

$$I = \log_2\left(\frac{2D}{W}\right)$$

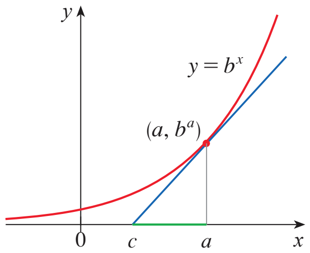
This law is used for designing products that involve human–computer interactions.

(a) If $W$ is held constant, what is the rate of change of $I$ with respect to $D$? Does this rate increase or decrease with increasing values of $D$?

(b) If $D$ is held constant, what is the rate of change of $I$ with respect to $W$? What does the negative sign in your answer indicate? Does this rate increase or decrease with increasing values of $W$?

(c) Do your answers to parts (a) and (b) agree with your intuition?

**99.** Let $c$ be the $x$-intercept of the tangent line to the curve $y = b^x$ $(b > 0, b \neq 1)$ at the point $(a, b^a)$. Show that the distance between the points $(a, 0)$ and $(c, 0)$ is the same for all values of $a$.



**100.** On every exponential curve $y = b^x$ $(b > 0, b \neq 1)$, there is exactly one point $(x_0, y_0)$ at which the tangent line to the curve passes through the origin. Show that in every case, $y_0 = e$. [*Hint:* You may wish to use Formula 6.3.7.]

## 6.2* The Natural Logarithmic Function

If your instructor has assigned Sections 6.2–6.4, you need not read Sections 6.2*, 6.3*, and 6.4*.

In this section we define the natural logarithm as an integral and then show that it obeys the usual laws of logarithms. The Fundamental Theorem makes it easy to differentiate this function.

### Properties and the Derivative of the Natural Logarithm Function

We first define the natural logarithmic function in terms of an integral of the reciprocal function.

**1 Definitio** The **natural logarithmic function** is the function defined by

$$\ln x = \int_1^x \frac{1}{t}\,dt \qquad x > 0$$

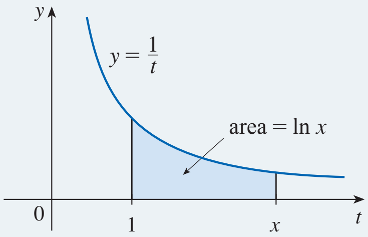

**FIGURE 1**

The existence of this function depends on the fact that the integral of a continuous function always exists. If $x > 1$, then $\ln x$ can be interpreted geometrically as the area under the hyperbola $y = 1/t$ from $t = 1$ to $t = x$. (See Figure 1.) For $x = 1$, we have

$$\ln 1 = \int_1^1 \frac{1}{t}\,dt = 0$$

For $0 < x < 1$,

$$\ln x = \int_1^x \frac{1}{t}\,dt = -\int_x^1 \frac{1}{t}\,dt < 0$$

and so $\ln x$ is the negative of the area shaded in Figure 2.

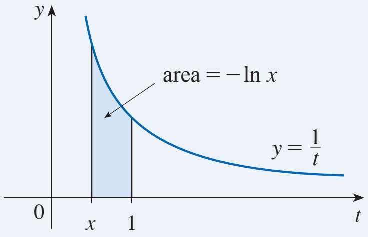

**FIGURE 2**

**EXAMPLE 1**

(a) By comparing areas, show that $\frac{1}{2} < \ln 2 < \frac{3}{4}$.

(b) Use the Midpoint Rule with $n = 10$ to estimate the value of ln 2.

**SOLUTION**

(a) We can interpret ln 2 as the area under the curve $y = 1/t$ from 1 to 2. From Figure 3 we see that this area is larger than the area of rectangle *BCDE* and smaller than the area of trapezoid *ABCD*. Thus we have

$$\frac{1}{2} \cdot 1 < \ln 2 < 1 \cdot \frac{1}{2}\left(1 + \frac{1}{2}\right)$$

$$\frac{1}{2} < \ln 2 < \frac{3}{4}$$

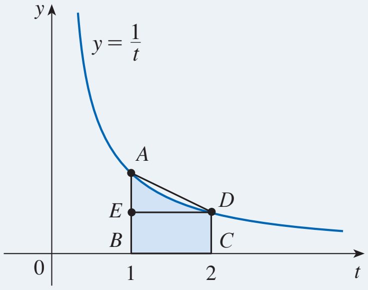

**FIGURE 3**

(b) If we use the Midpoint Rule with $f(t) = 1/t$, $n = 10$, and $\Delta t = 0.1$, we get

$$\ln 2 = \int_1^2 \frac{1}{t}\,dt \approx (0.1)[f(1.05) + f(1.15) + \cdots + f(1.95)]$$

$$= (0.1)\left(\frac{1}{1.05} + \frac{1}{1.15} + \cdots + \frac{1}{1.95}\right) \approx 0.693$$ ■

Notice that the integral that defines $\ln x$ is exactly the type of integral discussed in Part 1 of the Fundamental Theorem of Calculus (see Section 4.3). In fact, using that theorem, we have

$$\frac{d}{dx}\int_1^x \frac{1}{t}\,dt = \frac{1}{x}$$

and so

$$\boxed{2} \qquad \boxed{\frac{d}{dx}(\ln x) = \frac{1}{x}}$$

We now use this differentiation rule to prove the following properties of the logarithm function.

$\boxed{3}$ **Laws of Logarithms** If $x$ and $y$ are positive numbers and $r$ is a rational number, then

**1.** $\ln(xy) = \ln x + \ln y$ **2.** $\ln\left(\dfrac{x}{y}\right) = \ln x - \ln y$ **3.** $\ln(x^r) = r \ln x$

**PROOF**

**1.** Let $f(x) = \ln(ax)$, where $a$ is a positive constant. Then, using Equation 2 and the Chain Rule, we have

$$f'(x) = \frac{1}{ax}\frac{d}{dx}(ax) = \frac{1}{ax} \cdot a = \frac{1}{x}$$

Therefore $f(x)$ and $\ln x$ have the same derivative and so they must differ by a constant:

$$\ln(ax) = \ln x + C$$

Putting $x = 1$ in this equation, we get $\ln a = \ln 1 + C = 0 + C = C$. Thus

$$\ln(ax) = \ln x + \ln a$$

If we now replace the constant $a$ by any number $y$, we have

$$\ln(xy) = \ln x + \ln y$$

**2.** Using Law 1 with $x = 1/y$, we have

$$\ln\frac{1}{y} + \ln y = \ln\left(\frac{1}{y} \cdot y\right) = \ln 1 = 0$$

and so $$\ln\frac{1}{y} = -\ln y$$

Using Law 1 again, we have

$$\ln\left(\frac{x}{y}\right) = \ln\left(x \cdot \frac{1}{y}\right) = \ln x + \ln\frac{1}{y} = \ln x - \ln y$$

The proof of Law 3 is left as an exercise. ■

**EXAMPLE 2** Use the laws of logarithms to expand the expression $\ln\dfrac{(x^2+5)^4 \sin x}{x^3+1}$.

**SOLUTION** Using Laws 1, 2, and 3, we get

$$\begin{aligned}\ln\frac{(x^2+5)^4 \sin x}{x^3+1} &= \ln(x^2+5)^4 + \ln \sin x - \ln(x^3+1)\\ &= 4\ln(x^2+5) + \ln \sin x - \ln(x^3+1)\end{aligned}$$ ■

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 3** Express $\ln a + \frac{1}{2}\ln b$ as a single logarithm.

**SOLUTION** Using Laws 3 and 1 of logarithms, we have

$$\begin{aligned}\ln a + \tfrac{1}{2}\ln b &= \ln a + \ln b^{1/2}\\ &= \ln a + \ln\sqrt{b}\\ &= \ln\left(a\sqrt{b}\,\right)\end{aligned}$$ ■

In order to graph $y = \ln x$, we first determine its limits:

$$\boxed{4} \qquad \boxed{\text{(a)}\ \lim_{x\to\infty} \ln x = \infty \qquad \text{(b)}\ \lim_{x\to 0^+} \ln x = -\infty}$$

**PROOF**

(a) Using Law 3 with $x = 2$ and $r = n$ (where $n$ is any positive integer), we have $\ln(2^n) = n\ln 2$. Now $\ln 2 > 0$, so this shows that $\ln(2^n) \to \infty$ as $n \to \infty$. But $\ln x$ is an increasing function since its derivative $1/x > 0$. Therefore $\ln x \to \infty$ as $x \to \infty$.

(b) If we let $t = 1/x$, then $t \to \infty$ as $x \to 0^+$. Thus, using (a), we have

$$\lim_{x\to 0^+} \ln x = \lim_{t\to\infty} \ln\left(\frac{1}{t}\right) = \lim_{t\to\infty} (-\ln t) = -\infty$$ ■

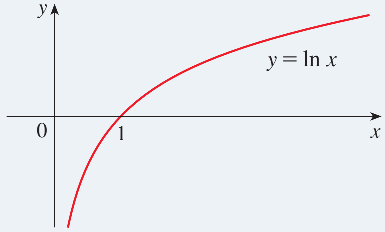

**FIGURE 4**

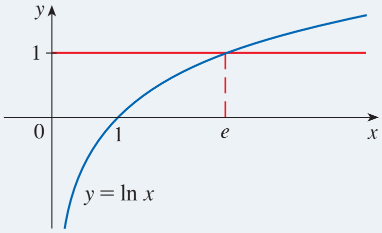

**FIGURE 5**

If $y = \ln x$, $x > 0$, then

$$\frac{dy}{dx} = \frac{1}{x} > 0 \qquad \text{and} \qquad \frac{d^2y}{dx^2} = -\frac{1}{x^2} < 0$$

which shows that $\ln x$ is increasing and concave downward on $(0, \infty)$. Putting this information together with (4), we draw the graph of $y = \ln x$ in Figure 4.

Since $\ln 1 = 0$ and $\ln x$ is an increasing continuous function that takes on arbitrarily large values, the Intermediate Value Theorem shows that there is a number where $\ln x$ takes on the value 1. (See Figure 5.) This important number is denoted by $e$.

**5 Definitio** $e$ is the number such that $\ln e = 1$.

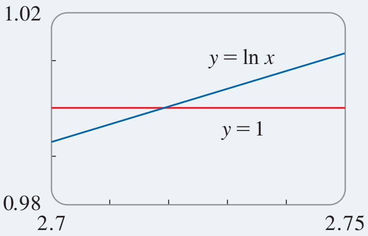

**FIGURE 6**

**EXAMPLE 4** Use a graphing calculator or computer to estimate the value of $e$.

**SOLUTION** According to Definition 5, we can estimate the value of $e$ by graphing the curves $y = \ln x$ and $y = 1$, as in Figure 6, and determining the $x$-coordinate of the point of intersection. Doing so, we estimate that

$$e \approx 2.718$$ ■

With more sophisticated methods, it can be shown that the approximate value of $e$, to 20 decimal places, is

$$e \approx 2.71828182845904523536$$

The decimal expansion of $e$ is nonrepeating because $e$ is an irrational number.

Now let's use Formula 2 to differentiate functions that involve the natural logarithmic function.

**EXAMPLE 5** Differentiate $y = \ln(x^3 + 1)$.

**SOLUTION** To use the Chain Rule, we let $u = x^3 + 1$. Then $y = \ln u$, so

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = \frac{1}{u}\frac{du}{dx} = \frac{1}{x^3 + 1}(3x^2) = \frac{3x^2}{x^3 + 1} \qquad ■$$

In general, if we combine Formula 2 with the Chain Rule as in Example 5, we get

$$\boxed{6} \quad \boxed{\frac{d}{dx}(\ln u) = \frac{1}{u}\frac{du}{dx}} \quad \text{or} \quad \boxed{\frac{d}{dx}[\ln g(x)] = \frac{g'(x)}{g(x)}}$$

**EXAMPLE 6** Find $\dfrac{d}{dx}\ln(\sin x)$.

**SOLUTION** Using (6), we have

$$\frac{d}{dx}\ln(\sin x) = \frac{1}{\sin x}\frac{d}{dx}(\sin x) = \frac{1}{\sin x}\cos x = \cot x \qquad ■$$

**EXAMPLE 7** Differentiate $f(x) = \sqrt{\ln x}$.

**SOLUTION** This time the logarithm is the inner function, so the Chain Rule gives

$$f'(x) = \tfrac{1}{2}(\ln x)^{-1/2}\frac{d}{dx}(\ln x) = \frac{1}{2\sqrt{\ln x}} \cdot \frac{1}{x} = \frac{1}{2x\sqrt{\ln x}} \qquad ■$$

Figure 7 shows the graph of the function $f$ of Example 8 together with the graph of its derivative. It gives a visual check on our calculation. Notice that $f'(x)$ is large negative when $f$ is rapidly decreasing and $f'(x) = 0$ when $f$ has a minimum.

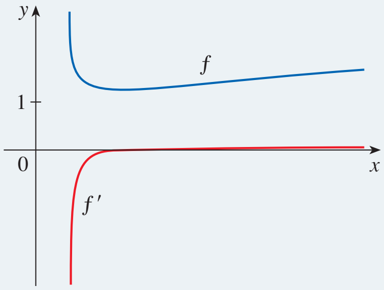

**FIGURE 7**

**EXAMPLE 8** Find $\dfrac{d}{dx}\ln\dfrac{x + 1}{\sqrt{x - 2}}$.

**SOLUTION 1**

$$\begin{aligned}
\frac{d}{dx}\ln\frac{x + 1}{\sqrt{x - 2}} &= \frac{1}{\dfrac{x + 1}{\sqrt{x - 2}}}\frac{d}{dx}\frac{x + 1}{\sqrt{x - 2}} \\
&= \frac{\sqrt{x - 2}}{x + 1}\,\frac{\sqrt{x - 2} \cdot 1 - (x + 1)\left(\frac{1}{2}\right)(x - 2)^{-1/2}}{x - 2} \\
&= \frac{x - 2 - \frac{1}{2}(x + 1)}{(x + 1)(x - 2)} \\
&= \frac{x - 5}{2(x + 1)(x - 2)}
\end{aligned}$$

**SOLUTION 2** If we first expand the given function using the laws of logarithms, then the differentiation becomes easier:

$$\begin{aligned}
\frac{d}{dx}\ln\frac{x + 1}{\sqrt{x - 2}} &= \frac{d}{dx}\left[\ln(x + 1) - \tfrac{1}{2}\ln(x - 2)\right] \\
&= \frac{1}{x + 1} - \frac{1}{2}\left(\frac{1}{x - 2}\right)
\end{aligned}$$

(This answer can be left as written, but if we used a common denominator we would see that it gives the same answer as in Solution 1.) ■

**EXAMPLE 9** Discuss the curve $y = \ln(4 - x^2)$ using the guidelines of Section 3.5.

**A. Domain** The domain is

$$\{x \mid 4 - x^2 > 0\} = \{x \mid x^2 < 4\} = \{x \mid |x| < 2\} = (-2, 2)$$

**B. Intercepts** The $y$-intercept is $f(0) = \ln 4$. To find the $x$-intercept we set

$$y = \ln(4 - x^2) = 0$$

We know that $\ln 1 = 0$, so we have $4 - x^2 = 1 \quad \Rightarrow \quad x^2 = 3$ and therefore the $x$-intercepts are $\pm\sqrt{3}$.

**C. Symmetry** Since $f(-x) = f(x)$, $f$ is even and the curve is symmetric about the $y$-axis.

**D. Asymptotes** We look for vertical asymptotes at the endpoints of the domain. Since $4 - x^2 \to 0^+$ as $x \to 2^-$ and also as $x \to -2^+$, we have

$$\lim_{x \to 2^-} \ln(4 - x^2) = -\infty \qquad \lim_{x \to -2^+} \ln(4 - x^2) = -\infty$$

Thus the lines $x = 2$ and $x = -2$ are vertical asymptotes.

**E. Intervals of Increase or Decrease**

$$f'(x) = \frac{-2x}{4 - x^2}$$

Since $f'(x) > 0$ when $-2 < x < 0$ and $f'(x) < 0$ when $0 < x < 2$, $f$ is increasing on $(-2, 0)$ and decreasing on $(0, 2)$.

**F. Local Maximum or Minimum Values** The only critical number is $x = 0$. Since $f'$ changes from positive to negative at 0, $f(0) = \ln 4$ is a local maximum by the First Derivative Test.

**G. Concavity and Points of Inflection**

$$f''(x) = \frac{(4 - x^2)(-2) + 2x(-2x)}{(4 - x^2)^2} = \frac{-8 - 2x^2}{(4 - x^2)^2}$$

Since $f''(x) < 0$ for all $x$, the curve is concave downward on $(-2, 2)$ and has no inflection point.

**H. Sketch the Curve** Using this information, we sketch the curve in Figure 8. ■

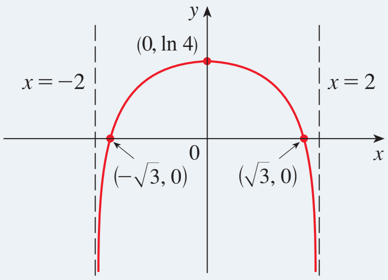

**FIGURE 8**
$y = \ln(4 - x^2)$

Figure 9 shows the graph of the function $f(x) = \ln|x|$ in Example 10 and its derivative $f'(x) = 1/x$. Notice that when $x$ is small, the graph of $y = \ln|x|$ is steep and so $f'(x)$ is large (positive or negative).

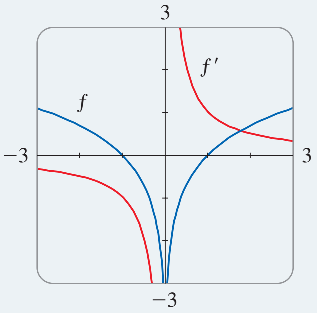

**FIGURE 9**

**EXAMPLE 10** Find $f'(x)$ if $f(x) = \ln|x|$.

**SOLUTION** Since

$$f(x) = \begin{cases} \ln x & \text{if } x > 0 \\ \ln(-x) & \text{if } x < 0 \end{cases}$$

it follows that

$$f'(x) = \begin{cases} \dfrac{1}{x} & \text{if } x > 0 \\[2ex] \dfrac{1}{-x}(-1) = \dfrac{1}{x} & \text{if } x < 0 \end{cases}$$

Thus $f'(x) = 1/x$ for all $x \neq 0$. ■

The result of Example 10 is worth remembering:

**7**
$$\boxed{\frac{d}{dx}\ln|x| = \frac{1}{x}}$$

## Integrals involving the Natural Logarithm

Formula 7 leads to the following integration formula.

**8**
$$\boxed{\int \frac{1}{x}\,dx = \ln|x| + C}$$

We understand that Formula 8 is valid on any interval not containing 0. Notice that this fills the gap in the rule for integrating power functions:

$$\int x^n\,dx = \frac{x^{n+1}}{n+1} + C \qquad \text{if } n \neq -1$$

The missing case ($n = -1$) is supplied by Formula 8.

**EXAMPLE 11** Evaluate $\displaystyle\int \frac{x}{x^2+1}\,dx$.

**SOLUTION** We make the substitution $u = x^2 + 1$ because the differential $du = 2x\,dx$ occurs (except for the constant factor 2). Thus $x\,dx = \frac{1}{2}\,du$ and

$$\begin{aligned}\int \frac{x}{x^2+1}\,dx &= \tfrac{1}{2}\int \frac{du}{u} = \tfrac{1}{2}\ln|u| + C \\ &= \tfrac{1}{2}\ln|x^2+1| + C = \tfrac{1}{2}\ln(x^2+1) + C\end{aligned}$$

Notice that we removed the absolute value bars because $x^2 + 1 > 0$ for all $x$. We could use the laws of logarithms to write the answer as

$$\ln\sqrt{x^2+1} + C$$

but this isn't necessary. ■

Because the function $f(x) = (\ln x)/x$ in Example 12 is positive for $x > 1$, the integral represents the area of the shaded region in Figure 10.

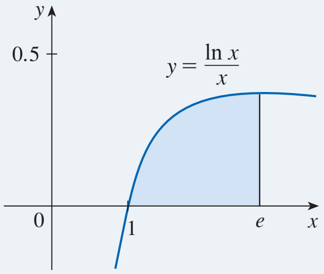

**FIGURE 10**

**EXAMPLE 12** Evaluate $\displaystyle\int_1^e \frac{\ln x}{x}\,dx$.

**SOLUTION** We let $u = \ln x$ because its differential $du = (1/x)\,dx$ occurs in the integral. When $x = 1$, $u = \ln 1 = 0$; when $x = e$, $u = \ln e = 1$. Thus

$$\int_1^e \frac{\ln x}{x}\,dx = \int_0^1 u\,du = \frac{u^2}{2}\Big]_0^1 = \frac{1}{2}$$ ■

**EXAMPLE 13** Evaluate $\displaystyle\int \tan x\,dx$.

**SOLUTION** First we write tangent in terms of sine and cosine:

$$\int \tan x\,dx = \int \frac{\sin x}{\cos x}\,dx$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

This suggests that we should substitute $u = \cos x$, since then $du = -\sin x\, dx$ and so $\sin x\, dx = -du$:

$$\int \tan x\, dx = \int \frac{\sin x}{\cos x}\, dx = -\int \frac{1}{u}\, du$$

$$= -\ln|u| + C = -\ln|\cos x| + C$$ ■

Notice that $-\ln|\cos x| = \ln(|\cos x|^{-1}) = \ln(1/|\cos x|) = \ln|\sec x|$, so the result of Example 13 can also be written as

**9**

$$\boxed{\int \tan x\, dx = \ln|\sec x| + C}$$

## ■ Logarithmic Differentiation

The calculation of derivatives of complicated functions involving products, quotients, or powers can often be simplified by taking logarithms. The method used in the following example is called **logarithmic differentiation**.

**EXAMPLE 14** Differentiate $y = \dfrac{x^{3/4}\sqrt{x^2+1}}{(3x+2)^5}$.

**SOLUTION** We take logarithms of both sides of the equation and use the laws of logarithms to simplify:

$$\ln y = \tfrac{3}{4}\ln x + \tfrac{1}{2}\ln(x^2+1) - 5\ln(3x+2)$$

Differentiating implicitly with respect to $x$ gives

$$\frac{1}{y}\frac{dy}{dx} = \frac{3}{4}\cdot\frac{1}{x} + \frac{1}{2}\cdot\frac{2x}{x^2+1} - 5\cdot\frac{3}{3x+2}$$

Solving for $dy/dx$, we get

$$\frac{dy}{dx} = y\left(\frac{3}{4x} + \frac{x}{x^2+1} - \frac{15}{3x+2}\right)$$

If we hadn't used logarithmic differentiation in Example 14, we would have had to use both the Quotient Rule and the Product Rule. The resulting calculation would have been horrendous.

Because we have an explicit expression for $y$, we can substitute and write

$$\frac{dy}{dx} = \frac{x^{3/4}\sqrt{x^2+1}}{(3x+2)^5}\left(\frac{3}{4x} + \frac{x}{x^2+1} - \frac{15}{3x+2}\right)$$ ■

**Steps in Logarithmic Differentiation**

1. Take natural logarithms of both sides of an equation $y = f(x)$ and use the laws of logarithms to expand the expression.
2. Differentiate implicitly with respect to $x$.
3. Solve the resulting equation for $y'$ and replace $y$ by $f(x)$.

If $f(x) < 0$ for some values of $x$, then $\ln f(x)$ is not defined, but we can still use logarithmic differentiation by first writing $|y| = |f(x)|$ and then using Equation 7.

## 6.2* Exercises

**1–2** Use the laws of logarithms to expand each expression.

**1.** (a) $\ln \sqrt{ab}$ (b) $\ln\left(\dfrac{x^4}{\sqrt{x^2-4}}\right)$

**2.** (a) $\ln \dfrac{x^2}{y^3 z^4}$ (b) $\ln \sqrt{\dfrac{3x}{x-3}}$

**3–5** Express as a single logarithm.

**3.** (a) $\ln a - 2\ln b + 3\ln c$

(b) $\ln 4 + \ln a - \frac{1}{3}\ln(a+1)$

**4.** (a) $\ln 10 + 2\ln 5$

(b) $3\ln(x-2) - \ln(x^2-5x+6) + 2\ln(x-3)$

**5.** (a) $\ln 3 + \frac{1}{3}\ln 8$

(b) $\frac{1}{3}\ln(x+2)^3 + \frac{1}{2}[\ln x - \ln(x^2+3x+2)^2]$

**6–9** Make a rough sketch by hand of the graph of each function. Use the graph given in Figure 4 and, if necessary, the transformations of Section 1.3.

**6.** $y = \ln(-x)$ **7.** $y = -\ln x$

**8.** $y = \ln|x|$ **9.** $y = \ln(x+3)$

**10–14** Find the limit.

**10.** $\lim\limits_{x\to 1^+} \ln(\sqrt{x}-1)$ **11.** $\lim\limits_{x\to 0} \ln(\cos x)$

**12.** $\lim\limits_{x\to 0^+} \ln(\sin x)$

**13.** $\lim\limits_{x\to\infty} [\ln(1+x^2) - \ln(1+x)]$

**14.** $\lim\limits_{x\to\infty} [\ln(2+x) - \ln(1+x)]$

**15–34** Differentiate the function.

**15.** $f(x) = x^3 \ln x$ **16.** $f(x) = x\ln x - x$

**17.** $f(x) = \ln(x^2+3x+5)$ **18.** $g(t) = \ln(3+t^2)$

**19.** $f(x) = \sin(\ln x)$ **20.** $Q(r) = \ln(\cos r)$

**21.** $f(x) = \ln \dfrac{1}{x}$ **22.** $y = \dfrac{1}{\ln x}$

**23.** $f(x) = \sin x \ln(5x)$ **24.** $g(t) = \sqrt{1+\ln t}$

**25.** $F(t) = (\ln t)^2 \sin t$ **26.** $p(t) = \ln\sqrt{t^2+1}$

**27.** $y = (\ln \tan x)^2$ **28.** $y = \ln(\tan^2 x)$

**29.** $f(u) = \dfrac{\ln u}{1+\ln(2u)}$ **30.** $g(x) = \ln \dfrac{a-x}{a+x}$

**31.** $g(t) = \ln \dfrac{t(t^2+1)^4}{\sqrt[3]{2t-1}}$ **32.** $y = \ln\sqrt{\dfrac{1+2x}{1-2x}}$

**33.** $y = \ln|3-2x^5|$ **34.** $y = \ln(\csc x - \cot x)$

**35.** Show that $\dfrac{d}{dx}\ln\left(x+\sqrt{x^2+1}\right) = \dfrac{1}{\sqrt{x^2+1}}$.

**36.** Show that $\dfrac{d}{dx}\ln\sqrt{\dfrac{1-\cos x}{1+\cos x}} = \csc x$.

**37–40** Find $y'$ and $y''$.

**37.** $y = \sqrt{x}\ln x$ **38.** $y = \dfrac{\ln x}{1+\ln x}$

**39.** $y = \ln|\sec x|$ **40.** $y = \ln(1+\ln x)$

**41–44** Differentiate $f$ and find the domain of $f$.

**41.** $f(x) = \dfrac{x}{1-\ln(x-1)}$ **42.** $f(x) = \sqrt{2+\ln x}$

**43.** $f(x) = \ln(x^2-2x)$ **44.** $f(x) = \ln\ln\ln x$

**45.** If $f(x) = \ln(x+\ln x)$, find $f'(1)$.

**46.** If $f(x) = \dfrac{\ln x}{x}$, find $f''(e)$.

**47–48** Find $f'(x)$. Check that your answer is reasonable by comparing the graphs of $f$ and $f'$.

**47.** $f(x) = \sin x + \ln x$ **48.** $f(x) = \ln(x^2+x+1)$

**49–50** Find an equation of the tangent line to the curve at the given point.

**49.** $y = \sin(2\ln x)$, $(1, 0)$ **50.** $y = \ln(x^3-7)$, $(2, 0)$

**51.** Find $y'$ if $y = \ln(x^2+y^2)$.

**52.** Find $y'$ if $\ln xy = y\sin x$.

**53.** Find a formula for $f^{(n)}(x)$ if $f(x) = \ln(x-1)$.

**54.** Find $\dfrac{d^9}{dx^9}(x^8 \ln x)$.

**55–58** Discuss the curve under the guidelines of Section 3.5.

**55.** $y = \ln(\sin x)$ **56.** $y = \ln(\tan^2 x)$

**57.** $y = \ln(1+x^2)$ **58.** $y = \ln(1+x^3)$

**59.** If $f(x) = \ln(2x + x\sin x)$, use a computer algebra system to compute $f'$ and $f''$. Then use the graphs of $f$, $f'$, and $f''$ to estimate the intervals of increase and the inflection points of $f$ on the interval $(0, 15]$.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**60.** Investigate the family of curves $f(x) = \ln(x^2 + c)$. What happens to the inflection points and asymptotes as $c$ changes? Graph several members of the family to illustrate what you discover.

**61–62** Use a graph to estimate the solutions of the equation correct to one decimal place. Then use these estimates as the initial approximations in Newton's method to find the solutions correct to six decimal places.

**61.** $(x - 4)^2 = \ln x$

**62.** $\ln(4 - x^2) = x$

---

**63–66** Use logarithmic differentiation to find the derivative of the function.

**63.** $y = (x^2 + 2)^2(x^4 + 4)^4$

**64.** $y = \dfrac{(x + 1)^4(x - 5)^3}{(x - 3)^8}$

**65.** $y = \sqrt{\dfrac{x - 1}{x^4 + 1}}$

**66.** $y = \dfrac{(x^3 + 1)^4 \sin^2 x}{x^{1/3}}$

---

**67–76** Evaluate the integral.

**67.** $\displaystyle\int_2^4 \frac{3}{x}\,dx$

**68.** $\displaystyle\int_0^3 \frac{dx}{5x + 1}$

**69.** $\displaystyle\int_1^2 \frac{dt}{8 - 3t}$

**70.** $\displaystyle\int_4^9 \left(\sqrt{x} + \frac{1}{\sqrt{x}}\right)^2 dx$

**71.** $\displaystyle\int_1^3 \left(\frac{3x^2 + 4x + 1}{x}\right) dx$

**72.** $\displaystyle\int_e^6 \frac{dx}{x \ln x}$

**73.** $\displaystyle\int \frac{(\ln x)^2}{x}\,dx$

**74.** $\displaystyle\int \frac{z^2}{z^3 + 1}\,dz$

**75.** $\displaystyle\int \frac{\sin 2x}{1 + \cos^2 x}\,dx$

**76.** $\displaystyle\int \frac{\cos(\ln t)}{t}\,dt$

---

**77.** Show that $\int \cot x\,dx = \ln|\sin x| + C$ by (a) differentiating the right side of the equation and (b) using the method of Example 13.

**78.** Sketch the region enclosed by the curves

$$y = \frac{\ln x}{x} \qquad \text{and} \qquad y = \frac{(\ln x)^2}{x}$$

and find its area.

**79.** Find the volume of the solid obtained by rotating the region under the curve

$$y = \frac{1}{\sqrt{x + 1}}$$

from 0 to 1 about the $x$-axis.

**80.** Find the volume of the solid obtained by rotating the region under the curve

$$y = \frac{1}{x^2 + 1}$$

from 0 to 3 about the $y$-axis.

**81.** The work done by a gas when it expands from volume $V_1$ to volume $V_2$ is $W = \int_{V_1}^{V_2} P\,dV$, where $P = P(V)$ is the pressure as a function of the volume $V$. (See Exercise 5.4.29.) Boyle's Law states that when a quantity of gas expands at constant temperature, $PV = C$, where $C$ is a constant. If the initial volume is 600 cm$^3$ and the initial pressure is 150 kPa, find the work done by the gas when it expands at constant temperature to 1000 cm$^3$.

**82.** Find $f$ if $f''(x) = x^{-2}$, $x > 0$, $f(1) = 0$, and $f(2) = 0$.

**83.** If $g$ is the inverse function of $f(x) = 2x + \ln x$, find $g'(2)$.

**84.** (a) Find the linear approximation to $f(x) = \ln x$ near 1.
  (b) Illustrate part (a) by graphing $f$ and its linearization.
  (c) For what values of $x$ is the linear approximation accurate to within 0.1?

**85.** (a) By comparing areas, show that

$$\tfrac{1}{3} < \ln 1.5 < \tfrac{5}{12}$$

  (b) Use the Midpoint Rule with $n = 10$ to estimate ln 1.5.

**86.** Refer to Example 1.
  (a) Find an equation of the tangent line to the curve $y = 1/t$ that is parallel to the secant line $AD$.
  (b) Use part (a) to show that $\ln 2 > 0.66$.

**87.** By comparing areas, show that

$$\frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} < \ln n < 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n - 1}$$

**88.** Prove the third law of logarithms. [*Hint:* Start by showing that both sides of the equation have the same derivative.]

**89.** For what values of $m$ do the line $y = mx$ and the curve $y = x/(x^2 + 1)$ enclose a region? Find the area of the region.

**90.** Compare the functions $f(x) = x^{0.1}$ and $g(x) = \ln x$ by graphing both functions in several viewing rectangles. When does the graph of $f$ finally surpass the graph of $g$?

**91.** Use the definition of a derivative to prove that

$$\lim_{x \to 0} \frac{\ln(1 + x)}{x} = 1$$

## 6.3* The Natural Exponential Function

### The Natural Exponential Function and Its Properties

Since ln is an increasing function, it is one-to-one and therefore has an inverse function, which we denote by exp. Thus, according to the definition of an inverse function,

$f^{-1}(x) = y \iff f(y) = x$

**1** $$\boxed{\exp(x) = y \iff \ln y = x}$$

and the cancellation equations are

$f^{-1}(f(x)) = x$
$f(f^{-1}(x)) = x$

**2** $$\boxed{\exp(\ln x) = x \qquad \text{and} \qquad \ln(\exp x) = x}$$

In particular, we have

$$\exp(0) = 1 \quad \text{since} \quad \ln 1 = 0$$
$$\exp(1) = e \quad \text{since} \quad \ln e = 1$$

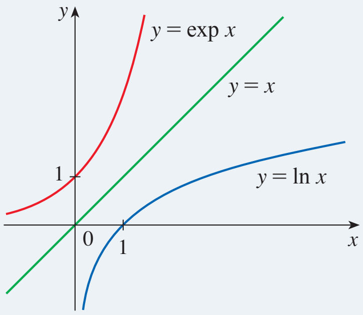

**FIGURE 1**

We obtain the graph of $y = \exp x$ by reflecting the graph of $y = \ln x$ about the line $y = x$. (See Figure 1.) The domain of exp is the range of ln, that is, $(-\infty, \infty)$; the range of exp is the domain of ln, that is, $(0, \infty)$.

If $r$ is any rational number, then the third law of logarithms gives

$$\ln(e^r) = r \ln e = r$$

Therefore, by (1), $$\exp(r) = e^r$$

Thus $\exp(x) = e^x$ whenever $x$ is a rational number. This leads us to define $e^x$, even for irrational values of $x$, by the equation

$$\boxed{e^x = \exp(x)}$$

In other words, for the reasons given, we define $e^x$ to be the inverse of the function $\ln x$. In this notation (1) becomes

**3** $$\boxed{e^x = y \iff \ln y = x}$$

and the cancellation equations (2) become

**4** $$\boxed{e^{\ln x} = x \qquad x > 0}$$

**5** $$\boxed{\ln(e^x) = x \qquad \text{for all } x}$$

**EXAMPLE 1** Find $x$ if $\ln x = 5$.

**SOLUTION 1** From (3) we see that

$$\ln x = 5 \qquad \text{means} \qquad e^5 = x$$

Therefore $x = e^5$.

**SOLUTION 2** Start with the equation

$$\ln x = 5$$

and apply the exponential function to both sides of the equation:

$$e^{\ln x} = e^5$$

But (4) says that $e^{\ln x} = x$. Therefore $x = e^5$. ■

**EXAMPLE 2** Solve the equation $e^{5-3x} = 10$.

**SOLUTION** We take natural logarithms of both sides of the equation and use (5):

$$\begin{aligned} \ln(e^{5-3x}) &= \ln 10 \\ 5 - 3x &= \ln 10 \\ 3x &= 5 - \ln 10 \\ x &= \tfrac{1}{3}(5 - \ln 10) \end{aligned}$$

Using a calculator, we can approximate the solution: to four decimal places, $x \approx 0.8991$. ■

The exponential function $f(x) = e^x$ is one of the most frequently occurring functions in calculus and its applications, so it is important to be familiar with its graph (Figure 2) and its properties (which follow from the fact that it is the inverse of the natural logarithmic function).

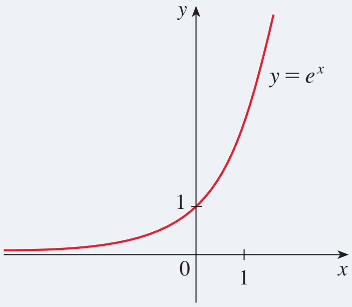

**FIGURE 2**
The natural exponential function

**6 Properties of the Natural Exponential Function** The exponential function $f(x) = e^x$ is an increasing continuous function with domain $\mathbb{R}$ and range $(0, \infty)$. Thus $e^x > 0$ for all $x$. Also

$$\lim_{x \to -\infty} e^x = 0 \qquad \lim_{x \to \infty} e^x = \infty$$

So the $x$-axis is a horizontal asymptote of $f(x) = e^x$.

**EXAMPLE 3** Find $\displaystyle\lim_{x \to \infty} \frac{e^{2x}}{e^{2x} + 1}$.

**SOLUTION** We divide numerator and denominator by $e^{2x}$:

$$\lim_{x \to \infty} \frac{e^{2x}}{e^{2x} + 1} = \lim_{x \to \infty} \frac{1}{1 + e^{-2x}} = \frac{1}{1 + \displaystyle\lim_{x \to \infty} e^{-2x}}$$

$$= \frac{1}{1 + 0} = 1$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We have used the fact that $t = -2x \to -\infty$ as $x \to \infty$ and so

$$\lim_{x\to\infty} e^{-2x} = \lim_{t\to-\infty} e^{t} = 0$$ ■

We now verify that $f(x) = e^x$ has the other properties expected of an exponential function.

**7** **Laws of Exponents** If $x$ and $y$ are real numbers and $r$ is rational, then

**1.** $e^{x+y} = e^x e^y$ **2.** $e^{x-y} = \dfrac{e^x}{e^y}$ **3.** $(e^x)^r = e^{rx}$

**PROOF OF LAW 1** Using the first law of logarithms and Equation 5, we have

$$\ln(e^x e^y) = \ln(e^x) + \ln(e^y) = x + y = \ln(e^{x+y})$$

Since ln is a one-to-one function, it follows that $e^x e^y = e^{x+y}$.

Laws 2 and 3 are proved similarly (see Exercises 105 and 106). As we will see in the next section, Law 3 actually holds when $r$ is any real number. ■

## Differentiation

The natural exponential function has the remarkable property that *it is its own derivative.*

**8**

$$\boxed{\frac{d}{dx}(e^x) = e^x}$$

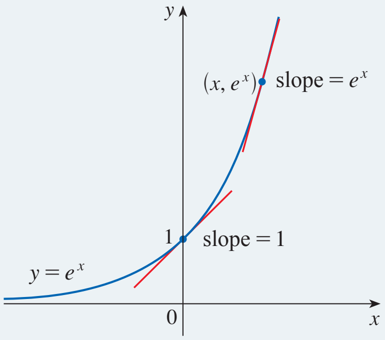

**FIGURE 3**

**PROOF** The function $y = e^x$ is differentiable because it is the inverse function of $y = \ln x$, which we know is differentiable with nonzero derivative. To find its derivative, we use the inverse function method. Let $y = e^x$. Then $\ln y = x$ and, differentiating this latter equation implicitly with respect to $x$, we get

$$\frac{1}{y}\frac{dy}{dx} = 1$$

$$\frac{dy}{dx} = y = e^x$$ ■

The geometric interpretation of Formula 8 is that the slope of a tangent line to the curve $y = e^x$ at any point is equal to the $y$-coordinate of the point (see Figure 3). This property implies that the exponential curve $y = e^x$ grows very rapidly.

**EXAMPLE 4** Differentiate the function $y = e^{\tan x}$.

**SOLUTION** To use the Chain Rule, we let $u = \tan x$. Then we have $y = e^u$, so

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = e^u \frac{du}{dx} = e^{\tan x}\sec^2 x$$ ■

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

In general, if we combine Formula 8 with the Chain Rule, as in Example 4, we get

**9**
$$\boxed{\frac{d}{dx}(e^u) = e^u \frac{du}{dx}}$$

**EXAMPLE 5** Find $y'$ if $y = e^{-4x} \sin 5x$.

**SOLUTION** Using Formula 9 and the Product Rule, we have

$$y' = e^{-4x}(\cos 5x)(5) + (\sin 5x)e^{-4x}(-4) = e^{-4x}(5 \cos 5x - 4 \sin 5x)$$ ■

**EXAMPLE 6** Find the absolute maximum value of the function $f(x) = xe^{-x}$.

**SOLUTION** We differentiate to find any critical numbers:

$$f'(x) = xe^{-x}(-1) + e^{-x}(1) = e^{-x}(1 - x)$$

Since exponential functions are always positive, we see that $f'(x) > 0$ when $1 - x > 0$, that is, when $x < 1$. Similarly, $f'(x) < 0$ when $x > 1$. By the First Derivative Test for Absolute Extreme Values, $f$ has an absolute maximum value when $x = 1$ and the value is

$$f(1) = (1)e^{-1} = \frac{1}{e} \approx 0.37$$ ■

**EXAMPLE 7** Use the first and second derivatives of $f(x) = e^{1/x}$, together with asymptotes, to sketch its graph.

**SOLUTION** Notice that the domain of $f$ is $\{x \mid x \neq 0\}$, so we check for vertical asymptotes by computing the left and right limits as $x \to 0$. As $x \to 0^+$, we know that $t = 1/x \to \infty$, so

$$\lim_{x \to 0^+} e^{1/x} = \lim_{t \to \infty} e^t = \infty$$

and this shows that $x = 0$ is a vertical asymptote. As $x \to 0^-$, we have $t = 1/x \to -\infty$, so

$$\lim_{x \to 0^-} e^{1/x} = \lim_{t \to -\infty} e^t = 0$$

As $x \to \pm\infty$, we have $1/x \to 0$ and so

$$\lim_{x \to \pm\infty} e^{1/x} = e^0 = 1$$

This shows that $y = 1$ is a horizontal asymptote (to both the left and right).

Now let's compute the derivative. The Chain Rule gives

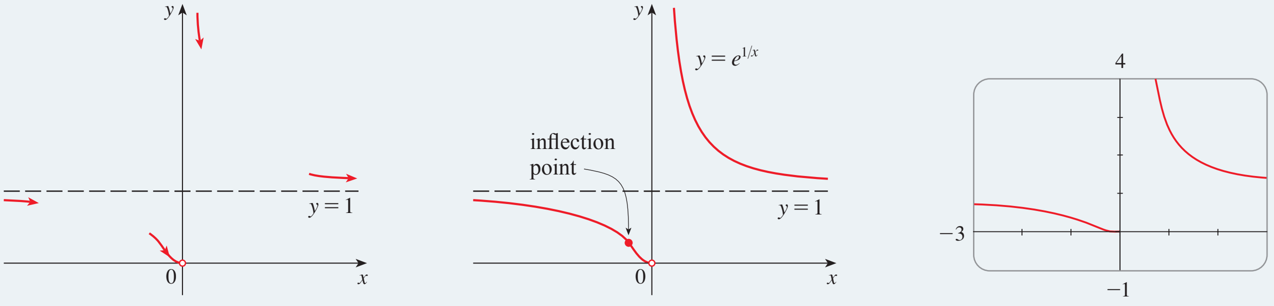
$$f'(x) = -\frac{e^{1/x}}{x^2}$$

Since $e^{1/x} > 0$ and $x^2 > 0$ for all $x \neq 0$, we have $f'(x) < 0$ for all $x \neq 0$. Thus $f$ is decreasing on $(-\infty, 0)$ and on $(0, \infty)$. There is no critical number, so the function has no local maximum or minimum. The second derivative is

$$f''(x) = -\frac{x^2 e^{1/x}(-1/x^2) - e^{1/x}(2x)}{x^4} = \frac{e^{1/x}(2x + 1)}{x^4}$$

Since $e^{1/x} > 0$ and $x^4 > 0$, we have $f''(x) > 0$ when $x > -\frac{1}{2}$ $(x \neq 0)$ and $f''(x) < 0$ when $x < -\frac{1}{2}$. So the curve is concave downward on $\left(-\infty, -\frac{1}{2}\right)$ and concave upward on $\left(-\frac{1}{2}, 0\right)$ and on $(0, \infty)$. There is one inflection point: $\left(-\frac{1}{2}, e^{-2}\right)$.

To sketch the graph of $f$ we first draw the horizontal asymptote $y = 1$ (as a dashed line), together with the parts of the curve near the asymptotes in a preliminary sketch [Figure 4(a)]. These parts reflect the information concerning limits and the fact that $f$ is decreasing on both $(-\infty, 0)$ and $(0, \infty)$. Notice that we have indicated that $f(x) \to 0$ as $x \to 0^-$ even though $f(0)$ does not exist. In Figure 4(b) we finish the sketch by incorporating the information concerning concavity and the inflection point. In Figure 4(c) we check our work with a computer.



(a) Preliminary sketch

(b) Finished sketch

(c) Computer confirmation

**FIGURE 4**

■

## ■ Integration

Because the exponential function $y = e^x$ has a simple derivative, its integral is also simple:

**10**

$$\boxed{\int e^x\,dx = e^x + C}$$

**EXAMPLE 8** Evaluate $\int x^2 e^{x^3}\,dx$.

**SOLUTION** We substitute $u = x^3$. Then $du = 3x^2\,dx$, so $x^2\,dx = \frac{1}{3}\,du$ and

$$\int x^2 e^{x^3}\,dx = \frac{1}{3}\int e^u\,du = \frac{1}{3}e^u + C = \frac{1}{3}e^{x^3} + C$$ ■

**EXAMPLE 9** Find the area under the curve $y = e^{-3x}$ from 0 to 1.

**SOLUTION** The area is

$$A = \int_0^1 e^{-3x}\,dx = -\frac{1}{3}e^{-3x}\Big]_0^1 = \frac{1}{3}(1 - e^{-3})$$ ■

## 6.3* Exercises

**1.** Sketch, by hand, the graph of the function $f(x) = e^x$ with particular attention to how the graph crosses the $y$-axis. What fact allows you to do this?

**2–4** Simplify each expression.

**2.** (a) $e^{\ln 15}$ (b) $e^{3 \ln 2}$ (c) $e^{-2 \ln 5}$

**3.** (a) $\ln \dfrac{1}{e^2}$ (b) $\ln \sqrt{e}$ (c) $\ln e^{\sin x}$

**4.** (a) $\ln\left(\ln e^{e^{50}}\right)$ (b) $e^{\ln(\ln e^3)}$ (c) $e^{x + \ln x}$

**5–8** Solve each equation for $x$. Give both an exact value and a decimal approximation, correct to three decimal places.

**5.** (a) $\ln(4x + 2) = 3$ (b) $e^{2x-3} = 12$

**6.** (a) $\ln(x^2 - 1) = 3$ (b) $1 + e^{4x+1} = 20$

**7.** (a) $\ln x + \ln(x - 1) = 0$ (b) $e - e^{-2x} = 1$

**8.** (a) $\ln(\ln x) = 0$ (b) $\dfrac{60}{1 + e^{-x}} = 4$

**9–10** Solve each equation for $x$.

**9.** (a) $e^{2x} - 3e^x + 2 = 0$ (b) $e^{e^x} = 10$

**10.** (a) $e^{3x+1} = k$ (b) $\ln(2x + 1) = 2 - \ln x$

**11–12** Find the solution of the equation correct to four decimal places.

**11.** (a) $\ln(1 + x^3) - 4 = 0$ (b) $2e^{1/x} = 42$

**12.** (a) $e^{1/(x-4)} = 7$ (b) $\ln \dfrac{x + 1}{x} = 2$

**13–14** Solve each inequality for $x$.

**13.** (a) $\ln x < 0$ (b) $e^x > 5$

**14.** (a) $1 < e^{3x-1} < 2$ (b) $1 - 2 \ln x < 3$

**15–18** Make a rough sketch by hand of the graph of the function. Use the graphs given in Figure 2 and, if necessary, the transformations of Section 1.3.

**15.** $y = -e^{-x}$

**16.** $y = e^{|x|}$

**17.** $y = 1 - \frac{1}{2}e^{-x}$

**18.** $y = 2(1 - e^x)$

**19–20** Find (a) the domain of $f$ and (b) $f^{-1}$ and its domain.

**19.** $f(x) = \sqrt{3 - e^{2x}}$

**20.** $f(x) = \ln(2 + \ln x)$

**21–24** Find a formula for the inverse of the function.

**21.** $y = 3 \ln(x - 2)$

**22.** $y = (\ln x)^2, \quad x \geqslant 1$

**23.** $y = e^{1-x}$

**24.** $y = (1 - e^{-x})/(1 + e^{-x})$

**25–30** Find the limit.

**25.** $\displaystyle\lim_{x \to \infty} \frac{e^{3x} - e^{-3x}}{e^{3x} + e^{-3x}}$

**26.** $\displaystyle\lim_{x \to \infty} e^{-x^2}$

**27.** $\displaystyle\lim_{x \to 2^+} e^{3/(2-x)}$

**28.** $\displaystyle\lim_{x \to 2^-} e^{3/(2-x)}$

**29.** $\displaystyle\lim_{x \to \infty} (e^{-2x} \cos x)$

**30.** $\displaystyle\lim_{x \to (\pi/2)^+} e^{\sec x}$

**31–50** Differentiate the function.

**31.** $f(t) = -2e^t$

**32.** $k(r) = e^r + r^e$

**33.** $f(x) = (3x^2 - 5x)e^x$

**34.** $y = \dfrac{e^x}{1 - e^x}$

**35.** $y = e^{ax^3}$

**36.** $g(x) = e^{x^2 - x}$

**37.** $y = e^{\tan \theta}$

**38.** $y = \sqrt[3]{e^x + 1}$

**39.** $f(x) = \dfrac{x^2 e^x}{x^2 + e^x}$

**40.** $A(r) = \sqrt{r} \cdot e^{r^2+1}$

**41.** $y = x^2 e^{-3x}$

**42.** $f(t) = \tan(1 + e^{2t})$

**43.** $f(t) = e^{at} \sin bt$

**44.** $f(z) = e^{z/(z-1)}$

**45.** $F(t) = e^{t \sin 2t}$

**46.** $y = e^{\sin 2x} + \sin(e^{2x})$

**47.** $g(u) = e^{\sqrt{\sec u^2}}$

**48.** $f(t) = e^{1/t}\sqrt{t^2 - 1}$

**49.** $g(x) = \sin\left(\dfrac{e^x}{1 + e^x}\right)$

**50.** $f(x) = e^{\sin^2(x^2)}$

**51–52** Find an equation of the tangent line to the curve at the given point.

**51.** $y = e^x \cos x + \sin x, \quad (0, 1)$

**52.** $y = \dfrac{1 + x}{1 + e^x}, \quad \left(0, \frac{1}{2}\right)$

**53.** Find $y'$ if $e^{x/y} = x - y$.

**54.** Find an equation of the tangent line to the curve $xe^y + ye^x = 1$ at the point $(0, 1)$.

**55.** Show that the function $y = e^x + e^{-x/2}$ satisfies the differential equation $2y'' - y' - y = 0$.

**56.** Show that the function $y = Ae^{-x} + Bxe^{-x}$ satisfies the differential equation $y'' + 2y' + y = 0$.

**57.** For what values of $r$ does the function $y = e^{rx}$ satisfy the differential equation $y'' + 6y' + 8y = 0$?

**58.** Find the values of $\lambda$ for which $y = e^{\lambda x}$ satisfies the differential equation $y + y' = y''$.

**59.** If $f(x) = e^{2x}$, find a formula for $f^{(n)}(x)$.

**60.** Find the thousandth derivative of $f(x) = xe^{-x}$.

**61.** (a) Use the Intermediate Value Theorem to show that there is a solution of the equation $e^x + x = 0$.
(b) Use Newton's method to find the solution of the equation in part (a) correct to six decimal places.

**62.** Verify the linear approximation

$$\frac{2}{1 + e^x} \approx 1 - \tfrac{1}{2}x$$

at $a = 0$. Then determine the values of $x$ for which the linear approximation is accurate to within 0.1.

**63.** Under certain circumstances a rumor spreads according to the equation

$$p(t) = \frac{1}{1 + ae^{-kt}}$$

where $p(t)$ is the proportion of the population that has heard the rumor at time $t$ and $a$ and $k$ are positive constants. [In Section 9.4 we will see that this is a reasonable equation for $p(t)$.]
(a) Find $\lim_{t \to \infty} p(t)$ and interpret your answer.
(b) Find the rate of spread of the rumor.
(c) Graph $p$ for the case $a = 10$, $k = 0.5$ with $t$ measured in hours. Use the graph to estimate how long it will take for 80% of the population to have heard the rumor.

**64.** An object is attached to the end of a vibrating spring and its displacement from its equilibrium position is $y = 8e^{-t/2} \sin 4t$, where $t$ is measured in seconds and $y$ is measured in centimeters.
(a) Graph the displacement function together with the functions $y = 8e^{-t/2}$ and $y = -8e^{-t/2}$. How are these graphs related? Can you explain why?
(b) Use the graph to estimate the maximum value of the displacement. Does it occur when the graph touches the graph of $y = 8e^{-t/2}$?
(c) What is the velocity of the object when it first returns to its equilibrium position?
(d) Use the graph to estimate the time after which the displacement is no more than 2 cm from equilibrium.

**65–66** Find the absolute maximum and absolute minimum values of $f$ on the given interval.

**65.** $f(x) = \dfrac{e^x}{1 + x^2}$, $[0, 3]$

**66.** $f(x) = xe^{x/2}$, $[-3, 1]$

---

**67.** Find the absolute maximum value of the function $f(x) = x - e^x$.

**68.** Find the absolute minimum value of the function $g(x) = e^x/x$, $x > 0$.

**69–70** Find (a) the intervals of increase or decrease, (b) the intervals of concavity, and (c) the points of inflection.

**69.** $f(x) = xe^{2x}$

**70.** $f(x) = \dfrac{e^x}{x^2}$

---

**71–73** Discuss the curve using the guidelines of Section 3.5.

**71.** $y = e^{-1/(x+1)}$

**72.** $y = e^{2x} - e^x$

**73.** $y = 1/(1 + e^{-x})$

---

**74–75** Draw a graph of $f$ that shows all the important aspects of the curve. Estimate the local maximum and minimum values and then use calculus to find these values exactly. Use a graph of $f''$ to estimate the inflection points.

**74.** $f(x) = e^{\cos x}$

**75.** $f(x) = e^{x^3 - x}$

---

**76.** A *drug response curve* describes the level of medication in the bloodstream after a drug is administered. A surge function $S(t) = At^p e^{-kt}$ is often used to model the response curve, reflecting an initial surge in the drug level and then a more gradual decline. If, for a particular drug, $A = 0.01$, $p = 4$, $k = 0.07$, and $t$ is measured in minutes, estimate the times corresponding to the inflection points and explain their significance. Then graph the drug response curve.

**77.** After an alcoholic beverage is consumed, the concentration of alcohol in the bloodstream (blood alcohol concentration, or BAC) surges as the alcohol is absorbed, followed by a gradual decline as the alcohol is metabolized. The function

$$C(t) = 0.135te^{-2.802t}$$

models the average BAC, measured in g/dL, of a group of eight male subjects $t$ hours after rapid consumption of 15 mL of ethanol (corresponding to one alcoholic drink). What is the maximum average BAC during the first 3 hours? When does it occur?

*Source:* Adapted from P. Wilkinson et al., "Pharmacokinetics of Ethanol after Oral Administration in the Fasting State," *Journal of Pharmacokinetics and Biopharmaceutics* 5 (1977): 207–24.

**78. Normal Density Functions** The family of bell-shaped curves

$$y = \frac{1}{\sigma\sqrt{2\pi}} e^{-(x-\mu)^2/(2\sigma^2)}$$

occurs in probability and statistics, where it is called the *normal density function.* The constant $\mu$ is called the *mean* and the positive constant $\sigma$ is called the *standard deviation.* For simplicity, let's scale the function so as to remove the factor $1/(\sigma\sqrt{2\pi})$ and let's analyze the special case where $\mu = 0$. So we study the function

$$f(x) = e^{-x^2/(2\sigma^2)}$$

(a) Find the asymptote, maximum value, and inflection points of $f$.
(b) What role does $\sigma$ play in the shape of the curve?
(c) Illustrate by graphing four members of this family on the same screen.

**79–90** Evaluate the integral.

**79.** $\displaystyle\int_0^1 (x^e + e^x)\, dx$

**80.** $\displaystyle\int_{-5}^{5} e\, dx$

**81.** $\displaystyle\int_0^2 \frac{dx}{e^{\pi x}}$

**82.** $\displaystyle\int t^3 e^{-t^4}\,dt$

**83.** $\displaystyle\int e^x\sqrt{1 + e^x}\,dx$

**84.** $\displaystyle\int \frac{(1 + e^x)^2}{e^x}\,dx$

**85.** $\displaystyle\int (e^x + e^{-x})^2\,dx$

**86.** $\displaystyle\int e^x(4 + e^x)^5\,dx$

**87.** $\displaystyle\int \frac{e^u}{(1 - e^u)^2}\,du$

**88.** $\displaystyle\int e^{\sin\theta}\cos\theta\,d\theta$

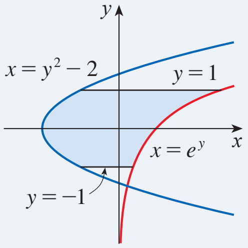
**89.** $\displaystyle\int_1^2 \frac{e^{1/x}}{x^2}\,dx$

**90.** $\displaystyle\int_0^1 \frac{\sqrt{1 + e^{-x}}}{e^x}\,dx$

---

**91.** Find the average value of $f(x) = 2xe^{-x^2}$ on the interval $[0, 2]$.

**92.** Find the area of the shaded region.



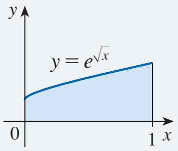
**93.** Find, correct to three decimal places, the area of the region bounded by the curves $y = e^x$, $y = e^{3x}$, and $x = 1$.

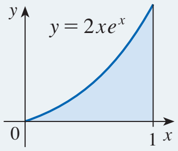
**94.** Find $f(x)$ if $f''(x) = 3e^x + 5\sin x$, $f(0) = 1$, and $f'(0) = 2$.

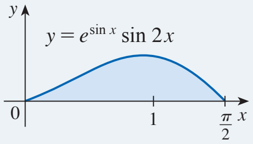
**95.** Find the volume of the solid obtained by rotating about the $x$-axis the region bounded by the curves $y = e^x$, $y = 0$, $x = 0$, and $x = 1$.

**96.** Find the volume of the solid obtained by rotating about the $y$-axis the region bounded by the curves $y = e^{-x^2}$, $y = 0$, $x = 0$, and $x = 1$.

**97.** Which of the following areas are equal? Why?







**98.** A bacteria population starts with 400 bacteria and grows at a rate of $r(t) = (450.268)e^{1.12567t}$ bacteria per hour. How many bacteria will there be after three hours?

**99.** An oil storage tank ruptures at time $t = 0$ and oil leaks from the tank at a rate of $r(t) = 100e^{-0.01t}$ liters per minute. How much oil leaks out during the first hour?

**100.** The rate of growth of a fish population was modeled by the equation

$$G(t) = \frac{60{,}000e^{-0.6t}}{(1 + 5e^{-0.6t})^2}$$

where $t$ is the number of years since 2000 and $G$ is measured in kilograms per year. If the biomass was 25,000 kg in the year 2000, what is the predicted biomass for the year 2020?

**101.** Dialysis treatment removes urea and other waste products from a patient's blood by diverting some of the bloodflow externally through a machine called a dialyzer. The rate at which urea is removed from the blood (in mg/min) is often well described by the equation

$$u(t) = \frac{r}{V}C_0e^{-rt/V}$$

where $r$ is the rate of flow of blood through the dialyzer (in mL/min), $V$ is the volume of the patient's blood (in mL), and $C_0$ is the amount of urea in the blood (in mg) at time $t = 0$. Evaluate the integral $\int_0^{30} u(t)\,dt$ and interpret it.

**102. The Error Function** The *error function*

$$\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}}\int_0^x e^{-t^2}\,dt$$

is used in probability, statistics, and engineering.

(a) Show that $\int_a^b e^{-t^2}\,dt = \frac{1}{2}\sqrt{\pi}\,[\operatorname{erf}(b) - \operatorname{erf}(a)]$.

(b) Show that the function $y = e^{x^2}\operatorname{erf}(x)$ satisfies the differential equation $y' = 2xy + 2/\sqrt{\pi}$.

**103.** If you graph the function

$$f(x) = \frac{1 - e^{1/x}}{1 + e^{1/x}}$$

you'll see that $f$ appears to be an odd function. Prove it.

**104.** Graph several members of the family of functions

$$f(x) = \frac{1}{1 + ae^{bx}}$$

where $a > 0$. How does the graph change when $b$ changes? How does it change when $a$ changes?

**105.** Prove the second law of exponents [see (7)].

**106.** Prove the third law of exponents [see (7)].

# 6.4* General Logarithmic and Exponential Functions

In this section we use the natural exponential and logarithmic functions to study exponential and logarithmic functions with base $b > 0$.

## General Exponential Functions

If $b > 0$ and $r$ is any rational number, then by (4) and (7) in Section 6.3*,

$$b^r = (e^{\ln b})^r = e^{r \ln b}$$

Therefore, even for irrational numbers $x$, we *define*

**1**
$$\boxed{b^x = e^{x \ln b}}$$

Thus, for instance,

$$2^{\sqrt{3}} = e^{\sqrt{3}\ln 2} \approx e^{1.20} \approx 3.32$$

The function $f(x) = b^x$ is called the **exponential function with base *b***. Notice that $b^x$ is positive for all $x$ because $e^x$ is positive for all $x$.

Definition 1 allows us to extend one of the laws of logarithms. We already know that $\ln(b^r) = r \ln b$ when $r$ is rational. But if we now let $r$ be any real number we have, from Definition 1,

$$\ln b^r = \ln(e^{r \ln b}) = r \ln b$$

Thus

**2**
$$\ln b^r = r \ln b \qquad \text{for any real number } r$$

The general laws of exponents follow from Definition 1 together with the laws of exponents for $e^x$.

**3 Laws of Exponents** If $x$ and $y$ are real numbers and $a, b > 0$, then

**1.** $b^{x+y} = b^x b^y$ **2.** $b^{x-y} = \dfrac{b^x}{b^y}$ **3.** $(b^x)^y = b^{xy}$ **4.** $(ab)^x = a^x b^x$

**PROOF**

**1.** Using Definition 1 and the laws of exponents for $e^x$, we have

$$\begin{aligned} b^{x+y} &= e^{(x+y)\ln b} = e^{x \ln b + y \ln b} \\ &= e^{x \ln b} e^{y \ln b} = b^x b^y \end{aligned}$$

**3.** Using Equation 2 we obtain

$$(b^x)^y = e^{y \ln(b^x)} = e^{yx \ln b} = e^{xy \ln b} = b^{xy}$$

The remaining proofs are left as exercises. ■

The differentiation formula for exponential functions is also a consequence of Definition 1:

**4**
$$\boxed{\frac{d}{dx}(b^x) = b^x \ln b}$$

**PROOF**

$$\frac{d}{dx}(b^x) = \frac{d}{dx}(e^{x \ln b}) = e^{x \ln b}\frac{d}{dx}(x \ln b) = b^x \ln b$$ ■

Notice that if $b = e$, then $\ln e = 1$ and Formula 4 simplifies to a formula that we already know: $(d/dx)\, e^x = e^x$. In fact, the reason that the natural exponential function is used more often than other exponential functions is that its differentiation formula is simpler.

**EXAMPLE 1** In Example 2.7.6 we considered a population of bacteria cells in a homogeneous nutrient medium. We showed that if the population doubles every hour, then the population after $t$ hours is

$$n = n_0 2^t$$

where $n_0$ is the initial population. Now we can use (4) to compute the growth rate:

$$\frac{dn}{dt} = n_0 2^t \ln 2$$

For instance, if the initial population is $n_0 = 1000$ cells, then the growth rate after two hours is

$$\begin{aligned}\left.\frac{dn}{dt}\right|_{t=2} &= (1000)2^t \ln 2\,\big|_{t=2}\\ &= 4000 \ln 2 \approx 2773 \text{ cells/h}\end{aligned}$$ ■

**EXAMPLE 2** Combining Formula 4 with the Chain Rule, we have

$$\frac{d}{dx}\left(10^{x^2}\right) = 10^{x^2}(\ln 10)\frac{d}{dx}(x^2) = (2 \ln 10)x10^{x^2}$$ ■

## ■ Exponential Graphs

If $b > 1$, then $\ln b > 0$, so $(d/dx)\, b^x = b^x \ln b > 0$, which shows that $y = b^x$ is increasing (see Figure 1). If $0 < b < 1$, then $\ln b < 0$ and so $y = b^x$ is decreasing (see Figure 2).

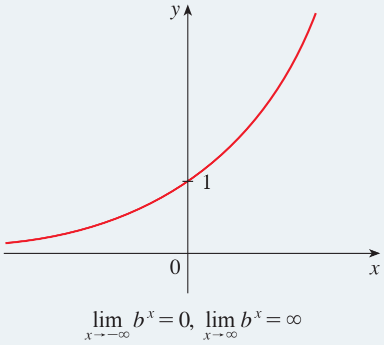

**FIGURE 1** $y = b^x,\ b > 1$

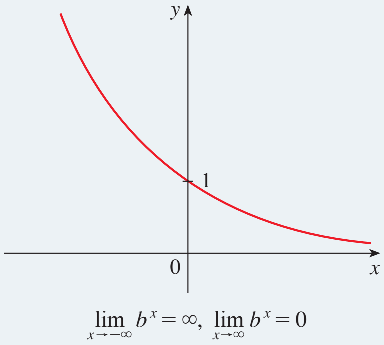

**FIGURE 2** $y = b^x,\ 0 < b < 1$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Notice from Figure 3 that as the base $b$ gets larger, the exponential function grows more rapidly (for $x > 0$).

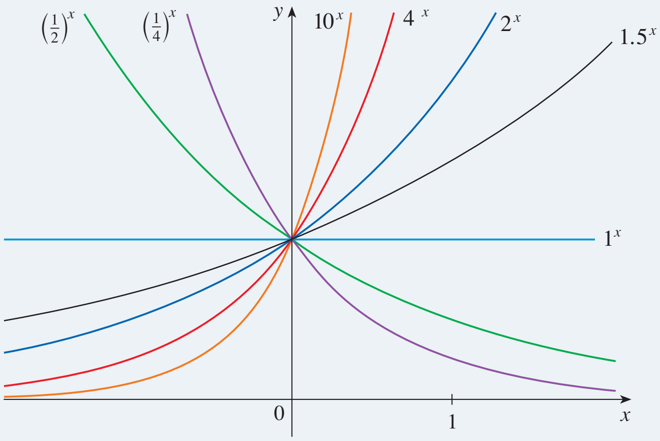

**FIGURE 3**
Members of the family of exponential functions

Example 3 shows that $y = 2^x$ increases more quickly than $y = x^2$. To demonstrate just how quickly $f(x) = 2^x$ increases, let's perform the following thought experiment. Suppose we start with a piece of paper a thousandth of an inch thick and we fold it in half 50 times. Each time we fold the paper in half, the thickness of the paper doubles, so the thickness of the resulting paper would be $2^{50}/1000$ inches. How thick do you think that is? It works out to be more than 17 million miles!

**EXAMPLE 3** Use a graphing calculator or computer to compare the exponential function $f(x) = 2^x$ and the power function $g(x) = x^2$. Which function grows more quickly when $x$ is large?

**SOLUTION** Figure 4 shows both functions graphed in the viewing rectangle $[-2, 6]$ by $[0, 40]$. We see that the graphs intersect three times, but for $x > 4$ the graph of $f(x) = 2^x$ stays above the graph of $g(x) = x^2$. Figure 5 gives a more global view and shows that for large values of $x$, the exponential function $f(x) = 2^x$ grows far more rapidly than the power function $g(x) = x^2$.

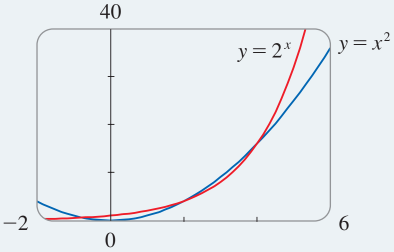

**FIGURE 4**

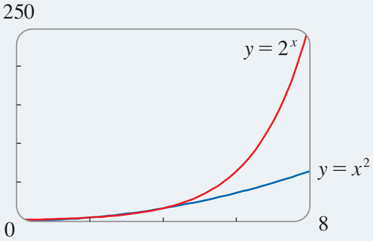

**FIGURE 5**

■

**Table 1** World Population

| $t$ (years since 1900) | Population $P$ (millions) |
|---|---|
| 0 | 1650 |
| 10 | 1750 |
| 20 | 1860 |
| 30 | 2070 |
| 40 | 2300 |
| 50 | 2560 |
| 60 | 3040 |
| 70 | 3710 |
| 80 | 4450 |
| 90 | 5280 |
| 100 | 6080 |
| 110 | 6870 |

In Section 6.5 we will show how exponential functions occur in the description of population growth and radioactive decay. In the next example we look at the human population.

**EXAMPLE 4** Table 1 shows data for the population of the world in the 20th century and Figure 6 shows the corresponding scatter plot.

The pattern of the data points in Figure 6 suggests exponential growth, so we use a graphing calculator (or computer) with exponential regression capability to apply the method of least squares and obtain the exponential model

$$P(t) = (1.43653 \times 10^9) \cdot (1.01395)^t$$

where $t = 0$ corresponds to 1900. Figure 7 shows the graph of this exponential function together with the original data points. We see that the exponential curve fits the data reasonably well. The period of relatively slow population growth is explained by the two world wars and the Great Depression of the 1930s.

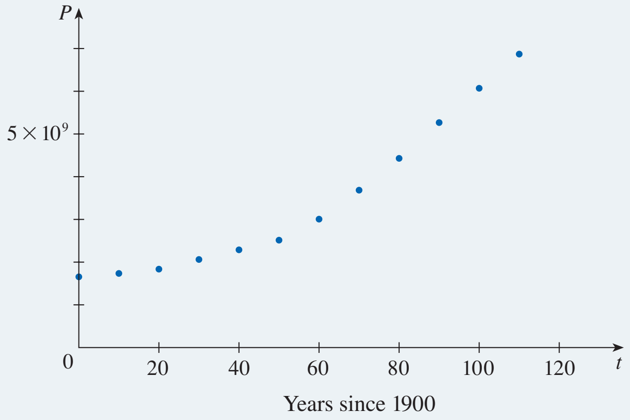

**FIGURE 6** Scatter plot for world population growth

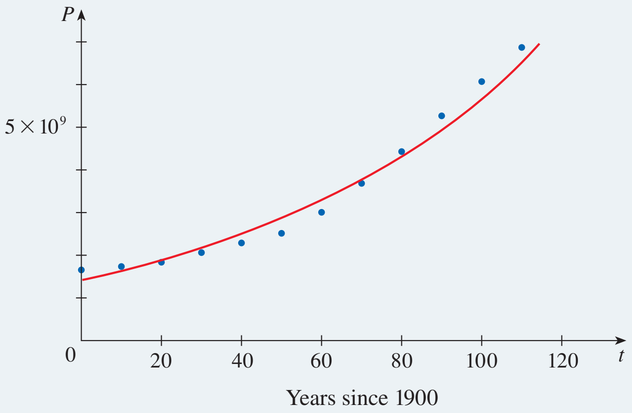

**FIGURE 7** Exponential model for world population growth ■

**EXAMPLE 5** In 1995 a research article was published that detailed the effect of the protease inhibitor ABT-538 on the human immunodeficiency virus HIV-1.[1] Table 2 shows values of the plasma viral load $V(t)$ of patient 303, measured in RNA copies per mL, $t$ days after ABT-538 treatment was begun. The corresponding scatter plot is shown in Figure 8.

**Table 2**

| $t$ (days) | $V(t)$ |
|---|---|
| 1 | 76.0 |
| 4 | 53.0 |
| 8 | 18.0 |
| 11 | 9.4 |
| 15 | 5.2 |
| 22 | 3.6 |

The rather dramatic decline of the viral load that we see in Figure 8 reminds us of the graphs of the exponential function $y = b^x$ in Figures 2 and 3 for the case where the base $b$ is less than 1. So let's model the function $V(t)$ by an exponential function. Using a graphing calculator or computer to fit the data in Table 2 with an exponential function of the form $y = a \cdot b^t$, we obtain the model

$$V = 96.39785 \cdot (0.818656)^t$$

In Figure 9 we graph this exponential function with the data points and observe that the model represents the viral load reasonably well for the first month of treatment.

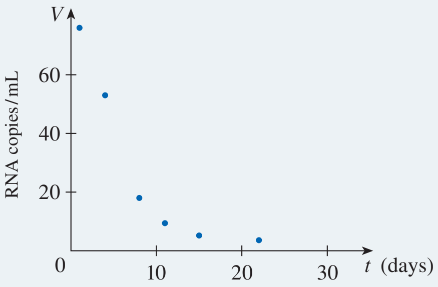

**FIGURE 8**
Plasma viral load in patient 303

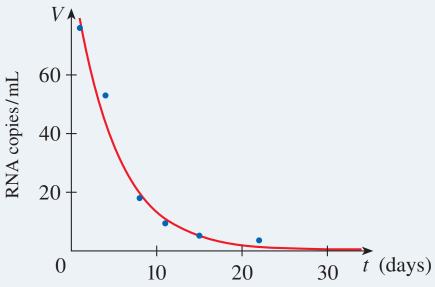

**FIGURE 9**
Exponential model for viral load ■

[1] D. Ho et al., "Rapid Turnover of Plasma Virions and CD4 Lymphocytes in HIV-1 Infection," *Nature* 373 (1995): 123–26.

## Exponential Integrals

The integration formula that follows from Formula 4 is

$$\boxed{\int b^x\,dx = \frac{b^x}{\ln b} + C \qquad b \neq 1}$$

**EXAMPLE 6** $\displaystyle \int_0^5 2^x\,dx = \frac{2^x}{\ln 2}\bigg]_0^5 = \frac{2^5}{\ln 2} - \frac{2^0}{\ln 2} = \frac{31}{\ln 2}$ ■

## The Power Rule versus the Exponential Rule

Now that we have defined arbitrary powers of numbers, we are in a position to prove the general version of the Power Rule, as promised in Section 2.3. Recall that the general version of the Power Rule states that if $n$ is any real number and $f(x) = x^n$, then $f'(x) = nx^{n-1}$.

**PROOF OF THE POWER RULE (GENERAL VERSION)** Let $y = x^n$ and use logarithmic differentiation:

If $x = 0$, we can show that $f'(0) = 0$ for $n > 1$ directly from the definition of a derivative.

$$\ln|y| = \ln|x|^n = n\ln|x| \qquad x \neq 0$$

Therefore

$$\frac{y'}{y} = \frac{n}{x}$$

Hence

$$y' = n\frac{y}{x} = n\frac{x^n}{x} = nx^{n-1}$$ ■

⊘ You should distinguish carefully between the Power Rule $[(d/dx)x^n = nx^{n-1}]$, where the base is variable and the exponent is constant, and the rule for differentiating exponential functions $[(d/dx)b^x = b^x \ln b]$, where the base is constant and the exponent is variable.

In general there are four cases for exponents and bases:

Constant base, constant exponent

**1.** $\dfrac{d}{dx}(b^n) = 0$ ($b$ and $n$ are constants)

Variable base, constant exponent

**2.** $\dfrac{d}{dx}[f(x)]^n = n[f(x)]^{n-1}f'(x)$

Constant base, variable exponent

**3.** $\dfrac{d}{dx}[b^{g(x)}] = b^{g(x)}(\ln b)g'(x)$

Variable base, variable exponent

**4.** To find $(d/dx)\,[f(x)]^{g(x)}$, logarithmic differentiation can be used, as in the next example.

**EXAMPLE 7** Differentiate $y = x^{\sqrt{x}}$.

**SOLUTION 1** Since both the base and the exponent are variable, we use logarithmic differentiation:

$$\ln y = \ln x^{\sqrt{x}} = \sqrt{x}\,\ln x$$

$$\frac{y'}{y} = \sqrt{x}\cdot\frac{1}{x} + (\ln x)\,\frac{1}{2\sqrt{x}}$$

$$y' = y\left(\frac{1}{\sqrt{x}} + \frac{\ln x}{2\sqrt{x}}\right) = x^{\sqrt{x}}\left(\frac{2 + \ln x}{2\sqrt{x}}\right)$$

Figure 10 illustrates Example 7 by showing the graphs of $f(x) = x^{\sqrt{x}}$ and its derivative.

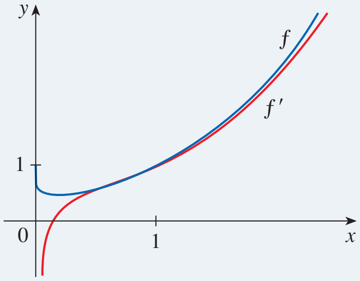

**FIGURE 10**

**SOLUTION 2** Another method is to use Equation 1 to write $x^{\sqrt{x}} = e^{\sqrt{x}\,\ln x}$:

$$\frac{d}{dx}\left(x^{\sqrt{x}}\right) = \frac{d}{dx}\left(e^{\sqrt{x}\,\ln x}\right) = e^{\sqrt{x}\,\ln x}\,\frac{d}{dx}\left(\sqrt{x}\,\ln x\right)$$

$$= x^{\sqrt{x}}\left(\frac{2 + \ln x}{2\sqrt{x}}\right) \qquad \text{(as in Solution 1)}$$

■

## ■ General Logarithmic Functions

If $b > 0$ and $b \neq 1$, then $f(x) = b^x$ is a one-to-one function. Its inverse function is called the **logarithmic function with base *b*** and is denoted by $\log_b$. Thus

$$\boxed{\log_b x = y \iff b^y = x} \tag{5}$$

In particular, we see that

$$\log_e x = \ln x$$

The cancellation equations for the inverse functions $\log_b x$ and $b^x$ are

$$b^{\log_b x} = x \qquad \text{and} \qquad \log_b(b^x) = x$$

Figure 11 shows the case where $b > 1$. (The most important logarithmic functions have base $b > 1$.) The fact that $y = b^x$ is a very rapidly increasing function for $x > 0$ is reflected in the fact that $y = \log_b x$ is a very slowly increasing function for $x > 1$.

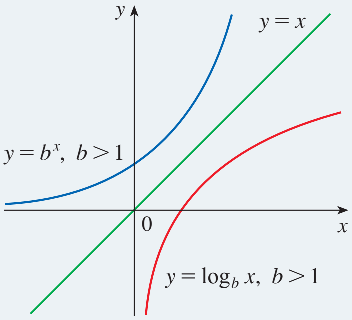

**FIGURE 11**

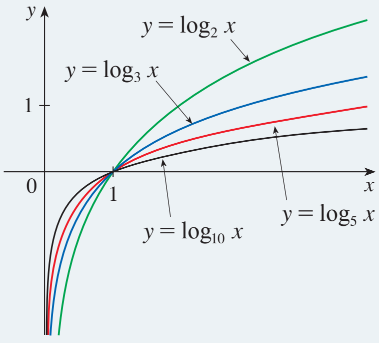

**FIGURE 12**

Figure 12 shows the graphs of $y = \log_b x$ with various values of the base $b > 1$. Because $\log_b 1 = 0$, the graphs of all logarithmic functions pass through the point $(1, 0)$.

The Laws of Logarithms are similar to those for the natural logarithm and can be deduced from the Laws of Exponents (see Exercise 71).

The following formula shows that logarithms with any base can be expressed in terms of the natural logarithm.

**6 Change of Base Formula** For any positive number $b$ ($b \neq 1$), we have

$$\log_b x = \frac{\ln x}{\ln b}$$

**PROOF** Let $y = \log_b x$. Then, from (5), we have $b^y = x$. Taking natural logarithms of both sides of this equation, we get $y \ln b = \ln x$. Therefore

$$y = \frac{\ln x}{\ln b}$$ ■

Formula 6 enables us to use a calculator to compute a logarithm with any base (as shown in the following example). Similarly, Formula 6 allows us to graph any logarithmic function on a graphing calculator or computer (see Exercises 14–16).

**Notation for Logarithms**

Most textbooks in calculus and the sciences, as well as calculators, use the notation $\ln x$ for the natural logarithm and $\log x$ for the "common logarithm," $\log_{10} x$. In the more advanced mathematical and scientific literature and in computer languages, however, the notation $\log x$ usually denotes the natural logarithm.

**EXAMPLE 8** Evaluate $\log_8 5$ correct to six decimal places.

**SOLUTION** Formula 6 gives

$$\log_8 5 = \frac{\ln 5}{\ln 8} \approx 0.773976$$ ■

Formula 6 enables us to differentiate any logarithmic function. Since $\ln b$ is a constant, we can differentiate as follows:

$$\frac{d}{dx}(\log_b x) = \frac{d}{dx}\frac{\ln x}{\ln b} = \frac{1}{\ln b}\frac{d}{dx}(\ln x) = \frac{1}{x \ln b}$$

**7**

$$\boxed{\frac{d}{dx}(\log_b x) = \frac{1}{x \ln b}}$$

**EXAMPLE 9** Differentiate $f(x) = \log_{10}(2 + \sin x)$.

**SOLUTION** Using Formula 7 with $b = 10$ and the Chain Rule, we get

$$f'(x) = \frac{d}{dx}\log_{10}(2 + \sin x) = \frac{1}{(2 + \sin x)\ln 10}\frac{d}{dx}(2 + \sin x)$$

$$= \frac{\cos x}{(2 + \sin x)\ln 10}$$ ■

From Formula 7 we see one of the main reasons that natural logarithms (logarithms with base $e$) are used in calculus: the differentiation formula is simplest when $b = e$ because $\ln e = 1$.

## The Number $e$ as a Limit

We have shown that if $f(x) = \ln x$, then $f'(x) = 1/x$. Thus $f'(1) = 1$. We now use this fact to express the number $e$ as a limit.

From the definition of a derivative as a limit, we have

$$\begin{aligned} f'(1) &= \lim_{h \to 0} \frac{f(1+h) - f(1)}{h} = \lim_{x \to 0} \frac{f(1+x) - f(1)}{x} \\ &= \lim_{x \to 0} \frac{\ln(1+x) - \ln 1}{x} = \lim_{x \to 0} \frac{1}{x} \ln(1+x) \\ &= \lim_{x \to 0} \ln(1+x)^{1/x} \end{aligned}$$

Because $f'(1) = 1$, we have

$$\lim_{x \to 0} \ln(1+x)^{1/x} = 1$$

Then, by Theorem 1.8.8 and the continuity of the exponential function, we have

$$e = e^1 = e^{\lim_{x \to 0} \ln(1+x)^{1/x}} = \lim_{x \to 0} e^{\ln(1+x)^{1/x}} = \lim_{x \to 0} (1+x)^{1/x}$$

**8**
$$\boxed{e = \lim_{x \to 0} (1+x)^{1/x}}$$

Formula 8 is illustrated by the graph of the function $y = (1+x)^{1/x}$ in Figure 13 and a table of values for small values of $x$.

| $x$ | $(1+x)^{1/x}$ |
|---|---|
| 0.1 | 2.59374246 |
| 0.01 | 2.70481383 |
| 0.001 | 2.71692393 |
| 0.0001 | 2.71814593 |
| 0.00001 | 2.71826824 |
| 0.000001 | 2.71828047 |
| 0.0000001 | 2.71828169 |
| 0.00000001 | 2.71828181 |

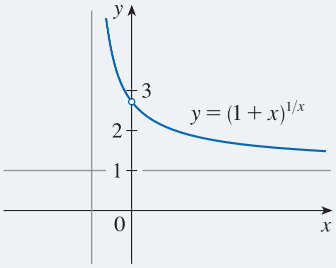

**FIGURE 13**

If we put $n = 1/x$ in Formula 8, then $n \to \infty$ as $x \to 0^+$ and so an alternative expression for $e$ is

**9**
$$\boxed{e = \lim_{n \to \infty} \left(1 + \frac{1}{n}\right)^n}$$

## 6.4* Exercises

**1.** (a) Write an equation that defines $b^x$ when $b$ is a positive number and $x$ is a real number.

(b) What is the domain of the function $f(x) = b^x$?

(c) If $b \neq 1$, what is the range of this function?

(d) Sketch the general shape of the graph of the exponential function for each of the following cases.

(i) $b > 1$ (ii) $b = 1$ (iii) $0 < b < 1$

**2.** (a) If $b$ is a positive number and $b \neq 1$, how is $\log_b x$ defined?

(b) What is the domain of the function $f(x) = \log_b x$?

(c) What is the range of this function?

(d) If $b > 1$, sketch the general shapes of the graphs of $y = \log_b x$ and $y = b^x$ with a common set of axes.

**3–6** Write the expression as a power of $e$.

**3.** $4^{-\pi}$

**4.** $x^{\sqrt{5}}$

**5.** $10^{x^2}$

**6.** $(\tan x)^{\sec x}$

---

**7–10** Evaluate the expression.

**7.** (a) $\log_3 81$ (b) $\log_3\left(\frac{1}{81}\right)$ (c) $\log_9 3$

**8.** (a) $\log_{10} \sqrt{10}$

(b) $\log_{10} 40 + \log_{10} 2.5$

(c) $\log_2 30 - \log_2 15$

**9.** (a) $\log_3 10 - \log_3 5 - \log_3 18$

(b) $2 \log_5 100 - 4 \log_5 50$

**10.** (a) $\log_a \dfrac{1}{a}$ (b) $10^{(\log_{10} 4 + \log_{10} 7)}$

---

**11–12** Graph the given functions on a common screen. How are these graphs related?

**11.** $y = 2^x$, $y = e^x$, $y = 5^x$, $y = 20^x$

**12.** $y = 3^x$, $y = 10^x$, $y = \left(\frac{1}{3}\right)^x$, $y = \left(\frac{1}{10}\right)^x$

---

**13.** Use Formula 6 to evaluate each logarithm correct to six decimal places.

(a) $\log_5 10$ (b) $\log_3 12$ (c) $\log_{12} 6$

**14–16** Use Formula 6 to graph the given functions on a common screen. How are these graphs related?

**14.** $y = \log_2 x$, $y = \log_4 x$, $y = \log_6 x$, $y = \log_8 x$

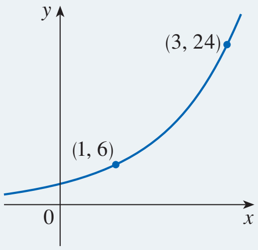
**15.** $y = \log_{1.5} x$, $y = \ln x$, $y = \log_{10} x$, $y = \log_{50} x$

**16.** $y = \ln x$, $y = \log_8 x$, $y = e^x$, $y = 8^x$

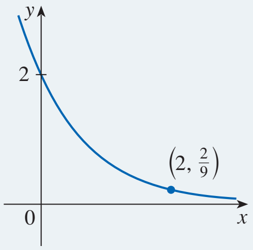
---

**17–18** Find the exponential function $f(x) = Cb^x$ whose graph is given.

**17.**



**18.**



---

**19.** (a) Suppose the graphs of $f(x) = x^2$ and $g(x) = 2^x$ are drawn on a coordinate grid where the unit of measurement is 1 inch. Show that at a distance 2 ft to the right of the origin, the height of the graph of $f$ is 48 ft but the height of the graph of $g$ is about 265 mi.

(b) Suppose that the graph of $y = \log_2 x$ is drawn on a coordinate grid where the unit of measurement is an inch. How many miles to the right of the origin do we have to move before the height of the curve reaches 3 ft?

**20.** Compare the functions $f(x) = x^5$ and $g(x) = 5^x$ by graphing both functions in several viewing rectangles. Find all points of intersection of the graphs correct to one decimal place. Which function grows more rapidly when $x$ is large?

**21–24** Find the limit.

**21.** $\lim_{x \to \infty} (1.001)^x$

**22.** $\lim_{x \to -\infty} (1.001)^x$

**23.** $\lim_{t \to \infty} 2^{-t^2}$

**24.** $\lim_{x \to 3^+} \log_{10}(x^2 - 5x + 6)$

---

**25–42** Differentiate the function.

**25.** $f(x) = x^5 + 5^x$

**26.** $g(x) = x \sin(2^x)$

**27.** $G(x) = 4^{C/x}$

**28.** $F(t) = 3^{\cos 2t}$

**29.** $L(v) = \tan\left(4^{v^2}\right)$

**30.** $G(u) = (1 + 10^{\ln u})^6$

**31.** $y = \log_8(x^2 + 3x)$

**32.** $f(x) = \log_{10} \sqrt{x}$

**33.** $y = x \log_4 \sin x$

**34.** $y = \log_2(x \log_5 x)$

**35.** $y = x^x$

**36.** $y = x^{1/x}$

**37.** $y = x^{\sin x}$

**38.** $y = \left(\sqrt{x}\right)^x$

**39.** $y = (\cos x)^x$

**40.** $y = (\sin x)^{\ln x}$

**41.** $y = x^{\ln x}$

**42.** $y = (\ln x)^{\cos x}$

**49.** $\int 3^{\sin\theta}\cos\theta\,d\theta$

**50.** $\int \frac{2^x}{2^x + 1}\,dx$

**51.** Find the area of the region bounded by the curves $y = 2^x$, $y = 5^x$, $x = -1$, and $x = 1$.

**52.** The region under the curve $y = 10^{-x}$ from $x = 0$ to $x = 1$ is rotated about the $x$-axis. Find the volume of the resulting solid.

**53.** Use a graph to find the solution of the equation $2^x = 1 + 3^{-x}$ correct to one decimal place. Then use this estimate as the initial approximation in Newton's method to find the solution correct to six decimal places.

**54.** Find $y'$ if $x^y = y^x$.

**55.** Find the inverse function of $g(x) = \log_4(x^3 + 2)$.

**56.** Calculate $\lim_{x\to 0^+} x^{-\ln x}$.

**57.** The geologist C. F. Richter defined the magnitude of an earthquake to be $\log_{10}(I/S)$, where $I$ is the intensity of the quake (measured by the amplitude of a seismograph 100 km from the epicenter) and $S$ is the intensity of a "standard" earthquake (where the amplitude is only 1 micron $= 10^{-4}$ cm). The 1989 Loma Prieta earthquake that shook San Francisco had a magnitude of 7.1 on the Richter scale. The 1906 San Francisco earthquake was 16 times as intense. What was its magnitude on the Richter scale?

**58.** A sound so faint that it can just be heard has intensity $I_0 = 10^{-12}\ \text{watt/m}^2$ at a frequency of 1000 hertz (Hz). The loudness, in decibels (dB), of a sound with intensity $I$ is then defined to be $L = 10\log_{10}(I/I_0)$. Amplified rock music is measured at 120 dB, whereas the noise from a motor-driven lawn mower is measured at 106 dB. Find the ratio of the intensity of the rock music to that of the mower.

**59.** Referring to Exercise 58, find the rate of change of the loudness with respect to the intensity when the sound is measured at 50 dB (the level of ordinary conversation).

**60.** According to the Beer-Lambert Law, the light intensity at a depth of $x$ meters below the surface of the ocean is $I(x) = I_0 a^x$, where $I_0$ is the light intensity at the surface and $a$ is a constant such that $0 < a < 1$.
(a) Express the rate of change of $I(x)$ with respect to $x$ in terms of $I(x)$.
(b) If $I_0 = 8$ and $a = 0.38$, find the rate of change of intensity with respect to depth at a depth of 20 m.
(c) Using the values from part (b), find the average light intensity between the surface and a depth of 20 m.

**61.** The difficulty of "acquiring a target" (such as using a mouse to click on an icon on a computer screen) depends on the ratio between the distance $D$ to the target and width $W$ of the target. According to *Fitts' law*, the index $I$ of difficulty is modeled by

$$I = \log_2\left(\frac{2D}{W}\right)$$

This law is used for designing products that involve human–computer interactions.
(a) If $W$ is held constant, what is the rate of change of $I$ with respect to $D$? Does this rate increase or decrease with increasing values of $D$?
(b) If $D$ is held constant, what is the rate of change of $I$ with respect to $W$? What does the negative sign in your answer indicate? Does this rate increase or decrease with increasing values of $W$?
(c) Do your answers to parts (a) and (b) agree with your intuition?

**62.** In Example 4 we modeled the world population from 1900 to 2010 with the exponential function

$$P(t) = (1.43653 \times 10^9)\cdot(1.01395)^t$$

where $t = 0$ corresponds to the year 1900. According to this model, what was the rate of increase of world population in 1920? In 1950? In 2000?

**63.** In Example 5, the patient's viral load $V$ was 76.0 RNA copies per mL after one day of treatment. Use the graph of $V$ in Figure 9 to estimate the additional time required for the viral load to decrease to half that amount.

**64.** A researcher is trying to determine the doubling time for a population of the bacterium *Giardia lamblia*. He starts a

culture in a nutrient solution and estimates the bacteria count every four hours. His data are shown in the table.

| Time (hours) | 0 | 4 | 8 | 12 | 16 | 20 | 24 |
|---|---|---|---|---|---|---|---|
| Bacteria count (CFU/mL) | 37 | 47 | 63 | 78 | 105 | 130 | 173 |

(a) Make a scatter plot of the data.
(b) Use a calculator or computer to find an exponential curve $f(t) = a \cdot b^t$ that models the bacteria population $t$ hours later.
(c) Graph the model from part (b) together with the scatter plot in part (a). Use the graph to estimate how long it takes for the bacteria count to double.

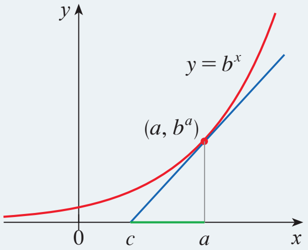
**65.** The table gives the US population from 1790 to 1860.

| Year | Population | Year | Population |
|---|---|---|---|
| 1790 | 3,929,000 | 1830 | 12,861,000 |
| 1800 | 5,308,000 | 1840 | 17,063,000 |
| 1810 | 7,240,000 | 1850 | 23,192,000 |
| 1820 | 9,639,000 | 1860 | 31,443,000 |

T (a) Fit an exponential function to the data. Graph the data points and the exponential model. How good is the fit?
(b) Estimate the rates of population growth in 1800 and 1850 by averaging slopes of secant lines.
(c) Use the exponential model in part (a) to estimate the rates of growth in 1800 and 1850. Compare these estimates with the ones in part (b).
(d) Use the exponential model to predict the population in 1870. Compare with the actual population of 38,558,000. Can you explain the discrepancy?

**66.** Show that $\lim_{n\to\infty}\left(1 + \frac{x}{n}\right)^n = e^x$ for any $x > 0$.

**67.** Let $c$ be the $x$-intercept of the tangent line to the curve $y = b^x$ $(b > 0, b \neq 1)$ at the point $(a, b^a)$. Show that the distance between the points $(a, 0)$ and $(c, 0)$ is the same for all values of $a$.



**68.** On every exponential curve $y = b^x$ $(b > 0, b \neq 1)$, there is exactly one point $(x_0, y_0)$ at which the tangent line to the curve passes through the origin. Show that in every case, $y_0 = e$. [*Hint:* You may wish to use Definition 1).]

**69.** Prove the second law of exponents [see (3)].

**70.** Prove the fourth law of exponents [see (3)].

**71.** Deduce the following laws of logarithms from (3):
(a) $\log_b(xy) = \log_b x + \log_b y$
(b) $\log_b(x/y) = \log_b x - \log_b y$
(c) $\log_b(x^y) = y \log_b x$

## 6.5 Exponential Growth and Decay

In many natural phenomena, quantities grow or decay at a rate proportional to their size. For instance, if $y = f(t)$ is the number of individuals in a population of animals or bacteria at time $t$, then it seems reasonable to expect that the rate of growth $f'(t)$ is proportional to the population $f(t)$; that is, $f'(t) = kf(t)$ for some constant $k$. Indeed, under ideal conditions (unlimited environment, adequate nutrition, immunity to disease) the mathematical model given by the equation $f'(t) = kf(t)$ predicts what actually happens fairly accurately. Another example occurs in nuclear physics: the mass of a radioactive substance decays at a rate proportional to the mass. In chemistry, the rate of a unimolecular first-order reaction is proportional to the concentration of the substance. In finance, the value of a savings account with continuously compounded interest increases at a rate proportional to that value.

In general, if $y(t)$ is the value of a quantity $y$ at time $t$ and if the rate of change of $y$ with respect to $t$ is proportional to its size $y(t)$ at any time, then

$$\boxed{1} \qquad \boxed{\frac{dy}{dt} = ky}$$

where $k$ is a constant. Equation 1 is sometimes called the **law of natural growth** (if $k > 0$) or the **law of natural decay** (if $k < 0$). It is called a *differential equation* because it involves an unknown function $y$ and its derivative $dy/dt$.

It's not hard to think of a solution of Equation 1. This equation asks us to find a function whose derivative is a constant multiple of itself. We have met such functions in this chapter. Any exponential function of the form $y(t) = Ce^{kt}$, where $C$ is a constant, satisfies

$$\frac{dy}{dt} = C(ke^{kt}) = k(Ce^{kt}) = ky$$

We will see in Section 9.4 that *any* function that satisfies $dy/dt = ky$ must be of the form $y = Ce^{kt}$. To see the significance of the constant $C$, we observe that

$$y(0) = Ce^{k \cdot 0} = C$$

Therefore $C$ is the **initial value** of the function.

**2 Theorem** The only solutions of the differential equation $dy/dt = ky$ are the exponential functions

$$y(t) = y(0)e^{kt}$$

## Population Growth

What is the significance of the proportionality constant $k$? In the context of population growth, where $P(t)$ is the size of a population at time $t$, we can write

**3**
$$\frac{dP}{dt} = kP \qquad \text{or} \qquad \frac{dP/dt}{P} = k$$

The quantity

$$\frac{dP/dt}{P}$$

is the growth rate divided by the population size; it is called the **relative growth rate**. According to (3), instead of saying "the growth rate is proportional to population size" we could say "the relative growth rate is constant." Then Theorem 2 says that a population with constant relative growth rate must grow exponentially. Notice that the relative growth rate $k$ appears as the coefficient of $t$ in the exponential function $Ce^{kt}$. For instance, if

$$\frac{dP}{dt} = 0.02P$$

and $t$ is measured in years, then the relative growth rate is $k = 0.02$ and the population grows at a relative rate of 2% per year. If the population at time 0 is $P_0$, then the expression for the population is

$$P(t) = P_0e^{0.02t}$$

**EXAMPLE 1** Use the fact that the world population was 2560 million in 1950 and 3040 million in 1960 to model the population of the world in the second half of the 20th century. (Assume that the growth rate is proportional to the population size.) What is the relative growth rate? Use the model to estimate the world population in 1993 and to predict the population in the year 2025.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**SOLUTION** We measure the time $t$ in years and let $t = 0$ in the year 1950. We measure the population $P(t)$ in millions of people. Then $P(0) = 2560$ and $P(10) = 3040$. Since we are assuming that $dP/dt = kP$, Theorem 2 gives

$$P(t) = P(0)e^{kt} = 2560e^{kt}$$

$$P(10) = 2560e^{10k} = 3040$$

$$k = \frac{1}{10} \ln \frac{3040}{2560} \approx 0.017185$$

The relative growth rate is about 1.7% per year and the model is

$$P(t) = 2560e^{0.017185t}$$

We estimate that the world population in 1993 was

$$P(43) = 2560e^{0.017185(43)} \approx 5360 \text{ million}$$

The model predicts that the population in 2025 will be

$$P(75) = 2560e^{0.017185(75)} \approx 9289 \text{ million}$$

The graph in Figure 1 shows that the model is fairly accurate to the end of the 20th century (the dots represent the actual population), so the estimate for 1993 is quite reliable. But the prediction for 2025 may not be so accurate.

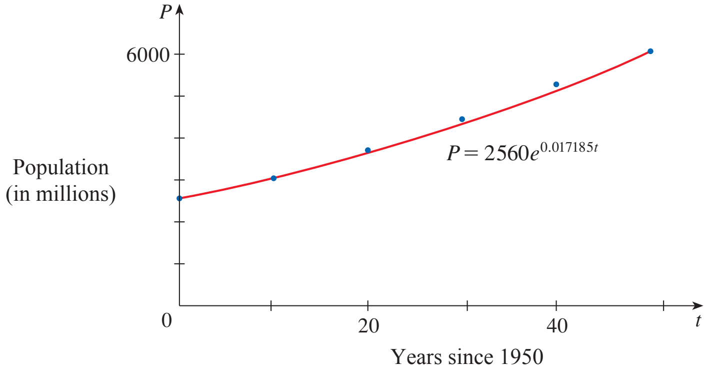

**FIGURE 1**
A model for world population growth in the second half of the 20th century

■

## Radioactive Decay

Radioactive substances decay by spontaneously emitting radiation. If $m(t)$ is the mass remaining from an initial mass $m_0$ of the substance after time $t$, then the relative decay rate

$$-\frac{dm/dt}{m}$$

has been found experimentally to be constant. (Since $dm/dt$ is negative, the relative decay rate is positive.) It follows that

$$\frac{dm}{dt} = km$$

where $k$ is a negative constant. In other words, radioactive substances decay at a rate proportional to the remaining mass. This means that we can use Theorem 2 to show that the mass decays exponentially:

$$m(t) = m_0 e^{kt}$$

Physicists express the rate of decay in terms of **half-life**, the time required for half of any given quantity to decay.

**EXAMPLE 2** The half-life of radium-226 is 1590 years.
(a) A sample of radium-226 has mass 100 mg. Find a formula for the mass of the sample that remains after $t$ years.
(b) Find the mass remaining after 1000 years correct to the nearest milligram.
(c) When will the mass be reduced to 30 mg?

**SOLUTION**
(a) Let $m(t)$ be the mass of radium-226 (in milligrams) that remains after $t$ years. Then $dm/dt = km$ and $m(0) = 100$, so Theorem 2 gives

$$m(t) = m(0)e^{kt} = 100e^{kt}$$

In order to determine the value of $k$, we use the fact that $m(1590) = \frac{1}{2}(100)$. Thus

$$100e^{1590k} = 50 \qquad \text{so} \qquad e^{1590k} = \tfrac{1}{2}$$

and
$$1590k = \ln\tfrac{1}{2} = -\ln 2$$

$$k = -\frac{\ln 2}{1590}$$

Therefore
$$m(t) = 100e^{-(\ln 2)t/1590}$$

We could use the fact that $e^{\ln 2} = 2$ to write the expression for $m(t)$ in the alternative form

$$m(t) = 100 \times 2^{-t/1590}$$

(b) The mass remaining after 1000 years is

$$m(1000) = 100e^{-(\ln 2)1000/1590} \approx 65 \text{ mg}$$

(c) We want to find the value of $t$ such that $m(t) = 30$, that is,

$$100e^{-(\ln 2)t/1590} = 30 \qquad \text{or} \qquad e^{-(\ln 2)t/1590} = 0.3$$

We solve this equation for $t$ by taking the natural logarithm of both sides:

$$-\frac{\ln 2}{1590}t = \ln 0.3$$

Thus
$$t = -1590\,\frac{\ln 0.3}{\ln 2} \approx 2762 \text{ years}$$ ■

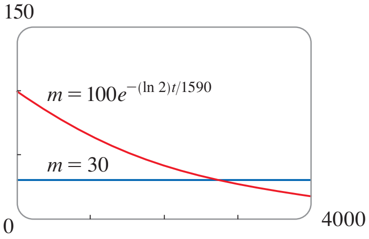

**FIGURE 2**

As a check on our work in Example 2, we use a calculator or computer to draw the graph of $m(t)$ in Figure 2 together with the horizontal line $m = 30$. These curves intersect when $t \approx 2800$, and this agrees with the answer to part (c).

## ■ Newton's Law of Cooling

Newton's Law of Cooling states that the rate of cooling of an object is proportional to the temperature difference between the object and its surroundings, provided that this difference is not too large. (This law also applies to warming.) If we let $T(t)$ be the temperature of the object at time $t$ and $T_s$ be the temperature of the surroundings, then we can formulate Newton's Law of Cooling as a differential equation:

$$\frac{dT}{dt} = k(T - T_s)$$

where $k$ is a constant. This equation is not quite the same as Equation 1, so we make the change of variable $y(t) = T(t) - T_s$. Because $T_s$ is constant, we have $y'(t) = T'(t)$ and so the equation becomes

$$\frac{dy}{dt} = ky$$

We can then use Theorem 2 to find an expression for $y$, from which we can find $T$.

**EXAMPLE 3** A bottle of iced tea at room temperature (72°F) is placed in a refrigerator where the temperature is 44°F. After half an hour the tea has cooled to 61°F.
(a) What is the temperature of the tea after another half hour?
(b) How long does it take for the tea to cool to 50°F?

**SOLUTION**
(a) Let $T(t)$ be the temperature of the tea after $t$ minutes. The surrounding temperature is $T_s = 44$°F, so Newton's Law of Cooling states that

$$\frac{dT}{dt} = k(T - 44)$$

If we let $y = T - 44$, then $y(0) = T(0) - 44 = 72 - 44 = 28$, so $y$ satisfies

$$\frac{dy}{dt} = ky \qquad y(0) = 28$$

and by (2) we have $$y(t) = y(0)e^{kt} = 28e^{kt}$$

We are given that $T(30) = 61$, so $y(30) = 61 - 44 = 17$ and

$$28e^{30k} = 17 \qquad e^{30k} = \tfrac{17}{28}$$

Taking logarithms, we have

$$k = \frac{\ln\left(\frac{17}{28}\right)}{30} \approx -0.01663$$

Thus

$$\begin{aligned} y(t) &= 28e^{-0.01663t} \\ T(t) &= 44 + 28e^{-0.01663t} \\ T(60) &= 44 + 28e^{-0.01663(60)} \approx 54.3 \end{aligned}$$

So after another half hour the tea has cooled to about 54°F.

(b) We have $T(t) = 50$ when

$$\begin{aligned} 44 + 28e^{-0.01663t} &= 50 \\ e^{-0.01663t} &= \tfrac{6}{28} \\ t &= \frac{\ln\left(\frac{6}{28}\right)}{-0.01663} \approx 92.6 \end{aligned}$$

The tea cools to 50°F after about 1 hour 33 minutes. ■

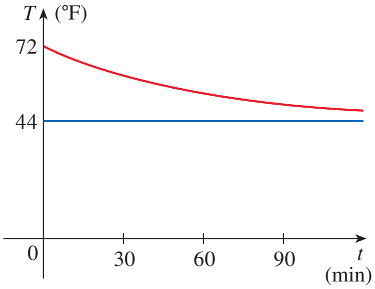

**FIGURE 3**

Notice that in Example 3 we have

$$\lim_{t\to\infty} T(t) = \lim_{t\to\infty} (44 + 28e^{-0.01663t}) = 44 + 28 \cdot 0 = 44$$

This means that, as expected, the temperature of the tea approaches the ambient temperature inside the refrigerator. The graph of the temperature function is shown in Figure 3.

## Continuously Compounded Interest

**EXAMPLE 4** If \$5000 is invested at 2% interest, compounded annually, then after 1 year the investment is worth \$5000(1.02) = \$5100.00, after 2 years it's worth [\$5000(1.02)](1.02) = \$5202.00, and after $t$ years it's worth $\$5000(1.02)^t$. In general, if an amount $A_0$ is invested at an interest rate $r$ ($r = 0.02$ in this example), then after $t$ years it's worth $A_0(1 + r)^t$. Usually, interest is compounded more frequently, say, $n$ times per year. Then in each compounding period the rate is $r/n$, and there are $nt$ compounding periods in $t$ years, so the value of the investment is

$$A = A_0\left(1 + \frac{r}{n}\right)^{nt}$$

For instance, after 3 years at 2% interest a \$5000 investment will be worth

$$\begin{aligned}\$5000(1.02)^3 &= \$5306.04 \text{ with annual compounding}\\ \$5000(1.01)^6 &= \$5307.60 \text{ with semiannual compounding}\\ \$5000(1.005)^{12} &= \$5308.39 \text{ with quarterly compounding}\\ \$5000\left(1 + \frac{0.02}{12}\right)^{36} &= \$5308.92 \text{ with monthly compounding}\\ \$5000\left(1 + \frac{0.02}{365}\right)^{365\cdot 3} &= \$5309.17 \text{ with daily compounding}\end{aligned}$$

You can see that the interest paid increases as the number of compounding periods ($n$) increases. If we let $n \to \infty$, then we will be compounding the interest **continuously** and the value of the investment will be

$$\begin{aligned}A(t) &= \lim_{n\to\infty} A_0\left(1 + \frac{r}{n}\right)^{nt}\\ &= \lim_{n\to\infty} A_0\left[\left(1 + \frac{r}{n}\right)^{n/r}\right]^{rt}\\ &= A_0\left[\lim_{n\to\infty}\left(1 + \frac{r}{n}\right)^{n/r}\right]^{rt}\\ &= A_0\left[\lim_{m\to\infty}\left(1 + \frac{1}{m}\right)^{m}\right]^{rt} \qquad (\text{where } m = n/r)\end{aligned}$$

Equation 6.4.9 (6.4*.9):

$$e = \lim_{n\to\infty}\left(1 + \frac{1}{n}\right)^n$$

But the limit in this expression is equal to the number $e$ (see Equation 6.4.9 or 6.4*.9). So with continuous compounding of interest at interest rate $r$, the amount after $t$ years is

$$A(t) = A_0e^{rt}$$

If we differentiate this equation, we get

$$\frac{dA}{dt} = rA_0e^{rt} = rA(t)$$

which says that, with continuous compounding of interest, the rate of increase of an investment is proportional to its size.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Returning to the example of \$5000 invested for 3 years at 2% interest, we see that with continuous compounding of interest the value of the investment will be

$$A(3) = \$5000e^{(0.02)3} = \$5309.18$$

Notice how close this is to the amount we calculated for daily compounding, \$5309.17. But the amount is easier to compute if we use continuous compounding. ■

## 6.5 Exercises

**1.** A population of the yeast cell *Saccharomyces cerevisiae* (a yeast used for fermentation) develops with a constant relative growth rate of 0.4159 per hour. The initial population consists of 3.8 million cells. Find the population size after 2 hours.

**2.** A common inhabitant of human intestines is the bacterium *Escherichia coli*, named after the German pediatrician Theodor Escherich, who identified it in 1885. A cell of this bacterium in a nutrient-broth medium divides into two cells every 20 minutes. The initial population of a culture is 50 cells.

(a) Find the relative growth rate.
(b) Find an expression for the number of cells after $t$ hours.
(c) Find the number of cells after 6 hours.
(d) Find the rate of growth after 6 hours.
(e) When will the population reach a million cells?

**3.** A culture of the bacterium *Salmonella enteritidis* initially contains 50 cells. When introduced into a nutrient broth, the culture grows at a rate proportional to its size. After 1.5 hours the population has increased to 975.

(a) Find an expression for the number of bacteria after $t$ hours.
(b) Find the number of bacteria after 3 hours.
(c) Find the rate of growth after 3 hours.
(d) After how many hours will the population reach 250,000?

**4.** A bacteria culture grows with constant relative growth rate. The bacteria count was 400 after 2 hours and 25,600 after 6 hours.

(a) What is the relative growth rate? Express your answer as a percentage.
(b) What was the initial size of the culture?
(c) Find an expression for the number of bacteria after $t$ hours.
(d) Find the number of bacteria after 4.5 hours.
(e) Find the rate of growth after 4.5 hours.
(f) When will the population reach 50,000?

**5.** The table gives estimates of the world population, in millions, from 1750 to 2000.

(a) Use the exponential model and the population figures for 1750 and 1800 to predict the world population in 1900 and 1950. Compare with the actual figures.
(b) Use the exponential model and the population figures for 1850 and 1900 to predict the world population in 1950. Compare with the actual population.
(c) Use the exponential model and the population figures for 1900 and 1950 to predict the world population in 2000. Compare with the actual population and try to explain the discrepancy.

| Year | Population (millions) | Year | Population (millions) |
|---|---|---|---|
| 1750 | 790 | 1900 | 1650 |
| 1800 | 980 | 1950 | 2560 |
| 1850 | 1260 | 2000 | 6080 |

**6.** The table gives census data for the population of Indonesia, in millions, during the second half of the 20th century.

| Year | Population (millions) |
|---|---|
| 1950 | 83 |
| 1960 | 100 |
| 1970 | 122 |
| 1980 | 150 |
| 1990 | 182 |
| 2000 | 214 |

(a) Assuming the population grows at a rate proportional to its size, use the census data for 1950 and 1960 to predict the population in 1980. Compare with the actual figure.
(b) Use the census data for 1960 and 1980 to predict the population in 2000. Compare with the actual population.
(c) Use the census data for 1980 and 2000 to predict the population in 2010 and compare with the actual population of 243 million.
(d) Use the model in part (c) to predict the population in 2025. Do you think the prediction will be too high or too low? Why?

**7.** Experiments show that if the chemical reaction

$$N_2O_5 \longrightarrow 2NO_2 + \tfrac{1}{2}O_2$$

takes place at 45°C, the rate of reaction of dinitrogen pentoxide is proportional to its concentration as follows:

$$-\frac{d[N_2O_5]}{dt} = 0.0005[N_2O_5]$$

(a) Find an expression for the concentration $[N_2O_5]$ after $t$ seconds if the initial concentration is $C$.

(b) How long will the reaction take to reduce the concentration of $N_2O_5$ to 90% of its original value?

**8.** Strontium-90 has a half-life of 28 days.

(a) A sample has initial mass 50 mg. Find a formula for the mass remaining after $t$ days.

(b) Find the mass remaining after 40 days.

(c) How long does it take the sample to decay to a mass of 2 mg?

(d) Sketch the graph of the mass function.

**9.** The half-life of cesium-137 is 30 years. Suppose we have a 100-mg sample.

(a) Find the mass that remains after $t$ years.

(b) How much of the sample remains after 100 years?

(c) After how long will only 1 mg remain?

**10.** A sample of einsteinium-252 decayed to 64.3% of its original mass after 300 days.

(a) What is the half-life of einsteinium-252?

(b) How long would it take the sample to decay to one-third of its original mass?

**11–13 Radiocarbon Dating** Scientists can determine the age of ancient objects by the method of *radiocarbon dating*. The bombardment of the upper atmosphere by cosmic rays converts nitrogen to a radioactive isotope of carbon, $^{14}C$, with a half-life of about 5730 years. Vegetation absorbs carbon dioxide through the atmosphere and animal life assimilates $^{14}C$ through food chains. When a plant or animal dies, it stops replacing its carbon and the amount of $^{14}C$ present begins to decrease through radioactive decay. Therefore the level of radioactivity must also decay exponentially.

**11.** A discovery revealed a parchment fragment that had about 74% as much $^{14}C$ radioactivity as does plant material on the earth today. Estimate the age of the parchment.

**12.** Dinosaur fossils are too old to be reliably dated using carbon-14. Suppose we had a 68-million-year-old dinosaur fossil. What fraction of the living dinosaur's $^{14}C$ would be remaining today? Suppose the minimum detectable mass is 0.1%. What is the maximum age of a fossil that could be dated using $^{14}C$?

**13.** Dinosaur fossils are often dated by using an element other than carbon, such as potassium-40, that has a longer half-life (in this case, approximately 1.25 billion years). Suppose the minimum detectable mass is 0.1% and a dinosaur is dated with $^{40}K$ to be 68 million years old. Is such a dating possible? In other words, what is the maximum age of a fossil that could be dated using $^{40}K$?

---

**14.** A curve passes through the point (0, 5) and has the property that the slope of the curve at every point $P$ is twice the $y$-coordinate of $P$. What is the equation of the curve?

**15.** A roast turkey is removed from an oven when its temperature has reached 185°F and is placed on a table in a room where the ambient temperature is 75°F.

(a) If the temperature of the turkey is 150°F after half an hour, what is the temperature after 45 minutes?

(b) When will the turkey have cooled to 100°F?

**16.** In a murder investigation, the temperature of the corpse was 32.5°C at 1:30 PM and 30.3°C an hour later. Normal body temperature is 37.0°C and the ambient temperature was 20.0°C. When did the murder take place?

**17.** When a cold drink is taken from a refrigerator, its temperature is 5°C. After 25 minutes in a 20°C room its temperature has increased to 10°C.

(a) What is the temperature of the drink after 50 minutes?

(b) When will its temperature reach 15°C?

**18.** A freshly brewed cup of coffee has temperature 95°C in a 20°C room. When its temperature is 70°C, it is cooling at a rate of 1°C per minute. When does this occur?

**19.** The rate of change of atmospheric pressure $P$ with respect to altitude $h$ is proportional to $P$, provided that the temperature is constant. At 15°C the pressure is 101.3 kPa at sea level and 87.14 kPa at $h = 1000$ m.

(a) What is the pressure at an altitude of 3000 m?

(b) What is the pressure at the top of Mount McKinley, at an altitude of 6187 m?

**20.** (a) If \$2500 is borrowed at 4.5% interest, find the amounts due at the end of 3 years if the interest is compounded (i) annually, (ii) quarterly, (iii) monthly, (iv) weekly, (v) daily, (vi) hourly, and (vii) continuously.

(b) Suppose \$2500 is borrowed and the interest is compounded continuously. If $A(t)$ is the amount due after $t$ years, where $0 \leqslant t \leqslant 3$, graph $A(t)$ for each of the interest rates 5%, 6%, and 7% on a common screen.

**21.** (a) If \$4000 is invested at 1.75% interest, find the value of the investment at the end of 5 years if the interest is compounded (i) annually, (ii) semiannually, (iii) monthly, (iv) weekly, (v) daily, and (vi) continuously.

(b) If $A(t)$ is the amount of the investment at time $t$ for the case of continuous compounding, write a differential equation and an initial condition satisfied by $A(t)$.

**22.** (a) How long will it take an investment to double in value if the interest rate is 3%, compounded continuously?

(b) What is the equivalent annual interest rate?

## APPLIED PROJECT | CONTROLLING RED BLOOD CELL LOSS DURING SURGERY

Kent Weakley / Shutterstock.com

A typical volume of blood in the human body is about 5 L. A certain percentage of that volume (called the *hematocrit*) consists of red blood cells (RBCs); typically the hematocrit is about 45% in males. Suppose that a surgery takes four hours and a male patient bleeds 2.5 L of blood. During surgery the patient's blood volume is maintained at 5 L by injection of saline solution, which mixes quickly with the blood but dilutes it so that the hematocrit decreases as time passes.

1. Assuming that the rate of RBC loss is proportional to the volume of RBCs, determine the patient's volume of RBCs by the end of the operation.
2. A procedure called *acute normovolemic hemodilution* (ANH) has been developed to minimize RBC loss during surgery. In this procedure blood is extracted from the patient before the operation and replaced with saline solution. This dilutes the patient's blood, resulting in fewer RBCs being lost by bleeding during surgery. The extracted blood is then returned to the patient after surgery. Only a certain amount of blood can be extracted, however, because the RBC concentration can never be allowed to drop below 25% during surgery. What is the maximum amount of blood that can be extracted in the ANH procedure for the surgery described in this project?
3. What is the RBC loss without the ANH procedure? What is the loss if the procedure is carried out with the volume calculated in Problem 2?

## 6.6 Inverse Trigonometric Functions

In this section we apply the ideas of Section 6.1 to find the derivatives of the so-called inverse trigonometric functions. We have a slight difficulty in this task: because the trigonometric functions are not one-to-one, they don't have inverse functions. The difficulty is overcome by restricting the domains of these functions so that they become one-to-one.

### Inverse Trigonometric Functions: Definitions and Derivatives

You can see from Figure 1 that the sine function $y = \sin x$ is not one-to-one (use the Horizontal Line Test). However, if we restrict the domain to the interval $[-\pi/2, \pi/2]$, then the function *is* one-to-one and all values in the range of $y = \sin x$ are attained (see Figure 2). The inverse function of this restricted sine function $f$ exists and is denoted by $\sin^{-1}$ or arcsin. It is called the **inverse sine function** or the **arcsine function**.

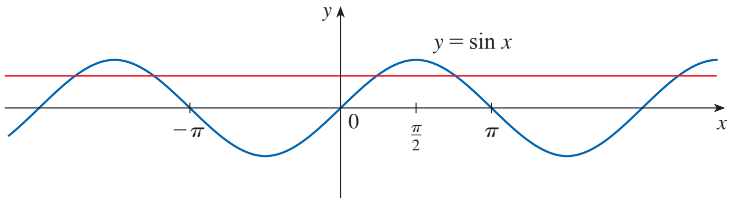

**FIGURE 1**

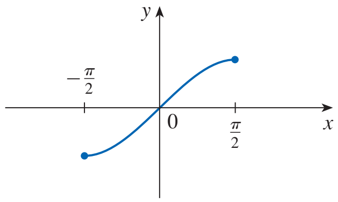

**FIGURE 2**

$y = \sin x,\ -\frac{\pi}{2} \leqslant x \leqslant \frac{\pi}{2}$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Since the definition of an inverse function says that

$$f^{-1}(x) = y \iff f(y) = x$$

we have

**1**

$$\boxed{\sin^{-1}x = y \iff \sin y = x \quad \text{and} \quad -\frac{\pi}{2} \leqslant y \leqslant \frac{\pi}{2}}$$

⊘ $\sin^{-1}x \neq \dfrac{1}{\sin x}$

So, if $-1 \leqslant x \leqslant 1$, $\sin^{-1}x$ is the number between $-\pi/2$ and $\pi/2$ whose sine is $x$.

**EXAMPLE 1** Evaluate (a) $\sin^{-1}\left(\frac{1}{2}\right)$ and (b) $\tan\left(\arcsin \frac{1}{3}\right)$.

**SOLUTION**

(a) We have

$$\sin^{-1}\left(\tfrac{1}{2}\right) = \frac{\pi}{6}$$

because $\sin(\pi/6) = \frac{1}{2}$ and $\pi/6$ lies between $-\pi/2$ and $\pi/2$.

(b) Let $\theta = \arcsin \frac{1}{3}$, so $\sin\theta = \frac{1}{3}$. Then we can draw a right triangle with angle $\theta$ as in Figure 3 and deduce from the Pythagorean Theorem that the third side has length $\sqrt{9-1} = 2\sqrt{2}$. This enables us to read from the triangle that

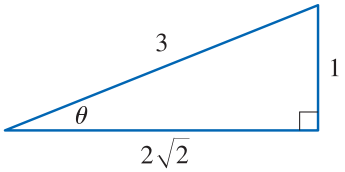

**FIGURE 3**

$$\tan\left(\arcsin \tfrac{1}{3}\right) = \tan\theta = \frac{1}{2\sqrt{2}} \qquad ■$$

The cancellation equations for inverse functions become, in this case,

**2**

$$\boxed{\begin{aligned} &\sin^{-1}(\sin x) = x \quad \text{for } -\frac{\pi}{2} \leqslant x \leqslant \frac{\pi}{2} \\ &\sin(\sin^{-1}x) = x \quad \text{for } -1 \leqslant x \leqslant 1 \end{aligned}}$$

The inverse sine function, $\sin^{-1}$, has domain $[-1, 1]$ and range $[-\pi/2, \pi/2]$, and its graph, shown in Figure 4, is obtained from that of the restricted sine function (Figure 2) by reflection about the line $y = x$.

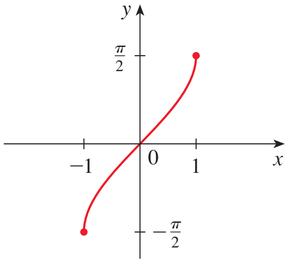

**FIGURE 4**

$y = \sin^{-1}x = \arcsin x$

We know that the sine function $f$ is continuous, so by Theorem 6.1.6 the inverse sine function is also continuous. We also know from Section 2.4 that the sine function is differentiable, so by Theorem 6.1.7 the inverse sine function is also differentiable. We could calculate the derivative of $\sin^{-1}$ by the formula in Theorem 6.1.7, but since we know that $\sin^{-1}$ is differentiable, we can just as easily calculate it by implicit differentiation as follows.

Let $y = \sin^{-1}x$. Then $\sin y = x$ and $-\pi/2 \leqslant y \leqslant \pi/2$. Differentiating $\sin y = x$ implicitly with respect to $x$, we obtain

$$\cos y \frac{dy}{dx} = 1 \qquad \text{or} \qquad \frac{dy}{dx} = \frac{1}{\cos y}$$

Now $\cos y \geqslant 0$ because $-\pi/2 \leqslant y \leqslant \pi/2$, so

$$\cos y = \sqrt{1 - \sin^2 y} = \sqrt{1 - x^2} \qquad (\cos^2 y + \sin^2 y = 1)$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Therefore $$\frac{dy}{dx} = \frac{1}{\cos y} = \frac{1}{\sqrt{1 - x^2}}$$

**3** $$\boxed{\frac{d}{dx}(\sin^{-1}x) = \frac{1}{\sqrt{1 - x^2}} \qquad -1 < x < 1}$$

**EXAMPLE 2** If $f(x) = \sin^{-1}(x^2 - 1)$, find (a) the domain of $f$, (b) $f'(x)$, and (c) the domain of $f'$.

**SOLUTION**

(a) Since the domain of the inverse sine function is $[-1, 1]$, the domain of $f$ is

$$\{x \mid -1 \leqslant x^2 - 1 \leqslant 1\} = \{x \mid 0 \leqslant x^2 \leqslant 2\}$$

$$= \{x \mid |x| \leqslant \sqrt{2}\} = [-\sqrt{2}, \sqrt{2}]$$

(b) Combining Formula 3 with the Chain Rule, we have

$$f'(x) = \frac{1}{\sqrt{1 - (x^2 - 1)^2}} \frac{d}{dx}(x^2 - 1)$$

$$= \frac{1}{\sqrt{1 - (x^4 - 2x^2 + 1)}} 2x = \frac{2x}{\sqrt{2x^2 - x^4}}$$

(c) The domain of $f'$ is

$$\{x \mid -1 < x^2 - 1 < 1\} = \{x \mid 0 < x^2 < 2\}$$

$$= \{x \mid 0 < |x| < \sqrt{2}\} = (-\sqrt{2}, 0) \cup (0, \sqrt{2}) \qquad \blacksquare$$

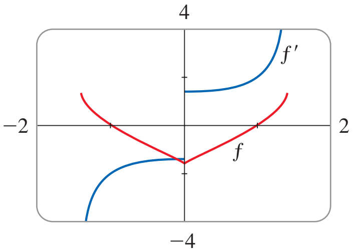

**FIGURE 5**

The graphs of the function $f$ of Example 2 and its derivative are shown in Figure 5. Notice that $f$ is not differentiable at 0 and this is consistent with the fact that the graph of $f'$ makes a sudden jump at $x = 0$.

The **inverse cosine function** is handled similarly. The restricted cosine function $f(x) = \cos x$, $0 \leqslant x \leqslant \pi$, is one-to-one (see Figure 6) and so it has an inverse function denoted by $\cos^{-1}$ or arccos.

**4** $$\boxed{\cos^{-1}x = y \iff \cos y = x \quad \text{and} \quad 0 \leqslant y \leqslant \pi}$$

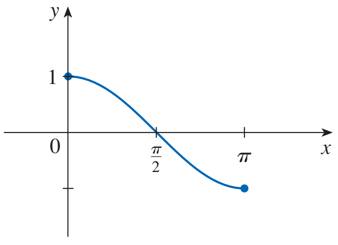

**FIGURE 6**
$y = \cos x$, $0 \leqslant x \leqslant \pi$

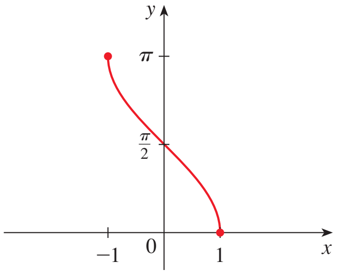

**FIGURE 7**
$y = \cos^{-1}x = \arccos x$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The cancellation equations are

**5**

$$\boxed{\begin{aligned} \cos^{-1}(\cos x) &= x \quad \text{for } 0 \leqslant x \leqslant \pi \\ \cos(\cos^{-1}x) &= x \quad \text{for } -1 \leqslant x \leqslant 1 \end{aligned}}$$

The inverse cosine function, $\cos^{-1}$, has domain $[-1, 1]$ and range $[0, \pi]$ and is a continuous function whose graph is shown in Figure 7. Its derivative is given by

**6**

$$\boxed{\frac{d}{dx}(\cos^{-1}x) = -\frac{1}{\sqrt{1 - x^2}} \qquad -1 < x < 1}$$

Formula 6 can be proved by the same method as for Formula 3 and is left as Exercise 17.

The tangent function can be made one-to-one by restricting it to the interval $(-\pi/2, \pi/2)$. Thus the **inverse tangent function** is defined as the inverse of the function $f(x) = \tan x$, $-\pi/2 < x < \pi/2$. (See Figure 8.) It is denoted by $\tan^{-1}$ or arctan.

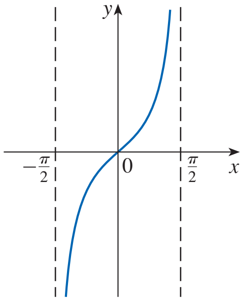

**FIGURE 8**
$y = \tan x$, $-\frac{\pi}{2} < x < \frac{\pi}{2}$

**7**

$$\boxed{\tan^{-1}x = y \iff \tan y = x \quad \text{and} \quad -\frac{\pi}{2} < y < \frac{\pi}{2}}$$

**EXAMPLE 3** Simplify the expression $\cos(\tan^{-1}x)$.

**SOLUTION 1** Let $y = \tan^{-1}x$. Then $\tan y = x$ and $-\pi/2 < y < \pi/2$. We want to find $\cos y$ but, since $\tan y$ is known, it is easier to find $\sec y$ first:

$$\sec^2 y = 1 + \tan^2 y = 1 + x^2$$

$$\sec y = \sqrt{1 + x^2} \qquad (\text{since } \sec y > 0 \text{ for } -\pi/2 < y < \pi/2)$$

Thus
$$\cos(\tan^{-1}x) = \cos y = \frac{1}{\sec y} = \frac{1}{\sqrt{1 + x^2}}$$

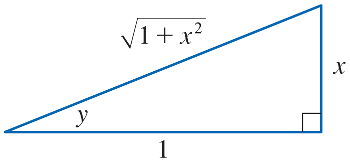

**FIGURE 9**

**SOLUTION 2** Instead of using trigonometric identities as in Solution 1, it is perhaps easier to use a diagram. If $y = \tan^{-1}x$, then $\tan y = x$, and we can read from Figure 9 (which illustrates the case $y > 0$) that

$$\cos(\tan^{-1}x) = \cos y = \frac{1}{\sqrt{1 + x^2}}$$ ■

The inverse tangent function, $\tan^{-1} = \arctan$, has domain $\mathbb{R}$ and range $(-\pi/2, \pi/2)$. Its graph is shown in Figure 10.

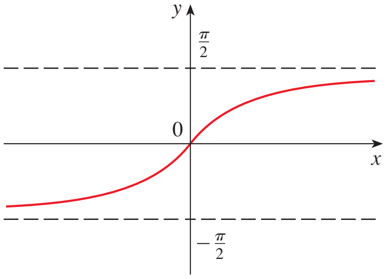

**FIGURE 10**
$y = \tan^{-1}x = \arctan x$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

We know that

$$\lim_{x \to (\pi/2)^-} \tan x = \infty \qquad \text{and} \qquad \lim_{x \to -(\pi/2)^+} \tan x = -\infty$$

and so the lines $x = \pm\pi/2$ are vertical asymptotes of the graph of tan. Since the graph of $\tan^{-1}$ is obtained by reflecting the graph of the restricted tangent function about the line $y = x$, it follows that the lines $y = \pi/2$ and $y = -\pi/2$ are horizontal asymptotes of the graph of $\tan^{-1}$. This fact is expressed by the following limits:

$$\boxed{\lim_{x \to -\infty} \tan^{-1}x = -\frac{\pi}{2} \qquad \lim_{x \to \infty} \tan^{-1}x = \frac{\pi}{2}} \tag{8}$$

**EXAMPLE 4** Evaluate $\displaystyle\lim_{x \to 2^+} \arctan\left(\frac{1}{x-2}\right)$.

**SOLUTION** If we let $t = 1/(x-2)$, we know that $t \to \infty$ as $x \to 2^+$. Therefore, by the second equation in (8), we have

$$\lim_{x \to 2^+} \arctan\left(\frac{1}{x-2}\right) = \lim_{t \to \infty} \arctan t = \frac{\pi}{2} \qquad ■$$

Because tan is differentiable, $\tan^{-1}$ is also differentiable. To find its derivative, we let $y = \tan^{-1}x$. Then $\tan y = x$. Differentiating this latter equation implicitly with respect to $x$, we have

$$\sec^2 y \, \frac{dy}{dx} = 1$$

and so

$$\frac{dy}{dx} = \frac{1}{\sec^2 y} = \frac{1}{1 + \tan^2 y} = \frac{1}{1 + x^2}$$

$$\boxed{\frac{d}{dx}(\tan^{-1}x) = \frac{1}{1 + x^2}} \tag{9}$$

The remaining inverse trigonometric functions are not used as frequently and are summarized here.

$$\boxed{\begin{aligned} y &= \csc^{-1}x \ \bigl(|x| \geqslant 1\bigr) &&\iff \csc y = x \quad \text{and} \quad y \in (0, \pi/2] \cup (\pi, 3\pi/2] \\ y &= \sec^{-1}x \ \bigl(|x| \geqslant 1\bigr) &&\iff \sec y = x \quad \text{and} \quad y \in [0, \pi/2) \cup [\pi, 3\pi/2) \\ y &= \cot^{-1}x \ \ (x \in \mathbb{R}) &&\iff \cot y = x \quad \text{and} \quad y \in (0, \pi) \end{aligned}} \tag{10}$$

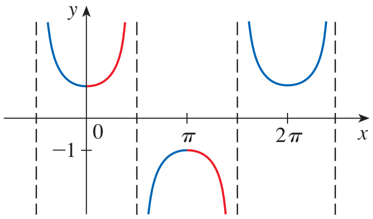

**FIGURE 11**
$y = \sec x$

The choice of intervals for $y$ in the definitions of $\csc^{-1}$ and $\sec^{-1}$ is not universally agreed upon. For instance, some authors use $y \in [0, \pi/2) \cup (\pi/2, \pi]$ in the definition of $\sec^{-1}$. [You can see from the graph of the secant function in Figure 11 that both this choice and the one in (10) will work.] The reason for the choice in (10) is that the differentiation formulas are simpler (see Exercise 83).

We collect in Table 11 the differentiation formulas for all of the inverse trigonometric functions. The proofs of the formulas for the derivatives of $\csc^{-1}$, $\sec^{-1}$, and $\cot^{-1}$ are left as Exercises 19–21.

**11 Table of Derivatives of Inverse Trigonometric Functions**

$$\frac{d}{dx}(\sin^{-1}x) = \frac{1}{\sqrt{1-x^2}} \qquad \frac{d}{dx}(\csc^{-1}x) = -\frac{1}{x\sqrt{x^2-1}}$$

$$\frac{d}{dx}(\cos^{-1}x) = -\frac{1}{\sqrt{1-x^2}} \qquad \frac{d}{dx}(\sec^{-1}x) = \frac{1}{x\sqrt{x^2-1}}$$

$$\frac{d}{dx}(\tan^{-1}x) = \frac{1}{1+x^2} \qquad \frac{d}{dx}(\cot^{-1}x) = -\frac{1}{1+x^2}$$

Each of these formulas can be combined with the Chain Rule. For instance, if $u$ is a differentiable function of $x$, then

$$\frac{d}{dx}(\sin^{-1}u) = \frac{1}{\sqrt{1-u^2}}\frac{du}{dx} \quad \text{and} \quad \frac{d}{dx}(\tan^{-1}u) = \frac{1}{1+u^2}\frac{du}{dx}$$

**EXAMPLE 5** Differentiate (a) $y = \dfrac{1}{\sin^{-1}x}$ and (b) $f(x) = x \arctan\sqrt{x}$.

**SOLUTION**

(a)
$$\frac{dy}{dx} = \frac{d}{dx}(\sin^{-1}x)^{-1} = -(\sin^{-1}x)^{-2}\frac{d}{dx}(\sin^{-1}x)$$
$$= -\frac{1}{(\sin^{-1}x)^2\sqrt{1-x^2}}$$

Recall that arctan $x$ is an alternative notation for $\tan^{-1}x$.

(b)
$$f'(x) = x\frac{1}{1+\left(\sqrt{x}\right)^2}\left(\tfrac{1}{2}x^{-1/2}\right) + \arctan\sqrt{x}$$
$$= \frac{\sqrt{x}}{2(1+x)} + \arctan\sqrt{x}$$ ■

**EXAMPLE 6** Prove the identity $\tan^{-1}x + \cot^{-1}x = \pi/2$.

**SOLUTION** Although calculus isn't needed to prove this identity, the proof using calculus is quite simple. If $f(x) = \tan^{-1}x + \cot^{-1}x$, then

$$f'(x) = \frac{1}{1+x^2} - \frac{1}{1+x^2} = 0$$

for all values of $x$. Therefore $f(x) = C$, a constant. To determine the value of $C$, we put $x = 1$ [because we can evaluate $f(1)$ exactly]. Then

$$C = f(1) = \tan^{-1}1 + \cot^{-1}1 = \frac{\pi}{4} + \frac{\pi}{4} = \frac{\pi}{2}$$

Thus $\tan^{-1}x + \cot^{-1}x = \pi/2$. ■

## ■ Integrals involving Inverse Trigonometric Functions

Each of the formulas in Table 11 gives rise to an integration formula. The two most useful of these are the following:

**12**
$$\boxed{\int \frac{1}{\sqrt{1 - x^2}}\,dx = \sin^{-1}x + C}$$

**13**
$$\boxed{\int \frac{1}{x^2 + 1}\,dx = \tan^{-1}x + C}$$

**EXAMPLE 7** Find $\displaystyle\int_0^{1/4} \frac{1}{\sqrt{1 - 4x^2}}\,dx$.

**SOLUTION** If we write

$$\int_0^{1/4} \frac{1}{\sqrt{1 - 4x^2}}\,dx = \int_0^{1/4} \frac{1}{\sqrt{1 - (2x)^2}}\,dx$$

then the integral resembles Equation 12 and the substitution $u = 2x$ is suggested. This gives $du = 2\,dx$, so $dx = du/2$. When $x = 0$, $u = 0$; when $x = \frac{1}{4}$, $u = \frac{1}{2}$. So

$$\int_0^{1/4} \frac{1}{\sqrt{1 - 4x^2}}\,dx = \tfrac{1}{2}\int_0^{1/2} \frac{du}{\sqrt{1 - u^2}} = \tfrac{1}{2}\sin^{-1}u\Big]_0^{1/2}$$

$$= \tfrac{1}{2}\Big[\sin^{-1}\big(\tfrac{1}{2}\big) - \sin^{-1}0\Big] = \frac{1}{2}\cdot\frac{\pi}{6} = \frac{\pi}{12} \qquad ■$$

**EXAMPLE 8** Evaluate $\displaystyle\int \frac{1}{x^2 + a^2}\,dx$.

**SOLUTION** To make the given integral more like Equation 13 we write

$$\int \frac{dx}{x^2 + a^2} = \int \frac{dx}{a^2\left(\dfrac{x^2}{a^2} + 1\right)} = \frac{1}{a^2}\int \frac{dx}{\left(\dfrac{x}{a}\right)^2 + 1}$$

This suggests that we substitute $u = x/a$. Then $du = dx/a$, $dx = a\,du$, and

$$\int \frac{dx}{x^2 + a^2} = \frac{1}{a^2}\int \frac{a\,du}{u^2 + 1} = \frac{1}{a}\int \frac{du}{u^2 + 1} = \frac{1}{a}\tan^{-1}u + C$$

Thus we have the formula

One of the main uses of inverse trigonometric functions in calculus is that they often arise when we integrate rational functions.

**14**
$$\boxed{\int \frac{1}{x^2 + a^2}\,dx = \frac{1}{a}\tan^{-1}\left(\frac{x}{a}\right) + C} \qquad ■$$

**EXAMPLE 9** Find $\displaystyle\int \frac{x}{x^4+9}\,dx$.

**SOLUTION** We substitute $u = x^2$ because then $du = 2x\,dx$ and we can use Equation 14 with $a = 3$:

$$\begin{aligned}\int \frac{x}{x^4+9}\,dx &= \frac{1}{2}\int \frac{du}{u^2+9} = \frac{1}{2}\cdot\frac{1}{3}\tan^{-1}\left(\frac{u}{3}\right) + C\\ &= \frac{1}{6}\tan^{-1}\left(\frac{x^2}{3}\right) + C\end{aligned}$$

■

## 6.6 Exercises

**1–10** Find the exact value of each expression.

**1.** (a) $\sin^{-1}(0.5)$ (b) $\cos^{-1}(-1)$

**2.** (a) $\tan^{-1}\sqrt{3}$ (b) $\sec^{-1} 2$

**3.** (a) $\csc^{-1}\sqrt{2}$ (b) $\cos^{-1}(\sqrt{3}/2)$

**4.** (a) $\cot^{-1}(-\sqrt{3})$ (b) $\arcsin 1$

**5.** (a) $\tan(\arctan 10)$ (b) $\arcsin(\sin(5\pi/4))$

**6.** (a) $\tan^{-1}(\tan 3\pi/4)$ (b) $\cos\left(\arcsin \frac{1}{2}\right)$

**7.** $\tan\left(\sin^{-1}\left(\frac{2}{3}\right)\right)$

**8.** $\csc\left(\arccos \frac{3}{5}\right)$

**9.** $\cos\left(2\sin^{-1}\left(\frac{5}{13}\right)\right)$

**10.** $\cos(\tan^{-1} 2 + \tan^{-1} 3)$

**11.** Prove that $\cos(\sin^{-1}x) = \sqrt{1-x^2}$.

**12–14** Simplify the expression.

**12.** $\tan(\sin^{-1}x)$

**13.** $\sin(\tan^{-1}x)$

**14.** $\sin(2\arccos x)$

**15-16** Graph the given functions on the same screen. How are these graphs related?

**15.** $y = \sin x,\ -\pi/2 \leqslant x \leqslant \pi/2;\quad y = \sin^{-1}x;\quad y = x$

**16.** $y = \tan x,\ -\pi/2 < x < \pi/2;\quad y = \tan^{-1}x;\quad y = x$

**17.** Prove Formula 6 for the derivative of $\cos^{-1}$ by the same method as for Formula 3.

**18.** (a) Prove that $\sin^{-1}x + \cos^{-1}x = \pi/2$.
(b) Use part (a) to prove Formula 6.

**19.** Prove that $\dfrac{d}{dx}(\cot^{-1}x) = -\dfrac{1}{1+x^2}$.

**20.** Prove that $\dfrac{d}{dx}(\sec^{-1}x) = \dfrac{1}{x\sqrt{x^2-1}}$.

**21.** Prove that $\dfrac{d}{dx}(\csc^{-1}x) = -\dfrac{1}{x\sqrt{x^2-1}}$.

**22–37** Find the derivative of the function. Simplify where possible.

**22.** $y = \tan^{-1}(x^2)$

**23.** $f(x) = \sin^{-1}(5x)$

**24.** $g(x) = \arccos\sqrt{x}$

**25.** $y = (\tan^{-1}x)^2$

**26.** $g(x) = \sec^{-1}(e^x)$

**27.** $y = \tan^{-1}\sqrt{x-1}$

**28.** $g(t) = \ln(\arctan(t^4))$

**29.** $y = \arctan(\cos\theta)$

**30.** $y = \tan^{-1}\left(x - \sqrt{1+x^2}\right)$

**31.** $f(z) = e^{\arcsin(z^2)}$

**32.** $R(t) = \arcsin(1/t)$

**33.** $h(t) = \cot^{-1}(t) + \cot^{-1}(1/t)$

**34.** $y = \cos^{-1}(\sin^{-1}t)$

**35.** $y = x\sin^{-1}x + \sqrt{1-x^2}$

**36.** $y = \arctan\sqrt{\dfrac{1-x}{1+x}}$

**37.** $y = \tan^{-1}\left(\dfrac{x}{a}\right) + \ln\sqrt{\dfrac{x-a}{x+a}}$

**38–39** Find the derivative of the function. Find the domains of the function and its derivative.

**38.** $f(x) = \arcsin(e^x)$

**39.** $g(x) = \cos^{-1}(3-2x)$

**40.** Find $y'$ if $\tan^{-1}(x^2y) = x + xy^2$.

**41.** If $g(x) = x\sin^{-1}(x/4) + \sqrt{16-x^2}$, find $g'(2)$.

**42.** Find an equation of the tangent line to the curve $y = 3\arccos(x/2)$ at the point $(1, \pi)$.

**43–44** Find $f'(x)$. Check that your answer is reasonable by comparing the graphs of $f$ and $f'$.

**43.** $f(x) = \sqrt{1-x^2}\arcsin x$

**44.** $f(x) = \arctan(x^2 - x)$

**45–48** Find the limit.

**45.** $\lim_{x \to -1^+} \sin^{-1} x$

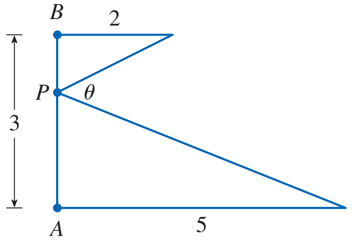
**46.** $\lim_{x \to \infty} \arccos\left(\dfrac{1 + x^2}{1 + 2x^2}\right)$

**47.** $\lim_{x \to \infty} \arctan(e^x)$

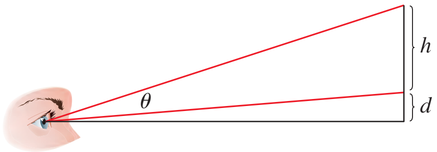
**48.** $\lim_{x \to 0^+} \tan^{-1}(\ln x)$

---

**49.** Where should the point $P$ be chosen on the line segment $AB$ so as to maximize the angle $\theta$?



**50.** A painting in an art gallery has height $h$ and is hung so that its lower edge is a distance $d$ above the eye of an observer (as in the figure). How far from the wall should the observer stand to get the best view? (In other words, where should the observer stand so as to maximize the angle $\theta$ subtended at his eye by the painting?)



**51.** A ladder 10 ft long leans against a vertical wall. If the bottom of the ladder slides away from the base of the wall at a speed of 2 ft/s, how fast is the angle between the ladder and the wall changing when the bottom of the ladder is 6 ft from the base of the wall?

**52.** A lighthouse is located on a small island 3 km away from the nearest point $P$ on a straight shoreline and its light makes four revolutions per minute. How fast is the beam of light moving along the shoreline when it is 1 km from $P$?

**53–56** Sketch the curve using the guidelines of Section 3.5.

**53.** $y = \sin^{-1}\left(\dfrac{x}{x + 1}\right)$

**54.** $y = \tan^{-1}\left(\dfrac{x - 1}{x + 1}\right)$

**55.** $y = x - \tan^{-1} x$

**56.** $y = e^{\arctan x}$

---

T **57.** If $f(x) = \arctan(\cos(3 \arcsin x))$, use a computer algebra system to compute $f'$ and $f''$. Then use the graphs of $f$, $f'$, and $f''$ to estimate the $x$-coordinates of the maximum and minimum points and inflection points of $f$.

**58.** Investigate the family of curves given by $f(x) = x - c \sin^{-1} x$. What happens to the number of maxima and minima as $c$ changes? Graph several members of the family to illustrate what you discover.

**59.** Find the most general antiderivative of the function

$$f(x) = \frac{2x^2 + 5}{x^2 + 1}$$

**60.** Find $g(t)$ if $g'(t) = 2/\sqrt{1 - t^2}$ and $g(1) = 5$.

**61–74** Evaluate the integral.

**61.** $\displaystyle\int_{1/\sqrt{3}}^{\sqrt{3}} \frac{8}{1 + x^2}\, dx$

**62.** $\displaystyle\int_{-1/\sqrt{2}}^{1/\sqrt{2}} \frac{6}{\sqrt{1 - p^2}}\, dp$

**63.** $\displaystyle\int_0^{1/2} \frac{\sin^{-1} x}{\sqrt{1 - x^2}}\, dx$

**64.** $\displaystyle\int_0^{\sqrt{3}/4} \frac{dx}{1 + 16x^2}$

**65.** $\displaystyle\int \frac{1 + x}{1 + x^2}\, dx$

**66.** $\displaystyle\int_0^{\pi/2} \frac{\sin x}{1 + \cos^2 x}\, dx$

**67.** $\displaystyle\int \frac{(\arctan x)^2}{x^2 + 1}\, dx$

**68.** $\displaystyle\int \frac{1}{(x^2 + 1)\arctan x}\, dx$

**69.** $\displaystyle\int \frac{e^{\arcsin x}}{\sqrt{1 - x^2}}\, dx$

**70.** $\displaystyle\int \frac{1}{x\sqrt{x^2 - 4}}\, dx$

**71.** $\displaystyle\int \frac{t^2}{\sqrt{1 - t^6}}\, dt$

**72.** $\displaystyle\int_0^1 \frac{e^x}{1 + e^{2x}}\, dx$

**73.** $\displaystyle\int \frac{dx}{\sqrt{x}\,(1 + x)}$

**74.** $\displaystyle\int \frac{x}{1 + x^4}\, dx$

---

**75.** Use the method of Example 8 to show that, if $a > 0$,

$$\int \frac{1}{\sqrt{a^2 - x^2}}\, dx = \sin^{-1}\left(\frac{x}{a}\right) + C$$

**76.** The region under the curve $y = 1/\sqrt{x^2 + 4}$ from $x = 0$ to $x = 2$ is rotated about the $x$-axis. Find the volume of the resulting solid.

**77.** Evaluate $\int_0^1 \sin^{-1} x\, dx$ by interpreting it as an area and integrating with respect to $y$ instead of $x$.

**78.** Prove that, for $xy \neq 1$,

$$\arctan x + \arctan y = \arctan \frac{x + y}{1 - xy}$$

if the left side lies between $-\pi/2$ and $\pi/2$.

**79.** Use the result of Exercise 78 to prove the following:

(a) $\arctan \frac{1}{2} + \arctan \frac{1}{3} = \pi/4$

(b) $2 \arctan \frac{1}{3} + \arctan \frac{1}{7} = \pi/4$

**80.** (a) Sketch the graph of the function $f(x) = \sin(\sin^{-1} x)$.

(b) Sketch the graph of the function

$$g(x) = \sin^{-1}(\sin x) \qquad x \in \mathbb{R}$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

(c) Show that $g'(x) = \dfrac{\cos x}{|\cos x|}$.

(d) Sketch the graph of $h(x) = \cos^{-1}(\sin x)$, $x \in \mathbb{R}$, and find its derivative.

**81.** Use the method of Example 6 to prove the identity

$$2 \sin^{-1}x = \cos^{-1}(1 - 2x^2) \qquad x \geqslant 0$$

**82.** Prove the identity

$$\arcsin \frac{x-1}{x+1} = 2 \arctan \sqrt{x} - \frac{\pi}{2}$$

**83.** Some authors define $y = \sec^{-1}x \iff \sec y = x$ and $y \in [0, \pi/2) \cup (\pi/2, \pi]$. Show that with this definition we have (instead of the formula given in Exercise 20)

$$\frac{d}{dx}(\sec^{-1}x) = \frac{1}{|x|\sqrt{x^2 - 1}} \qquad |x| > 1$$

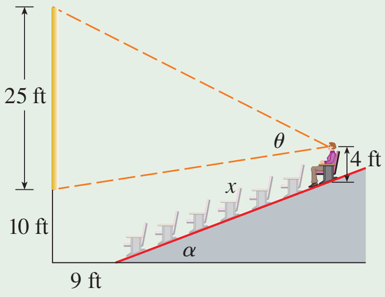
**84.** Let $f(x) = x \arctan(1/x)$ if $x \neq 0$ and $f(0) = 0$.

(a) Is $f$ continuous at 0?

(b) Is $f$ differentiable at 0?

## APPLIED PROJECT | WHERE TO SIT AT THE MOVIES

A movie theater has a screen that is positioned 10 ft off the floor and is 25 ft high. The first row of seats is placed 9 ft from the screen and the rows are set 3 ft apart. The floor of the seating area is inclined at an angle of $\alpha = 20°$ above the horizontal and the distance up the incline that you sit is $x$. The theater has 21 rows of seats, so $0 \leqslant x \leqslant 60$. Suppose you decide that the best place to sit is in the row where the angle $\theta$ subtended by the screen at your eyes is a maximum. Let's also suppose that your eyes are 4 ft above the floor, as shown in the figure. (In Exercise 6.6.50 we looked at a simpler version of this problem, where the floor is horizontal, but this project involves a more complicated situation and requires technology.)



**1.** Show that

$$\theta = \arccos\left(\frac{a^2 + b^2 - 625}{2ab}\right)$$

where $\qquad a^2 = (9 + x\cos\alpha)^2 + (31 - x\sin\alpha)^2$

and $\qquad b^2 = (9 + x\cos\alpha)^2 + (x\sin\alpha - 6)^2$

**2.** Use a graph of $\theta$ as a function of $x$ to estimate the value of $x$ that maximizes $\theta$. In which row should you sit? What is the viewing angle $\theta$ in this row?

**3.** Use a computer algebra system to differentiate $\theta$ and find a numerical value for the solution of the equation $d\theta/dx = 0$. Does this value confirm your result in Problem 2?

**4.** Use the graph of $\theta$ to estimate the average value of $\theta$ on the interval $0 \leqslant x \leqslant 60$. Then use a computer algebra system to compute the average value. Compare with the maximum and minimum values of $\theta$.

# 6.7 Hyperbolic Functions

## Hyperbolic Functions and Their Derivatives

Certain combinations of the exponential functions $e^x$ and $e^{-x}$ arise so frequently in mathematics and its applications that they deserve to be given special names. In many ways they are analogous to the trigonometric functions, and they have the same relationship to the hyperbola that the trigonometric functions have to the circle. For this reason they are collectively called **hyperbolic functions** and individually called **hyperbolic sine**, **hyperbolic cosine**, and so on.

### Definition of the Hyperbolic Functions

$$\sinh x = \frac{e^x - e^{-x}}{2} \qquad \operatorname{csch} x = \frac{1}{\sinh x}$$

$$\cosh x = \frac{e^x + e^{-x}}{2} \qquad \operatorname{sech} x = \frac{1}{\cosh x}$$

$$\tanh x = \frac{\sinh x}{\cosh x} \qquad \coth x = \frac{\cosh x}{\sinh x}$$

The graphs of hyperbolic sine and hyperbolic cosine can be sketched using graphical addition as in Figures 1 and 2.

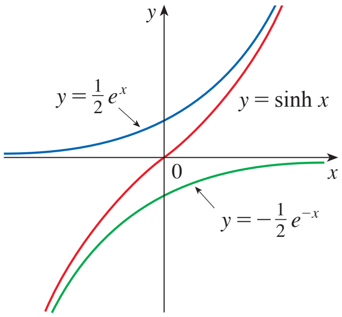


**FIGURE 1**
$y = \sinh x = \frac{1}{2}e^x - \frac{1}{2}e^{-x}$

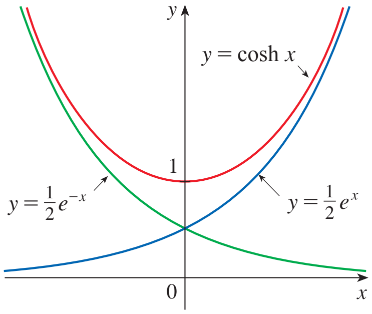

**FIGURE 2**
$y = \cosh x = \frac{1}{2}e^x + \frac{1}{2}e^{-x}$

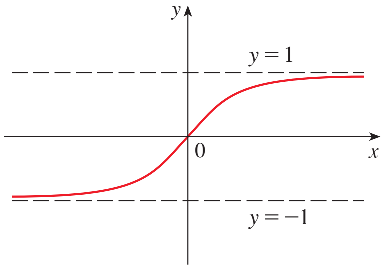

**FIGURE 3**
$y = \tanh x$

Note that sinh has domain $\mathbb{R}$ and range $\mathbb{R}$, whereas cosh has domain $\mathbb{R}$ and range $[1, \infty)$. The graph of tanh is shown in Figure 3. It has horizontal asymptotes $y = \pm 1$. (See Exercise 27.)

Some of the mathematical uses of hyperbolic functions will be seen in Chapter 7. Applications to science and engineering occur whenever an entity such as light, velocity, electricity, or radioactivity is gradually absorbed or extinguished because the decay can be represented by hyperbolic functions. The most famous application is the use of hyperbolic cosine to describe the shape of a hanging wire. It can be proved that if a heavy flexible cable (such as an overhead power line) is suspended between two points at the same height, then it takes the shape of a curve with equation

$$y = c + a\cosh(x/a)$$

called a *catenary* (see Figure 4). (The Latin word *catena* means "chain.")

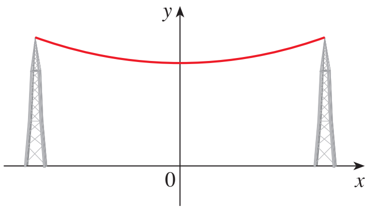

**FIGURE 4**
A catenary $y = c + a\cosh(x/a)$

Another application of hyperbolic functions occurs in the description of ocean waves: the velocity of a water wave with length $L$ moving across a body of water with depth $d$ is modeled by the function

$$v = \sqrt{\frac{gL}{2\pi}\tanh\left(\frac{2\pi d}{L}\right)}$$

where $g$ is the acceleration due to gravity (see Figure 5 and Exercise 57).

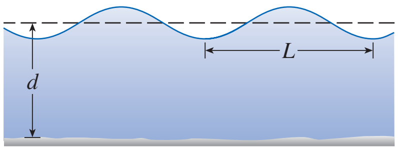

**FIGURE 5**
Idealized water wave

The hyperbolic functions satisfy a number of identities that are similar to well-known trigonometric identities. We list some of them here and leave most of the proofs to the exercises.

iStock.com / gnagel

The Gateway Arch in St. Louis was designed using a hyperbolic cosine function (see Exercise 56).

**Hyperbolic Identities**

$$\sinh(-x) = -\sinh x \qquad \cosh(-x) = \cosh x$$

$$\cosh^2 x - \sinh^2 x = 1 \qquad 1 - \tanh^2 x = \operatorname{sech}^2 x$$

$$\sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y$$

$$\cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y$$

**EXAMPLE 1** Prove (a) $\cosh^2 x - \sinh^2 x = 1$ and (b) $1 - \tanh^2 x = \operatorname{sech}^2 x$.

**SOLUTION**

(a)
$$\cosh^2 x - \sinh^2 x = \left(\frac{e^x + e^{-x}}{2}\right)^2 - \left(\frac{e^x - e^{-x}}{2}\right)^2$$

$$= \frac{e^{2x} + 2 + e^{-2x}}{4} - \frac{e^{2x} - 2 + e^{-2x}}{4}$$

$$= \frac{4}{4} = 1$$

(b) We start with the identity proved in part (a):

$$\cosh^2 x - \sinh^2 x = 1$$

If we divide both sides by $\cosh^2 x$, we get

$$1 - \frac{\sinh^2 x}{\cosh^2 x} = \frac{1}{\cosh^2 x}$$

or
$$1 - \tanh^2 x = \operatorname{sech}^2 x$$ ■

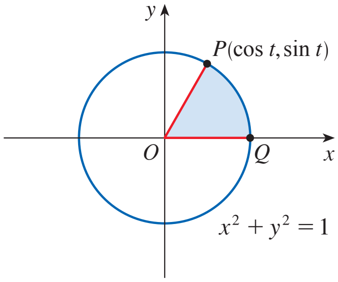

**FIGURE 6**

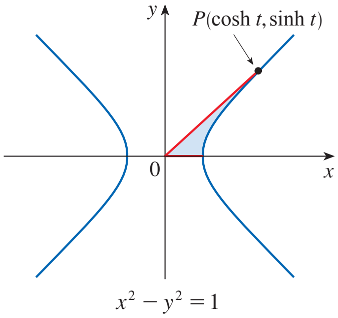

**FIGURE 7**

The identity proved in Example 1(a) gives a clue to the reason for the name "hyperbolic" functions:

If $t$ is any real number, then the point $P(\cos t, \sin t)$ lies on the unit circle $x^2 + y^2 = 1$ because $\cos^2 t + \sin^2 t = 1$. In fact, $t$ can be interpreted as the radian measure of $\angle POQ$ in Figure 6. For this reason the trigonometric functions are sometimes called *circular* functions.

Likewise, if $t$ is any real number, then the point $P(\cosh t, \sinh t)$ lies on the right branch of the hyperbola $x^2 - y^2 = 1$ because $\cosh^2 t - \sinh^2 t = 1$ and $\cosh t \geqslant 1$. This time, $t$ does not represent the measure of an angle. However, it turns out that $t$ represents twice the area of the shaded hyperbolic sector in Figure 7, just as in the trigonometric case $t$ represents twice the area of the shaded circular sector in Figure 6.

The derivatives of the hyperbolic functions are easily computed. For example,

$$\frac{d}{dx}(\sinh x) = \frac{d}{dx}\left(\frac{e^x - e^{-x}}{2}\right) = \frac{e^x + e^{-x}}{2} = \cosh x$$

We list the differentiation formulas for the hyperbolic functions as Table 1. The remaining proofs are left as exercises. Note the analogy with the differentiation formulas for trigonometric functions, but note that the signs are different in some cases.

**1 Table of Derivatives of Hyperbolic Functions**

$$\begin{array}{ll}
\dfrac{d}{dx}(\sinh x) = \cosh x & \dfrac{d}{dx}(\operatorname{csch} x) = -\operatorname{csch} x \coth x \\[2ex]
\dfrac{d}{dx}(\cosh x) = \sinh x & \dfrac{d}{dx}(\operatorname{sech} x) = -\operatorname{sech} x \tanh x \\[2ex]
\dfrac{d}{dx}(\tanh x) = \operatorname{sech}^2 x & \dfrac{d}{dx}(\coth x) = -\operatorname{csch}^2 x
\end{array}$$

Any of these differentiation rules can be combined with the Chain Rule, as in the next example.

**EXAMPLE 2** If $y = \cosh\sqrt{x}$, find $dy/dx$.

**SOLUTION** Using (1) and the Chain Rule, we have

$$\frac{dy}{dx} = \frac{d}{dx}\left(\cosh\sqrt{x}\right) = \sinh\sqrt{x} \cdot \frac{d}{dx}\sqrt{x} = \frac{\sinh\sqrt{x}}{2\sqrt{x}}$$ ■

## Inverse Hyperbolic Functions and Their Derivatives

You can see from Figures 1 and 3 that sinh and tanh are one-to-one functions and so they have inverse functions denoted by $\sinh^{-1}$ and $\tanh^{-1}$. Figure 2 shows that cosh is not one-to-one, but if we restrict the domain to the interval $[0, \infty)$, then the function $y = \cosh x$ is one-to-one and attains all the values in its range $[1, \infty)$. The inverse hyperbolic cosine function is defined as the inverse of this restricted function.

**2**

$$\begin{array}{lcl}
y = \sinh^{-1}x & \iff & \sinh y = x \\
y = \cosh^{-1}x & \iff & \cosh y = x \quad \text{and} \quad y \geqslant 0 \\
y = \tanh^{-1}x & \iff & \tanh y = x
\end{array}$$

The remaining inverse hyperbolic functions are defined similarly (see Exercise 32).

We sketch the graphs of $\sinh^{-1}$, $\cosh^{-1}$, and $\tanh^{-1}$ in Figures 8, 9, and 10 by referring to Figures 1, 2, and 3.

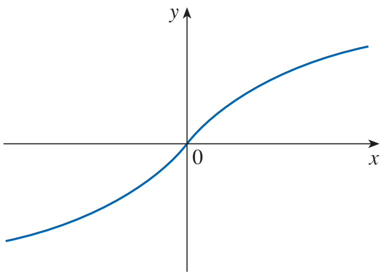

**FIGURE 8** $y = \sinh^{-1}x$
domain $= \mathbb{R}$ range $= \mathbb{R}$

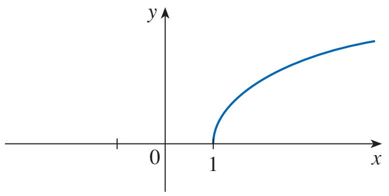

**FIGURE 9** $y = \cosh^{-1}x$
domain $= [1, \infty)$ range $= [0, \infty)$

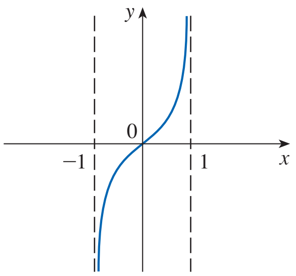

**FIGURE 10** $y = \tanh^{-1}x$
domain $= (-1, 1)$ range $= \mathbb{R}$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Since the hyperbolic functions are defined in terms of exponential functions, it's not surprising to learn that the inverse hyperbolic functions can be expressed in terms of logarithms. In particular, we have:

Formula 3 is proved in Example 3. The proofs of Formulas 4 and 5 are requested in Exercises 30 and 31.

**3** $$\sinh^{-1}x = \ln\left(x + \sqrt{x^2 + 1}\right) \qquad x \in \mathbb{R}$$

**4** $$\cosh^{-1}x = \ln\left(x + \sqrt{x^2 - 1}\right) \qquad x \geqslant 1$$

**5** $$\tanh^{-1}x = \tfrac{1}{2}\ln\left(\frac{1 + x}{1 - x}\right) \qquad -1 < x < 1$$

**EXAMPLE 3** Show that $\sinh^{-1}x = \ln\left(x + \sqrt{x^2 + 1}\right)$.

**SOLUTION** Let $y = \sinh^{-1}x$. Then

$$x = \sinh y = \frac{e^y - e^{-y}}{2}$$

so $$e^y - 2x - e^{-y} = 0$$

or, multiplying by $e^y$, $$e^{2y} - 2xe^y - 1 = 0$$

This is really a quadratic equation in $e^y$:

$$(e^y)^2 - 2x(e^y) - 1 = 0$$

Solving by the quadratic formula, we get

$$e^y = \frac{2x \pm \sqrt{4x^2 + 4}}{2} = x \pm \sqrt{x^2 + 1}$$

Note that $e^y > 0$, but $x - \sqrt{x^2 + 1} < 0$ $\left(\text{because } x < \sqrt{x^2 + 1}\right)$. Thus the minus sign is inadmissible and we have

$$e^y = x + \sqrt{x^2 + 1}$$

Therefore $$y = \ln(e^y) = \ln\left(x + \sqrt{x^2 + 1}\right)$$

This shows that $$\sinh^{-1}x = \ln\left(x + \sqrt{x^2 + 1}\right)$$

(See Exercise 29 for another method.) ■

Notice that the formulas for the derivatives of $\tanh^{-1}x$ and $\coth^{-1}x$ appear to be identical. But the domains of these functions have no numbers in common: $\tanh^{-1}x$ is defined for $|x| < 1$, whereas $\coth^{-1}x$ is defined for $|x| > 1$.

### 6 Table of Derivatives of Inverse Hyperbolic Functions

$$\frac{d}{dx}(\sinh^{-1}x) = \frac{1}{\sqrt{1 + x^2}} \qquad \frac{d}{dx}(\operatorname{csch}^{-1}x) = -\frac{1}{|x|\sqrt{x^2 + 1}}$$

$$\frac{d}{dx}(\cosh^{-1}x) = \frac{1}{\sqrt{x^2 - 1}} \qquad \frac{d}{dx}(\operatorname{sech}^{-1}x) = -\frac{1}{x\sqrt{1 - x^2}}$$

$$\frac{d}{dx}(\tanh^{-1}x) = \frac{1}{1 - x^2} \qquad \frac{d}{dx}(\coth^{-1}x) = \frac{1}{1 - x^2}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Note that the inverse hyperbolic functions are all differentiable because the hyperbolic functions are differentiable. The formulas in Table 6 can be proved either by the method for inverse functions or by differentiating Formulas 3, 4, and 5.

**EXAMPLE 4** Prove that $\dfrac{d}{dx}(\sinh^{-1}x) = \dfrac{1}{\sqrt{1+x^2}}$.

**SOLUTION 1** Let $y = \sinh^{-1}x$. Then $\sinh y = x$. If we differentiate this equation implicitly with respect to $x$, we get

$$\cosh y \frac{dy}{dx} = 1$$

Since $\cosh^2 y - \sinh^2 y = 1$ and $\cosh y \geqslant 0$, we have $\cosh y = \sqrt{1 + \sinh^2 y}$, so

$$\frac{dy}{dx} = \frac{1}{\cosh y} = \frac{1}{\sqrt{1+\sinh^2 y}} = \frac{1}{\sqrt{1+x^2}}$$

**SOLUTION 2** From Equation 3 (proved in Example 3), we have

$$\begin{aligned}\frac{d}{dx}(\sinh^{-1}x) &= \frac{d}{dx}\ln\left(x+\sqrt{x^2+1}\right)\\ &= \frac{1}{x+\sqrt{x^2+1}}\frac{d}{dx}\left(x+\sqrt{x^2+1}\right)\\ &= \frac{1}{x+\sqrt{x^2+1}}\left(1+\frac{x}{\sqrt{x^2+1}}\right)\\ &= \frac{\sqrt{x^2+1}+x}{\left(x+\sqrt{x^2+1}\right)\sqrt{x^2+1}}\\ &= \frac{1}{\sqrt{x^2+1}}\end{aligned}$$ ■

**EXAMPLE 5** Find $\dfrac{d}{dx}[\tanh^{-1}(\sin x)]$.

**SOLUTION** Using Table 6 and the Chain Rule, we have

$$\begin{aligned}\frac{d}{dx}[\tanh^{-1}(\sin x)] &= \frac{1}{1-(\sin x)^2}\frac{d}{dx}(\sin x)\\ &= \frac{1}{1-\sin^2 x}\cos x = \frac{\cos x}{\cos^2 x} = \sec x\end{aligned}$$ ■

**EXAMPLE 6** Evaluate $\displaystyle\int_0^1 \frac{dx}{\sqrt{1+x^2}}$.

**SOLUTION** Using Table 6 (or Example 4) we know that an antiderivative of $1/\sqrt{1+x^2}$ is $\sinh^{-1}x$. Therefore

$$\begin{aligned}\int_0^1 \frac{dx}{\sqrt{1+x^2}} &= \sinh^{-1}x\Big]_0^1 = \sinh^{-1} 1\\ &= \ln\left(1+\sqrt{2}\right) \qquad \text{(from Equation 3)}\end{aligned}$$ ■

## 6.7 Exercises

**1–6** Find the numerical value of each expression.

**1.** (a) $\sinh 0$ (b) $\cosh 0$

**2.** (a) $\tanh 0$ (b) $\tanh 1$

**3.** (a) $\cosh(\ln 5)$ (b) $\cosh 5$

**4.** (a) $\sinh 4$ (b) $\sinh(\ln 4)$

**5.** (a) $\operatorname{sech} 0$ (b) $\cosh^{-1} 1$

**6.** (a) $\sinh 1$ (b) $\sinh^{-1} 1$

**7.** Write $8 \sinh x + 5 \cosh x$ in terms of $e^x$ and $e^{-x}$.

**8.** Write $2e^{2x} + 3e^{-2x}$ in terms of $\sinh 2x$ and $\cosh 2x$.

**9.** Write $\sinh(\ln x)$ as a rational function of $x$.

**10.** Write $\cosh(4 \ln x)$ as a rational function of $x$.

**11–23** Prove the identity.

**11.** $\sinh(-x) = -\sinh x$
(This shows that sinh is an odd function.)

**12.** $\cosh(-x) = \cosh x$
(This shows that cosh is an even function.)

**13.** $\cosh x + \sinh x = e^x$

**14.** $\cosh x - \sinh x = e^{-x}$

**15.** $\sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y$

**16.** $\cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y$

**17.** $\coth^2 x - 1 = \operatorname{csch}^2 x$

**18.** $\tanh(x + y) = \dfrac{\tanh x + \tanh y}{1 + \tanh x \tanh y}$

**19.** $\sinh 2x = 2 \sinh x \cosh x$

**20.** $\cosh 2x = \cosh^2 x + \sinh^2 x$

**21.** $\tanh(\ln x) = \dfrac{x^2 - 1}{x^2 + 1}$

**22.** $\dfrac{1 + \tanh x}{1 - \tanh x} = e^{2x}$

**23.** $(\cosh x + \sinh x)^n = \cosh nx + \sinh nx$
($n$ any real number)

**24.** If $\tanh x = \frac{12}{13}$, find the values of the other hyperbolic functions at $x$.

**25.** If $\cosh x = \frac{5}{3}$ and $x > 0$, find the values of the other hyperbolic functions at $x$.

**26.** (a) Use the graphs of sinh, cosh, and tanh in Figures 1–3 to draw the graphs of csch, sech, and coth.
(b) Check the graphs that you sketched in part (a) by using a graphing calculator or computer to produce them.

**27.** Use the definitions of the hyperbolic functions to find each of the following limits.

(a) $\displaystyle\lim_{x\to\infty} \tanh x$ (b) $\displaystyle\lim_{x\to-\infty} \tanh x$

(c) $\displaystyle\lim_{x\to\infty} \sinh x$ (d) $\displaystyle\lim_{x\to-\infty} \sinh x$

(e) $\displaystyle\lim_{x\to\infty} \operatorname{sech} x$ (f) $\displaystyle\lim_{x\to\infty} \coth x$

(g) $\displaystyle\lim_{x\to0^+} \coth x$ (h) $\displaystyle\lim_{x\to0^-} \coth x$

(i) $\displaystyle\lim_{x\to-\infty} \operatorname{csch} x$ (j) $\displaystyle\lim_{x\to\infty} \frac{\sinh x}{e^x}$

**28.** Prove the formulas given in Table 1 for the derivatives of the functions (a) cosh, (b) tanh, (c) csch, (d) sech, and (e) coth.

**29.** Give an alternative solution to Example 3 by letting $y = \sinh^{-1}x$ and then using Exercise 13 and Example 1(a) with $x$ replaced by $y$.

**30.** Prove Equation 4.

**31.** Prove Equation 5 using (a) the method of Example 3 and (b) Exercise 22 with $x$ replaced by $y$.

**32.** For each of the following functions (i) give a definition like those in (2), (ii) sketch the graph, and (iii) find a formula similar to Equation 3.
(a) $\operatorname{csch}^{-1}$ (b) $\operatorname{sech}^{-1}$ (c) $\coth^{-1}$

**33.** Prove the formula given in Table 6 for the derivative of each of the following functions.
(a) $\cosh^{-1}$ (b) $\tanh^{-1}$ (c) $\coth^{-1}$

**34.** Prove the formula given in Table 6 for the derivative of each of the following functions.
(a) $\operatorname{sech}^{-1}$ (b) $\operatorname{csch}^{-1}$

**35–53** Find the derivative. Simplify where possible.

**35.** $f(x) = \cosh 3x$

**36.** $f(x) = e^x \cosh x$

**37.** $h(x) = \sinh(x^2)$

**38.** $g(x) = \sinh^2 x$

**39.** $G(t) = \sinh(\ln t)$

**40.** $F(t) = \ln(\sinh t)$

**41.** $f(x) = \tanh\sqrt{x}$

**42.** $H(v) = e^{\tanh 2v}$

**43.** $y = \operatorname{sech} x \tanh x$

**44.** $y = \operatorname{sech}(\tanh x)$

**45.** $g(t) = t \coth\sqrt{t^2 + 1}$

**46.** $f(t) = \dfrac{1 + \sinh t}{1 - \sinh t}$

**47.** $f(x) = \sinh^{-1}(-2x)$

**48.** $g(x) = \tanh^{-1}(x^3)$

**49.** $y = \cosh^{-1}(\sec\theta), \quad 0 \leqslant \theta < \pi/2$

**50.** $y = \operatorname{sech}^{-1}(\sin\theta), \quad 0 < \theta < \pi/2$

**51.** $G(u) = \cosh^{-1}\sqrt{1 + u^2}, \quad u > 0$

**52.** $y = x \tanh^{-1}x + \ln\sqrt{1 - x^2}$

**53.** $y = x \sinh^{-1}(x/3) - \sqrt{9 + x^2}$

---

**54.** Show that $\dfrac{d}{dx}\sqrt[4]{\dfrac{1 + \tanh x}{1 - \tanh x}} = \frac{1}{2}e^{x/2}$.

**55.** Show that $\dfrac{d}{dx}\arctan(\tanh x) = \operatorname{sech} 2x$.

**56. The Gateway Arch** The Gateway Arch in St. Louis was designed by Eero Saarinen and was constructed using the equation

$$y = 211.49 - 20.96 \cosh 0.03291765x$$

for the central curve of the arch, where $x$ and $y$ are measured in meters and $|x| \leqslant 91.20$.

(a) Graph the central curve.
(b) What is the height of the arch at its center?
(c) At what points is the height 100 m?
(d) What is the slope of the arch at the points in part (c)?

**57.** If a water wave with length $L$ moves with velocity $v$ in a body of water with depth $d$, then

$$v = \sqrt{\frac{gL}{2\pi}\tanh\left(\frac{2\pi d}{L}\right)}$$

where $g$ is the acceleration due to gravity. (See Figure 5.) Explain why the approximation

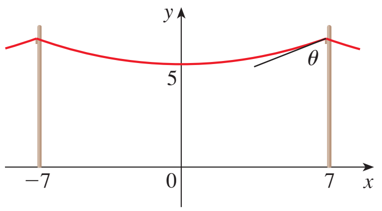
$$v \approx \sqrt{\frac{gL}{2\pi}}$$

is appropriate in deep water.

**58.** A flexible cable always hangs in the shape of a catenary $y = c + a\cosh(x/a)$, where $c$ and $a$ are constants and $a > 0$ (see Figure 4 and Exercise 60). Graph several members of the family of functions $y = a\cosh(x/a)$. How does the graph change as $a$ varies?

**59.** A telephone line hangs between two poles 14 m apart in the shape of the catenary $y = 20\cosh(x/20) - 15$, where $x$ and $y$ are measured in meters.

(a) Find the slope of this curve where it meets the right-hand pole.
(b) Find the angle $\theta$ between the line and the pole.



**60.** Using principles from physics it can be shown that when a cable is hung between two poles, it takes the shape of a curve $y = f(x)$ that satisfies the differential equation

$$\frac{d^2y}{dx^2} = \frac{\rho g}{T}\sqrt{1 + \left(\frac{dy}{dx}\right)^2}$$

where $\rho$ is the linear density of the cable, $g$ is the acceleration due to gravity, $T$ is the tension in the cable at its lowest point, and the coordinate system is chosen appropriately. Verify that the function

$$y = f(x) = \frac{T}{\rho g}\cosh\left(\frac{\rho g x}{T}\right)$$

is a solution of this differential equation.

**61.** A cable with linear density $\rho = 2$ kg/m is strung from the tops of two poles that are 200 m apart.

(a) Use Exercise 60 to find the tension $T$ so that the cable is 60 m above the ground at its lowest point. How tall are the poles?
(b) If the tension is doubled, what is the new low point of the cable? How tall are the poles now?

**62.** A model for the velocity of a falling object after time $t$ is

$$v(t) = \sqrt{\frac{mg}{k}}\tanh\left(t\sqrt{\frac{gk}{m}}\right)$$

where $m$ is the mass of the object, $g = 9.8\ \text{m/s}^2$ is the acceleration due to gravity, $k$ is a constant, $t$ is measured in seconds, and $v$ in m/s.

(a) Calculate the terminal velocity of the object, that is, $\lim_{t\to\infty} v(t)$.
(b) If a person skydives from a plane, the value of the constant $k$ depends on his or her position. For a "belly-to-earth" position, $k = 0.515$ kg/s, but for a "feet-first" position, $k = 0.067$ kg/s. If a 60-kg person descends in belly-to-earth position, what is the terminal velocity? What about feet-first?

*Source:* L. Long et al., "How Terminal Is Terminal Velocity?" *American Mathematical Monthly* 113 (2006): 752–55.

**63.** (a) Show that any function of the form

$$y = A\sinh mx + B\cosh mx$$

satisfies the differential equation $y'' = m^2y$.
(b) Find $y = y(x)$ such that $y'' = 9y$, $y(0) = -4$, and $y'(0) = 6$.

**64.** If $x = \ln(\sec\theta + \tan\theta)$, show that $\sec\theta = \cosh x$.

**65.** At what point of the curve $y = \cosh x$ does the tangent have slope 1?

**66.** Investigate the family of functions $f_n(x) = \tanh(n\sin x)$ where $n$ is a positive integer. Describe what happens to the graph of $f_n$ when $n$ becomes large.

**67–75** Evaluate the integral.

**67.** $\displaystyle\int \sinh x\cosh^2 x\,dx$

**68.** $\displaystyle\int \sinh(1 + 4x)\,dx$

**69.** $\displaystyle\int \frac{\sinh\sqrt{x}}{\sqrt{x}}\,dx$

**70.** $\displaystyle\int \tanh x\,dx$

**71.** $\displaystyle\int \frac{\cosh x}{\cosh^2 x - 1}\,dx$

**72.** $\displaystyle\int \frac{\operatorname{sech}^2 x}{2 + \tanh x}\,dx$

**73.** $\displaystyle\int_4^6 \frac{1}{\sqrt{t^2 - 9}}\,dt$

**74.** $\displaystyle\int_0^1 \frac{1}{\sqrt{16t^2 + 1}}\,dt$

**75.** $\displaystyle\int \frac{e^x}{1 - e^{2x}}\,dx$

**76.** Estimate the value of the number $c$ such that the area under the curve $y = \sinh cx$ between $x = 0$ and $x = 1$ is equal to 1.

**77.** (a) Use a graph or Newton's method to find approximate solutions of the equation $\cosh 2x = 1 + \sinh x$.

(b) Estimate the area of the region bounded by the curves $y = \cosh 2x$ and $y = 1 + \sinh x$.

**78.** Show that the area of the shaded hyperbolic sector in Figure 7 is $A(t) = \frac{1}{2}t$. [*Hint:* First show that

$$A(t) = \tfrac{1}{2}\sinh t\,\cosh t - \int_1^{\cosh t} \sqrt{x^2 - 1}\,dx$$

and then verify that $A'(t) = \frac{1}{2}$.]

**79.** Show that if $a \neq 0$ and $b \neq 0$, then there exist numbers $\alpha$ and $\beta$ such that $ae^x + be^{-x}$ equals either

$$\alpha\sinh(x + \beta) \qquad \text{or} \qquad \alpha\cosh(x + \beta)$$

In other words, almost every function of the form $f(x) = ae^x + be^{-x}$ is a shifted and stretched hyperbolic sine or hyperbolic cosine function.

## 6.8 Indeterminate Forms and l'Hospital's Rule

Suppose we are trying to analyze the behavior of the function

$$F(x) = \frac{\ln x}{x - 1}$$

Although $F$ is not defined when $x = 1$, we need to know how $F$ behaves *near* 1. In particular, we would like to know the value of the limit

$$\boxed{1} \qquad \lim_{x\to 1} \frac{\ln x}{x - 1}$$

In computing this limit we can't apply Law 5 of limits (the limit of a quotient is the quotient of the limits, see Section 1.6) because the limit of the denominator is 0. In fact, although the limit in (1) exists, its value is not obvious because both numerator and denominator approach 0 and $\frac{0}{0}$ is not defined.

### Indeterminate Forms (Types $\frac{0}{0}, \frac{\infty}{\infty}$)

In general, if we have a limit of the form

$$\lim_{x\to a} \frac{f(x)}{g(x)}$$

where both $f(x) \to 0$ and $g(x) \to 0$ as $x \to a$, then this limit may or may not exist and is called an **indeterminate form of type $\frac{0}{0}$**. We met some limits of this type in Chapter 1. For rational functions, we can cancel common factors:

$$\lim_{x\to 1} \frac{x^2 - x}{x^2 - 1} = \lim_{x\to 1} \frac{x(x - 1)}{(x + 1)(x - 1)} = \lim_{x\to 1} \frac{x}{x + 1} = \frac{1}{2}$$

In Section 2.4 we used a geometric argument to show that

$$\lim_{x\to 0} \frac{\sin x}{x} = 1$$

But these methods do not work for limits such as (1).

Another situation in which a limit is not obvious occurs when we look for a horizontal asymptote of $F$ and need to evaluate the limit

$$\boxed{2} \qquad \lim_{x \to \infty} \frac{\ln x}{x - 1}$$

It isn't obvious how to evaluate this limit because both numerator and denominator become large as $x \to \infty$. There is a struggle between numerator and denominator. If the numerator wins, the limit will be $\infty$ (the numerator was increasing significantly faster than the denominator); if the denominator wins, the answer will be 0. Or there may be some compromise, in which case the answer will be some finite positive number.

In general, if we have a limit of the form

$$\lim_{x \to a} \frac{f(x)}{g(x)}$$

where both $f(x) \to \infty$ (or $-\infty$) and $g(x) \to \infty$ (or $-\infty$), then the limit may or may not exist and is called an **indeterminate form of type $\frac{\infty}{\infty}$**. We saw in Section 3.4 that this type of limit can be evaluated for certain functions, including rational functions, by dividing numerator and denominator by the highest power of $x$ that occurs in the denominator. For instance,

$$\lim_{x \to \infty} \frac{x^2 - 1}{2x^2 + 1} = \lim_{x \to \infty} \frac{1 - \dfrac{1}{x^2}}{2 + \dfrac{1}{x^2}} = \frac{1 - 0}{2 + 0} = \frac{1}{2}$$

But this method does not work for limits such as (2).

## L'Hospital's Rule

We now introduce a systematic method, known as *l'Hospital's Rule*, for the evaluation of indeterminate forms of type $\frac{0}{0}$ or type $\frac{\infty}{\infty}$.

**L'Hospital's Rule** Suppose $f$ and $g$ are differentiable and $g'(x) \neq 0$ on an open interval $I$ that contains $a$ (except possibly at $a$). Suppose that

$$\lim_{x \to a} f(x) = 0 \qquad \text{and} \qquad \lim_{x \to a} g(x) = 0$$

or that

$$\lim_{x \to a} f(x) = \pm\infty \qquad \text{and} \qquad \lim_{x \to a} g(x) = \pm\infty$$

(In other words, we have an indeterminate form of type $\frac{0}{0}$ or $\frac{\infty}{\infty}$.) Then

$$\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)}$$

if the limit on the right side exists (or is $\infty$ or $-\infty$).

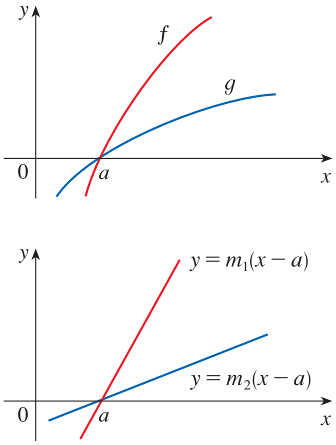

**FIGURE 1**

Figure 1 suggests visually why l'Hospital's Rule might be true. The first graph shows two differentiable functions $f$ and $g$, each of which approaches 0 as $x \to a$. If we were to zoom in toward the point $(a, 0)$, the graphs would start to look almost linear. But if the functions actually *were* linear, as in the second graph, then their ratio would be

$$\frac{m_1(x - a)}{m_2(x - a)} = \frac{m_1}{m_2}$$

which is the ratio of their derivatives. This suggests that

$$\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)}$$

**Note 1** L'Hospital's Rule says that the limit of a quotient of functions is equal to the limit of the quotient of their derivatives, provided that the given conditions are satisfied. It is especially important to verify the conditions regarding the limits of $f$ and $g$ before using l'Hospital's Rule.

**L'Hospital**

L'Hospital's Rule is named after a French nobleman, the Marquis de l'Hospital (1661–1704), but was discovered by a Swiss mathematician, John Bernoulli (1667–1748). You might sometimes see l'Hospital spelled as l'Hôpital, but he spelled his own name l'Hospital, as was common in the 17th century. See Exercise 99 for the example that the Marquis used to illustrate his rule. See the project following this section for further historical details.

**NOTE 2** L'Hospital's Rule is also valid for one-sided limits and for limits at infinity or negative infinity; that is, "$x \to a$" can be replaced by any of the symbols $x \to a^+$, $x \to a^-$, $x \to \infty$, or $x \to -\infty$.

**NOTE 3** For the special case in which $f(a) = g(a) = 0$, $f'$ and $g'$ are continuous, and $g'(a) \neq 0$, it is easy to see why l'Hospital's Rule is true. In fact, using the alternative form of the definition of a derivative (2.1.5), we have

$$\begin{aligned}
\lim_{x \to a} \frac{f'(x)}{g'(x)} = \frac{f'(a)}{g'(a)} &= \frac{\displaystyle\lim_{x \to a} \frac{f(x) - f(a)}{x - a}}{\displaystyle\lim_{x \to a} \frac{g(x) - g(a)}{x - a}} \\
&= \lim_{x \to a} \frac{\dfrac{f(x) - f(a)}{x - a}}{\dfrac{g(x) - g(a)}{x - a}} \\
&= \lim_{x \to a} \frac{f(x) - f(a)}{g(x) - g(a)} = \lim_{x \to a} \frac{f(x)}{g(x)} \qquad [\text{because } f(a) = g(a) = 0]
\end{aligned}$$

The general version of l'Hospital's Rule for the indeterminate form $\frac{0}{0}$ is somewhat more difficult and its proof is deferred to the end of this section. The proof for the indeterminate form $\frac{\infty}{\infty}$ can be found in more advanced books.

**EXAMPLE 1** Find $\displaystyle\lim_{x \to 1} \frac{\ln x}{x - 1}$.

**SOLUTION** Since

$$\lim_{x \to 1} \ln x = \ln 1 = 0 \qquad \text{and} \qquad \lim_{x \to 1} (x - 1) = 0$$

the limit is an indeterminate form of type $\frac{0}{0}$, so we can apply l'Hospital's Rule:

⊘ Notice that when using l'Hospital's Rule we differentiate the numerator and denominator *separately*. We do *not* use the Quotient Rule.

$$\begin{aligned}
\lim_{x \to 1} \frac{\ln x}{x - 1} &= \lim_{x \to 1} \frac{\dfrac{d}{dx}(\ln x)}{\dfrac{d}{dx}(x - 1)} = \lim_{x \to 1} \frac{1/x}{1} \\
&= \lim_{x \to 1} \frac{1}{x} = 1
\end{aligned}$$

■

The graph of the function of Example 2 is shown in Figure 2. We have noticed previously that exponential functions grow far more rapidly than power functions, so the result of Example 2 is not unexpected. See also Exercise 75.

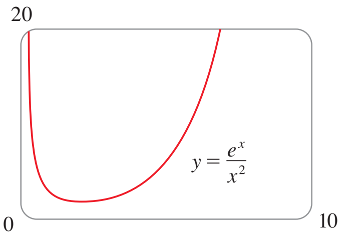

**FIGURE 2**

**EXAMPLE 2** Calculate $\displaystyle\lim_{x \to \infty} \frac{e^x}{x^2}$.

**SOLUTION** We have $\lim_{x \to \infty} e^x = \infty$ and $\lim_{x \to \infty} x^2 = \infty$, so the limit is an indeterminate form of type $\frac{\infty}{\infty}$, and l'Hospital's Rule gives

$$\lim_{x \to \infty} \frac{e^x}{x^2} = \lim_{x \to \infty} \frac{\dfrac{d}{dx}(e^x)}{\dfrac{d}{dx}(x^2)} = \lim_{x \to \infty} \frac{e^x}{2x}$$

Since $e^x \to \infty$ and $2x \to \infty$ as $x \to \infty$, the limit on the right side is also indeterminate. A second application of l'Hospital's Rule gives

$$\lim_{x \to \infty} \frac{e^x}{x^2} = \lim_{x \to \infty} \frac{e^x}{2x} = \lim_{x \to \infty} \frac{e^x}{2} = \infty$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The graph of the function of Example 3 is shown in Figure 3. We have discussed previously the slow growth of logarithms, so it isn't surprising that this ratio approaches 0 as $x \to \infty$. See also Exercise 76.

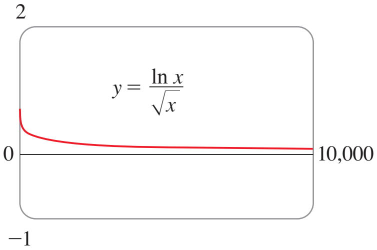

**FIGURE 3**

**EXAMPLE 3** Calculate $\displaystyle\lim_{x \to \infty} \frac{\ln x}{\sqrt{x}}$.

**SOLUTION** Since $\ln x \to \infty$ and $\sqrt{x} \to \infty$ as $x \to \infty$, l'Hospital's Rule applies:

$$\lim_{x \to \infty} \frac{\ln x}{\sqrt{x}} = \lim_{x \to \infty} \frac{1/x}{\frac{1}{2}x^{-1/2}} = \lim_{x \to \infty} \frac{1/x}{1/\left(2\sqrt{x}\,\right)}$$

Notice that the limit on the right side is now indeterminate of type $\frac{0}{0}$. But instead of applying l'Hospital's Rule a second time as we did in Example 2, we simplify the expression and see that a second application is unnecessary:

$$\lim_{x \to \infty} \frac{\ln x}{\sqrt{x}} = \lim_{x \to \infty} \frac{1/x}{1/\left(2\sqrt{x}\,\right)} = \lim_{x \to \infty} \frac{2}{\sqrt{x}} = 0$$

■

In both Examples 2 and 3 we evaluated limits of type $\frac{\infty}{\infty}$, but we got two different results. In Example 2, the infinite limit tells us that the numerator $e^x$ increases significantly faster than the denominator $x^2$, resulting in larger and larger ratios. In fact, $y = e^x$ grows more quickly than all the power functions $y = x^n$ (see Exercise 75). In Example 3 we have the opposite situation; the limit of 0 means that the denominator outpaces the numerator, and the ratio eventually approaches 0.

**EXAMPLE 4** Find $\displaystyle\lim_{x \to 0} \frac{\tan x - x}{x^3}$. (See Exercise 1.5.42.)

**SOLUTION** Noting that both $\tan x - x \to 0$ and $x^3 \to 0$ as $x \to 0$, we use l'Hospital's Rule:

$$\lim_{x \to 0} \frac{\tan x - x}{x^3} = \lim_{x \to 0} \frac{\sec^2 x - 1}{3x^2}$$

Since the limit on the right side is still indeterminate of type $\frac{0}{0}$, we apply l'Hospital's Rule again:

$$\lim_{x \to 0} \frac{\sec^2 x - 1}{3x^2} = \lim_{x \to 0} \frac{2\sec^2 x \tan x}{6x}$$

Because $\lim_{x \to 0} \sec^2 x = 1$, we simplify the calculation by writing

$$\lim_{x \to 0} \frac{2\sec^2 x \tan x}{6x} = \frac{1}{3} \lim_{x \to 0} \sec^2 x \cdot \lim_{x \to 0} \frac{\tan x}{x} = \frac{1}{3} \lim_{x \to 0} \frac{\tan x}{x}$$

We can evaluate this last limit either by using l'Hospital's Rule a third time or by writing $\tan x$ as $(\sin x)/(\cos x)$ and making use of our knowledge of trigonometric limits. Putting together all the steps, we get

$$\begin{aligned} \lim_{x \to 0} \frac{\tan x - x}{x^3} &= \lim_{x \to 0} \frac{\sec^2 x - 1}{3x^2} = \lim_{x \to 0} \frac{2\sec^2 x \tan x}{6x} \\ &= \frac{1}{3} \lim_{x \to 0} \frac{\tan x}{x} = \frac{1}{3} \lim_{x \to 0} \frac{\sec^2 x}{1} = \frac{1}{3} \end{aligned}$$

■

The graph in Figure 4 gives visual confirmation of the result of Example 4. If we were to zoom in too far, however, we would get an inaccurate graph because $\tan x$ is close to $x$ when $x$ is small. See Exercise 1.5.42(d).

**EXAMPLE 5** Find $\displaystyle\lim_{x\to\pi^-} \frac{\sin x}{1-\cos x}$.

**SOLUTION** If we blindly attempted to use l'Hospital's Rule, we might think that an equivalent limit is

$$\lim_{x\to\pi^-} \frac{\cos x}{\sin x} = -\infty$$

⊘ This is wrong! Although the numerator $\sin x \to 0$ as $x \to \pi^-$, notice that the denominator $(1 - \cos x)$ does not approach 0, so l'Hospital's Rule can't be applied here.

The required limit can, in fact, be found by direct substitution because the function is continuous at $\pi$ and the denominator is nonzero there:

$$\lim_{x\to\pi^-} \frac{\sin x}{1-\cos x} = \frac{\sin \pi}{1-\cos \pi} = \frac{0}{1-(-1)} = 0$$ ■

Example 5 shows what can go wrong if you use l'Hospital's Rule without thinking. Some limits *can* be found using l'Hospital's Rule but are more easily found by other methods. (See Examples 1.6.3, 1.6.5, and 3.4.3, and the discussion at the beginning of this section.) When evaluating any limit, you should consider other methods before using l'Hospital's Rule.

## ■ Indeterminate Products (Type $0 \cdot \infty$)

If $\lim_{x\to a} f(x) = 0$ and $\lim_{x\to a} g(x) = \infty$ (or $-\infty$), then it isn't clear what the value of $\lim_{x\to a} [f(x)g(x)]$, if any, will be. There is a struggle between $f$ and $g$. If $f$ wins, the answer will be 0; if $g$ wins, the answer will be $\infty$ (or $-\infty$). Or there may be a compromise where the answer is a finite nonzero number. For instance,

$$\lim_{x\to 0^+} x^2 = 0, \qquad \lim_{x\to 0^+} \frac{1}{x} = \infty \qquad \text{and} \qquad \lim_{x\to 0^+} x^2 \cdot \frac{1}{x} = \lim_{x\to 0^+} x = 0$$

$$\lim_{x\to 0^+} x = 0, \qquad \lim_{x\to 0^+} \frac{1}{x^2} = \infty \qquad \text{and} \qquad \lim_{x\to 0^+} x \cdot \frac{1}{x^2} = \lim_{x\to 0^+} \frac{1}{x} = \infty$$

$$\lim_{x\to 0^+} x = 0, \qquad \lim_{x\to 0^+} \frac{1}{x} = \infty \qquad \text{and} \qquad \lim_{x\to 0^+} x \cdot \frac{1}{x} = \lim_{x\to 0^+} 1 = 1$$

This kind of limit is called an **indeterminate form of type $0 \cdot \infty$**. We can deal with it by writing the product $fg$ as a quotient:

$$fg = \frac{f}{1/g} \qquad \text{or} \qquad fg = \frac{g}{1/f}$$

This converts the given limit into an indeterminate form of type $\frac{0}{0}$ or $\frac{\infty}{\infty}$ so that we can use l'Hospital's Rule.

Figure 5 shows the graph of the function in Example 6. Notice that the function is undefined at $x = 0$; the graph approaches the origin but never quite reaches it.

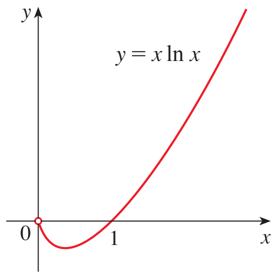

**FIGURE 5**

**EXAMPLE 6** Evaluate $\displaystyle\lim_{x\to 0^+} x \ln x$.

**SOLUTION** The given limit is indeterminate because, as $x \to 0^+$, the first factor $(x)$ approaches 0 while the second factor $(\ln x)$ approaches $-\infty$. Writing $x = 1/(1/x)$, we have $1/x \to \infty$ as $x \to 0^+$, so l'Hospital's Rule gives

$$\lim_{x\to 0^+} x \ln x = \lim_{x\to 0^+} \frac{\ln x}{1/x} = \lim_{x\to 0^+} \frac{1/x}{-1/x^2} = \lim_{x\to 0^+} (-x) = 0$$ ■

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**NOTE** In solving Example 6 another possible option would have been to write

$$\lim_{x \to 0^+} x \ln x = \lim_{x \to 0^+} \frac{x}{1/\ln x}$$

This gives an indeterminate form of the type $\frac{0}{0}$, but if we apply l'Hospital's Rule we get a more complicated expression than the one we started with. In general, when we rewrite an indeterminate product, we try to choose the option that leads to the simpler limit.

**EXAMPLE 7** Use l'Hospital's Rule to help sketch the graph of $f(x) = xe^x$.

**SOLUTION** Because both $x$ and $e^x$ become large as $x \to \infty$, we have $\lim_{x \to \infty} xe^x = \infty$. As $x \to -\infty$, however, $e^x \to 0$ and so we have an indeterminate product that requires the use of l'Hospital's Rule:

$$\lim_{x \to -\infty} xe^x = \lim_{x \to -\infty} \frac{x}{e^{-x}} = \lim_{x \to -\infty} \frac{1}{-e^{-x}} = \lim_{x \to -\infty} (-e^x) = 0$$

Thus the $x$-axis is a horizontal asymptote.

We use the methods of Chapter 3 to gather other information concerning the graph. The derivative is

$$f'(x) = xe^x + e^x = (x + 1)e^x$$

Since $e^x$ is always positive, we see that $f'(x) > 0$ when $x + 1 > 0$, and $f'(x) < 0$ when $x + 1 < 0$. So $f$ is increasing on $(-1, \infty)$ and decreasing on $(-\infty, -1)$. Because $f'(-1) = 0$ and $f'$ changes from negative to positive at $x = -1$, $f(-1) = -e^{-1} \approx -0.37$ is a local (and absolute) minimum. The second derivative is

$$f''(x) = (x + 1)e^x + e^x = (x + 2)e^x$$

Since $f''(x) > 0$ if $x > -2$ and $f''(x) < 0$ if $x < -2$, $f$ is concave upward on $(-2, \infty)$ and concave downward on $(-\infty, -2)$. The inflection point is $(-2, -2e^{-2}) \approx (-2, -0.27)$.

We use this information to sketch the curve in Figure 6. ■

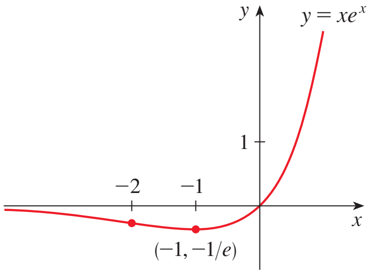

**FIGURE 6**

## ■ Indeterminate Differences (Type ∞ − ∞)

If $\lim_{x \to a} f(x) = \infty$ and $\lim_{x \to a} g(x) = \infty$, then the limit

$$\lim_{x \to a} [f(x) - g(x)]$$

is called an **indeterminate form of type** $\infty - \infty$. Again there is a contest between $f$ and $g$. Will the answer be $\infty$ ($f$ wins) or will it be $-\infty$ ($g$ wins) or will they compromise on a finite number? To find out, we try to convert the difference into a quotient (for instance, by using a common denominator, or rationalization, or factoring out a common factor) so that we have an indeterminate form of type $\frac{0}{0}$ or $\frac{\infty}{\infty}$.

**EXAMPLE 8** Compute $\lim_{x \to (\pi/2)^-} (\sec x - \tan x)$.

**SOLUTION** First notice that $\sec x \to \infty$ and $\tan x \to \infty$ as $x \to (\pi/2)^-$, so the limit is indeterminate. Here we use a common denominator:

$$\lim_{x \to (\pi/2)^-} (\sec x - \tan x) = \lim_{x \to (\pi/2)^-} \left( \frac{1}{\cos x} - \frac{\sin x}{\cos x} \right)$$

$$= \lim_{x \to (\pi/2)^-} \frac{1 - \sin x}{\cos x} = \lim_{x \to (\pi/2)^-} \frac{-\cos x}{-\sin x} = 0$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Note that the use of l'Hospital's Rule is justified because $1 - \sin x \to 0$ and $\cos x \to 0$ as $x \to (\pi/2)^-$. ■

**EXAMPLE 9** Calculate $\lim_{x \to \infty} (e^x - x)$.

**SOLUTION** This is an indeterminate difference because both $e^x$ and $x$ approach infinity. We would expect the limit to be infinity because $e^x \to \infty$ much faster than $x$. But we can verify this by factoring out $x$:

$$e^x - x = x\left(\frac{e^x}{x} - 1\right)$$

The term $e^x/x \to \infty$ as $x \to \infty$ by l'Hospital's Rule and so we now have a product in which both factors grow large:

$$\lim_{x \to \infty} (e^x - x) = \lim_{x \to \infty} \left[x\left(\frac{e^x}{x} - 1\right)\right] = \infty$$ ■

## ■ Indeterminate Powers (Types $0^0$, $\infty^0$, $1^\infty$)

Several indeterminate forms arise from the limit

$$\lim_{x \to a} [f(x)]^{g(x)}$$

1. $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} g(x) = 0$ type $0^0$
2. $\lim_{x \to a} f(x) = \infty$ and $\lim_{x \to a} g(x) = 0$ type $\infty^0$
3. $\lim_{x \to a} f(x) = 1$ and $\lim_{x \to a} g(x) = \pm\infty$ type $1^\infty$

Although forms of the type $0^0$, $\infty^0$, and $1^\infty$ are indeterminate, the form $0^\infty$ is not indeterminate. (See Exercise 102.)

Each of these three cases can be treated either by taking the natural logarithm:

$$\text{let} \quad y = [f(x)]^{g(x)}, \quad \text{then} \quad \ln y = g(x) \ln f(x)$$

or by writing the function as an exponential:

$$[f(x)]^{g(x)} = e^{g(x) \ln f(x)}$$

(Recall that both of these methods were used in differentiating such functions.) In either method we are led to the indeterminate product $g(x) \ln f(x)$, which is of type $0 \cdot \infty$.

**EXAMPLE 10** Calculate $\lim_{x \to 0^+} (1 + \sin 4x)^{\cot x}$.

**SOLUTION** First notice that as $x \to 0^+$, we have $1 + \sin 4x \to 1$ and $\cot x \to \infty$, so the given limit is indeterminate (type $1^\infty$). Let

$$y = (1 + \sin 4x)^{\cot x}$$

Then $$\ln y = \ln[(1 + \sin 4x)^{\cot x}] = \cot x \ln(1 + \sin 4x) = \frac{\ln(1 + \sin 4x)}{\tan x}$$

so l'Hospital's Rule gives

$$\lim_{x \to 0^+} \ln y = \lim_{x \to 0^+} \frac{\ln(1 + \sin 4x)}{\tan x} = \lim_{x \to 0^+} \frac{\dfrac{4 \cos 4x}{1 + \sin 4x}}{\sec^2 x} = 4$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

So far we have computed the limit of ln $y$, but what we want is the limit of $y$. To find this we use the fact that $y = e^{\ln y}$:

$$\lim_{x \to 0^+} (1 + \sin 4x)^{\cot x} = \lim_{x \to 0^+} y = \lim_{x \to 0^+} e^{\ln y} = e^4 \qquad \blacksquare$$

The graph of the function $y = x^x$, $x > 0$, is shown in Figure 7. Notice that although $0^0$ is not defined, the values of the function approach 1 as $x \to 0^+$. This confirms the result of Example 11.

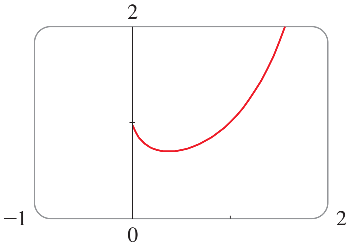

**FIGURE 7**

**EXAMPLE 11** Find $\lim_{x \to 0^+} x^x$.

**SOLUTION** Notice that this limit is indeterminate since $0^x = 0$ for any $x > 0$ but $x^0 = 1$ for any $x \neq 0$. (Recall that $0^0$ is undefined.) We could proceed as in Example 10 or by writing the function as an exponential:

$$x^x = (e^{\ln x})^x = e^{x \ln x}$$

In Example 6 we used l'Hospital's Rule to show that

$$\lim_{x \to 0^+} x \ln x = 0$$

Therefore

$$\lim_{x \to 0^+} x^x = \lim_{x \to 0^+} e^{x \ln x} = e^0 = 1 \qquad \blacksquare$$

## Proof of l'Hospital's Rule

In order to give the promised proof of l'Hospital's Rule, we first need a generalization of the Mean Value Theorem. The following theorem is named after another French mathematician, Augustin-Louis Cauchy (1789–1857).

See the biographical sketch of Cauchy in Section 1.7.

**3 Cauchy's Mean Value Theorem** Suppose that the functions $f$ and $g$ are continuous on $[a, b]$ and differentiable on $(a, b)$, and $g'(x) \neq 0$ for all $x$ in $(a, b)$. Then there is a number $c$ in $(a, b)$ such that

$$\frac{f'(c)}{g'(c)} = \frac{f(b) - f(a)}{g(b) - g(a)}$$

Notice that if we take the special case in which $g(x) = x$, then $g'(c) = 1$ and Theorem 3 is just the ordinary Mean Value Theorem. Furthermore, Theorem 3 can be proved in a similar manner. You can verify that all we have to do is change the function $h$ given by Equation 3.2.4 to the function

$$h(x) = f(x) - f(a) - \frac{f(b) - f(a)}{g(b) - g(a)} [g(x) - g(a)]$$

and apply Rolle's Theorem as before.

**PROOF OF L'HOSPITAL'S RULE** We are assuming that $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} g(x) = 0$. Let

$$L = \lim_{x \to a} \frac{f'(x)}{g'(x)}$$

We must show that $\lim_{x \to a} f(x)/g(x) = L$. Define

$$F(x) = \begin{cases} f(x) & \text{if } x \neq a \\ 0 & \text{if } x = a \end{cases} \qquad G(x) = \begin{cases} g(x) & \text{if } x \neq a \\ 0 & \text{if } x = a \end{cases}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Then $F$ is continuous on $I$ since $f$ is continuous on $\{x \in I \mid x \neq a\}$ and

$$\lim_{x \to a} F(x) = \lim_{x \to a} f(x) = 0 = F(a)$$

Likewise, $G$ is continuous on $I$. Let $x \in I$ and $x > a$. Then $F$ and $G$ are continuous on $[a, x]$ and differentiable on $(a, x)$ and $G' \neq 0$ there (since $F' = f'$ and $G' = g'$). Therefore, by Cauchy's Mean Value Theorem, there is a number $y$ such that $a < y < x$ and

$$\frac{F'(y)}{G'(y)} = \frac{F(x) - F(a)}{G(x) - G(a)} = \frac{F(x)}{G(x)}$$

Here we have used the fact that, by definition, $F(a) = 0$ and $G(a) = 0$. Now, if we let $x \to a^+$, then $y \to a^+$ (since $a < y < x$), so

$$\lim_{x \to a^+} \frac{f(x)}{g(x)} = \lim_{x \to a^+} \frac{F(x)}{G(x)} = \lim_{y \to a^+} \frac{F'(y)}{G'(y)} = \lim_{y \to a^+} \frac{f'(y)}{g'(y)} = L$$

A similar argument shows that the left-hand limit is also $L$. Therefore

$$\lim_{x \to a} \frac{f(x)}{g(x)} = L$$

This proves l'Hospital's Rule for the case where $a$ is finite.

If $a$ is infinite, we let $t = 1/x$. Then $t \to 0^+$ as $x \to \infty$, so we have

$$\begin{aligned} \lim_{x \to \infty} \frac{f(x)}{g(x)} &= \lim_{t \to 0^+} \frac{f(1/t)}{g(1/t)} \\ &= \lim_{t \to 0^+} \frac{f'(1/t)(-1/t^2)}{g'(1/t)(-1/t^2)} \qquad \text{(by l'Hospital's Rule for finite } a\text{)} \\ &= \lim_{t \to 0^+} \frac{f'(1/t)}{g'(1/t)} = \lim_{x \to \infty} \frac{f'(x)}{g'(x)} \end{aligned}$$

■

## 6.8 Exercises

**1–4** Given that

$$\lim_{x \to a} f(x) = 0 \qquad \lim_{x \to a} g(x) = 0 \qquad \lim_{x \to a} h(x) = 1$$

$$\lim_{x \to a} p(x) = \infty \qquad \lim_{x \to a} q(x) = \infty$$

which of the following limits are indeterminate forms? For any limit that is not an indeterminate form, evaluate it where possible.

**1.** (a) $\displaystyle\lim_{x \to a} \frac{f(x)}{g(x)}$ (b) $\displaystyle\lim_{x \to a} \frac{f(x)}{p(x)}$

(c) $\displaystyle\lim_{x \to a} \frac{h(x)}{p(x)}$ (d) $\displaystyle\lim_{x \to a} \frac{p(x)}{f(x)}$

(e) $\displaystyle\lim_{x \to a} \frac{p(x)}{q(x)}$

**2.** (a) $\displaystyle\lim_{x \to a} [f(x)p(x)]$ (b) $\displaystyle\lim_{x \to a} [h(x)p(x)]$

(c) $\displaystyle\lim_{x \to a} [p(x)q(x)]$

**3.** (a) $\displaystyle\lim_{x \to a} [f(x) - p(x)]$ (b) $\displaystyle\lim_{x \to a} [p(x) - q(x)]$

(c) $\displaystyle\lim_{x \to a} [p(x) + q(x)]$

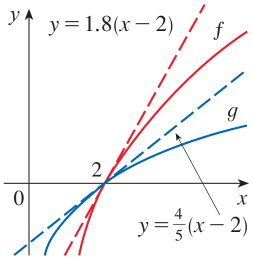
**4.** (a) $\displaystyle\lim_{x \to a} [f(x)]^{g(x)}$ (b) $\displaystyle\lim_{x \to a} [f(x)]^{p(x)}$

(c) $\displaystyle\lim_{x \to a} [h(x)]^{p(x)}$ (d) $\displaystyle\lim_{x \to a} [p(x)]^{f(x)}$

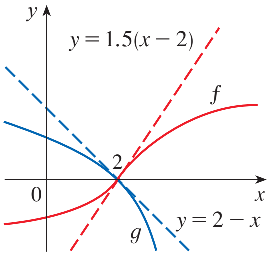
(e) $\displaystyle\lim_{x \to a} [p(x)]^{q(x)}$ (f) $\displaystyle\lim_{x \to a} \sqrt[q(x)]{p(x)}$

**5–6** Use the graphs of $f$ and $g$ and their tangent lines at (2, 0) to find $\lim_{x\to 2} \dfrac{f(x)}{g(x)}$.

**5.**

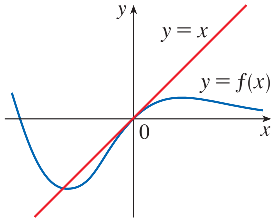


**6.**



---

**7.** The graph of a function $f$ and its tangent line at 0 are shown. What is the value of $\lim_{x\to 0} \dfrac{f(x)}{e^x - 1}$?



**8–70** Find the limit. Use l'Hospital's Rule where appropriate. If there is a more elementary method, consider using it. If l'Hospital's Rule doesn't apply, explain why.

**8.** $\lim_{x\to 3} \dfrac{x - 3}{x^2 - 9}$

**9.** $\lim_{x\to 4} \dfrac{x^2 - 2x - 8}{x - 4}$

**10.** $\lim_{x\to -2} \dfrac{x^3 + 8}{x + 2}$

**11.** $\lim_{x\to 1} \dfrac{x^7 - 1}{x^3 - 1}$

**12.** $\lim_{x\to 4} \dfrac{\sqrt{x} - 2}{x - 4}$

**13.** $\lim_{x\to \pi/4} \dfrac{\sin x - \cos x}{\tan x - 1}$

**14.** $\lim_{x\to 0} \dfrac{\tan 3x}{\sin 2x}$

**15.** $\lim_{t\to 0} \dfrac{e^{2t} - 1}{\sin t}$

**16.** $\lim_{x\to 0} \dfrac{x^2}{1 - \cos x}$

**17.** $\lim_{x\to 1} \dfrac{\sin(x - 1)}{x^3 + x - 2}$

**18.** $\lim_{\theta\to \pi} \dfrac{1 + \cos\theta}{1 - \cos\theta}$

**19.** $\lim_{x\to \infty} \dfrac{\sqrt{x}}{1 + e^x}$

**20.** $\lim_{x\to \infty} \dfrac{x + x^2}{1 - 2x^2}$

**21.** $\lim_{x\to 0^+} \dfrac{\ln x}{x}$

**22.** $\lim_{x\to \infty} \dfrac{\ln\sqrt{x}}{x^2}$

**23.** $\lim_{x\to 3} \dfrac{\ln(x/3)}{3 - x}$

**24.** $\lim_{t\to 0} \dfrac{8^t - 5^t}{t}$

**25.** $\lim_{x\to 0} \dfrac{\sqrt{1 + 2x} - \sqrt{1 - 4x}}{x}$

**26.** $\lim_{u\to \infty} \dfrac{e^{u/10}}{u^3}$

**27.** $\lim_{x\to 0} \dfrac{e^x + e^{-x} - 2}{e^x - x - 1}$

**28.** $\lim_{x\to 0} \dfrac{\sinh x - x}{x^3}$

**29.** $\lim_{x\to 0} \dfrac{\tanh x}{\tan x}$

**30.** $\lim_{x\to 0} \dfrac{x - \sin x}{x - \tan x}$

**31.** $\lim_{x\to 0} \dfrac{\sin^{-1}x}{x}$

**32.** $\lim_{x\to \infty} \dfrac{(\ln x)^2}{x}$

**33.** $\lim_{x\to 0} \dfrac{x3^x}{3^x - 1}$

**34.** $\lim_{x\to 0} \dfrac{e^x + e^{-x} - 2\cos x}{x\sin x}$

**35.** $\lim_{x\to 0} \dfrac{\ln(1 + x)}{\cos x + e^x - 1}$

**36.** $\lim_{x\to 1} \dfrac{x\sin(x - 1)}{2x^2 - x - 1}$

**37.** $\lim_{x\to 0^+} \dfrac{\arctan 2x}{\ln x}$

**38.** $\lim_{x\to 0} \dfrac{x^2\sin x}{\sin x - x}$

**39.** $\lim_{x\to 1} \dfrac{x^a - 1}{x^b - 1}$, $b \neq 0$

**40.** $\lim_{x\to \infty} \dfrac{e^{-x}}{(\pi/2) - \tan^{-1}x}$

**41.** $\lim_{x\to 0} \dfrac{\cos x - 1 + \frac{1}{2}x^2}{x^4}$

**42.** $\lim_{x\to 0} \dfrac{x - \sin x}{x\sin(x^2)}$

**43.** $\lim_{x\to \infty} x\sin(\pi/x)$

**44.** $\lim_{x\to \infty} \sqrt{x}\, e^{-x/2}$

**45.** $\lim_{x\to 0} \sin 5x \csc 3x$

**46.** $\lim_{x\to -\infty} x\ln\left(1 - \dfrac{1}{x}\right)$

**47.** $\lim_{x\to \infty} x^3e^{-x^2}$

**48.** $\lim_{x\to \infty} x^{3/2}\sin(1/x)$

**49.** $\lim_{x\to 1^+} \ln x \tan(\pi x/2)$

**50.** $\lim_{x\to (\pi/2)^-} \cos x \sec 5x$

**51.** $\lim_{x\to 1} \left(\dfrac{x}{x - 1} - \dfrac{1}{\ln x}\right)$

**52.** $\lim_{x\to 0} (\csc x - \cot x)$

**53.** $\lim_{x\to 0^+} \left(\dfrac{1}{x} - \dfrac{1}{e^x - 1}\right)$

**54.** $\lim_{x\to 0^+} \left(\dfrac{1}{x} - \dfrac{1}{\tan^{-1}x}\right)$

**55.** $\lim_{x\to 0^+} \left(\dfrac{1}{x} - \dfrac{1}{\tan x}\right)$

**56.** $\lim_{x\to \infty} (x - \ln x)$

**57.** $\lim_{x\to 0^+} x^{\sqrt{x}}$

**58.** $\lim_{x\to 0^+} (\tan 2x)^x$

**59.** $\lim_{x\to 0} (1 - 2x)^{1/x}$

**60.** $\lim_{x\to \infty} \left(1 + \dfrac{a}{x}\right)^{bx}$

**61.** $\lim_{x\to 1^+} x^{1/(1-x)}$

**62.** $\lim_{x\to \infty} (e^x + 10x)^{1/x}$

**63.** $\lim_{x\to \infty} x^{1/x}$

**64.** $\lim_{x\to \infty} x^{e^{-x}}$

**65.** $\lim_{x\to 0^+} (4x + 1)^{\cot x}$

**66.** $\lim_{x\to 0^+} (1 - \cos x)^{\sin x}$

**67.** $\lim_{x\to 0^+} (1 + \sin 3x)^{1/x}$

**68.** $\lim_{x\to 0} (\cos x)^{1/x^2}$

**69.** $\lim_{x\to 0^+} \dfrac{x^x - 1}{\ln x + x - 1}$

**70.** $\lim_{x\to \infty} \left(\dfrac{2x - 3}{2x + 5}\right)^{2x+1}$

**71–72** Use a graph to estimate the value of the limit. Then use l'Hospital's Rule to find the exact value.

**71.** $\lim_{x\to\infty}\left(1+\dfrac{2}{x}\right)^x$ **72.** $\lim_{x\to 0}\dfrac{5^x-4^x}{3^x-2^x}$

**73–74** Illustrate l'Hospital's Rule by graphing both $f(x)/g(x)$ and $f'(x)/g'(x)$ near $x = 0$ to see that these ratios have the same limit as $x \to 0$. Also, calculate the exact value of the limit.

**73.** $f(x) = e^x - 1, \quad g(x) = x^3 + 4x$

**74.** $f(x) = 2x\sin x, \quad g(x) = \sec x - 1$

**75.** Prove that

$$\lim_{x\to\infty}\frac{e^x}{x^n} = \infty$$

for any positive integer $n$. This shows that the exponential function approaches infinity faster than any power of $x$.

**76.** Prove that

$$\lim_{x\to\infty}\frac{\ln x}{x^p} = 0$$

for any number $p > 0$. This shows that the logarithmic function approaches infinity more slowly than any power of $x$.

**77–78** What happens if you try to use l'Hospital's Rule to find the limit? Evaluate the limit using another method.

**77.** $\lim_{x\to\infty}\dfrac{x}{\sqrt{x^2+1}}$ **78.** $\lim_{x\to(\pi/2)^-}\dfrac{\sec x}{\tan x}$

**79–84** Use l'Hospital's Rule to help sketch the curve. Use the guidelines of Section 3.5.

**79.** $y = xe^{-x}$ **80.** $y = \dfrac{\ln x}{x^2}$

**81.** $y = xe^{-x^2}$ **82.** $y = e^x/x$

**83.** $y = \dfrac{1}{x} + \ln x$ **84.** $y = (x^2-3)e^{-x}$

**85–87**

(a) Graph the function.

(b) Explain the shape of the graph by computing the limit as $x \to 0^+$ or as $x \to \infty$.

(c) Estimate the maximum and minimum values and then use calculus to find the exact values.

(d) Use a computer algebra system to compute $f''$. Then use a graph of $f''$ to estimate the $x$-coordinates of the inflection points.

**85.** $f(x) = x^{-x}$ **86.** $f(x) = (\sin x)^{\sin x}$

**87.** $f(x) = x^{1/x}$

**88.** Investigate the family of curves given by $f(x) = x^n e^{-x}$, where $n$ is a positive integer. What features do these curves have in common? How do they differ from one another? In particular, what happens to the maximum and minimum points and inflection points as $n$ increases? Illustrate by graphing several members of the family.

**89.** Investigate the family of curves $f(x) = e^x - cx$. In particular, find the limits as $x \to \pm\infty$ and determine the values of $c$ for which $f$ has an absolute minimum. What happens to the minimum points as $c$ increases?

**90.** If an object with mass $m$ is dropped from rest, one model for its speed $v$ after $t$ seconds, taking air resistance into account, is

$$v = \frac{mg}{c}\left(1 - e^{-ct/m}\right)$$

where $g$ is the acceleration due to gravity and $c$ is a positive constant. (In Chapter 9 we will be able to deduce this equation from the assumption that the air resistance is proportional to the speed of the object; $c$ is the proportionality constant.)

(a) Calculate $\lim_{t\to\infty} v$. What is the meaning of this limit?

(b) For fixed $t$, use l'Hospital's Rule to calculate $\lim_{c\to 0^+} v$. What can you conclude about the velocity of a falling object in a vacuum?

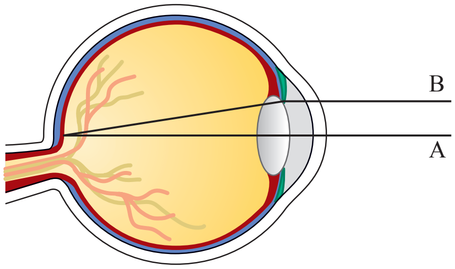
**91.** If an initial amount $A_0$ of money is invested at an interest rate $r$ compounded $n$ times a year, the value of the investment after $t$ years is

$$A = A_0\left(1 + \frac{r}{n}\right)^{nt}$$

If we let $n \to \infty$, we refer to the *continuous compounding* of interest. Use l'Hospital's Rule to show that if interest is compounded continuously, then the amount after $t$ years is

$$A = A_0 e^{rt}$$

**92.** Light enters the eye through the pupil and strikes the retina, where photoreceptor cells sense light and color. W. Stanley Stiles and B. H. Crawford studied the phenomenon in which measured brightness decreases as light enters farther from the center of the pupil (see the figure).



A light beam A that enters through the center of the pupil measures brighter than a beam B entering near the edge of the pupil.

They detailed their findings of this phenomenon, known as the *Stiles–Crawford effect of the first kind*, in an important

paper published in 1933. In particular, they observed that the amount of luminance sensed was *not* proportional to the area of the pupil as they expected. The percentage $P$ of the total luminance entering a pupil of radius $r$ mm that is sensed at the retina can be described by

$$P = \frac{1 - 10^{-\rho r^2}}{\rho r^2 \ln 10}$$

where $\rho$ is an experimentally determined constant, typically about 0.05.

(a) What is the percentage of luminance sensed by a pupil of radius 3 mm? Use $\rho = 0.05$.

(b) Compute the percentage of luminance sensed by a pupil of radius 2 mm. Does it make sense that it is larger than the answer to part (a)?

(c) Compute $\lim_{r \to 0^+} P$. Is the result what you would expect? Is this result physically possible?

*Source:* Adapted from W. Stiles and B. Crawford, “The Luminous Efficiency of Rays Entering the Eye Pupil at Different Points.” *Proceedings of the Royal Society of London, Series B: Biological Sciences* 112 (1933): 428–50.

**93. Logistic Equations** Some populations initally grow exponentially but eventually level off. Equations of the form

$$P(t) = \frac{M}{1 + Ae^{-kt}}$$

where $M$, $A$, and $k$ are positive constants, are called *logistic equations* and are often used to model such populations. (We will investigate these in detail in Chapter 9.) Here $M$ is called the *carrying capacity* and represents the maximum population size that can be supported, and

$$A = \frac{M - P_0}{P_0}$$

where $P_0$ is the initial population.

(a) Compute $\lim_{t \to \infty} P(t)$. Explain why your answer is to be expected.

(b) Compute $\lim_{M \to \infty} P(t)$. (Note that $A$ is defined in terms of $M$.) What kind of function is your result?

**94.** A metal cable has radius $r$ and is covered by insulation so that the distance from the center of the cable to the exterior of the insulation is $R$. The velocity $v$ of an electrical impulse in the cable is

$$v = -c\left(\frac{r}{R}\right)^2 \ln\left(\frac{r}{R}\right)$$

where $c$ is a positive constant. Find the following limits and interpret your answers.

(a) $\displaystyle\lim_{R \to r^+} v$ (b) $\displaystyle\lim_{r \to 0^+} v$

**95–96** Use l’Hospital’s Rule to evaluate the limit.

**95.** $\displaystyle\lim_{x \to 0} \frac{1}{x^2} \int_0^x \frac{2t}{\sqrt{t^3 + 1}}\, dt$ **96.** $\displaystyle\lim_{x \to \infty} \frac{1}{x^2} \int_0^x \ln(1 + e^t)\, dt$

**97.** In Section 4.3 we investigated the Fresnel function $S(x) = \int_0^x \sin\left(\frac{1}{2}\pi t^2\right) dt$, which arises in the study of the diffraction of light waves. Evaluate

$$\lim_{x \to 0} \frac{S(x)}{x^3}$$

**98.** Suppose that the temperature in a long thin rod placed along the $x$-axis is initially $C/(2a)$ if $|x| \leqslant a$ and 0 if $|x| > a$. It can be shown that if the heat diffusivity of the rod is $k$, then the temperature of the rod at the point $x$ at time $t$ is

$$T(x, t) = \frac{C}{a\sqrt{4\pi kt}} \int_0^a e^{-(x-u)^2/(4kt)}\, du$$

To find the temperature distribution that results from an initial hot spot concentrated at the origin, we need to compute

$$\lim_{a \to 0} T(x, t)$$

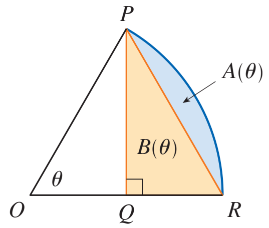
Use l’Hospital’s Rule to find this limit.

**99.** The first appearance in print of l’Hospital’s Rule was in the book *Analyse des infiniment petits* published by the Marquis de l’Hospital in 1696. This was the first calculus textbook ever published. The example that the Marquis used in that book to illustrate his rule was to find the limit of the function

$$y = \frac{\sqrt{2a^3x - x^4} - a\sqrt[3]{aax}}{a - \sqrt[4]{ax^3}}$$

as $x$ approaches $a$, where $a > 0$. (At that time it was common to write $aa$ instead of $a^2$.) Solve this problem.

**100.** The figure shows a sector of a circle with central angle $\theta$. Let $A(\theta)$ be the area of the segment between the chord $PR$ and the arc $PR$. Let $B(\theta)$ be the area of the triangle $PQR$. Find $\lim_{\theta \to 0^+} A(\theta)/B(\theta)$.



**101.** Evaluate

$$\lim_{x \to \infty} \left[x - x^2 \ln\left(\frac{1 + x}{x}\right)\right]$$

**102.** Suppose $f$ is a positive function. If $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} g(x) = \infty$, show that

$$\lim_{x \to a} [f(x)]^{g(x)} = 0$$

This shows that $0^\infty$ is not an indeterminate form.

**103.** Find functions $f$ and $g$ where $\lim_{x \to 0} f(x) = \lim_{x \to 0} g(x) = \infty$ and

(a) $\displaystyle\lim_{x \to 0} \frac{f(x)}{g(x)} = 7$ (b) $\displaystyle\lim_{x \to 0} [f(x) - g(x)] = 7$

**104.** For what values of $a$ and $b$ is the following equation true?

$$\lim_{x \to 0} \left( \frac{\sin 2x}{x^3} + a + \frac{b}{x^2} \right) = 0$$

**105.** Let

$$f(x) = \begin{cases} e^{-1/x^2} & \text{if } x \neq 0 \\ 0 & \text{if } x = 0 \end{cases}$$

(a) Use the definition of a derivative to compute $f'(0)$.

(b) Show that $f$ has derivatives of all orders that are defined on $\mathbb{R}$. [*Hint:* First show by induction that there is a polynomial $p_n(x)$ and a nonnegative integer $k_n$ such that $f^{(n)}(x) = p_n(x)f(x)/x^{k_n}$ for $x \neq 0$.]

**106.** Let

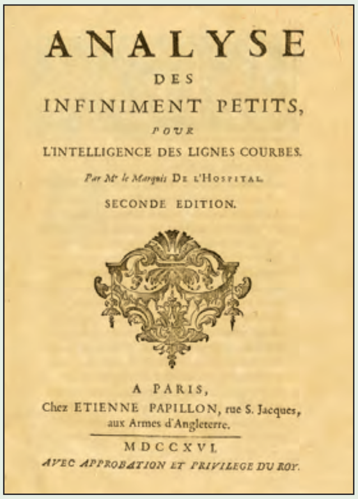
$$f(x) = \begin{cases} |x|^x & \text{if } x \neq 0 \\ 1 & \text{if } x = 0 \end{cases}$$

(a) Show that $f$ is continuous at 0.

(b) Investigate graphically whether $f$ is differentiable at 0 by zooming in several times toward the point (0, 1) on the graph of $f$.

(c) Show that $f$ is not differentiable at 0. How can you reconcile this fact with the appearance of the graphs in part (b)?

## WRITING PROJECT | THE ORIGINS OF L'HOSPITAL'S RULE



ANALYSE
DES
INFINIMENT PETITS,
POUR
L'INTELLIGENCE DES LIGNES COURBES.
Par M^r le Marquis DE L'HOSPITAL.
SECONDE EDITION.

A PARIS,
Chez ETIENNE PAPILLON, rue S. Jacques,
aux Armes d'Angleterre.
MDCCXVI.
AVEC APPROBATION ET PRIVILEGE DU ROY.

Thomas Fisher Rare Book Library

L'Hospital's Rule was first published in 1696 in the Marquis de l'Hospital's calculus textbook *Analyse des infiniment petits*, but the rule was discovered in 1694 by the Swiss mathematician John (Johann) Bernoulli. The explanation is that these two mathematicians had entered into a curious business arrangement whereby the Marquis de l'Hospital bought the rights to Bernoulli's mathematical discoveries. The details, including a translation of l'Hospital's letter to Bernoulli proposing the arrangement, can be found in the book by Eves [1].

Write an essay on the historical and mathematical origins of l'Hospital's Rule. Start by providing brief biographical details of both men (the dictionary edited by Gillispie [2] is a good source) and outline the business deal between them. Then give l'Hospital's statement of his rule, which is found in Struik's source book [4] and more briefly in the book of Katz [3]. Notice that l'Hospital and Bernoulli formulated the rule geometrically and gave the answer in terms of differentials. Compare their statement with the version of l'Hospital's Rule given in Section 6.8 and show that the two statements are essentially the same.

# 6 REVIEW

## CONCEPT CHECK

Answers to the Concept Check are available at StewartCalculus.com.

**1.** (a) What is a one-to-one function? How can you tell if a function is one-to-one by looking at its graph?
(b) If $f$ is a one-to-one function, how is its inverse function $f^{-1}$ defined? How do you obtain the graph of $f^{-1}$ from the graph of $f$?
(c) If $f$ is a one-to-one function and $f'(f^{-1}(a)) \neq 0$, write a formula for $(f^{-1})'(a)$.

**2.** (a) What are the domain and range of the natural exponential function $f(x) = e^x$?
(b) What are the domain and range of the natural logarithmic function $g(x) = \ln x$?
(c) How are the functions $f(x) = e^x$ and $g(x) = \ln x$ related?
(d) How are the graphs of these functions related? Sketch these graphs by hand, using the same axes.
(e) If $b$ is a positive number, $b \neq 1$, write an equation that expresses $\log_b x$ in terms of $\ln x$.

**3.** (a) How is the inverse sine function $f(x) = \sin^{-1}x$ defined? What are its domain and range?
(b) How is the inverse cosine function $f(x) = \cos^{-1}x$ defined? What are its domain and range?
(c) How is the inverse tangent function $f(x) = \tan^{-1}x$ defined? What are its domain and range? Sketch its graph.

**4.** Write the definitions of the hyperbolic functions $\sinh x$, $\cosh x$, and $\tanh x$.

**5.** State the derivative of each function.
(a) $y = e^x$ (b) $y = b^x$ (c) $y = \ln x$
(d) $y = \log_b x$ (e) $y = \sin^{-1}x$ (f) $y = \cos^{-1}x$
(g) $y = \tan^{-1}x$ (h) $y = \sinh x$ (i) $y = \cosh x$
(j) $y = \tanh x$ (k) $y = \sinh^{-1}x$ (l) $y = \cosh^{-1}x$
(m) $y = \tanh^{-1}x$

**6.** (a) How is the number $e$ defined?
(b) Express $e$ as a limit.
(c) Why is the natural exponential function $y = e^x$ used more often in calculus than the other exponential functions $y = b^x$?
(d) Why is the natural logarithmic function $y = \ln x$ used more often in calculus than the other logarithmic functions $y = \log_b x$?

**7.** (a) Write a differential equation that expresses the law of natural growth.
(b) Under what circumstances is this an appropriate model for population growth?
(c) What are the solutions of this equation?

**8.** (a) What does l'Hospital's Rule say?
(b) How can you use l'Hospital's Rule if you have a product $f(x)\,g(x)$ where $f(x) \to 0$ and $g(x) \to \infty$ as $x \to a$?
(c) How can you use l'Hospital's Rule if you have a difference $f(x) - g(x)$ where $f(x) \to \infty$ and $g(x) \to \infty$ as $x \to a$?
(d) How can you use l'Hospital's Rule if you have a power $[f(x)]^{g(x)}$ where $f(x) \to 0$ and $g(x) \to 0$ as $x \to a$?

**9.** State whether each of the following limit forms is indeterminate. Where possible, state the limit.
(a) $\dfrac{0}{0}$ (b) $\dfrac{\infty}{\infty}$ (c) $\dfrac{0}{\infty}$ (d) $\dfrac{\infty}{0}$
(e) $\infty + \infty$ (f) $\infty - \infty$ (g) $\infty \cdot \infty$ (h) $\infty \cdot 0$
(i) $0^0$ (j) $0^\infty$ (k) $\infty^0$ (l) $1^\infty$

## TRUE-FALSE QUIZ

Determine whether the statement is true or false. If it is true, explain why. If it is false, explain why or give an example that disproves the statement.

**1.** If $f$ is one-to-one, with domain $\mathbb{R}$, then $f^{-1}(f(6)) = 6$.

**2.** If $f$ is one-to-one and differentiable, with domain $\mathbb{R}$, then $(f^{-1})'(6) = 1/f'(6)$.

**3.** The function $f(x) = \cos x$, $-\pi/2 \leqslant x \leqslant \pi/2$, is one-to-one.

**4.** $\tan^{-1}(-1) = 3\pi/4$

**5.** If $0 < a < b$, then $\ln a < \ln b$.

**6.** $\pi^{\sqrt{5}} = e^{\sqrt{5}\ln \pi}$

**7.** You can always divide by $e^x$.

**8.** If $a > 0$ and $b > 0$, then $\ln(a + b) = \ln a + \ln b$.

**9.** If $x > 0$, then $(\ln x)^6 = 6 \ln x$.

**10.** $\dfrac{d}{dx}(10^x) = x10^{x-1}$ **11.** $\dfrac{d}{dx}(\ln 10) = \dfrac{1}{10}$

**12.** The inverse function of $y = e^{3x}$ is $y = \frac{1}{3}\ln x$.

**13.** $\cos^{-1}x = \dfrac{1}{\cos x}$ **14.** $\tan^{-1}x = \dfrac{\sin^{-1}x}{\cos^{-1}x}$

**15.** $\cosh x \geqslant 1$ for all $x$

**16.** $\ln \dfrac{1}{10} = -\displaystyle\int_1^{10} \frac{dx}{x}$

**17.** $\displaystyle\int_2^{16} \frac{dx}{x} = 3 \ln 2$

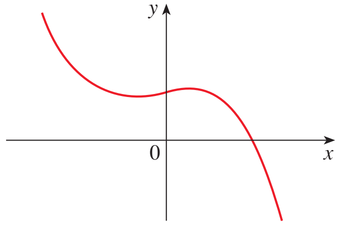
**18.** $\displaystyle\lim_{x \to \pi^-} \frac{\tan x}{1 - \cos x} = \lim_{x \to \pi^-} \frac{\sec^2 x}{\sin x} = \infty$

**19.** If $\displaystyle\lim_{x \to \infty} f(x) = 1$ and $\displaystyle\lim_{x \to \infty} g(x) = \infty$, then

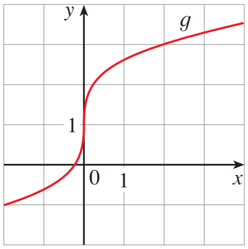
$$\lim_{x \to \infty} [f(x)]^{g(x)} = 1$$

## EXERCISES

**1.** The graph of $f$ is shown. Is $f$ one-to-one? Explain.



**2.** The graph of $g$ is given.



(a) Why is $g$ one-to-one?
(b) Estimate the value of $g^{-1}(2)$.
(c) Estimate the domain of $g^{-1}$.
(d) Sketch the graph of $g^{-1}$.

**3.** Suppose $f$ is one-to-one, $f(7) = 3$, and $f'(7) = 8$. Find (a) $f^{-1}(3)$ and (b) $(f^{-1})'(3)$.

**4.** Find the inverse function of $f(x) = \dfrac{2x + 3}{1 - 5x}$.

**5–9** Sketch a rough graph of the function without using a calculator.

**5.** $y = 5^x - 1$

**6.** $y = -e^{-x}$

**7.** $y = -\ln x$

**8.** $y = \ln(x + 5)$

**9.** $y = 2 \arctan x$

---

**10.** Let $b > 1$. For large values of $x$, which of the functions $y = x^b$, $y = b^x$, and $y = \log_b x$ has the largest values and which has the smallest values?

**11–12** Find the exact value of each expression.

**11.** (a) $e^{2 \ln 5}$ (b) $\log_6 4 + \log_6 54$ (c) $\tan\left(\arcsin \frac{4}{5}\right)$

**12.** (a) $\ln \dfrac{1}{e^3}$ (b) $\sin(\tan^{-1} 1)$ (c) $10^{-3 \log 4}$

---

**13–19** Solve the equation for $x$. Give both an exact value and a decimal approximation, correct to three decimal places.

**13.** $e^{2x} = 3$

**14.** $\ln x^2 = 5$

**15.** $e^{e^x} = 10$

**16.** $\cos^{-1} x = 2$

**17.** $\tan^{-1}(3x^2) = \dfrac{\pi}{4}$

**18.** $\ln(1 + e^{-x}) = 3$

**19.** $\ln x - 1 = \ln(5 + x) - 4$

---

**20.** Solve the equation $\log_5(c^x) = d$ for $x$.

**21–47** Differentiate.

**21.** $f(t) = t^2 \ln t$

**22.** $g(t) = \dfrac{e^t}{1 + e^t}$

**23.** $h(\theta) = e^{\tan 2\theta}$

**24.** $h(u) = 10^{\sqrt{u}}$

**25.** $y = \ln|\sec 5x + \tan 5x|$

**26.** $y = e^{mx} \cos nx$

**27.** $y = \ln(\sec^2 x)$

**28.** $y = \sqrt{t \ln(t^4)}$

**29.** $y = \dfrac{e^{1/x}}{x^2}$

**30.** $y = (\arcsin 2x)^2$

**31.** $y = 5 \arctan(1/x)$

**32.** $y = x \sec^{-1} x$

**33.** $y = 3^{x \ln x}$

**34.** $y = e^{\cos x} + \cos(e^x)$

**35.** $y = x \tan^{-1} x - \frac{1}{2} \ln(1 + x^2)$

**36.** $F(z) = \log_{10}(1 + z^2)$

**37.** $y = x \sinh(x^2)$

**38.** $y = (\cos x)^x$

**39.** $y = \ln(\arcsin x^2)$

**40.** $y = \arctan\left(\arcsin \sqrt{x}\right)$

**41.** $y = \ln\left(\dfrac{1}{x}\right) + \dfrac{1}{\ln x}$

**42.** $y = \ln\left|\dfrac{x^2 - 4}{2x + 5}\right|$

**43.** $y = \ln(\cosh 3x)$

**44.** $y = \dfrac{(x^2 + 1)^4}{(2x + 1)^3 (3x - 1)^5}$

**45.** $y = \cosh^{-1}(\sinh x)$

**46.** $y = x \tanh^{-1} \sqrt{x}$

**47.** $y = \cos\left(e^{\sqrt{\tan 3x}}\right)$

---

**48.** Show that

$$\frac{d}{dx}\left(\frac{1}{2} \tan^{-1} x + \frac{1}{4} \ln \frac{(x + 1)^2}{x^2 + 1}\right) = \frac{1}{(1 + x)(1 + x^2)}$$

**49–52** Find $f'$ in terms of $g'$.

**49.** $f(x) = e^{g(x)}$

**50.** $f(x) = g(e^x)$

**51.** $f(x) = \ln|g(x)|$

**52.** $f(x) = g(\ln x)$

---

**53–54** Find $f^{(n)}(x)$.

**53.** $f(x) = 2^x$

**54.** $f(x) = \ln(2x)$

---

**55.** Use mathematical induction to show that if $f(x) = xe^x$, then $f^{(n)}(x) = (x + n)e^x$. (*Note:* See Principles of Problem Solving following Chapter 1.)

**56.** Find $y'$ if $y = x + \arctan y$.

**57–58** Find an equation of the tangent to the curve at the given point.

**57.** $y = (2 + x)e^{-x}, \quad (0, 2)$

**58.** $y = x \ln x, \quad (e, e)$

---

**59.** At what point on the curve $y = [\ln(x + 4)]^2$ is the tangent horizontal?

**60.** If $f(x) = xe^{\sin x}$, find $f'(x)$. Graph $f$ and $f'$ on the same screen and comment.

**61.** (a) Find an equation of the tangent line to the curve $y = e^x$ that is parallel to the line $x - 4y = 1$.
(b) Find an equation of the tangent to the curve $y = e^x$ that passes through the origin.

**62.** The function $C(t) = K(e^{-at} - e^{-bt})$, where $a$, $b$, and $K$ are positive constants and $b > a$, is used to model the concentration at time $t$ of a drug injected into the bloodstream.
(a) Show that $\lim_{t\to\infty} C(t) = 0$.
(b) Find $C'(t)$, the rate of change of drug concentration in the blood.
(c) When is this rate equal to 0?

**63–78** Evaluate the limit.

**63.** $\lim\limits_{x\to\infty} e^{-3x}$

**64.** $\lim\limits_{x\to 10^-} \ln(100 - x^2)$

**65.** $\lim\limits_{x\to 3^-} e^{2/(x-3)}$

**66.** $\lim\limits_{x\to\infty} \arctan(x^3 - x)$

**67.** $\lim\limits_{x\to 0} \ln(\cosh x)$

**68.** $\lim\limits_{x\to\infty} e^{-x}\sin x$

**69.** $\lim\limits_{x\to\infty} \dfrac{1 + 2^x}{1 - 2^x}$

**70.** $\lim\limits_{x\to\infty} \left(1 + \dfrac{4}{x}\right)^x$

**71.** $\lim\limits_{x\to 0} \dfrac{e^x - 1}{\tan x}$

**72.** $\lim\limits_{x\to 0} \dfrac{1 - \cos x}{x^2 + x}$

**73.** $\lim\limits_{x\to 0} \dfrac{e^{2x} - e^{-2x}}{\ln(x + 1)}$

**74.** $\lim\limits_{x\to\infty} \dfrac{e^{2x} - e^{-2x}}{\ln(x + 1)}$

**75.** $\lim\limits_{x\to -\infty} (x^2 - x^3)e^{2x}$

**76.** $\lim\limits_{x\to 0^+} x^2 \ln x$

**77.** $\lim\limits_{x\to 1^+} \left(\dfrac{x}{x - 1} - \dfrac{1}{\ln x}\right)$

**78.** $\lim\limits_{x\to(\pi/2)^-} (\tan x)^{\cos x}$

---

**79–84** Sketch the curve using the guidelines of Section 3.5.

**79.** $y = e^x \sin x, \quad -\pi \leqslant x \leqslant \pi$

**80.** $y = \sin^{-1}(1/x)$

**81.** $y = x \ln x$

**82.** $y = e^{2x - x^2}$

**83.** $y = (x - 2)e^{-x}$

**84.** $y = x + \ln(x^2 + 1)$

---

**85.** Investigate the family of curves given by $f(x) = xe^{-cx}$, where $c$ is a real number. Start by computing the limits as $x \to \pm\infty$. Identify any transitional values of $c$ where the basic shape changes. What happens to the maximum or minimum points and inflection points as $c$ changes? Illustrate by graphing several members of the family.

**86.** Investigate the family of functions $f(x) = cxe^{-cx^2}$. What happens to the maximum and minimum points and the inflection points as $c$ changes? Illustrate your conclusions by graphing several members of the family.

**87.** An equation of motion of the form $s = Ae^{-ct}\cos(\omega t + \delta)$ represents damped oscillation of an object. Find the velocity and acceleration of the object.

**88.** (a) Show that there is exactly one solution of the equation $\ln x = 3 - x$ and that it lies between 2 and $e$.
(b) Use Newton's method to find the solution of the equation in part (a) correct to four decimal places.

**89.** A bacteria culture contains 200 cells initially and grows at a rate proportional to its size. After half an hour the population has increased to 360 cells.
(a) Find the number of cells after $t$ hours.
(b) Find the number of cells after 4 hours.
(c) Find the rate of growth after 4 hours.
(d) When will the population reach 10,000?

**90.** Cobalt-60 has a half-life of 5.24 years.
(a) Find the mass that remains from a 100-mg sample after 20 years.
(b) How long would it take for the mass to decay to 1 mg?

**91.** The biologist G. F. Gause conducted an experiment in the 1930s with the protozoan *Paramecium* and used the population function

$$P(t) = \frac{64}{1 + 31e^{-0.7944t}}$$

to model his data, where $t$ was measured in days. Use this model to determine when the population was increasing most rapidly.

**92–105** Evaluate the integral.

**92.** $\displaystyle\int_0^4 \frac{1}{16 + t^2}\,dt$

**93.** $\displaystyle\int_0^1 ye^{-2y^2}\,dy$

**94.** $\displaystyle\int_2^5 \frac{dr}{1 + 2r}$

**95.** $\displaystyle\int_0^1 \frac{e^x}{1 + e^{2x}}\,dx$

**104.** $\displaystyle\int \sinh au\,du$

**105.** $\displaystyle\int_{-2}^{-1} \frac{z^2 + 1}{z}\,dz$

**106–108** Use properties of integrals to prove the inequality.

**106.** $\displaystyle\int_0^1 \sqrt{1 + e^{2x}}\,dx \geqslant e - 1$

**107.** $\displaystyle\int_0^1 e^x \cos x\,dx \leqslant e - 1$

**108.** $\displaystyle\int_0^1 x \sin^{-1} x\,dx \leqslant \pi/4$

**109–110** Find $f'(x)$.

**109.** $\displaystyle f(x) = \int_1^{\sqrt{x}} \frac{e^s}{s}\,ds$

**110.** $\displaystyle f(x) = \int_{\ln x}^{2x} e^{-t^2}\,dt$

**111.** (a) Find the average value of the function $f(x) = (\ln x)/x$ on the interval $[1, 5]$.
(b) Find the absolute maximum and minimum values of the function $f(x) = (\ln x)/x$ on the interval $[1, 5]$.

**112.** Find the area of the region bounded by the curves $y = e^x$, $y = e^{-x}$, $x = -2$, and $x = 1$.

**113.** Find the volume of the solid obtained by rotating about the $y$-axis the region under the curve $y = 1/(1 + x^4)$ from $x = 0$ to $x = 1$.

**114.** If $f(x) = x + x^2 + e^x$, find $(f^{-1})'(1)$.

**115.** If $f(x) = \ln x + \tan^{-1} x$, find $(f^{-1})'(\pi/4)$.

**116.** What is the area of the largest rectangle in the first quadrant with two sides on the axes and one vertex on the curve $y = e^{-x}$?

**117.** What is the area of the largest triangle in the first quadrant with two sides on the axes and the third side tangent to the curve $y = e^{-x}$?

**118.** Evaluate $\int_0^1 e^x\,dx$ without using the Fundamental Theorem of Calculus. [*Hint:* Use the definition of a definite integral with right endpoints, sum a geometric series, and then use l'Hospital's Rule.]

**119.** If $F(x) = \int_a^b t^x\,dt$, where $a, b > 0$, then, by the Fundamental Theorem,

$$F(x) = \frac{b^{x+1} - a^{x+1}}{x + 1} \qquad x \neq -1$$

$$F(-1) = \ln b - \ln a$$

Use l'Hospital's Rule to show that $F$ is continuous at $-1$.

**120.** Show that

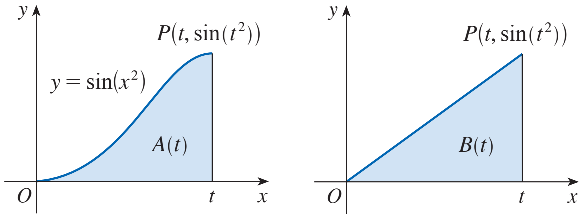
$$\cos\{\arctan[\sin(\operatorname{arccot} x)]\} = \sqrt{\frac{x^2 + 1}{x^2 + 2}}$$

**121.** If $f$ is a continuous function such that

$$\int_1^x f(t)\,dt = (x - 1)e^{2x} + \int_1^x e^{-t} f(t)\,dt$$

for all $x$, find an explicit formula for $f(x)$.

**122.** The figure shows two regions in the first quadrant: $A(t)$ is the area under the curve $y = \sin(x^2)$ from 0 to $t$, and $B(t)$ is the area of the triangle with vertices $O$, $P$, and $(t, 0)$. Find $\displaystyle\lim_{t \to 0^+} [A(t)/B(t)]$.



# Problems Plus

Cover up the solution to the example and try it yourself.

**EXAMPLE** For what values of $c$ does the equation $\ln x = cx^2$ have exactly one solution?

**SOLUTION** One of the most important principles of problem solving is to draw a diagram, even if the problem as stated doesn't explicitly mention a geometric situation. Our present problem can be reformulated geometrically as follows: for what values of $c$ does the curve $y = \ln x$ intersect the curve $y = cx^2$ in exactly one point?

Let's start by graphing $y = \ln x$ and $y = cx^2$ for various values of $c$. We know that, for $c \neq 0$, $y = cx^2$ is a parabola that opens upward if $c > 0$ and downward if $c < 0$. Figure 1 shows the parabolas $y = cx^2$ for several positive values of $c$. Most of them don't intersect $y = \ln x$ at all and one intersects twice. We have the feeling that there must be a value of $c$ (somewhere between 0.1 and 0.3) for which the curves intersect exactly once, as in Figure 2.

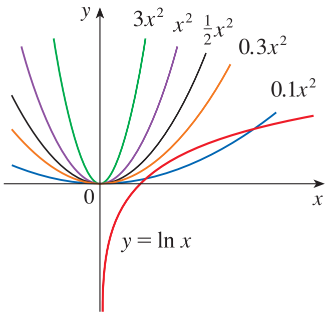


**FIGURE 1**

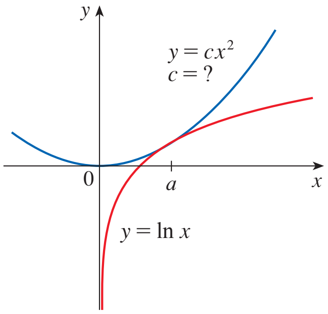

**FIGURE 2**

To find that particular value of $c$, we let $a$ be the $x$-coordinate of the single point of intersection. In other words, $\ln a = ca^2$, so $a$ is the unique solution of the given equation. We see from Figure 2 that the curves just touch, so they have a common tangent line when $x = a$. That means the curves $y = \ln x$ and $y = cx^2$ have the same slope when $x = a$. Therefore

$$\frac{1}{a} = 2ca$$

Solving the equations $\ln a = ca^2$ and $1/a = 2ca$, we get

$$\ln a = ca^2 = c \cdot \frac{1}{2c} = \frac{1}{2}$$

Thus $a = e^{1/2}$ and

$$c = \frac{\ln a}{a^2} = \frac{\ln e^{1/2}}{e} = \frac{1}{2e}$$

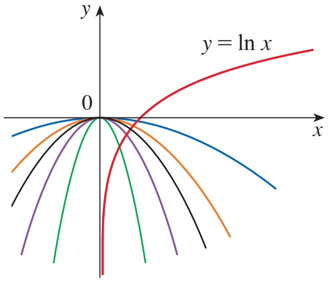

**FIGURE 3**

For negative values of $c$ we have the situation illustrated in Figure 3: all parabolas $y = cx^2$ with negative values of $c$ intersect $y = \ln x$ exactly once. And let's not forget about $c = 0$: the curve $y = 0x^2 = 0$ is just the $x$-axis, which intersects $y = \ln x$ exactly once.

To summarize, the required values of $c$ are $c = 1/(2e)$ and $c \leqslant 0$. ■

## Problems

**1.** If a rectangle has its base on the $x$-axis and two vertices on the curve $y = e^{-x^2}$, show that the rectangle has the largest possible area when the two vertices are at the points of inflection of the curve.

**2.** Prove that $\log_2 5$ is an irrational number.

**3.** Solve the inequality $\ln(x^2 - 2x - 2) \leqslant 0$.

**4.** Show that if $x > 0$ and $x \neq 1$, then

$$\frac{1}{\log_2 x} + \frac{1}{\log_3 x} + \frac{1}{\log_5 x} = \frac{1}{\log_{30} x}$$

**5.** Does the function $f(x) = e^{10|x-2|-x^2}$ have an absolute maximum? If so, find it. What about an absolute minimum?

**6.** If $\int_0^4 e^{(x-2)^4}\,dx = k$, find the value of $\int_0^4 xe^{(x-2)^4}\,dx$.

**7.** Show that

$$\frac{d^n}{dx^n}(e^{ax}\sin bx) = r^n e^{ax}\sin(bx + n\theta)$$

where $a$ and $b$ are positive numbers, $r^2 = a^2 + b^2$, and $\theta = \tan^{-1}(b/a)$.

**8.** Show that $\sin^{-1}(\tanh x) = \tan^{-1}(\sinh x)$.

**9.** Show that, for $x > 0$,

$$\frac{x}{1 + x^2} < \tan^{-1}x < x$$

**10.** Suppose $f$ is continuous, $f(0) = 0$, $f(1) = 1$, $f'(x) > 0$, and $\int_0^1 f(x)\,dx = \frac{1}{3}$. Find the value of the integral $\int_0^1 f^{-1}(y)\,dy$.

**11.** Show that $f(x) = \int_1^x \sqrt{1 + t^3}\,dt$ is one-to-one and find $(f^{-1})'(0)$.

**12.** If

$$y = \frac{x}{\sqrt{a^2 - 1}} - \frac{2}{\sqrt{a^2 - 1}}\arctan\frac{\sin x}{a + \sqrt{a^2 - 1} + \cos x}$$

show that $y' = \dfrac{1}{a + \cos x}$.

**13.** For what value of $a$ is the following equation true?

$$\lim_{x\to\infty}\left(\frac{x + a}{x - a}\right)^x = e$$

**14.** Evaluate

$$\lim_{x\to\infty}\frac{(x + 2)^{1/x} - x^{1/x}}{(x + 3)^{1/x} - x^{1/x}}$$

**15.** Evaluate $\lim_{x\to 0}(1/x)\int_0^x (1 - \tan 2t)^{1/t}\,dt$.
[Assume that the integrand is defined and continuous at $t = 0$; see Exercise 4.3.70.]

**16.** Sketch the set of all points $(x, y)$ such that $|x + y| \leqslant e^x$.

**17.** Prove that $\cosh(\sinh x) < \sinh(\cosh x)$ for all $x$.

**18.** Show that, for all positive values of $x$ and $y$,

$$\frac{e^{x+y}}{xy} \geqslant e^2$$

**19.** For what value of $k$ does the equation $e^{2x} = k\sqrt{x}$ have exactly one solution?

**20.** For which positive numbers $a$ is it true that $a^x \geqslant 1 + x$ for all $x$?

**21.** For which positive numbers $a$ does the curve $y = a^x$ intersect the line $y = x$?

**22.** For what values of $c$ does the curve $y = cx^3 + e^x$ have inflection points?

**The physical principles that govern the motion of a model rocket also apply to rockets that send spacecraft into earth orbit. In Exercise 7.1.74 you will use an integral to calculate the fuel needed to send a rocket to a specified height above the earth.**

# Techniques of Integration

**BECAUSE OF THE FUNDAMENTAL THEOREM** of Calculus, we can integrate a function if we know an antiderivative, that is, an indefinite integral. We summarize here the most important integrals that we have learned so far.

$$\int k\,dx = kx + C$$

$$\int x^n\,dx = \frac{x^{n+1}}{n+1} + C \quad (n \neq -1)$$

$$\int \frac{1}{x}\,dx = \ln|x| + C$$

$$\int e^x\,dx = e^x + C$$

$$\int b^x\,dx = \frac{b^x}{\ln b} + C$$

$$\int \sin x\,dx = -\cos x + C$$

$$\int \cos x\,dx = \sin x + C$$

$$\int \sec^2 x\,dx = \tan x + C$$

$$\int \csc^2 x\,dx = -\cot x + C$$

$$\int \sec x\,\tan x\,dx = \sec x + C$$

$$\int \csc x\,\cot x\,dx = -\csc x + C$$

$$\int \tan x\,dx = \ln|\sec x| + C$$

$$\int \cot x\,dx = \ln|\sin x| + C$$

$$\int \frac{1}{x^2 + a^2}\,dx = \frac{1}{a}\tan^{-1}\left(\frac{x}{a}\right) + C$$

$$\int \frac{1}{\sqrt{a^2 - x^2}}\,dx = \sin^{-1}\left(\frac{x}{a}\right) + C, \quad a > 0$$

$$\int \sinh x\,dx = \cosh x + C$$

$$\int \cosh x\,dx = \sinh x + C$$

In this chapter we develop techniques for using these basic integration formulas to obtain indefinite integrals of more complicated functions. We learned the most important method of integration, the Substitution Rule, in Section 4.5. The other general technique, integration by parts, is presented in Section 7.1. Then we learn methods that are special to particular classes of functions, such as trigonometric functions and rational functions.

Integration is not as straightforward as differentiation; there are no rules that absolutely guarantee obtaining an indefinite integral of a function. Therefore we discuss a strategy for integration in Section 7.5.

## 7.1 Integration by Parts

Every differentiation rule has a corresponding integration rule. For instance, the Substitution Rule for integration corresponds to the Chain Rule for differentiation. The integration rule that corresponds to the Product Rule for differentiation is called *integration by parts*.

### Integration by Parts: Indefinite Integrals

The Product Rule states that if $f$ and $g$ are differentiable functions, then

$$\frac{d}{dx}[f(x)g(x)] = f(x)g'(x) + g(x)f'(x)$$

In the notation for indefinite integrals this equation becomes

$$\int [f(x)g'(x) + g(x)f'(x)]\,dx = f(x)g(x)$$

or

$$\int f(x)g'(x)\,dx + \int g(x)f'(x)\,dx = f(x)g(x)$$

We can rearrange this equation as

$$\boxed{1} \qquad \boxed{\int f(x)g'(x)\,dx = f(x)g(x) - \int g(x)f'(x)\,dx}$$

Formula 1 is called the **formula for integration by parts**. It is perhaps easier to remember in the following notation. Let $u = f(x)$ and $v = g(x)$. Then the differentials are $du = f'(x)\,dx$ and $dv = g'(x)\,dx$, so, by the Substitution Rule, the formula for integration by parts becomes

$$\boxed{2} \qquad \boxed{\int u\,dv = uv - \int v\,du}$$

**EXAMPLE 1** Find $\int x \sin x\,dx$.

**SOLUTION USING FORMULA 1** Suppose we choose $f(x) = x$ and $g'(x) = \sin x$. Then $f'(x) = 1$ and $g(x) = -\cos x$. (For $g$ we can choose *any* antiderivative of $g'$.) Thus, using Formula 1, we have

$$\begin{aligned}\int x \sin x\,dx &= f(x)g(x) - \int g(x)f'(x)\,dx \\ &= x(-\cos x) - \int (-\cos x)\,dx = -x\cos x + \int \cos x\,dx \\ &= -x\cos x + \sin x + C\end{aligned}$$

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

It's wise to check the answer by differentiating it. If we do so, we get $x \sin x$, as expected.

It is helpful to use the pattern:

$u = \square \qquad dv = \square$

$du = \square \qquad v = \square$

**SOLUTION USING FORMULA 2** Let

$$u = x \qquad dv = \sin x\, dx$$

Then

$$du = dx \qquad v = -\cos x$$

and so

$$\int x \sin x\, dx = \int \overbrace{x}^{u}\ \overbrace{\sin x\, dx}^{dv} = \overbrace{x}^{u}\ \overbrace{(-\cos x)}^{v} - \int \overbrace{(-\cos x)}^{v}\ \overbrace{dx}^{du}$$

$$= -x \cos x + \int \cos x\, dx$$

$$= -x \cos x + \sin x + C$$

■

**NOTE** Our aim in using integration by parts is to obtain a simpler integral than the one we started with. Thus in Example 1 we started with $\int x \sin x\, dx$ and expressed it in terms of the simpler integral $\int \cos x\, dx$. If we had instead chosen $u = \sin x$ and $dv = x\, dx$, then $du = \cos x\, dx$ and $v = x^2/2$, so integration by parts gives

$$\int x \sin x\, dx = (\sin x)\frac{x^2}{2} - \frac{1}{2}\int x^2 \cos x\, dx$$

Although this is true, $\int x^2 \cos x\, dx$ is a more difficult integral than the one we started with. In general, when deciding on a choice for $u$ and $dv$, we usually try to choose $u = f(x)$ to be a function that becomes simpler when differentiated (or at least not more complicated) as long as $dv = g'(x)\, dx$ can be readily integrated to give $v$.

**EXAMPLE 2** Evaluate $\displaystyle\int \ln x\, dx$.

**SOLUTION** Here we don't have much choice for $u$ and $dv$. Let

$$u = \ln x \qquad dv = dx$$

Then

$$du = \frac{1}{x}\, dx \qquad v = x$$

Integrating by parts, we get

$$\int \ln x\, dx = x \ln x - \int x \cdot \frac{1}{x}\, dx$$

It's customary to write $\int 1\, dx$ as $\int dx$.

$$= x \ln x - \int dx$$

Check the answer by differentiating it.

$$= x \ln x - x + C$$

Integration by parts is effective in this example because the derivative of the function $f(x) = \ln x$ is simpler than $f$.

■

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 3** Find $\int t^2 e^t\,dt$.

**SOLUTION** Notice that $e^t$ is unchanged when differentiated or integrated whereas $t^2$ becomes simpler when differentiated, so we choose

$$u = t^2 \qquad dv = e^t\,dt$$

Then

$$du = 2t\,dt \qquad v = e^t$$

Integration by parts gives

$$\boxed{3} \qquad \int t^2 e^t\,dt = t^2 e^t - 2\int te^t\,dt$$

The integral that we obtained, $\int te^t\,dt$, is simpler than the original integral but is still not obvious. Therefore we use integration by parts a second time, this time with $u = t$ and $dv = e^t\,dt$. Then $du = dt$, $v = e^t$, and

$$\begin{aligned}\int te^t\,dt &= te^t - \int e^t\,dt\\ &= te^t - e^t + C\end{aligned}$$

Putting this in Equation 3, we get

$$\begin{aligned}\int t^2 e^t\,dt &= t^2 e^t - 2\int te^t\,dt\\ &= t^2 e^t - 2(te^t - e^t + C)\\ &= t^2 e^t - 2te^t + 2e^t + C_1 \qquad \text{where } C_1 = -2C\end{aligned}$$

■

**EXAMPLE 4** Evaluate $\int e^x \sin x\,dx$.

**SOLUTION** Neither $e^x$ nor $\sin x$ becomes simpler when differentiated, so let's try choosing $u = e^x$ and $dv = \sin x\,dx$. (It turns out that, in this example, choosing $u = \sin x$, $dv = e^x\,dx$ also works.) Then $du = e^x\,dx$ and $v = -\cos x$, so integration by parts gives

$$\boxed{4} \qquad \int e^x \sin x\,dx = -e^x \cos x + \int e^x \cos x\,dx$$

The integral that we have obtained, $\int e^x \cos x\,dx$, is no simpler than the original one, but at least it's no more difficult. Having had success in the preceding example integrating by parts twice, we persevere and integrate by parts again. It is important that we again choose $u = e^x$, so $dv = \cos x\,dx$. Then $du = e^x\,dx$, $v = \sin x$, and

$$\boxed{5} \qquad \int e^x \cos x\,dx = e^x \sin x - \int e^x \sin x\,dx$$

At first glance, it appears as if we have accomplished nothing because we have arrived at $\int e^x \sin x\,dx$, which is where we started. However, if we put the expression for $\int e^x \cos x\,dx$ from Equation 5 into Equation 4 we get

$$\int e^x \sin x\,dx = -e^x \cos x + e^x \sin x - \int e^x \sin x\,dx$$

This can be regarded as an equation to be solved for the unknown integral. Adding $\int e^x \sin x\,dx$ to both sides, we obtain

$$2\int e^x \sin x\,dx = -e^x \cos x + e^x \sin x$$

Dividing by 2 and adding the constant of integration, we get

$$\int e^x \sin x\,dx = \tfrac{1}{2}e^x(\sin x - \cos x) + C$$ ■

Figure 1 illustrates Example 4 by showing the graphs of $f(x) = e^x \sin x$ and $F(x) = \frac{1}{2}e^x(\sin x - \cos x)$. As a visual check on our work, notice that $f(x) = 0$ when $F$ has a maximum or minimum.

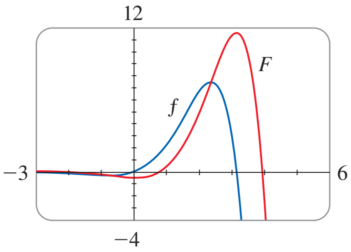

**FIGURE 1**

## ■ Integration by Parts: Definite Integrals

If we combine the formula for integration by parts with Part 2 of the Fundamental Theorem of Calculus, we can evaluate definite integrals by parts. Evaluating both sides of Formula 1 between $a$ and $b$, assuming $f'$ and $g'$ are continuous, and using the Fundamental Theorem, we obtain

**6** $$\boxed{\int_a^b f(x)g'(x)\,dx = f(x)g(x)\Big]_a^b - \int_a^b g(x)f'(x)\,dx}$$

**EXAMPLE 5** Calculate $\int_0^1 \tan^{-1}x\,dx$.

**SOLUTION** Let

$$u = \tan^{-1}x \qquad dv = dx$$

Then $$du = \frac{dx}{1+x^2} \qquad v = x$$

So Formula 6 gives

$$\begin{aligned}\int_0^1 \tan^{-1}x\,dx &= x\tan^{-1}x\Big]_0^1 - \int_0^1 \frac{x}{1+x^2}\,dx\\ &= 1\cdot\tan^{-1}1 - 0\cdot\tan^{-1}0 - \int_0^1 \frac{x}{1+x^2}\,dx\\ &= \frac{\pi}{4} - \int_0^1 \frac{x}{1+x^2}\,dx\end{aligned}$$

Since $\tan^{-1}x \geqslant 0$ for $x \geqslant 0$, the integral in Example 5 can be interpreted as the area of the region shown in Figure 2.

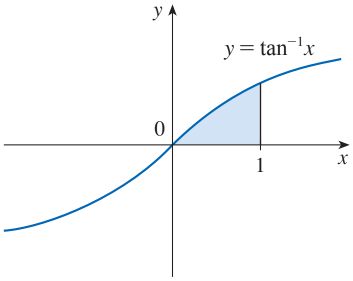

**FIGURE 2**

To evaluate this integral we use the substitution $t = 1 + x^2$ (since $u$ has another meaning in this example). Then $dt = 2x\,dx$, so $x\,dx = \frac{1}{2}\,dt$. When $x = 0$, $t = 1$; when $x = 1$, $t = 2$; so

$$\begin{aligned}\int_0^1 \frac{x}{1+x^2}\,dx &= \tfrac{1}{2}\int_1^2 \frac{dt}{t} = \tfrac{1}{2}\ln|t|\Big]_1^2\\ &= \tfrac{1}{2}(\ln 2 - \ln 1) = \tfrac{1}{2}\ln 2\end{aligned}$$

Therefore $$\int_0^1 \tan^{-1}x\,dx = \frac{\pi}{4} - \int_0^1 \frac{x}{1+x^2}\,dx = \frac{\pi}{4} - \frac{\ln 2}{2}$$ ■

## ■ Reduction Formulas

The preceding examples show that integration by parts often allows us to express one integral in terms of a simpler one. If the integrand contains a power of a function, we can

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

sometimes use integration by parts to reduce the power. In this way we can find a *reduction formula* as in the next example.

**EXAMPLE 6** Prove the reduction formula

$$\boxed{7}\qquad \int \sin^n x\,dx = -\frac{1}{n}\cos x\sin^{n-1}x + \frac{n-1}{n}\int \sin^{n-2}x\,dx$$

where $n \geqslant 2$ is an integer.

Equation 7 is called a *reduction formula* because the exponent $n$ has been *reduced* to $n - 1$ and $n - 2$.

**SOLUTION** Let

$$u = \sin^{n-1}x \qquad\qquad dv = \sin x\,dx$$

Then

$$du = (n-1)\sin^{n-2}x\cos x\,dx \qquad\qquad v = -\cos x$$

and integration by parts gives

$$\int \sin^n x\,dx = -\cos x\sin^{n-1}x + (n-1)\int \sin^{n-2}x\cos^2 x\,dx$$

Since $\cos^2 x = 1 - \sin^2 x$, we have

$$\int \sin^n x\,dx = -\cos x\sin^{n-1}x + (n-1)\int \sin^{n-2}x\,dx - (n-1)\int \sin^n x\,dx$$

As in Example 4, we solve this equation for the desired integral by taking the last term on the right side to the left side. Thus we have

$$n\int \sin^n x\,dx = -\cos x\sin^{n-1}x + (n-1)\int \sin^{n-2}x\,dx$$

or

$$\int \sin^n x\,dx = -\frac{1}{n}\cos x\sin^{n-1}x + \frac{n-1}{n}\int \sin^{n-2}x\,dx$$ ■

The reduction formula (7) is useful because by using it repeatedly we could eventually express $\int \sin^n x\,dx$ in terms of $\int \sin x\,dx$ (if $n$ is odd) or $\int (\sin x)^0\,dx = \int dx$ (if $n$ is even).

## 7.1 Exercises

**1–4** Evaluate the integral using integration by parts with the indicated choices of $u$ and $dv$.

**1.** $\int xe^{2x}\,dx$; $u = x$, $dv = e^{2x}\,dx$

**2.** $\int \sqrt{x}\ln x\,dx$; $u = \ln x$, $dv = \sqrt{x}\,dx$

**3.** $\int x\cos 4x\,dx$; $u = x$, $dv = \cos 4x\,dx$

**4.** $\int \sin^{-1}x\,dx$; $u = \sin^{-1}x$, $dv = dx$

**5–42** Evaluate the integral.

**5.** $\int te^{2t}\,dt$ **6.** $\int ye^{-y}\,dy$

**7.** $\int x\sin 10x\,dx$ **8.** $\int (\pi - x)\cos \pi x\,dx$

**9.** $\int w\ln w\,dw$ **10.** $\int \frac{\ln x}{x^2}\,dx$

**11.** $\int (x^2 + 2x)\cos x\,dx$ **12.** $\int t^2\sin\beta t\,dt$

**13.** $\int \cos^{-1}x\,dx$ **14.** $\int \ln\sqrt{x}\,dx$

**15.** $\int t^4\ln t\,dt$ **16.** $\int \tan^{-1}(2y)\,dy$

**17.** $\int t\csc^2 t\,dt$ **18.** $\int x\cosh ax\,dx$

**19.** $\int (\ln x)^2\,dx$ **20.** $\int \frac{z}{10^z}\,dz$

**21.** $\int e^{3x}\cos x\,dx$ **22.** $\int e^x\sin\pi x\,dx$

**23.** $\int e^{2\theta}\sin 3\theta\,d\theta$ **24.** $\int e^{-\theta}\cos 2\theta\,d\theta$

**25.** $\int z^3 e^z\,dz$

**26.** $\int (\arcsin x)^2\,dx$

**27.** $\int (1 + x^2)\,e^{3x}\,dx$

**28.** $\int_0^{1/2} \theta \sin 3\pi\theta\,d\theta$

**29.** $\int_0^1 x\,3^x\,dx$

**30.** $\int_0^1 \frac{xe^x}{(1 + x)^2}\,dx$

**31.** $\int_0^2 y \sinh y\,dy$

**32.** $\int_1^2 w^2 \ln w\,dw$

**33.** $\int_1^5 \frac{\ln R}{R^2}\,dR$

**34.** $\int_0^{2\pi} t^2 \sin 2t\,dt$

**35.** $\int_0^{\pi} x \sin x \cos x\,dx$

**36.** $\int_1^{\sqrt{3}} \arctan(1/x)\,dx$

**37.** $\int_1^5 \frac{M}{e^M}\,dM$

**38.** $\int_1^2 \frac{(\ln x)^2}{x^3}\,dx$

**39.** $\int_0^{\pi/3} \sin x \ln(\cos x)\,dx$

**40.** $\int_0^1 \frac{r^3}{\sqrt{4 + r^2}}\,dr$

**41.** $\int_0^{\pi} \cos x \sinh x\,dx$

**42.** $\int_0^t e^s \sin(t - s)\,ds$

---

**43–48** First make a substitution and then use integration by parts to evaluate the integral.

**43.** $\int e^{\sqrt{x}}\,dx$

**44.** $\int \cos(\ln x)\,dx$

**45.** $\int_{\sqrt{\pi/2}}^{\sqrt{\pi}} \theta^3 \cos(\theta^2)\,d\theta$

**46.** $\int_0^{\pi} e^{\cos t} \sin 2t\,dt$

**47.** $\int x \ln(1 + x)\,dx$

**48.** $\int \frac{\arcsin(\ln x)}{x}\,dx$

---

**49–52** Evaluate the indefinite integral. Illustrate, and check that your answer is reasonable, by graphing both the function and its antiderivative (take $C = 0$).

**49.** $\int xe^{-2x}\,dx$

**50.** $\int x^{3/2} \ln x\,dx$

**51.** $\int x^3 \sqrt{1 + x^2}\,dx$

**52.** $\int x^2 \sin 2x\,dx$

---

**53.** (a) Use the reduction formula in Example 6 to show that

$$\int \sin^2 x\,dx = \frac{x}{2} - \frac{\sin 2x}{4} + C$$

(b) Use part (a) and the reduction formula to evaluate $\int \sin^4 x\,dx$.

**54.** (a) Prove the reduction formula

$$\int \cos^n x\,dx = \frac{1}{n}\cos^{n-1} x \sin x + \frac{n - 1}{n}\int \cos^{n-2} x\,dx$$

(b) Use part (a) to evaluate $\int \cos^2 x\,dx$.

(c) Use parts (a) and (b) to evaluate $\int \cos^4 x\,dx$.

**55.** (a) Use the reduction formula in Example 6 to show that

$$\int_0^{\pi/2} \sin^n x\,dx = \frac{n - 1}{n}\int_0^{\pi/2} \sin^{n-2} x\,dx$$

where $n \geqslant 2$ is an integer.

(b) Use part (a) to evaluate $\int_0^{\pi/2} \sin^3 x\,dx$ and $\int_0^{\pi/2} \sin^5 x\,dx$.

(c) Use part (a) to show that, for odd powers of sine,

$$\int_0^{\pi/2} \sin^{2n+1} x\,dx = \frac{2 \cdot 4 \cdot 6 \cdot \cdots \cdot 2n}{3 \cdot 5 \cdot 7 \cdot \cdots \cdot (2n + 1)}$$

**56.** Prove that, for even powers of sine,

$$\int_0^{\pi/2} \sin^{2n} x\,dx = \frac{1 \cdot 3 \cdot 5 \cdot \cdots \cdot (2n - 1)}{2 \cdot 4 \cdot 6 \cdot \cdots \cdot 2n}\,\frac{\pi}{2}$$

**57–60** Use integration by parts to prove the reduction formula.

**57.** $\int (\ln x)^n\,dx = x(\ln x)^n - n\int (\ln x)^{n-1}\,dx$

**58.** $\int x^n e^x\,dx = x^n e^x - n\int x^{n-1} e^x\,dx$

**59.** $\int \tan^n x\,dx = \frac{\tan^{n-1} x}{n - 1} - \int \tan^{n-2} x\,dx \quad (n \neq 1)$

**60.** $\int \sec^n x\,dx = \frac{\tan x \sec^{n-2} x}{n - 1} + \frac{n - 2}{n - 1}\int \sec^{n-2} x\,dx \quad (n \neq 1)$

---

**61.** Use Exercise 57 to find $\int (\ln x)^3\,dx$.

**62.** Use Exercise 58 to find $\int x^4 e^x\,dx$.

**63–64** Find the area of the region bounded by the given curves.

**63.** $y = x^2 \ln x, \quad y = 4 \ln x$

**64.** $y = x^2 e^{-x}, \quad y = xe^{-x}$

---

**65–66** Use a graph to find approximate $x$-coordinates of the points of intersection of the given curves. Then find (approximately) the area of the region bounded by the curves.

**65.** $y = \arcsin\left(\frac{1}{2}x\right), \quad y = 2 - x^2$

**66.** $y = x \ln(x + 1), \quad y = 3x - x^2$

---

**67–70** Use the method of cylindrical shells to find the volume generated by rotating the region bounded by the curves about the given axis.

**67.** $y = \cos(\pi x/2),\ y = 0,\ 0 \leqslant x \leqslant 1;$ about the $y$-axis

**68.** $y = e^x,\ y = e^{-x},\ x = 1;$ about the $y$-axis

**69.** $y = e^{-x},\ y = 0,\ x = -1,\ x = 0;$ about $x = 1$

**70.** $y = e^x,\ x = 0,\ y = 3;$ about the $x$-axis

**71.** Calculate the volume generated by rotating the region bounded by the curves $y = \ln x$, $y = 0$, and $x = 2$ about each axis.
(a) The $y$-axis (b) The $x$-axis

**72.** Calculate the average value of $f(x) = x \sec^2 x$ on the interval $[0, \pi/4]$.

**73.** The Fresnel function $S(x) = \int_0^x \sin\left(\frac{1}{2}\pi t^2\right) dt$ was discussed in Example 4.3.3 and is used extensively in the theory of optics. Find $\int S(x)\, dx$. [Your answer will involve $S(x)$.]

**74. A Rocket Equation** A rocket accelerates by burning its onboard fuel, so its mass decreases with time. Suppose the initial mass of the rocket at liftoff (including its fuel) is $m$, the fuel is consumed at rate $r$, and the exhaust gases are ejected with constant velocity $v_e$ (relative to the rocket). A model for the velocity of the rocket at time $t$ is given by the equation

$$v(t) = -gt - v_e \ln \frac{m - rt}{m}$$

where $g$ is the acceleration due to gravity and $t$ is not too large. If $g = 9.8 \text{ m/s}^2$, $m = 30{,}000$ kg, $r = 160$ kg/s, and $v_e = 3000$ m/s, find the height of the rocket (a) one minute after liftoff and (b) after it has consumed 6000 kg of fuel.

**75.** A particle that moves along a straight line has velocity $v(t) = t^2 e^{-t}$ meters per second after $t$ seconds. How far will it travel during the first $t$ seconds?

**76.** If $f(0) = g(0) = 0$ and $f''$ and $g''$ are continuous, show that

$$\int_0^a f(x)g''(x)\, dx = f(a)g'(a) - f'(a)g(a) + \int_0^a f''(x)g(x)\, dx$$

**77.** Suppose that $f(1) = 2$, $f(4) = 7$, $f'(1) = 5$, $f'(4) = 3$, and $f''$ is continuous. Find the value of $\int_1^4 x f''(x)\, dx$.

**78.** (a) Use integration by parts to show that

$$\int f(x)\, dx = xf(x) - \int xf'(x)\, dx$$

(b) If $f$ and $g$ are inverse functions and $f'$ is continuous, prove that

$$\int_a^b f(x)\, dx = bf(b) - af(a) - \int_{f(a)}^{f(b)} g(y)\, dy$$

[*Hint:* Use part (a) and make the substitution $y = f(x)$.]
(c) In the case where $f$ and $g$ are positive functions and $b > a > 0$, draw a diagram to give a geometric interpretation of part (b).
(d) Use part (b) to evaluate $\int_1^e \ln x\, dx$.

**79.** (a) Recall that the formula for integration by parts is obtained from the Product Rule. Use similar reasoning to obtain the following integration formula from the Quotient Rule.

$$\int \frac{u}{v^2}\, dv = -\frac{u}{v} + \int \frac{1}{v}\, du$$

(b) Use the formula in part (a) to evaluate $\int \dfrac{\ln x}{x^2}\, dx$.

**80. The Wallis Product Formula for $\pi$** Let $I_n = \int_0^{\pi/2} \sin^n x\, dx$.
(a) Show that $I_{2n+2} \leqslant I_{2n+1} \leqslant I_{2n}$.
(b) Use Exercise 56 to show that

$$\frac{I_{2n+2}}{I_{2n}} = \frac{2n + 1}{2n + 2}$$

(c) Use parts (a) and (b) to show that

$$\frac{2n + 1}{2n + 2} \leqslant \frac{I_{2n+1}}{I_{2n}} \leqslant 1$$

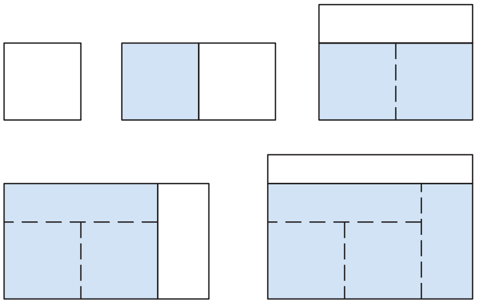
and deduce that $\lim_{n\to\infty} I_{2n+1}/I_{2n} = 1$.
(d) Use part (c) and Exercises 55 and 56 to show that

$$\lim_{n\to\infty} \frac{2}{1} \cdot \frac{2}{3} \cdot \frac{4}{3} \cdot \frac{4}{5} \cdot \frac{6}{5} \cdot \frac{6}{7} \cdot \cdots \cdot \frac{2n}{2n - 1} \cdot \frac{2n}{2n + 1} = \frac{\pi}{2}$$

This formula is usually written as an infinite product:

$$\frac{\pi}{2} = \frac{2}{1} \cdot \frac{2}{3} \cdot \frac{4}{3} \cdot \frac{4}{5} \cdot \frac{6}{5} \cdot \frac{6}{7} \cdot \cdots$$

and is called the *Wallis product*.
(e) We construct rectangles as follows. Start with a square of area 1 and attach rectangles of area 1 alternately beside or on top of the previous rectangle (see the figure). Find the limit of the ratios of width to height of these rectangles.

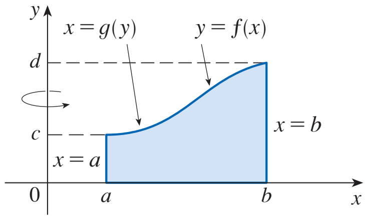


**81.** We arrived at Formula 5.3.2, $V = \int_a^b 2\pi x f(x)\, dx$, by using cylindrical shells, but now we can use integration by parts to prove it using the slicing method of Section 5.2, at least for the case where $f$ is one-to-one and therefore has an inverse function $g$. Use the figure to show that

$$V = \pi b^2 d - \pi a^2 c - \int_c^d \pi [g(y)]^2\, dy$$

Make the substitution $y = f(x)$ and then use integration by parts on the resulting integral to prove that

$$V = \int_a^b 2\pi x f(x)\, dx$$



## 7.2 Trigonometric Integrals

In this section we use trigonometric identities to integrate certain combinations of trigonometric functions.

### Integrals of Powers of Sine and Cosine

We begin by considering integrals in which the integrand is a power of sine, a power of cosine, or a product of these.

**EXAMPLE 1** Evaluate $\int \cos^3 x\,dx$.

**SOLUTION** Simply substituting $u = \cos x$ isn't helpful, since then $du = -\sin x\,dx$. In order to integrate powers of cosine, we would need an extra $\sin x$ factor. Similarly, a power of sine would require an extra $\cos x$ factor. Thus here we can separate one cosine factor and convert the remaining $\cos^2 x$ factor to an expression involving sine using the identity $\sin^2 x + \cos^2 x = 1$:

$$\cos^3 x = \cos^2 x \cdot \cos x = (1 - \sin^2 x)\cos x$$

We can then evaluate the integral by substituting $u = \sin x$, so $du = \cos x\,dx$ and

$$\begin{aligned}\int \cos^3 x\,dx &= \int \cos^2 x \cdot \cos x\,dx = \int (1 - \sin^2 x)\cos x\,dx\\ &= \int (1 - u^2)\,du = u - \tfrac{1}{3}u^3 + C\\ &= \sin x - \tfrac{1}{3}\sin^3 x + C\end{aligned}$$ ■

In general, we try to write an integrand involving powers of sine and cosine in a form where we have only one sine factor (and the remainder of the expression in terms of cosine) or only one cosine factor (and the remainder of the expression in terms of sine). The identity $\sin^2 x + \cos^2 x = 1$ enables us to convert back and forth between even powers of sine and cosine.

**EXAMPLE 2** Find $\int \sin^5 x \cos^2 x\,dx$.

**SOLUTION** We could convert $\cos^2 x$ to $1 - \sin^2 x$, but we would be left with an expression in terms of $\sin x$ with no extra $\cos x$ factor. Instead, we separate a single sine factor and rewrite the remaining $\sin^4 x$ factor in terms of $\cos x$:

$$\sin^5 x \cos^2 x = (\sin^2 x)^2 \cos^2 x \sin x = (1 - \cos^2 x)^2 \cos^2 x \sin x$$

Substituting $u = \cos x$, we have $du = -\sin x\,dx$ and so

$$\begin{aligned}\int \sin^5 x \cos^2 x\,dx &= \int (\sin^2 x)^2 \cos^2 x \sin x\,dx\\ &= \int (1 - \cos^2 x)^2 \cos^2 x \sin x\,dx\\ &= \int (1 - u^2)^2 u^2 (-du) = -\int (u^2 - 2u^4 + u^6)\,du\\ &= -\left(\frac{u^3}{3} - 2\frac{u^5}{5} + \frac{u^7}{7}\right) + C\\ &= -\tfrac{1}{3}\cos^3 x + \tfrac{2}{5}\cos^5 x - \tfrac{1}{7}\cos^7 x + C\end{aligned}$$ ■

Figure 1 shows the graphs of the integrand $\sin^5 x \cos^2 x$ in Example 2 and its indefinite integral (with $C = 0$). Which is which?

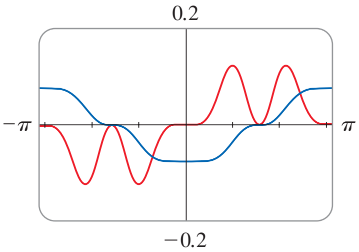


**FIGURE 1**

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

In the preceding examples, an odd power of sine or cosine enabled us to separate a single factor and convert the remaining even power. If the integrand contains even powers of both sine and cosine, this strategy fails. In this case, we can take advantage of the following half-angle identities (see Equations 18b and 18a in Appendix D):

$$\sin^2 x = \tfrac{1}{2}(1 - \cos 2x) \qquad \text{and} \qquad \cos^2 x = \tfrac{1}{2}(1 + \cos 2x)$$

**EXAMPLE 3** Evaluate $\displaystyle\int_0^\pi \sin^2 x\,dx$.

Example 3 shows that the area of the region shown in Figure 2 is $\pi/2$.

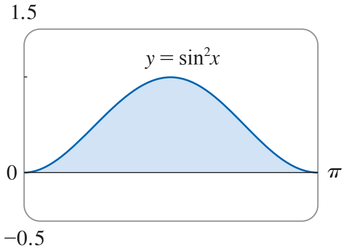

**FIGURE 2**

**SOLUTION** If we write $\sin^2 x = 1 - \cos^2 x$, the integral is no simpler to evaluate. Using the half-angle formula for $\sin^2 x$, however, we have

$$\begin{aligned}\int_0^\pi \sin^2 x\,dx &= \tfrac{1}{2}\int_0^\pi (1 - \cos 2x)\,dx\\ &= \left[\tfrac{1}{2}\left(x - \tfrac{1}{2}\sin 2x\right)\right]_0^\pi\\ &= \tfrac{1}{2}\left(\pi - \tfrac{1}{2}\sin 2\pi\right) - \tfrac{1}{2}\left(0 - \tfrac{1}{2}\sin 0\right) = \tfrac{1}{2}\pi\end{aligned}$$

Notice that we mentally made the substitution $u = 2x$ when integrating $\cos 2x$. Another method for evaluating this integral was given in Exercise 7.1.53. ■

**EXAMPLE 4** Find $\displaystyle\int \sin^4 x\,dx$.

**SOLUTION** We could evaluate this integral using the reduction formula for $\int \sin^n x\,dx$ (Equation 7.1.7) together with Example 3 (as in Exercise 7.1.53), but a better method is to write $\sin^4 x = (\sin^2 x)^2$ and use a half-angle formula:

$$\begin{aligned}\int \sin^4 x\,dx &= \int (\sin^2 x)^2\,dx\\ &= \int \left[\tfrac{1}{2}(1 - \cos 2x)\right]^2 dx\\ &= \tfrac{1}{4}\int \left[1 - 2\cos 2x + \cos^2(2x)\right] dx\end{aligned}$$

Since $\cos^2(2x)$ occurs, we use the half-angle formula for cosine to write

$$\cos^2(2x) = \tfrac{1}{2}[1 + \cos(2 \cdot 2x)] = \tfrac{1}{2}(1 + \cos 4x)$$

This gives

$$\begin{aligned}\int \sin^4 x\,dx &= \tfrac{1}{4}\int \left[1 - 2\cos 2x + \tfrac{1}{2}(1 + \cos 4x)\right] dx\\ &= \tfrac{1}{4}\int \left(\tfrac{3}{2} - 2\cos 2x + \tfrac{1}{2}\cos 4x\right) dx\\ &= \tfrac{1}{4}\left(\tfrac{3}{2}x - \sin 2x + \tfrac{1}{8}\sin 4x\right) + C\end{aligned}$$ ■

To summarize, we list guidelines to follow when evaluating integrals of the form $\int \sin^m x \cos^n x\,dx$, where $m \geqslant 0$ and $n \geqslant 0$ are integers.

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**Strategy for Evaluating $\int \sin^m x \cos^n x\,dx$**

(a) If the power of cosine is odd ($n = 2k + 1$), save one cosine factor and use $\cos^2 x = 1 - \sin^2 x$ to express the remaining factors in terms of sine:

$$\int \sin^m x \cos^{2k+1} x\,dx = \int \sin^m x\,(\cos^2 x)^k \cos x\,dx$$

$$= \int \sin^m x\,(1 - \sin^2 x)^k \cos x\,dx$$

Then substitute $u = \sin x$. See Example 1.

(b) If the power of sine is odd ($m = 2k + 1$), save one sine factor and use $\sin^2 x = 1 - \cos^2 x$ to express the remaining factors in terms of cosine:

$$\int \sin^{2k+1} x \cos^n x\,dx = \int (\sin^2 x)^k \cos^n x\,\sin x\,dx$$

$$= \int (1 - \cos^2 x)^k \cos^n x\,\sin x\,dx$$

Then substitute $u = \cos x$. See Example 2.

[Note that if the powers of both sine and cosine are odd, either (a) or (b) can be used.]

(c) If the powers of both sine and cosine are even, use the half-angle identities

$$\sin^2 x = \tfrac{1}{2}(1 - \cos 2x) \qquad \cos^2 x = \tfrac{1}{2}(1 + \cos 2x)$$

See Examples 3 and 4.

It is sometimes helpful to use the identity

$$\sin x \cos x = \tfrac{1}{2}\sin 2x$$

## Integrals of Powers of Secant and Tangent

We use similar reasoning to evaluate integrals of the form $\int \tan^m x \sec^n x\,dx$. Because $(d/dx)\tan x = \sec^2 x$, we can separate a $\sec^2 x$ factor and convert the remaining (even) power of secant to an expression involving tangent using the identity $\sec^2 x = 1 + \tan^2 x$. Or, since $(d/dx)\sec x = \sec x \tan x$, we can separate a $\sec x \tan x$ factor and convert the remaining (even) power of tangent to secant.

**EXAMPLE 5** Evaluate $\int \tan^6 x \sec^4 x\,dx$.

**SOLUTION** If we separate one $\sec^2 x$ factor, we can express the remaining $\sec^2 x$ factor in terms of tangent using the identity $\sec^2 x = 1 + \tan^2 x$. We can then evaluate the integral by substituting $u = \tan x$ so that $du = \sec^2 x\,dx$:

$$\int \tan^6 x \sec^4 x\,dx = \int \tan^6 x \sec^2 x \sec^2 x\,dx$$

$$= \int \tan^6 x\,(1 + \tan^2 x)\sec^2 x\,dx$$

$$= \int u^6(1 + u^2)\,du = \int (u^6 + u^8)\,du$$

$$= \frac{u^7}{7} + \frac{u^9}{9} + C = \tfrac{1}{7}\tan^7 x + \tfrac{1}{9}\tan^9 x + C$$ ■

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 6** Find $\int \tan^5\theta \sec^7\theta \, d\theta$.

**SOLUTION** If we separate a $\sec^2\theta$ factor, as in the preceding example, we are left with a $\sec^5\theta$ factor, which isn't easily converted to tangent. However, if we separate a $\sec\theta \tan\theta$ factor, we can convert the remaining power of tangent to an expression involving only secant using the identity $\tan^2\theta = \sec^2\theta - 1$. We can then evaluate the integral by substituting $u = \sec\theta$, so $du = \sec\theta \tan\theta \, d\theta$:

$$\begin{aligned}
\int \tan^5\theta \sec^7\theta \, d\theta &= \int \tan^4\theta \sec^6\theta \sec\theta \tan\theta \, d\theta \\
&= \int (\sec^2\theta - 1)^2 \sec^6\theta \sec\theta \tan\theta \, d\theta \\
&= \int (u^2 - 1)^2 u^6 \, du \\
&= \int (u^{10} - 2u^8 + u^6) \, du \\
&= \frac{u^{11}}{11} - 2\frac{u^9}{9} + \frac{u^7}{7} + C \\
&= \tfrac{1}{11}\sec^{11}\theta - \tfrac{2}{9}\sec^9\theta + \tfrac{1}{7}\sec^7\theta + C
\end{aligned}$$

■

The preceding examples demonstrate strategies for evaluating integrals of the form $\int \tan^m x \sec^n x \, dx$ for two cases, which we summarize here.

**Strategy for Evaluating $\int \tan^m x \sec^n x \, dx$**

(a) If the power of secant is even ($n = 2k$, $k \geqslant 2$), save a factor of $\sec^2 x$ and use $\sec^2 x = 1 + \tan^2 x$ to express the remaining factors in terms of $\tan x$:

$$\begin{aligned}
\int \tan^m x \sec^{2k} x \, dx &= \int \tan^m x \, (\sec^2 x)^{k-1} \sec^2 x \, dx \\
&= \int \tan^m x \, (1 + \tan^2 x)^{k-1} \sec^2 x \, dx
\end{aligned}$$

Then substitute $u = \tan x$. See Example 5.

(b) If the power of tangent is odd ($m = 2k + 1$), save a factor of $\sec x \tan x$ and use $\tan^2 x = \sec^2 x - 1$ to express the remaining factors in terms of $\sec x$:

$$\begin{aligned}
\int \tan^{2k+1} x \sec^n x \, dx &= \int (\tan^2 x)^k \sec^{n-1} x \sec x \tan x \, dx \\
&= \int (\sec^2 x - 1)^k \sec^{n-1} x \sec x \tan x \, dx
\end{aligned}$$

Then substitute $u = \sec x$. See Example 6.

For other cases, the guidelines are not as clear-cut. We may need to use identities, integration by parts, and occasionally a little ingenuity. We will sometimes need to be able to integrate $\tan x$ by using the formula established in Chapter 6:

$$\boxed{\int \tan x \, dx = \ln|\sec x| + C}$$

We will also need the indefinite integral of secant:

**1**

$$\boxed{\int \sec x\,dx = \ln|\sec x + \tan x| + C}$$

Formula 1 was discovered by James Gregory in 1668. (See his biography in Section 2.5.) Gregory used this formula to solve a problem in constructing nautical tables.

We could verify Formula 1 by differentiating the right side, or as follows. First we multiply numerator and denominator by $\sec x + \tan x$:

$$\int \sec x\,dx = \int \sec x\,\frac{\sec x + \tan x}{\sec x + \tan x}\,dx$$

$$= \int \frac{\sec^2 x + \sec x\tan x}{\sec x + \tan x}\,dx$$

If we substitute $u = \sec x + \tan x$, then $du = (\sec x\tan x + \sec^2 x)\,dx$, so the integral becomes $\int (1/u)\,du = \ln|u| + C$. Thus we have

$$\int \sec x\,dx = \ln|\sec x + \tan x| + C$$

**EXAMPLE 7** Find $\int \tan^3 x\,dx$.

**SOLUTION** Here only $\tan x$ occurs, so we use $\tan^2 x = \sec^2 x - 1$ to rewrite a $\tan^2 x$ factor in terms of $\sec^2 x$:

$$\int \tan^3 x\,dx = \int \tan x\,\tan^2 x\,dx = \int \tan x\,(\sec^2 x - 1)\,dx$$

$$= \int \tan x\,\sec^2 x\,dx - \int \tan x\,dx$$

$$= \tfrac{1}{2}\tan^2 x - \ln|\sec x| + C$$

In the first integral we mentally substituted $u = \tan x$ so that $du = \sec^2 x\,dx$. ■

If an even power of tangent appears with an odd power of secant, it is helpful to express the integrand completely in terms of $\sec x$. Powers of $\sec x$ may require integration by parts, as shown in the following example.

**EXAMPLE 8** Find $\int \sec^3 x\,dx$.

**SOLUTION** Here we integrate by parts with

$$u = \sec x \qquad dv = \sec^2 x\,dx$$

$$du = \sec x\tan x\,dx \qquad v = \tan x$$

Then
$$\int \sec^3 x\,dx = \sec x\tan x - \int \sec x\tan^2 x\,dx$$

$$= \sec x\tan x - \int \sec x\,(\sec^2 x - 1)\,dx$$

$$= \sec x\tan x - \int \sec^3 x\,dx + \int \sec x\,dx$$

Using Formula 1 and solving for the required integral, we get

$$\int \sec^3 x\,dx = \tfrac{1}{2}\left(\sec x \tan x + \ln\left|\sec x + \tan x\right|\right) + C$$ ■

Integrals such as the one in the preceding example may seem very special but they occur frequently in applications of integration, as we will see in Chapter 8.

Finally, integrals of the form

$$\int \cot^m x \csc^n x\,dx$$

can be found in a similar way by using the identity $1 + \cot^2 x = \csc^2 x$.

## Using Product Identities

The following product identities are useful in evaluating certain trigonometric integrals.

These product identities are discussed in Appendix D.

**2** To evaluate the integrals (a) $\int \sin mx \cos nx\,dx$, (b) $\int \sin mx \sin nx\,dx$, or (c) $\int \cos mx \cos nx\,dx$, use the corresponding identity:

$$\text{(a)}\quad \sin A \cos B = \tfrac{1}{2}[\sin(A - B) + \sin(A + B)]$$

$$\text{(b)}\quad \sin A \sin B = \tfrac{1}{2}[\cos(A - B) - \cos(A + B)]$$

$$\text{(c)}\quad \cos A \cos B = \tfrac{1}{2}[\cos(A - B) + \cos(A + B)]$$

**EXAMPLE 9** Evaluate $\int \sin 4x \cos 5x\,dx$.

**SOLUTION** This integral could be evaluated using integration by parts, but it's easier to use the identity in Equation 2(a) as follows:

$$\begin{aligned}\int \sin 4x \cos 5x\,dx &= \int \tfrac{1}{2}[\sin(-x) + \sin 9x]\,dx\\ &= \tfrac{1}{2}\int(-\sin x + \sin 9x)\,dx\\ &= \tfrac{1}{2}\left(\cos x - \tfrac{1}{9}\cos 9x\right) + C\end{aligned}$$ ■

## 7.2 Exercises

**1–56** Evaluate the integral.

**1.** $\int \sin^3 x \cos^2 x\,dx$

**2.** $\int \cos^6 y \sin^3 y\,dy$

**3.** $\int_0^{\pi/2} \cos^9 x \sin^5 x\,dx$

**4.** $\int_0^{\pi/4} \sin^5 x\,dx$

**5.** $\int \sin^5(2t)\cos^2(2t)\,dt$

**6.** $\int \cos^3(t/2)\sin^2(t/2)\,dt$

**7.** $\int_0^{\pi/2} \cos^2\theta\,d\theta$

**8.** $\int_0^{\pi/4} \sin^2(2\theta)\,d\theta$

**9.** $\int_0^{\pi} \cos^4(2t)\,dt$

**10.** $\int_0^{\pi} \sin^2 t \cos^4 t\,dt$

**11.** $\int_0^{\pi/2} \sin^2 x \cos^2 x\,dx$

**12.** $\int_0^{\pi/2} (2 - \sin\theta)^2\,d\theta$

**13.** $\int \sqrt{\cos\theta}\,\sin^3\theta\,d\theta$

**14.** $\int \left(1 + \sqrt[3]{\sin t}\right)\cos^3 t\,dt$

**15.** $\int \sin x \sec^5 x\,dx$

**16.** $\int \csc^5\theta \cos^3\theta\,d\theta$

**17.** $\int \cot x \cos^2 x\,dx$

**18.** $\int \tan^2 x \cos^3 x\,dx$

**19.** $\int \sin^2 x \sin 2x\,dx$

**20.** $\int \sin x \cos\left(\tfrac{1}{2}x\right)dx$

**21.** $\int \tan x \sec^3 x \, dx$

**22.** $\int \tan^2\theta \sec^4\theta \, d\theta$

**23.** $\int \tan^2 x \, dx$

**24.** $\int (\tan^2 x + \tan^4 x) \, dx$

**25.** $\int \tan^4 x \sec^6 x \, dx$

**26.** $\int_0^{\pi/4} \sec^6\theta \tan^6\theta \, d\theta$

**27.** $\int \tan^3 x \sec x \, dx$

**28.** $\int \tan^5 x \sec^3 x \, dx$

**29.** $\int \tan^3 x \sec^6 x \, dx$

**30.** $\int_0^{\pi/4} \tan^4 t \, dt$

**31.** $\int \tan^5 x \, dx$

**32.** $\int \tan^2 x \sec x \, dx$

**33.** $\int \frac{1 - \tan^2 x}{\sec^2 x} \, dx$

**34.** $\int \frac{\tan x \sec^2 x}{\cos x} \, dx$

**35.** $\int_0^{\pi/4} \frac{\sin^3 x}{\cos x} \, dx$

**36.** $\int \frac{\sin\theta + \tan\theta}{\cos^3\theta} \, d\theta$

**37.** $\int_{\pi/6}^{\pi/2} \cot^2 x \, dx$

**38.** $\int_{\pi/4}^{\pi/2} \cot^3 x \, dx$

**39.** $\int_{\pi/4}^{\pi/2} \cot^5\phi \csc^3\phi \, d\phi$

**40.** $\int_{\pi/4}^{\pi/2} \csc^4\theta \cot^4\theta \, d\theta$

**41.** $\int \csc x \, dx$

**42.** $\int_{\pi/6}^{\pi/3} \csc^3 x \, dx$

**43.** $\int \sin 8x \cos 5x \, dx$

**44.** $\int \sin 2\theta \sin 6\theta \, d\theta$

**45.** $\int_0^{\pi/2} \cos 5t \cos 10t \, dt$

**46.** $\int t \cos^5(t^2) \, dt$

**47.** $\int \frac{\sin^2(1/t)}{t^2} \, dt$

**48.** $\int \sec^2 y \cos^3(\tan y) \, dy$

**49.** $\int_0^{\pi/6} \sqrt{1 + \cos 2x} \, dx$

**50.** $\int_0^{\pi/4} \sqrt{1 - \cos 4\theta} \, d\theta$

**51.** $\int t \sin^2 t \, dt$

**52.** $\int x \sec x \tan x \, dx$

**53.** $\int x \tan^2 x \, dx$

**54.** $\int x \sin^3 x \, dx$

**55.** $\int \frac{dx}{\cos x - 1}$

**56.** $\int \frac{1}{\sec\theta + 1} \, d\theta$

**57–60** Evaluate the indefinite integral. Illustrate, and check that your answer is reasonable, by graphing both the integrand and its antiderivative (taking $C = 0$).

**57.** $\int x \sin^2(x^2) \, dx$

**58.** $\int \sin^5 x \cos^3 x \, dx$

**59.** $\int \sin 3x \sin 6x \, dx$

**60.** $\int \sec^4\left(\tfrac{1}{2}x\right) dx$

**61.** If $\int_0^{\pi/4} \tan^6 x \sec x \, dx = I$, express the value of $\int_0^{\pi/4} \tan^8 x \sec x \, dx$ in terms of $I$.

**62.** (a) Prove the reduction formula

$$\int \tan^{2n} x \, dx = \frac{\tan^{2n-1} x}{2n - 1} - \int \tan^{2n-2} x \, dx$$

(b) Use this formula to find $\int \tan^8 x \, dx$.

**63.** Find the average value of the function $f(x) = \sin^2 x \cos^3 x$ on the interval $[-\pi, \pi]$.

**64.** Evaluate $\int \sin x \cos x \, dx$ by four methods:
(a) the substitution $u = \cos x$
(b) the substitution $u = \sin x$
(c) the identity $\sin 2x = 2 \sin x \cos x$
(d) integration by parts
Explain the different appearances of the answers.

**65–66** Find the area of the region bounded by the given curves.

**65.** $y = \sin^2 x, \quad y = \sin^3 x, \quad 0 \leqslant x \leqslant \pi$

**66.** $y = \tan x, \quad y = \tan^2 x, \quad 0 \leqslant x \leqslant \pi/4$

**67–68** Use a graph of the integrand to guess the value of the integral. Then use the methods of this section to prove that your guess is correct.

**67.** $\int_0^{2\pi} \cos^3 x \, dx$

**68.** $\int_0^2 \sin 2\pi x \cos 5\pi x \, dx$

**69–72** Find the volume obtained by rotating the region bounded by the curves about the given axis.

**69.** $y = \sin x, \ y = 0, \ \pi/2 \leqslant x \leqslant \pi;$ about the $x$-axis

**70.** $y = \sin^2 x, \ y = 0, \ 0 \leqslant x \leqslant \pi;$ about the $x$-axis

**71.** $y = \sin x, \ y = \cos x, \ 0 \leqslant x \leqslant \pi/4;$ about $y = 1$

**72.** $y = \sec x, \ y = \cos x, \ 0 \leqslant x \leqslant \pi/3;$ about $y = -1$

**73.** A particle moves on a straight line with velocity function $v(t) = \sin \omega t \cos^2 \omega t$. Find its position function $s = f(t)$ if $f(0) = 0$.

**74.** Household electricity is supplied in the form of alternating current that varies from 155 V to $-155$ V with a frequency of 60 cycles per second (Hz). The voltage is thus given by the equation

$$E(t) = 155 \sin(120\pi t)$$

where $t$ is the time in seconds. Voltmeters read the RMS (root-mean-square) voltage, which is the square root of the average value of $[E(t)]^2$ over one cycle.
(a) Calculate the RMS voltage of household current.
(b) Many electric stoves require an RMS voltage of 220 V. Find the corresponding amplitude $A$ needed for the voltage $E(t) = A \sin(120\pi t)$.

**75–77** Prove the formula, where $m$ and $n$ are positive integers.

**75.** $\int_{-\pi}^{\pi} \sin mx \cos nx \, dx = 0$

**76.** $\int_{-\pi}^{\pi} \sin mx \sin nx \, dx = \begin{cases} 0 & \text{if } m \neq n \\ \pi & \text{if } m = n \end{cases}$

**77.** $\int_{-\pi}^{\pi} \cos mx \cos nx \, dx = \begin{cases} 0 & \text{if } m \neq n \\ \pi & \text{if } m = n \end{cases}$

**78.** A *finite Fourier series* is given by the sum

$$f(x) = \sum_{n=1}^{N} a_n \sin nx$$

$$= a_1 \sin x + a_2 \sin 2x + \cdots + a_N \sin Nx$$

Use the result of Exercise 76 to show that the $m$th coefficient $a_m$ is given by the formula

$$a_m = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin mx \, dx$$

## 7.3 Trigonometric Substitution

In finding the area of a circle or an ellipse, an integral of the form $\int \sqrt{a^2 - x^2}\, dx$ arises, where $a > 0$. If the integral were $\int x\sqrt{a^2 - x^2}\, dx$, the substitution $u = a^2 - x^2$ would be effective but, as it stands, $\int \sqrt{a^2 - x^2}\, dx$ is more difficult. If we change the variable from $x$ to $\theta$ by the substitution $x = a \sin \theta$, then the identity $1 - \sin^2\theta = \cos^2\theta$ allows us to eliminate the root sign because

$$\sqrt{a^2 - x^2} = \sqrt{a^2 - a^2 \sin^2\theta} = \sqrt{a^2(1 - \sin^2\theta)} = \sqrt{a^2 \cos^2\theta} = a\,|\cos\theta|$$

Notice the difference between the substitution $u = a^2 - x^2$ (in which the new variable is a function of the old one) and the substitution $x = a \sin \theta$ (the old variable is a function of the new one).

In general, we can make a substitution of the form $x = g(t)$ by using the Substitution Rule in reverse. To make our calculations simpler, we assume that $g$ has an inverse function; that is, $g$ is one-to-one. In this case, if we replace $u$ by $x$ and $x$ by $t$ in the Substitution Rule (Equation 4.5.4), we obtain

$$\int f(x)\, dx = \int f(g(t))\, g'(t)\, dt$$

This kind of substitution is called *inverse substitution.*

We can make the inverse substitution $x = a \sin \theta$ provided that it defines a one-to-one function. This can be accomplished by restricting $\theta$ to lie in the interval $[-\pi/2, \pi/2]$.

In the following table we list trigonometric substitutions that are effective for the given radical expressions because of the specified trigonometric identities. In each case the restriction on $\theta$ is imposed to ensure that the function that defines the substitution is one-to-one. (These are the same intervals used in Section 6.6 in defining the inverse functions.)

**Table of Trigonometric Substitutions**

| Expression | Substitution | Identity |
|---|---|---|
| $\sqrt{a^2 - x^2}$ | $x = a \sin\theta,\quad -\frac{\pi}{2} \leqslant \theta \leqslant \frac{\pi}{2}$ | $1 - \sin^2\theta = \cos^2\theta$ |
| $\sqrt{a^2 + x^2}$ | $x = a \tan\theta,\quad -\frac{\pi}{2} < \theta < \frac{\pi}{2}$ | $1 + \tan^2\theta = \sec^2\theta$ |
| $\sqrt{x^2 - a^2}$ | $x = a \sec\theta,\quad 0 \leqslant \theta < \frac{\pi}{2}$ or $\pi \leqslant \theta < \frac{3\pi}{2}$ | $\sec^2\theta - 1 = \tan^2\theta$ |

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 1** Evaluate $\displaystyle\int \frac{\sqrt{9-x^2}}{x^2}\,dx$.

**SOLUTION** Let $x = 3\sin\theta$, where $-\pi/2 \leqslant \theta \leqslant \pi/2$. Then $dx = 3\cos\theta\, d\theta$ and

$$\sqrt{9-x^2} = \sqrt{9-9\sin^2\theta} = \sqrt{9\cos^2\theta} = 3\,|\cos\theta| = 3\cos\theta$$

(Note that $\cos\theta \geqslant 0$ because $-\pi/2 \leqslant \theta \leqslant \pi/2$.) Thus the Inverse Substitution Rule gives

$$\begin{aligned}\int \frac{\sqrt{9-x^2}}{x^2}\,dx &= \int \frac{3\cos\theta}{9\sin^2\theta}\,3\cos\theta\,d\theta \\ &= \int \frac{\cos^2\theta}{\sin^2\theta}\,d\theta = \int \cot^2\theta\,d\theta \\ &= \int (\csc^2\theta - 1)\,d\theta \\ &= -\cot\theta - \theta + C\end{aligned}$$

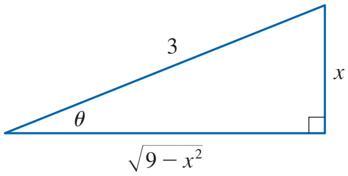

**FIGURE 1**

$\sin\theta = \dfrac{x}{3}$

Because this is an indefinite integral, we must return to the original variable $x$. This can be done either by using trigonometric identities to express $\cot\theta$ in terms of $\sin\theta = x/3$ or by drawing a diagram, as in Figure 1, where $\theta$ is interpreted as an angle of a right triangle. Since $\sin\theta = x/3$, we label the opposite side and the hypotenuse as having lengths $x$ and 3. Then the Pythagorean Theorem gives the length of the adjacent side as $\sqrt{9-x^2}$, so we can simply read the value of $\cot\theta$ from the figure:

$$\cot\theta = \frac{\sqrt{9-x^2}}{x}$$

(Although $\theta > 0$ in the diagram, this expression for $\cot\theta$ is valid even when $\theta < 0$.) Since $\sin\theta = x/3$, we have $\theta = \sin^{-1}(x/3)$ and so

$$\int \frac{\sqrt{9-x^2}}{x^2}\,dx = -\cot\theta - \theta + C = -\frac{\sqrt{9-x^2}}{x} - \sin^{-1}\!\left(\frac{x}{3}\right) + C \qquad ■$$

**EXAMPLE 2** Find the area enclosed by the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

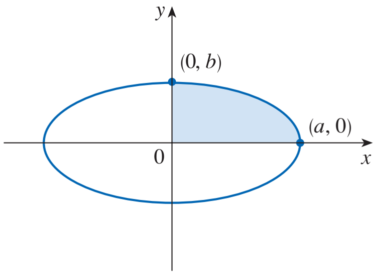

**FIGURE 2**

$\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1$

**SOLUTION** Solving the equation of the ellipse for $y$, we get

$$\frac{y^2}{b^2} = 1 - \frac{x^2}{a^2} = \frac{a^2 - x^2}{a^2} \qquad \text{or} \qquad y = \pm\frac{b}{a}\sqrt{a^2 - x^2}$$

Because the ellipse is symmetric with respect to both axes, the total area $A$ is four times the area in the first quadrant (see Figure 2). The part of the ellipse in the first quadrant is given by the function

$$y = \frac{b}{a}\sqrt{a^2 - x^2} \qquad 0 \leqslant x \leqslant a$$

and so

$$\tfrac{1}{4}A = \int_0^a \frac{b}{a}\sqrt{a^2 - x^2}\,dx$$

To evaluate this integral we substitute $x = a\sin\theta$. Then $dx = a\cos\theta\,d\theta$. To change

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

the limits of integration we note that when $x = 0$, $\sin\theta = 0$, so $\theta = 0$; when $x = a$, $\sin\theta = 1$, so $\theta = \pi/2$. Also

$$\sqrt{a^2 - x^2} = \sqrt{a^2 - a^2\sin^2\theta} = \sqrt{a^2\cos^2\theta} = a|\cos\theta| = a\cos\theta$$

since $0 \leqslant \theta \leqslant \pi/2$. Therefore

$$\begin{aligned} A &= 4\frac{b}{a}\int_0^a \sqrt{a^2 - x^2}\,dx = 4\frac{b}{a}\int_0^{\pi/2} a\cos\theta \cdot a\cos\theta\,d\theta \\ &= 4ab\int_0^{\pi/2}\cos^2\theta\,d\theta = 4ab\int_0^{\pi/2}\tfrac{1}{2}(1 + \cos 2\theta)\,d\theta \\ &= 2ab\Big[\theta + \tfrac{1}{2}\sin 2\theta\Big]_0^{\pi/2} = 2ab\left(\frac{\pi}{2} + 0 - 0\right) = \pi ab \end{aligned}$$

We have shown that the area of an ellipse with semiaxes $a$ and $b$ is $\pi ab$. In particular, taking $a = b = r$, we have proved the famous formula that the area of a circle with radius $r$ is $\pi r^2$. ■

**NOTE** Because the integral in Example 2 was a definite integral, we changed the limits of integration and did not have to convert back to the original variable $x$.

**EXAMPLE 3** Find $\displaystyle\int \frac{1}{x^2\sqrt{x^2 + 4}}\,dx$.

**SOLUTION** Let $x = 2\tan\theta$, $-\pi/2 < \theta < \pi/2$. Then $dx = 2\sec^2\theta\,d\theta$ and

$$\sqrt{x^2 + 4} = \sqrt{4(\tan^2\theta + 1)} = \sqrt{4\sec^2\theta} = 2|\sec\theta| = 2\sec\theta$$

So we have

$$\int \frac{dx}{x^2\sqrt{x^2 + 4}} = \int \frac{2\sec^2\theta\,d\theta}{4\tan^2\theta \cdot 2\sec\theta} = \frac{1}{4}\int \frac{\sec\theta}{\tan^2\theta}\,d\theta$$

To evaluate this trigonometric integral we put everything in terms of $\sin\theta$ and $\cos\theta$:

$$\frac{\sec\theta}{\tan^2\theta} = \frac{1}{\cos\theta} \cdot \frac{\cos^2\theta}{\sin^2\theta} = \frac{\cos\theta}{\sin^2\theta}$$

Therefore, making the substitution $u = \sin\theta$, we have

$$\begin{aligned} \int \frac{dx}{x^2\sqrt{x^2 + 4}} &= \frac{1}{4}\int \frac{\cos\theta}{\sin^2\theta}\,d\theta = \frac{1}{4}\int \frac{du}{u^2} \\ &= \frac{1}{4}\left(-\frac{1}{u}\right) + C = -\frac{1}{4\sin\theta} + C \\ &= -\frac{\csc\theta}{4} + C \end{aligned}$$

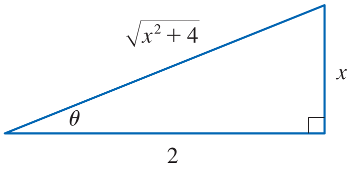

**FIGURE 3**

$\tan\theta = \dfrac{x}{2}$

We use Figure 3 to determine that $\csc\theta = \sqrt{x^2 + 4}/x$ and so

$$\int \frac{dx}{x^2\sqrt{x^2 + 4}} = -\frac{\sqrt{x^2 + 4}}{4x} + C$$ ■

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**EXAMPLE 4** Find $\displaystyle\int \frac{x}{\sqrt{x^2+4}}\,dx$.

**SOLUTION** It would be possible to use the trigonometric substitution $x = 2\tan\theta$ here (as in Example 3). But the direct substitution $u = x^2 + 4$ is simpler, because then $du = 2x\,dx$ and

$$\int \frac{x}{\sqrt{x^2+4}}\,dx = \frac{1}{2}\int \frac{du}{\sqrt{u}} = \sqrt{u} + C = \sqrt{x^2+4} + C \qquad ■$$

**NOTE** Example 4 illustrates the fact that even when trigonometric substitutions are possible, they may not give the easiest solution. You should look for a simpler method first.

**EXAMPLE 5** Evaluate $\displaystyle\int \frac{dx}{\sqrt{x^2-a^2}}$, where $a > 0$.

**SOLUTION 1** We let $x = a\sec\theta$, where $0 < \theta < \pi/2$ or $\pi < \theta < 3\pi/2$. Then $dx = a\sec\theta\,\tan\theta\,d\theta$ and

$$\sqrt{x^2-a^2} = \sqrt{a^2(\sec^2\theta - 1)} = \sqrt{a^2\tan^2\theta} = a\,|\tan\theta| = a\tan\theta$$

Therefore

$$\int \frac{dx}{\sqrt{x^2-a^2}} = \int \frac{a\sec\theta\,\tan\theta}{a\tan\theta}\,d\theta = \int \sec\theta\,d\theta = \ln|\sec\theta + \tan\theta| + C$$

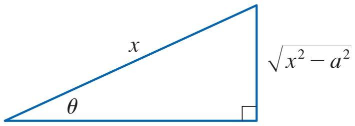

**FIGURE 4**

$\sec\theta = \dfrac{x}{a}$

The triangle in Figure 4 gives $\tan\theta = \sqrt{x^2-a^2}/a$, so we have

$$\int \frac{dx}{\sqrt{x^2-a^2}} = \ln\left|\frac{x}{a} + \frac{\sqrt{x^2-a^2}}{a}\right| + C$$
$$= \ln\left|x + \sqrt{x^2-a^2}\right| - \ln a + C$$

Writing $C_1 = C - \ln a$, we have

$$\boxed{1} \qquad \int \frac{dx}{\sqrt{x^2-a^2}} = \ln\left|x + \sqrt{x^2-a^2}\right| + C_1$$

**SOLUTION 2** For $x > 0$ the hyperbolic substitution $x = a\cosh t$ can also be used. Using the identity $\cosh^2 y - \sinh^2 y = 1$, we have

$$\sqrt{x^2-a^2} = \sqrt{a^2(\cosh^2 t - 1)} = \sqrt{a^2\sinh^2 t} = a\sinh t$$

Since $dx = a\sinh t\,dt$, we obtain

$$\int \frac{dx}{\sqrt{x^2-a^2}} = \int \frac{a\sinh t\,dt}{a\sinh t} = \int dt = t + C$$

Since $\cosh t = x/a$, we have $t = \cosh^{-1}(x/a)$ and

$$\boxed{2} \qquad \int \frac{dx}{\sqrt{x^2-a^2}} = \cosh^{-1}\left(\frac{x}{a}\right) + C$$

Although Formulas 1 and 2 look quite different, they are actually equivalent by Formula 6.7.4. ■

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**NOTE** As Example 5 illustrates, hyperbolic substitutions can be used in place of trigonometric substitutions and sometimes they lead to simpler answers. But we usually use trigonometric substitutions because trigonometric identities are more familiar than hyperbolic identities.

As Example 6 shows, trigonometric substitution is sometimes a good idea when $(x^2 + a^2)^{n/2}$ occurs in an integral, where $n$ is any integer. The same is true when $(a^2 - x^2)^{n/2}$ or $(x^2 - a^2)^{n/2}$ occur.

**EXAMPLE 6** Find $\displaystyle\int_0^{3\sqrt{3}/2} \frac{x^3}{(4x^2 + 9)^{3/2}}\,dx$.

**SOLUTION** First we note that $(4x^2 + 9)^{3/2} = (\sqrt{4x^2 + 9})^3$ so trigonometric substitution is appropriate. Although $\sqrt{4x^2 + 9}$ is not quite one of the expressions in the table of trigonometric substitutions, it becomes one of them if we make the preliminary substitution $u = 2x$, which gives $\sqrt{u^2 + 9}$. Then we substitute $u = 3\tan\theta$ or, equivalently, $x = \frac{3}{2}\tan\theta$, which gives $dx = \frac{3}{2}\sec^2\theta\,d\theta$ and

$$\sqrt{4x^2 + 9} = \sqrt{9\tan^2\theta + 9} = 3\sec\theta$$

When $x = 0$, $\tan\theta = 0$, so $\theta = 0$; when $x = 3\sqrt{3}/2$, $\tan\theta = \sqrt{3}$, so $\theta = \pi/3$.

$$\begin{aligned}
\int_0^{3\sqrt{3}/2} \frac{x^3}{(4x^2 + 9)^{3/2}}\,dx &= \int_0^{\pi/3} \frac{\frac{27}{8}\tan^3\theta}{27\sec^3\theta}\,\tfrac{3}{2}\sec^2\theta\,d\theta \\
&= \tfrac{3}{16}\int_0^{\pi/3} \frac{\tan^3\theta}{\sec\theta}\,d\theta = \tfrac{3}{16}\int_0^{\pi/3} \frac{\sin^3\theta}{\cos^2\theta}\,d\theta \\
&= \tfrac{3}{16}\int_0^{\pi/3} \frac{1 - \cos^2\theta}{\cos^2\theta}\sin\theta\,d\theta
\end{aligned}$$

Now we substitute $u = \cos\theta$ so that $du = -\sin\theta\,d\theta$. When $\theta = 0$, $u = 1$; when $\theta = \pi/3$, $u = \frac{1}{2}$. Therefore

$$\begin{aligned}
\int_0^{3\sqrt{3}/2} \frac{x^3}{(4x^2 + 9)^{3/2}}\,dx &= -\tfrac{3}{16}\int_1^{1/2} \frac{1 - u^2}{u^2}\,du \\
&= \tfrac{3}{16}\int_1^{1/2} (1 - u^{-2})\,du = \tfrac{3}{16}\left[u + \frac{1}{u}\right]_1^{1/2} \\
&= \tfrac{3}{16}\left[\left(\tfrac{1}{2} + 2\right) - (1 + 1)\right] = \tfrac{3}{32}
\end{aligned}$$

■

**EXAMPLE 7** Evaluate $\displaystyle\int \frac{x}{\sqrt{3 - 2x - x^2}}\,dx$.

**SOLUTION** We can transform the integrand into a function for which trigonometric substitution is appropriate by first completing the square under the root sign:

$$\begin{aligned}
3 - 2x - x^2 &= 3 - (x^2 + 2x) = 3 + 1 - (x^2 + 2x + 1) \\
&= 4 - (x + 1)^2
\end{aligned}$$

This suggests that we make the substitution $u = x + 1$. Then $du = dx$ and $x = u - 1$, so

$$\int \frac{x}{\sqrt{3 - 2x - x^2}}\,dx = \int \frac{u - 1}{\sqrt{4 - u^2}}\,du$$

Figure 5 shows the graphs of the integrand in Example 7 and its indefinite integral (with $C = 0$). Which is which?

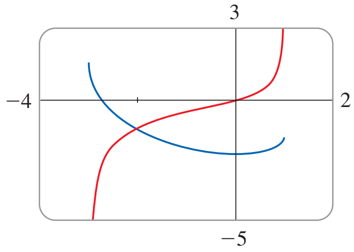

**FIGURE 5**

We now substitute $u = 2\sin\theta$, giving $du = 2\cos\theta\, d\theta$ and $\sqrt{4 - u^2} = 2\cos\theta$, so

$$\begin{aligned}\int \frac{x}{\sqrt{3 - 2x - x^2}}\,dx &= \int \frac{2\sin\theta - 1}{2\cos\theta}\,2\cos\theta\,d\theta \\ &= \int (2\sin\theta - 1)\,d\theta \\ &= -2\cos\theta - \theta + C \\ &= -\sqrt{4 - u^2} - \sin^{-1}\!\left(\frac{u}{2}\right) + C \\ &= -\sqrt{3 - 2x - x^2} - \sin^{-1}\!\left(\frac{x + 1}{2}\right) + C \qquad \blacksquare\end{aligned}$$

## 7.3 Exercises

**1–4** (a) Determine an appropriate trigonometric substitution. (b) Apply the substitution to transform the integral into a trigonometric integral. Do not evaluate the integral.

**1.** $\displaystyle\int \frac{x^3}{\sqrt{1 + x^2}}\,dx$

**2.** $\displaystyle\int \frac{x^3}{\sqrt{9 - x^2}}\,dx$

**3.** $\displaystyle\int \frac{x^2}{\sqrt{x^2 - 2}}\,dx$

**4.** $\displaystyle\int \frac{x^3}{(9 - 4x^2)^{3/2}}\,dx$

**5–8** Evaluate the integral using the indicated trigonometric substitution. Sketch and label the associated right triangle.

**5.** $\displaystyle\int \frac{x^3}{\sqrt{1 - x^2}}\,dx \qquad x = \sin\theta$

**6.** $\displaystyle\int \frac{x^3}{\sqrt{9 + x^2}}\,dx \qquad x = 3\tan\theta$

**7.** $\displaystyle\int \frac{\sqrt{4x^2 - 25}}{x}\,dx \qquad x = \tfrac{5}{2}\sec\theta$

**8.** $\displaystyle\int \frac{\sqrt{2 - x^2}}{x^2}\,dx \qquad x = \sqrt{2}\sin\theta$

**9–36** Evaluate the integral.

**9.** $\displaystyle\int x^3\sqrt{16 + x^2}\,dx$

**10.** $\displaystyle\int \frac{x^2}{\sqrt{9 - x^2}}\,dx$

**11.** $\displaystyle\int \frac{\sqrt{x^2 - 1}}{x^4}\,dx$

**12.** $\displaystyle\int_0^3 \frac{x}{\sqrt{36 - x^2}}\,dx$

**13.** $\displaystyle\int_0^a \frac{dx}{(a^2 + x^2)^{3/2}}, \quad a > 0$

**14.** $\displaystyle\int \frac{dt}{t^2\sqrt{t^2 - 16}}$

**15.** $\displaystyle\int_2^3 \frac{dx}{(x^2 - 1)^{3/2}}$

**16.** $\displaystyle\int_0^{2/3} \sqrt{4 - 9x^2}\,dx$

**17.** $\displaystyle\int_0^{1/2} x\sqrt{1 - 4x^2}\,dx$

**18.** $\displaystyle\int_0^2 \frac{dt}{\sqrt{4 + t^2}}$

**19.** $\displaystyle\int \frac{\sqrt{x^2 - 9}}{x^3}\,dx$

**20.** $\displaystyle\int_0^1 \frac{dx}{(x^2 + 1)^2}$

**21.** $\displaystyle\int_0^a x^2\sqrt{a^2 - x^2}\,dx$

**22.** $\displaystyle\int_{1/4}^{\sqrt{3}/4} \sqrt{1 - 4x^2}\,dx$

**23.** $\displaystyle\int \frac{x}{\sqrt{x^2 - 7}}\,dx$

**24.** $\displaystyle\int \frac{x}{\sqrt{1 + x^2}}\,dx$

**25.** $\displaystyle\int \frac{\sqrt{1 + x^2}}{x}\,dx$

**26.** $\displaystyle\int_0^{0.3} \frac{x}{(9 - 25x^2)^{3/2}}\,dx$

**27.** $\displaystyle\int_0^{0.6} \frac{x^2}{\sqrt{9 - 25x^2}}\,dx$

**28.** $\displaystyle\int_0^1 \sqrt{x^2 + 1}\,dx$

**29.** $\displaystyle\int \frac{dx}{\sqrt{x^2 + 2x + 5}}$

**30.** $\displaystyle\int_0^1 \sqrt{x - x^2}\,dx$

**31.** $\displaystyle\int x^2\sqrt{3 + 2x - x^2}\,dx$

**32.** $\displaystyle\int \frac{x^2}{(3 + 4x - 4x^2)^{3/2}}\,dx$

**33.** $\displaystyle\int \sqrt{x^2 + 2x}\,dx$

**34.** $\displaystyle\int \frac{x^2 + 1}{(x^2 - 2x + 2)^2}\,dx$

**35.** $\displaystyle\int x\sqrt{1 - x^4}\,dx$

**36.** $\displaystyle\int_0^{\pi/2} \frac{\cos t}{\sqrt{1 + \sin^2 t}}\,dt$

**37.** (a) Use trigonometric substitution to show that

$$\int \frac{dx}{\sqrt{x^2 + a^2}} = \ln\left(x + \sqrt{x^2 + a^2}\right) + C$$

(b) Use the hyperbolic substitution $x = a \sinh t$ to show that

$$\int \frac{dx}{\sqrt{x^2 + a^2}} = \sinh^{-1}\left(\frac{x}{a}\right) + C$$

These formulas are connected by Formula 6.7.3.

**38.** Evaluate

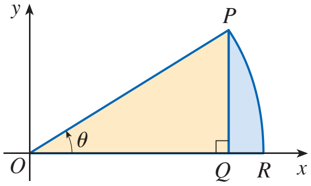
$$\int \frac{x^2}{(x^2 + a^2)^{3/2}}\, dx$$

(a) by trigonometric substitution.
(b) by the hyperbolic substitution $x = a \sinh t$.

**39.** Find the average value of $f(x) = \sqrt{x^2 - 1}/x$, $1 \leqslant x \leqslant 7$.

**40.** Find the area of the region bounded by the hyperbola $9x^2 - 4y^2 = 36$ and the line $x = 3$.

**41.** Prove the formula $A = \frac{1}{2}r^2\theta$ for the area of a sector of a circle with radius $r$ and central angle $\theta$. [*Hint:* Assume $0 < \theta < \pi/2$ and place the center of the circle at the origin so it has the equation $x^2 + y^2 = r^2$. Then $A$ is the sum of the area of the triangle $POQ$ and the area of the region $PQR$ in the figure.]



**42.** Evaluate the integral

$$\int \frac{dx}{x^4\sqrt{x^2 - 2}}$$

Graph the integrand and its indefinite integral on the same screen and check that your answer is reasonable.

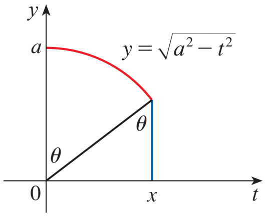
**43.** Find the volume of the solid obtained by rotating about the $x$-axis the region enclosed by the curves $y = 9/(x^2 + 9)$, $y = 0$, $x = 0$, and $x = 3$.

**44.** Find the volume of the solid obtained by rotating about the line $x = 1$ the region under the curve $y = x\sqrt{1 - x^2}$, $0 \leqslant x \leqslant 1$.

**45.** (a) Use trigonometric substitution to verify that

$$\int_0^x \sqrt{a^2 - t^2}\, dt = \tfrac{1}{2}a^2 \sin^{-1}(x/a) + \tfrac{1}{2}x\sqrt{a^2 - x^2}$$

(b) Use the figure to give trigonometric interpretations of both terms on the right side of the equation in part (a).



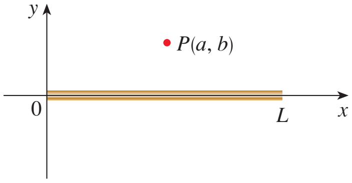
**46.** The parabola $y = \frac{1}{2}x^2$ divides the disk $x^2 + y^2 \leqslant 8$ into two parts. Find the areas of both parts.

**47.** A torus is generated by rotating the circle $x^2 + (y - R)^2 = r^2$ about the $x$-axis. Find the volume enclosed by the torus.

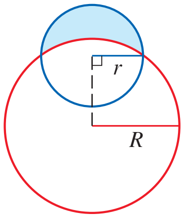
**48.** A charged rod of length $L$ produces an electric field at point $P(a, b)$ given by

$$E(P) = \int_{-a}^{L-a} \frac{\lambda b}{4\pi\varepsilon_0(x^2 + b^2)^{3/2}}\, dx$$

where $\lambda$ is the charge density per unit length on the rod and $\varepsilon_0$ is the free space permittivity (see the figure). Evaluate the integral to determine an expression for the electric field $E(P)$.



**49.** Find the area of the crescent-shaped region (called a *lune*) bounded by arcs of circles with radii $r$ and $R$. (See the figure.)



**50.** A water storage tank has the shape of a cylinder with diameter 10 ft. It is mounted so that the circular cross-sections are vertical. If the depth of the water is 7 ft, what percentage of the total capacity is being used?

## 7.4 Integration of Rational Functions by Partial Fractions

In this section we show how to integrate any rational function (a ratio of polynomials) by expressing it as a sum of simpler fractions, called *partial fractions,* that we already know how to integrate. To illustrate the method, observe that by taking the fractions $2/(x - 1)$ and $1/(x + 2)$ to a common denominator we obtain

$$\frac{2}{x-1} - \frac{1}{x+2} = \frac{2(x+2) - (x-1)}{(x-1)(x+2)} = \frac{x+5}{x^2+x-2}$$

If we now reverse the procedure, we see how to integrate the function on the right side of this equation:

$$\begin{aligned} \int \frac{x+5}{x^2+x-2}\,dx &= \int \left( \frac{2}{x-1} - \frac{1}{x+2} \right) dx \\ &= 2 \ln|x-1| - \ln|x+2| + C \end{aligned}$$

### The Method of Partial Fractions

To see how the method of partial fractions works in general, let's consider a rational function

$$f(x) = \frac{P(x)}{Q(x)}$$

where $P$ and $Q$ are polynomials. It's possible to express $f$ as a sum of simpler fractions provided that the degree of $P$ is less than the degree of $Q$. Such a rational function is called *proper*. Recall that if

$$P(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0$$

where $a_n \neq 0$, then the degree of $P$ is $n$ and we write $\deg(P) = n$.

If $f$ is *improper*, that is, $\deg(P) \geqslant \deg(Q)$, then we must take the preliminary step of dividing $Q$ into $P$ (by long division) until a remainder $R(x)$ is obtained such that $\deg(R) < \deg(Q)$. The result is

$$\boxed{1} \qquad f(x) = \frac{P(x)}{Q(x)} = S(x) + \frac{R(x)}{Q(x)}$$

where $S$ and $R$ are also polynomials.

As the following example illustrates, sometimes this preliminary step is all that is required.

**EXAMPLE 1** Find $\displaystyle\int \frac{x^3 + x}{x - 1}\,dx$.

**SOLUTION** Since the degree of the numerator is greater than the degree of the denominator, we first perform the long division. This enables us to write

$$\begin{array}{r@{}l} & \underline{x^2 + x \;+ 2} \\ x-1\,\big) & x^3 \qquad\;\; + x \\ & \underline{x^3 - x^2} \\ & \qquad x^2 + x \\ & \qquad \underline{x^2 - x} \\ & \qquad\quad 2x \\ & \qquad\quad \underline{2x - 2} \\ & \qquad\qquad\;\; 2 \end{array}$$

$$\begin{aligned} \int \frac{x^3 + x}{x - 1}\,dx &= \int \left( x^2 + x + 2 + \frac{2}{x-1} \right) dx \\ &= \frac{x^3}{3} + \frac{x^2}{2} + 2x + 2\ln|x-1| + C \end{aligned}$$ ■

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

If the denominator $Q(x)$ in Equation 1 is factorable, then the next step is to factor $Q(x)$ as far as possible. It can be shown that any polynomial $Q$ can be factored as a product of linear factors (of the form $ax + b$) and irreducible quadratic factors (of the form $ax^2 + bx + c$, where $b^2 - 4ac < 0$). For instance, if $Q(x) = x^4 - 16$, we could factor it as

$$Q(x) = (x^2 - 4)(x^2 + 4) = (x - 2)(x + 2)(x^2 + 4)$$

The third step is to express the proper rational function $R(x)/Q(x)$ (from Equation 1) as a sum of **partial fractions** of the form

$$\frac{A}{(ax + b)^i} \quad \text{or} \quad \frac{Ax + B}{(ax^2 + bx + c)^j}$$

A theorem in algebra guarantees that it is always possible to do this. We explain the details for the four cases that occur.

**CASE I The denominator $Q(x)$ is a product of distinct linear factors.**
This means that we can write

$$Q(x) = (a_1x + b_1)(a_2x + b_2) \cdots (a_kx + b_k)$$

where no factor is repeated (and no factor is a constant multiple of another). In this case the partial fraction theorem states that there exist constants $A_1, A_2, \ldots, A_k$ such that

$$\boxed{2} \qquad \frac{R(x)}{Q(x)} = \frac{A_1}{a_1x + b_1} + \frac{A_2}{a_2x + b_2} + \cdots + \frac{A_k}{a_kx + b_k}$$

These constants can be determined as in the following example.

**EXAMPLE 2** Evaluate $\displaystyle\int \frac{x^2 + 2x - 1}{2x^3 + 3x^2 - 2x}\,dx$.

**SOLUTION** Since the degree of the numerator is less than the degree of the denominator, we don't need to divide. We factor the denominator as

$$2x^3 + 3x^2 - 2x = x(2x^2 + 3x - 2) = x(2x - 1)(x + 2)$$

Since the denominator has three distinct linear factors, the partial fraction decomposition of the integrand (2) has the form

$$\boxed{3} \qquad \frac{x^2 + 2x - 1}{x(2x - 1)(x + 2)} = \frac{A}{x} + \frac{B}{2x - 1} + \frac{C}{x + 2}$$

Another method for finding $A$, $B$, and $C$ is given in the note after this example.

To determine the values of $A$, $B$, and $C$, we multiply both sides of this equation by the least common denominator, $x(2x - 1)(x + 2)$, obtaining

$$\boxed{4} \qquad x^2 + 2x - 1 = A(2x - 1)(x + 2) + Bx(x + 2) + Cx(2x - 1)$$

Expanding the right side of Equation 4 and writing it in the standard form for polynomials, we get

$$\boxed{5} \qquad x^2 + 2x - 1 = (2A + B + 2C)x^2 + (3A + 2B - C)x - 2A$$

The polynomials on each side of Equation 5 are identical, so the coefficients of corresponding terms must be equal. The coefficient of $x^2$ on the right side, $2A + B + 2C$, must equal the coefficient of $x^2$ on the left side—namely, 1. Likewise, the coefficients of $x$ are equal and the constant terms are equal. This gives the following system of equations for $A$, $B$, and $C$:

$$\begin{aligned} 2A + \phantom{2}B + 2C &= 1 \\ 3A + 2B - \phantom{2}C &= 2 \\ -2A \phantom{+ 2B - 2C} &= -1 \end{aligned}$$

Solving, we get $A = \frac{1}{2}$, $B = \frac{1}{5}$, and $C = -\frac{1}{10}$, and so

We could check our work by taking the terms to a common denominator and adding them.

$$\begin{aligned} \int \frac{x^2 + 2x - 1}{2x^3 + 3x^2 - 2x}\,dx &= \int \left( \frac{1}{2}\frac{1}{x} + \frac{1}{5}\frac{1}{2x - 1} - \frac{1}{10}\frac{1}{x + 2} \right) dx \\ &= \tfrac{1}{2}\ln|x| + \tfrac{1}{10}\ln|2x - 1| - \tfrac{1}{10}\ln|x + 2| + K \end{aligned}$$

In integrating the middle term we have made the mental substitution $u = 2x - 1$, which gives $du = 2\,dx$ and $dx = \frac{1}{2}\,du$. ■

**NOTE** We can use an alternative method to find the coefficients $A$, $B$, and $C$ in Example 2. Equation 4 is an identity; it is true for every value of $x$. Let's choose values of $x$ that simplify the equation. If we put $x = 0$ in Equation 4, then the second and third terms on the right side vanish and the equation then becomes $-2A = -1$, or $A = \frac{1}{2}$. Likewise, $x = \frac{1}{2}$ gives $5B/4 = \frac{1}{4}$ and $x = -2$ gives $10C = -1$, so $B = \frac{1}{5}$ and $C = -\frac{1}{10}$. (You may object that Equation 3 is not valid for $x = 0, \frac{1}{2}$, or $-2$, so why should Equation 4 be valid for those values? In fact, Equation 4 is true for all values of $x$, even $x = 0, \frac{1}{2}$, and $-2$. See Exercise 75 for the reason.)

**EXAMPLE 3** Find $\displaystyle\int \frac{dx}{x^2 - a^2}$, where $a \neq 0$.

**SOLUTION** The method of partial fractions gives

$$\frac{1}{x^2 - a^2} = \frac{1}{(x - a)(x + a)} = \frac{A}{x - a} + \frac{B}{x + a}$$

and therefore

$$A(x + a) + B(x - a) = 1$$

Using the method of the preceding note, we put $x = a$ in this equation and get $A(2a) = 1$, so $A = 1/(2a)$. If we put $x = -a$, we get $B(-2a) = 1$, so $B = -1/(2a)$. Thus

$$\begin{aligned} \int \frac{dx}{x^2 - a^2} &= \frac{1}{2a} \int \left( \frac{1}{x - a} - \frac{1}{x + a} \right) dx \\ &= \frac{1}{2a} \left( \ln|x - a| - \ln|x + a| \right) + C \end{aligned}$$

Since $\ln x - \ln y = \ln(x/y)$, we can write the integral as

$$\boxed{6} \qquad \int \frac{dx}{x^2 - a^2} = \frac{1}{2a} \ln \left| \frac{x-a}{x+a} \right| + C$$

(See Exercises 61–62 for ways of using Formula 6.) ■

**CASE II $Q(x)$ is a product of linear factors, some of which are repeated.**
Suppose the first linear factor $(a_1x + b_1)$ is repeated $r$ times; that is, $(a_1x + b_1)^r$ occurs in the factorization of $Q(x)$. Then instead of the single term $A_1/(a_1x + b_1)$ in Equation 2, we would use

$$\boxed{7} \qquad \frac{A_1}{a_1x + b_1} + \frac{A_2}{(a_1x + b_1)^2} + \cdots + \frac{A_r}{(a_1x + b_1)^r}$$

By way of illustration, we could write

$$\frac{x^3 - x + 1}{x^2(x-1)^3} = \frac{A}{x} + \frac{B}{x^2} + \frac{C}{x-1} + \frac{D}{(x-1)^2} + \frac{E}{(x-1)^3}$$

but we prefer to work out in detail a simpler example.

**EXAMPLE 4** Find $\displaystyle\int \frac{x^4 - 2x^2 + 4x + 1}{x^3 - x^2 - x + 1}\,dx$.

**SOLUTION** The first step is to divide. The result of long division is

$$\frac{x^4 - 2x^2 + 4x + 1}{x^3 - x^2 - x + 1} = x + 1 + \frac{4x}{x^3 - x^2 - x + 1}$$

The second step is to factor the denominator $Q(x) = x^3 - x^2 - x + 1$. Since $Q(1) = 0$, we know that $x - 1$ is a factor and we obtain

$$\begin{aligned} x^3 - x^2 - x + 1 &= (x-1)(x^2-1) = (x-1)(x-1)(x+1) \\ &= (x-1)^2(x+1) \end{aligned}$$

Since the linear factor $x - 1$ occurs twice, the partial fraction decomposition is

$$\frac{4x}{(x-1)^2(x+1)} = \frac{A}{x-1} + \frac{B}{(x-1)^2} + \frac{C}{x+1}$$

Multiplying by the least common denominator, $(x-1)^2(x+1)$, we get

$$\boxed{8} \qquad \begin{aligned} 4x &= A(x-1)(x+1) + B(x+1) + C(x-1)^2 \\ &= (A + C)x^2 + (B - 2C)x + (-A + B + C) \end{aligned}$$

Now we equate coefficients:

$$\begin{aligned} A \phantom{{}+B} + C &= 0 \\ B - 2C &= 4 \\ -A + B + C &= 0 \end{aligned}$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Solving, we obtain $A = 1$, $B = 2$, and $C = -1$, so

$$\begin{aligned}\int \frac{x^4 - 2x^2 + 4x + 1}{x^3 - x^2 - x + 1}\,dx &= \int \left[x + 1 + \frac{1}{x-1} + \frac{2}{(x-1)^2} - \frac{1}{x+1}\right] dx \\ &= \frac{x^2}{2} + x + \ln|x-1| - \frac{2}{x-1} - \ln|x+1| + K \\ &= \frac{x^2}{2} + x - \frac{2}{x-1} + \ln\left|\frac{x-1}{x+1}\right| + K \qquad \blacksquare\end{aligned}$$

**NOTE** We could also determine the coefficients $A$, $B$, and $C$ in Example 4 by following the method given after Example 2. Putting $x = 1$ in Equation 8 gives $4 = 2B$, so $B = 2$ and, likewise, putting $x = -1$ gives $-4 = 4C$, so $C = -1$. There is no value of $x$ that makes the second and third terms on the right side of Equation 8 vanish, so we can't find the value of $A$ as easily. But we can choose a third value for $x$ that still gives a useful relationship between $A$, $B$, and $C$. For instance $x = 0$ gives $0 = -A + B + C$, so $A = 1$.

**CASE III $Q(x)$ contains irreducible quadratic factors, none of which is repeated.** If $Q(x)$ has the factor $ax^2 + bx + c$, where $b^2 - 4ac < 0$, then, in addition to the partial fractions in Equations 2 and 7, the expression for $R(x)/Q(x)$ will have a term of the form

$$\boxed{9} \qquad \frac{Ax + B}{ax^2 + bx + c}$$

where $A$ and $B$ are constants to be determined. For instance, the function given by $f(x) = x/[(x-2)(x^2+1)(x^2+4)]$ has a partial fraction decomposition of the form

$$\frac{x}{(x-2)(x^2+1)(x^2+4)} = \frac{A}{x-2} + \frac{Bx + C}{x^2+1} + \frac{Dx + E}{x^2+4}$$

The term given in (9) can be integrated by completing the square (if necessary) and using the formula

$$\boxed{10} \qquad \boxed{\int \frac{dx}{x^2 + a^2} = \frac{1}{a}\tan^{-1}\left(\frac{x}{a}\right) + C}$$

**EXAMPLE 5** Evaluate $\displaystyle\int \frac{2x^2 - x + 4}{x^3 + 4x}\,dx$.

**SOLUTION** Since $x^3 + 4x = x(x^2 + 4)$ can't be factored further, we write

$$\frac{2x^2 - x + 4}{x(x^2+4)} = \frac{A}{x} + \frac{Bx + C}{x^2 + 4}$$

Multiplying by $x(x^2 + 4)$, we have

$$\begin{aligned}2x^2 - x + 4 &= A(x^2 + 4) + (Bx + C)x \\ &= (A + B)x^2 + Cx + 4A\end{aligned}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Equating coefficients, we obtain

$$A + B = 2 \qquad C = -1 \qquad 4A = 4$$

Therefore $A = 1$, $B = 1$, and $C = -1$ and so

$$\int \frac{2x^2 - x + 4}{x^3 + 4x}\,dx = \int \left(\frac{1}{x} + \frac{x-1}{x^2+4}\right) dx$$

In order to integrate the second term we split it into two parts:

$$\int \frac{x-1}{x^2+4}\,dx = \int \frac{x}{x^2+4}\,dx - \int \frac{1}{x^2+4}\,dx$$

We make the substitution $u = x^2 + 4$ in the first of these integrals so that $du = 2x\,dx$. We evaluate the second integral by means of Formula 10 with $a = 2$:

$$\begin{aligned}\int \frac{2x^2 - x + 4}{x(x^2+4)}\,dx &= \int \frac{1}{x}\,dx + \int \frac{x}{x^2+4}\,dx - \int \frac{1}{x^2+4}\,dx \\ &= \ln|x| + \tfrac{1}{2}\ln(x^2+4) - \tfrac{1}{2}\tan^{-1}(x/2) + K\end{aligned}$$ ■

**EXAMPLE 6** Evaluate $\displaystyle\int \frac{4x^2 - 3x + 2}{4x^2 - 4x + 3}\,dx$.

**SOLUTION** Since the degree of the numerator is *not less than* the degree of the denominator, we first divide and obtain

$$\frac{4x^2 - 3x + 2}{4x^2 - 4x + 3} = 1 + \frac{x-1}{4x^2 - 4x + 3}$$

Notice that the quadratic $4x^2 - 4x + 3$ is irreducible because its discriminant is $b^2 - 4ac = -32 < 0$. This means it can't be factored, so we don't need to use the partial fraction technique.

To integrate the given function we complete the square in the denominator:

$$4x^2 - 4x + 3 = (2x-1)^2 + 2$$

This suggests that we make the substitution $u = 2x - 1$. Then $du = 2\,dx$ and $x = \frac{1}{2}(u+1)$, so

$$\begin{aligned}\int \frac{4x^2 - 3x + 2}{4x^2 - 4x + 3}\,dx &= \int \left(1 + \frac{x-1}{4x^2 - 4x + 3}\right) dx \\ &= x + \tfrac{1}{2}\int \frac{\frac{1}{2}(u+1) - 1}{u^2+2}\,du = x + \tfrac{1}{4}\int \frac{u-1}{u^2+2}\,du \\ &= x + \tfrac{1}{4}\int \frac{u}{u^2+2}\,du - \tfrac{1}{4}\int \frac{1}{u^2+2}\,du \\ &= x + \tfrac{1}{8}\ln(u^2+2) - \frac{1}{4}\cdot\frac{1}{\sqrt{2}}\tan^{-1}\left(\frac{u}{\sqrt{2}}\right) + C \\ &= x + \tfrac{1}{8}\ln(4x^2 - 4x + 3) - \frac{1}{4\sqrt{2}}\tan^{-1}\left(\frac{2x-1}{\sqrt{2}}\right) + C\end{aligned}$$ ■

**NOTE** Example 6 illustrates the general procedure for integrating a partial fraction of the form

$$\frac{Ax + B}{ax^2 + bx + c} \qquad \text{where } b^2 - 4ac < 0$$

We complete the square in the denominator and then make a substitution that brings the integral into the form

$$\int \frac{Cu + D}{u^2 + a^2}\,du = C\int \frac{u}{u^2 + a^2}\,du + D\int \frac{1}{u^2 + a^2}\,du$$

Then the first integral is a logarithm and the second is expressed in terms of $\tan^{-1}$.

**CASE IV** $Q(x)$ **contains a repeated irreducible quadratic factor.**
If $Q(x)$ has the factor $(ax^2 + bx + c)^r$, where $b^2 - 4ac < 0$, then instead of the single partial fraction (9), the sum

$$\boxed{11} \qquad \frac{A_1x + B_1}{ax^2 + bx + c} + \frac{A_2x + B_2}{(ax^2 + bx + c)^2} + \cdots + \frac{A_rx + B_r}{(ax^2 + bx + c)^r}$$

occurs in the partial fraction decomposition of $R(x)/Q(x)$. Each of the terms in (11) can be integrated by using a substitution or by first completing the square if necessary.

It would be extremely tedious to work out by hand the numerical values of the coefficients in Example 7. Most computer algebra systems, however, can find the numerical values very quickly:

$$A = -1, \quad B = \tfrac{1}{8}, \quad C = D = -1,$$
$$E = \tfrac{15}{8}, \quad F = -\tfrac{1}{8}, \quad G = H = \tfrac{3}{4},$$
$$I = -\tfrac{1}{2}, \quad J = \tfrac{1}{2}$$

**EXAMPLE 7** Write out the form of the partial fraction decomposition of the function

$$\frac{x^3 + x^2 + 1}{x(x - 1)(x^2 + x + 1)(x^2 + 1)^3}$$

**SOLUTION**

$$\frac{x^3 + x^2 + 1}{x(x - 1)(x^2 + x + 1)(x^2 + 1)^3}$$
$$= \frac{A}{x} + \frac{B}{x - 1} + \frac{Cx + D}{x^2 + x + 1} + \frac{Ex + F}{x^2 + 1} + \frac{Gx + H}{(x^2 + 1)^2} + \frac{Ix + J}{(x^2 + 1)^3} \quad \blacksquare$$

**EXAMPLE 8** Evaluate $\displaystyle\int \frac{1 - x + 2x^2 - x^3}{x(x^2 + 1)^2}\,dx$.

**SOLUTION** The form of the partial fraction decomposition is

$$\frac{1 - x + 2x^2 - x^3}{x(x^2 + 1)^2} = \frac{A}{x} + \frac{Bx + C}{x^2 + 1} + \frac{Dx + E}{(x^2 + 1)^2}$$

Multiplying by $x(x^2 + 1)^2$, we have

$$\begin{aligned} -x^3 + 2x^2 - x + 1 &= A(x^2 + 1)^2 + (Bx + C)x(x^2 + 1) + (Dx + E)x \\ &= A(x^4 + 2x^2 + 1) + B(x^4 + x^2) + C(x^3 + x) + Dx^2 + Ex \\ &= (A + B)x^4 + Cx^3 + (2A + B + D)x^2 + (C + E)x + A \end{aligned}$$

If we equate coefficients, we get the system

$$A + B = 0 \qquad C = -1 \qquad 2A + B + D = 2 \qquad C + E = -1 \qquad A = 1$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

which has the solution $A = 1, B = -1, C = -1, D = 1$, and $E = 0$. Thus

$$\int \frac{1 - x + 2x^2 - x^3}{x(x^2 + 1)^2}\,dx = \int \left( \frac{1}{x} - \frac{x + 1}{x^2 + 1} + \frac{x}{(x^2 + 1)^2} \right) dx$$

$$= \int \frac{dx}{x} - \int \frac{x}{x^2 + 1}\,dx - \int \frac{dx}{x^2 + 1} + \int \frac{x\,dx}{(x^2 + 1)^2}$$

In the second and fourth terms we made the mental substitution $u = x^2 + 1$.

$$= \ln|x| - \tfrac{1}{2}\ln(x^2 + 1) - \tan^{-1}x - \frac{1}{2(x^2 + 1)} + K \qquad ■$$

**NOTE** Example 8 worked out rather nicely because the coefficient $E$ turned out to be 0. In general, we might get a term of the form $1/(x^2 + 1)^2$. One way to integrate such a term is to make the substitution $x = \tan\theta$. Another method is to use the formula in Exercise 76.

Partial fractions can sometimes be avoided when integrating a rational function. For instance, although the integral

$$\int \frac{x^2 + 1}{x(x^2 + 3)}\,dx$$

could be evaluated by using the method of Case III, it's much easier to observe that if $u = x(x^2 + 3) = x^3 + 3x$, then $du = (3x^2 + 3)\,dx$ and so

$$\int \frac{x^2 + 1}{x(x^2 + 3)}\,dx = \tfrac{1}{3}\ln|x^3 + 3x| + C$$

## ■ Rationalizing Substitutions

Some nonrational functions can be changed into rational functions by means of appropriate substitutions. In particular, when an integrand contains an expression of the form $\sqrt[n]{g(x)}$, then the substitution $u = \sqrt[n]{g(x)}$ may be effective. Other instances appear in the exercises.

**EXAMPLE 9** Evaluate $\displaystyle\int \frac{\sqrt{x + 4}}{x}\,dx$.

**SOLUTION** Let $u = \sqrt{x + 4}$. Then $u^2 = x + 4$, so $x = u^2 - 4$ and $dx = 2u\,du$. Therefore

$$\int \frac{\sqrt{x + 4}}{x}\,dx = \int \frac{u}{u^2 - 4}\,2u\,du = 2\int \frac{u^2}{u^2 - 4}\,du = 2\int \left( 1 + \frac{4}{u^2 - 4} \right) du$$

We can evaluate this integral either by factoring $u^2 - 4$ as $(u - 2)(u + 2)$ and using partial fractions or by using Formula 6 with $a = 2$:

$$\int \frac{\sqrt{x + 4}}{x}\,dx = 2\int du + 8\int \frac{du}{u^2 - 4}$$

$$= 2u + 8 \cdot \frac{1}{2 \cdot 2} \ln\left| \frac{u - 2}{u + 2} \right| + C$$

$$= 2\sqrt{x + 4} + 2\ln\left| \frac{\sqrt{x + 4} - 2}{\sqrt{x + 4} + 2} \right| + C \qquad ■$$

## 7.4 Exercises

**1–6** Write out the form of the partial fraction decomposition of the function (as in Example 7). Do not determine the numerical values of the coefficients.

**1.** (a) $\dfrac{1}{(x-3)(x+5)}$ (b) $\dfrac{2x+5}{(x-2)^2(x^2+2)}$

**2.** (a) $\dfrac{x-6}{x^2+x-6}$ (b) $\dfrac{1}{x^2+x^4}$

**3.** (a) $\dfrac{x^2+4}{x^3-3x^2+2x}$ (b) $\dfrac{x^3+x}{x(2x-1)^2(x^2+3)^2}$

**4.** (a) $\dfrac{5}{x^4-1}$ (b) $\dfrac{x^4+x+1}{(x^3-1)(x^2-1)}$

**5.** (a) $\dfrac{x^5+1}{(x^2-x)(x^4+2x^2+1)}$ (b) $\dfrac{x^2}{x^2+x-6}$

**6.** (a) $\dfrac{x^6}{x^2-4}$ (b) $\dfrac{x^4}{(x^2-x+1)(x^2+2)^2}$

**7–40** Evaluate the integral.

**7.** $\displaystyle\int \frac{5}{(x-1)(x+4)}\,dx$

**8.** $\displaystyle\int \frac{x-12}{x^2-4x}\,dx$

**9.** $\displaystyle\int \frac{5x+1}{(2x+1)(x-1)}\,dx$

**10.** $\displaystyle\int \frac{y}{(y+4)(2y-1)}\,dy$

**11.** $\displaystyle\int_0^1 \frac{2}{2x^2+3x+1}\,dx$

**12.** $\displaystyle\int_0^1 \frac{x-4}{x^2-5x+6}\,dx$

**13.** $\displaystyle\int \frac{1}{x(x-a)}\,dx$

**14.** $\displaystyle\int \frac{1}{(x+a)(x+b)}\,dx$

**15.** $\displaystyle\int \frac{x^2}{x-1}\,dx$

**16.** $\displaystyle\int \frac{3t-2}{t+1}\,dt$

**17.** $\displaystyle\int_1^2 \frac{4y^2-7y-12}{y(y+2)(y-3)}\,dy$

**18.** $\displaystyle\int_1^2 \frac{3x^2+6x+2}{x^2+3x+2}\,dx$

**19.** $\displaystyle\int_0^1 \frac{x^2+x+1}{(x+1)^2(x+2)}\,dx$

**20.** $\displaystyle\int_2^3 \frac{x(3-5x)}{(3x-1)(x-1)^2}\,dx$

**21.** $\displaystyle\int \frac{dt}{(t^2-1)^2}$

**22.** $\displaystyle\int \frac{3x^2+12x-20}{x^4-8x^2+16}\,dx$

**23.** $\displaystyle\int \frac{10}{(x-1)(x^2+9)}\,dx$

**24.** $\displaystyle\int \frac{3x^2-x+8}{x^3+4x}\,dx$

**25.** $\displaystyle\int_{-1}^0 \frac{x^3-4x+1}{x^2-3x+2}\,dx$

**26.** $\displaystyle\int_1^2 \frac{x^3+4x^2+x-1}{x^3+x^2}\,dx$

**27.** $\displaystyle\int \frac{4x}{x^3+x^2+x+1}\,dx$

**28.** $\displaystyle\int \frac{x^2+x+1}{(x^2+1)^2}\,dx$

**29.** $\displaystyle\int \frac{x^3+4x+3}{x^4+5x^2+4}\,dx$

**30.** $\displaystyle\int \frac{x^3+6x-2}{x^4+6x^2}\,dx$

**31.** $\displaystyle\int \frac{x+4}{x^2+2x+5}\,dx$

**32.** $\displaystyle\int_0^1 \frac{x}{x^2+4x+13}\,dx$

**33.** $\displaystyle\int \frac{1}{x^3-1}\,dx$

**34.** $\displaystyle\int \frac{x^3-2x^2+2x-5}{x^4+4x^2+3}\,dx$

**35.** $\displaystyle\int_0^1 \frac{x^3+2x}{x^4+4x^2+3}\,dx$

**36.** $\displaystyle\int \frac{x^5+x-1}{x^3+1}\,dx$

**37.** $\displaystyle\int \frac{5x^4+7x^2+x+2}{x(x^2+1)^2}\,dx$

**38.** $\displaystyle\int \frac{x^4+3x^2+1}{x^5+5x^3+5x}\,dx$

**39.** $\displaystyle\int \frac{x^2-3x+7}{(x^2-4x+6)^2}\,dx$

**40.** $\displaystyle\int \frac{x^3+2x^2+3x-2}{(x^2+2x+2)^2}\,dx$

**41–56** Make a substitution to express the integrand as a rational function and then evaluate the integral.

**41.** $\displaystyle\int \frac{dx}{x\sqrt{x-1}}$

**42.** $\displaystyle\int \frac{dx}{2\sqrt{x+3}+x}$

**43.** $\displaystyle\int \frac{dx}{x^2+x\sqrt{x}}$

**44.** $\displaystyle\int_0^1 \frac{1}{1+\sqrt[3]{x}}\,dx$

**45.** $\displaystyle\int \frac{x^3}{\sqrt[3]{x^2+1}}\,dx$

**46.** $\displaystyle\int \frac{dx}{(1+\sqrt{x})^2}$

**47.** $\displaystyle\int \frac{1}{\sqrt{x}-\sqrt[3]{x}}\,dx$ [*Hint:* Substitute $u=\sqrt[6]{x}$.]

**48.** $\displaystyle\int \frac{1}{x-x^{1/5}}\,dx$

**49.** $\displaystyle\int \frac{1}{x-3\sqrt{x}+2}\,dx$

**50.** $\displaystyle\int \frac{\sqrt{1+\sqrt{x}}}{x}\,dx$

**51.** $\displaystyle\int \frac{e^{2x}}{e^{2x}+3e^x+2}\,dx$

**52.** $\displaystyle\int \frac{\sin x}{\cos^2 x-3\cos x}\,dx$

**53.** $\displaystyle\int \frac{\sec^2 t}{\tan^2 t+3\tan t+2}\,dt$

**54.** $\displaystyle\int \frac{e^x}{(e^x-2)(e^{2x}+1)}\,dx$

**55.** $\displaystyle\int \frac{dx}{1+e^x}$

**56.** $\displaystyle\int \frac{\cosh t}{\sinh^2 t+\sinh^4 t}\,dt$

**57–58** Use integration by parts, together with the techniques of this section, to evaluate the integral.

**57.** $\displaystyle\int \ln(x^2-x+2)\,dx$

**58.** $\displaystyle\int x\tan^{-1}x\,dx$

**59.** Use a graph of $f(x)=1/(x^2-2x-3)$ to decide whether $\int_0^2 f(x)\,dx$ is positive or negative. Use the graph to give a rough estimate of the value of the integral and then use partial fractions to find the exact value.

**60.** Evaluate

$$\int \frac{1}{x^2 + k}\, dx$$

by considering several cases for the constant $k$.

**61–62** Evaluate the integral by completing the square and using Formula 6.

**61.** $\displaystyle\int \frac{dx}{x^2 - 2x}$ **62.** $\displaystyle\int \frac{2x + 1}{4x^2 + 12x - 7}\, dx$

---

**63. Weierstrass Substitution** The German mathematician Karl Weierstrass (1815–1897) noticed that the substitution $t = \tan(x/2)$ will convert any rational function of $\sin x$ and $\cos x$ into an ordinary rational function of $t$.

(a) If $t = \tan(x/2)$, $-\pi < x < \pi$, sketch a right triangle or use trigonometric identities to show that

$$\cos\frac{x}{2} = \frac{1}{\sqrt{1 + t^2}} \quad\text{and}\quad \sin\frac{x}{2} = \frac{t}{\sqrt{1 + t^2}}$$

(b) Show that

$$\cos x = \frac{1 - t^2}{1 + t^2} \quad\text{and}\quad \sin x = \frac{2t}{1 + t^2}$$

(c) Show that $dx = \dfrac{2}{1 + t^2}\, dt$.

**64–67** Use the substitution in Exercise 63 to transform the integrand into a rational function of $t$ and then evaluate the integral.

**64.** $\displaystyle\int \frac{dx}{1 - \cos x}$ **65.** $\displaystyle\int \frac{1}{3\sin x - 4\cos x}\, dx$

**66.** $\displaystyle\int_{\pi/3}^{\pi/2} \frac{1}{1 + \sin x - \cos x}\, dx$ **67.** $\displaystyle\int_{0}^{\pi/2} \frac{\sin 2x}{2 + \cos x}\, dx$

---

**68–69** Find the area of the region under the given curve from 1 to 2.

**68.** $y = \dfrac{1}{x^3 + x}$ **69.** $y = \dfrac{x^2 + 1}{3x - x^2}$

---

**70.** Find the volume of the resulting solid if the region under the curve

$$y = \frac{1}{x^2 + 3x + 2}$$

from $x = 0$ to $x = 1$ is rotated about (a) the $x$-axis and (b) the $y$-axis.

**71.** One method of slowing the growth of an insect population without using pesticides is to introduce into the population a number of sterile males that mate with fertile females but produce no offspring. (The photo shows a screw-worm fly, the first pest effectively eliminated from a region by this method.) Let $P$ represent the number of female insects in a population and $S$ the number of sterile males introduced each generation. Let $r$ be the per capita rate of production of females by females, provided their chosen mate is not sterile. Then the female population is related to time $t$ by

$$t = \int \frac{P + S}{P[(r - 1)P - S]}\, dP$$

Suppose an insect population with 10,000 females grows at a rate of $r = 1.1$ and 900 sterile males are added initially. Evaluate the integral to give an equation relating the female population to time. (Note that the resulting equation can't be solved explicitly for $P$.)

USDA

**72.** Factor $x^4 + 1$ as a difference of squares by first adding and subtracting the same quantity. Use this factorization to evaluate $\int 1/(x^4 + 1)\, dx$.

T **73.** (a) Use a computer algebra system to find the partial fraction decomposition of the function

$$f(x) = \frac{4x^3 - 27x^2 + 5x - 32}{30x^5 - 13x^4 + 50x^3 - 286x^2 - 299x - 70}$$

(b) Use part (a) to find $\int f(x)\, dx$ (by hand) and compare with the result of using the CAS to integrate $f$ directly. Comment on any discrepancy.

T **74.** (a) Use a computer algebra system to find the partial fraction decomposition of the function

$$f(x) = \frac{12x^5 - 7x^3 - 13x^2 + 8}{100x^6 - 80x^5 + 116x^4 - 80x^3 + 41x^2 - 20x + 4}$$

(b) Use part (a) to find $\int f(x)\, dx$ and graph $f$ and its indefinite integral on the same screen.

(c) Use the graph of $f$ to discover the main features of the graph of $\int f(x)\, dx$.

**75.** Suppose that $F$, $G$, and $Q$ are polynomials and

$$\frac{F(x)}{Q(x)} = \frac{G(x)}{Q(x)}$$

for all $x$ except when $Q(x) = 0$. Prove that $F(x) = G(x)$ for all $x$. [*Hint:* Use continuity.]

**76.** (a) Use integration by parts to show that, for any positive integer $n$,

$$\int \frac{dx}{(x^2 + a^2)^n} = \frac{x}{2a^2(n - 1)(x^2 + a^2)^{n-1}} + \frac{2n - 3}{2a^2(n - 1)} \int \frac{dx}{(x^2 + a^2)^{n-1}}$$

(b) Use part (a) to evaluate

$$\int \frac{dx}{(x^2+1)^2} \qquad \text{and} \qquad \int \frac{dx}{(x^2+1)^3}$$

**77.** If $a \neq 0$ and $n$ is a positive integer, find the partial fraction decomposition of $f(x) = 1/(x^n(x-a))$. [*Hint:* First find the coefficient of $1/(x-a)$. Then subtract the resulting term and simplify what is left.]

**78.** If $f$ is a quadratic function such that $f(0) = 1$ and

$$\int \frac{f(x)}{x^2(x+1)^3}\,dx$$

is a rational function, find the value of $f'(0)$.

## 7.5 Strategy for Integration

As we have seen, integration is more challenging than differentiation. In finding the derivative of a function it is obvious which differentiation formula we should apply. But it may not be obvious which technique we should use to integrate a given function.

### Guidelines for Integration

Until now individual techniques have been applied in each section. For instance, we usually used substitution in Exercises 4.5, integration by parts in Exercises 7.1, and partial fractions in Exercises 7.4. But in this section we present a collection of miscellaneous integrals in random order and the main challenge is to recognize which technique or formula to use. No hard and fast rules can be given as to which method applies in a given situation, but we give some general guidelines that you may find useful.

A prerequisite for applying a strategy is a knowledge of the basic integration formulas. In the following table we have collected the integrals from our previous list together with several additional formulas that we have learned in this chapter.

**Table of Integration Formulas** Constants of integration have been omitted.

**1.** $\displaystyle\int x^n\,dx = \frac{x^{n+1}}{n+1} \quad (n \neq -1)$

**2.** $\displaystyle\int \frac{1}{x}\,dx = \ln|x|$

**3.** $\displaystyle\int e^x\,dx = e^x$

**4.** $\displaystyle\int b^x\,dx = \frac{b^x}{\ln b}$

**5.** $\displaystyle\int \sin x\,dx = -\cos x$

**6.** $\displaystyle\int \cos x\,dx = \sin x$

**7.** $\displaystyle\int \sec^2 x\,dx = \tan x$

**8.** $\displaystyle\int \csc^2 x\,dx = -\cot x$

**9.** $\displaystyle\int \sec x \tan x\,dx = \sec x$

**10.** $\displaystyle\int \csc x \cot x\,dx = -\csc x$

**11.** $\displaystyle\int \sec x\,dx = \ln|\sec x + \tan x|$

**12.** $\displaystyle\int \csc x\,dx = \ln|\csc x - \cot x|$

**13.** $\displaystyle\int \tan x\,dx = \ln|\sec x|$

**14.** $\displaystyle\int \cot x\,dx = \ln|\sin x|$

**15.** $\displaystyle\int \sinh x\,dx = \cosh x$

**16.** $\displaystyle\int \cosh x\,dx = \sinh x$

**17.** $\displaystyle\int \frac{dx}{x^2+a^2} = \frac{1}{a}\tan^{-1}\left(\frac{x}{a}\right)$

**18.** $\displaystyle\int \frac{dx}{\sqrt{a^2-x^2}} = \sin^{-1}\left(\frac{x}{a}\right), \quad a > 0$

***19.** $\displaystyle\int \frac{dx}{x^2-a^2} = \frac{1}{2a}\ln\left|\frac{x-a}{x+a}\right|$

***20.** $\displaystyle\int \frac{dx}{\sqrt{x^2 \pm a^2}} = \ln\left|x + \sqrt{x^2 \pm a^2}\right|$

Most of these formulas should be memorized. It is useful to know them all, but the ones marked with an asterisk need not be memorized since they are easily derived. Formula 19 can be avoided by using partial fractions, and trigonometric substitutions can be used in place of Formula 20.

Once you are armed with these basic integration formulas, if you don't immediately see how to attack a given integral, you might try the following four-step strategy.

1. **Simplify the Integrand If Possible** Sometimes the use of algebraic manipulation or trigonometric identities will simplify the integrand and make the method of integration obvious. Here are some examples:

$$\int \sqrt{x}\,(1 + \sqrt{x})\,dx = \int (\sqrt{x} + x)\,dx$$

$$\begin{aligned}\int \frac{\tan\theta}{\sec^2\theta}\,d\theta &= \int \frac{\sin\theta}{\cos\theta}\cos^2\theta\,d\theta \\ &= \int \sin\theta\,\cos\theta\,d\theta = \tfrac{1}{2}\int \sin 2\theta\,d\theta\end{aligned}$$

$$\begin{aligned}\int (\sin x + \cos x)^2\,dx &= \int (\sin^2 x + 2\sin x\cos x + \cos^2 x)\,dx \\ &= \int (1 + 2\sin x\cos x)\,dx\end{aligned}$$

2. **Look for an Obvious Substitution** Try to find some function $u = g(x)$ in the integrand whose differential $du = g'(x)\,dx$ also occurs, apart from a constant factor. For instance, in the integral

$$\int \frac{x}{x^2 - 1}\,dx$$

we notice that if $u = x^2 - 1$, then $du = 2x\,dx$. Therefore we use the substitution $u = x^2 - 1$ instead of the method of partial fractions.

3. **Classify the Integrand According to Its Form** If Steps 1 and 2 have not led to the solution, then we take a look at the form of the integrand $f(x)$.
   (a) *Trigonometric functions.* If $f(x)$ is a product of powers of $\sin x$ and $\cos x$, of $\tan x$ and $\sec x$, or of $\cot x$ and $\csc x$, then we use the substitutions recommended in Section 7.2.
   (b) *Rational functions.* If $f$ is a rational function, we use the procedure of Section 7.4 involving partial fractions.
   (c) *Integration by parts.* If $f(x)$ is a product of a power of $x$ (or a polynomial) and a transcendental function (such as a trigonometric, exponential, or logarithmic function), then we try integration by parts, choosing $u$ and $dv$ according to the advice given in Section 7.1. If you look at the functions in Exercises 7.1, you will see that most of them are the type just described.
   (d) *Radicals.* Particular kinds of substitutions are recommended when certain radicals appear.
      (i) If $\sqrt{x^2 + a^2}$, $\sqrt{x^2 - a^2}$, or $\sqrt{a^2 - x^2}$ occurs, we use a trigonometric substitution according to the table in Section 7.3.
      (ii) If $\sqrt[n]{ax + b}$ occurs, we use the rationalizing substitution $u = \sqrt[n]{ax + b}$. More generally, this sometimes works for $\sqrt[n]{g(x)}$.

Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

4. **Try Again** If the first three steps have not produced the answer, remember that there are basically only two methods of integration: substitution and parts.

   (a) *Try substitution.* Even if no substitution is obvious (Step 2), some inspiration or ingenuity (or even desperation) may suggest an appropriate substitution.

   (b) *Try parts.* Although integration by parts is used most of the time on products of the form described in Step 3(c), it is sometimes effective on single functions. Looking at Section 7.1, we see that it works on $\tan^{-1}x$, $\sin^{-1}x$, and $\ln x$, and these are all inverse functions.

   (c) *Manipulate the integrand.* Algebraic manipulations (perhaps rationalizing the denominator or using trigonometric identities) may be useful in transforming the integral into an easier form. These manipulations may be more substantial than in Step 1 and may involve some ingenuity. Here is an example:

$$\int \frac{dx}{1-\cos x} = \int \frac{1}{1-\cos x}\cdot\frac{1+\cos x}{1+\cos x}\,dx = \int \frac{1+\cos x}{1-\cos^2 x}\,dx$$

$$= \int \frac{1+\cos x}{\sin^2 x}\,dx = \int \left(\csc^2 x + \frac{\cos x}{\sin^2 x}\right) dx$$

   (d) *Relate the problem to previous problems.* When you have built up some experience in integration, you may be able to use a method on a given integral that is similar to a method you have already used on a previous integral. Or you may even be able to express the given integral in terms of a previous one. For instance, $\int \tan^2 x \sec x\,dx$ is a challenging integral, but if we make use of the identity $\tan^2 x = \sec^2 x - 1$, we can write

$$\int \tan^2 x \sec x\,dx = \int \sec^3 x\,dx - \int \sec x\,dx$$

   and if $\int \sec^3 x\,dx$ has previously been evaluated (see Example 7.2.8), then that calculation can be used in the present problem.

   (e) *Use several methods.* Sometimes two or three methods are required to evaluate an integral. The evaluation could involve several successive substitutions of different types, or it might combine integration by parts with one or more substitutions.

In the following examples we indicate a method of attack but do not fully work out the integral.

**EXAMPLE 1** $\displaystyle\int \frac{\tan^3 x}{\cos^3 x}\,dx$

In Step 1 we rewrite the integral:

$$\int \frac{\tan^3 x}{\cos^3 x}\,dx = \int \tan^3 x \sec^3 x\,dx$$

The integral is now of the form $\int \tan^m x \sec^n x\,dx$ with $m$ odd, so we can use the advice in Section 7.2.

Alternatively, if in Step 1 we had written

$$\int \frac{\tan^3 x}{\cos^3 x}\,dx = \int \frac{\sin^3 x}{\cos^3 x}\,\frac{1}{\cos^3 x}\,dx = \int \frac{\sin^3 x}{\cos^6 x}\,dx$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

then we could have continued as follows with the substitution $u = \cos x$:

$$\int \frac{\sin^3 x}{\cos^6 x}\,dx = \int \frac{1 - \cos^2 x}{\cos^6 x}\sin x\,dx = \int \frac{1 - u^2}{u^6}(-du)$$
$$= \int \frac{u^2 - 1}{u^6}\,du = \int (u^{-4} - u^{-6})\,du \qquad ■$$

**EXAMPLE 2** $\int \sin\sqrt{x}\,dx$

According to (ii) in Step 3(d), we substitute $u = \sqrt{x}$. Then $x = u^2$, so $dx = 2u\,du$ and

$$\int \sin\sqrt{x}\,dx = 2\int u \sin u\,du$$

The integrand is now a product of $u$ and the trigonometric function $\sin u$ so it can be integrated by parts. ■

**EXAMPLE 3** $\int \frac{x^5 + 1}{x^3 - 3x^2 - 10x}\,dx$

No algebraic simplification or substitution is obvious, so Steps 1 and 2 don't apply here. The integrand is a rational function so we apply the procedure of Section 7.4, remembering that the first step is to divide. ■

**EXAMPLE 4** $\int \frac{dx}{x\sqrt{\ln x}}$

Here Step 2 is all that is needed. We substitute $u = \ln x$ because its differential is $du = dx/x$, which occurs in the integral. ■

**EXAMPLE 5** $\int \sqrt{\frac{1 - x}{1 + x}}\,dx$

Although the rationalizing substitution

$$u = \sqrt{\frac{1 - x}{1 + x}}$$

works here [(ii) in Step 3(d)], it leads to a very complicated rational function. An easier method is to do some algebraic manipulation [either as Step 1 or as Step 4(c)]. Multiplying numerator and denominator by $\sqrt{1 - x}$, we have

$$\int \sqrt{\frac{1 - x}{1 + x}}\,dx = \int \frac{1 - x}{\sqrt{1 - x^2}}\,dx$$
$$= \int \frac{1}{\sqrt{1 - x^2}}\,dx - \int \frac{x}{\sqrt{1 - x^2}}\,dx$$
$$= \sin^{-1}x + \sqrt{1 - x^2} + C \qquad ■$$

## ■ Can We Integrate All Continuous Functions?

The question arises: will our strategy for integration enable us to find the integral of every continuous function? For example, can we use it to evaluate $\int e^{x^2}\,dx$? The answer is no, at least not in terms of the functions that we are familiar with.

The functions that we have been dealing with in this book are called **elementary functions**. These are the polynomials, rational functions, power functions ($x^n$), exponential functions ($b^x$), logarithmic functions, trigonometric and inverse trigonometric functions, hyperbolic and inverse hyperbolic functions, and all functions that can be obtained from these by the five operations of addition, subtraction, multiplication, division, and composition. For instance, the function

$$f(x) = \sqrt{\frac{x^2 - 1}{x^3 + 2x - 1}} + \ln(\cosh x) - xe^{\sin 2x}$$

is an elementary function.

If $f$ is an elementary function, then $f'$ is an elementary function but $\int f(x)\,dx$ need not be an elementary function. Consider $f(x) = e^{x^2}$. Since $f$ is continuous, its integral exists, and if we define the function $F$ by

$$F(x) = \int_0^x e^{t^2}\,dt$$

then we know from Part 1 of the Fundamental Theorem of Calculus that

$$F'(x) = e^{x^2}$$

Thus $f(x) = e^{x^2}$ has an antiderivative $F$, but it has been proved that $F$ is not an elementary function. This means that no matter how hard we try, we will never succeed in evaluating $\int e^{x^2}\,dx$ in terms of the functions we know. (In Chapter 11, however, we will see how to express $\int e^{x^2}\,dx$ as an infinite series.) The same can be said of the following integrals:

$$\int \frac{e^x}{x}\,dx \qquad \int \sin(x^2)\,dx \qquad \int \cos(e^x)\,dx$$

$$\int \sqrt{x^3 + 1}\,dx \qquad \int \frac{1}{\ln x}\,dx \qquad \int \frac{\sin x}{x}\,dx$$

In fact, the majority of elementary functions don't have elementary antiderivatives. You may be assured, though, that the integrals in the following exercises are all elementary functions.

## 7.5 Exercises

**1–8** Three integrals are given that, although they look similar, may require different techniques of integration. Evaluate the integrals.

**1.** (a) $\int \frac{x}{1 + x^2}\,dx$ (b) $\int \frac{1}{1 + x^2}\,dx$

(c) $\int \frac{1}{1 - x^2}\,dx$

**2.** (a) $\int x\sqrt{x^2 - 1}\,dx$ (b) $\int \frac{1}{x\sqrt{x^2 - 1}}\,dx$

(c) $\int \frac{\sqrt{x^2 - 1}}{x}\,dx$

**3.** (a) $\int \frac{\ln x}{x}\,dx$ (b) $\int \ln(2x)\,dx$

(c) $\int x \ln x\,dx$

**4.** (a) $\int \sin^2 x\,dx$ (b) $\int \sin^3 x\,dx$

(c) $\int \sin 2x\,dx$

**5.** (a) $\int \frac{1}{x^2 - 4x + 3}\,dx$ (b) $\int \frac{1}{x^2 - 4x + 4}\,dx$

(c) $\int \frac{1}{x^2 - 4x + 5}\,dx$

**6.** (a) $\int x \cos x^2\,dx$ (b) $\int x \cos^2 x\,dx$

(c) $\int x^2 \cos x\,dx$

**7.** (a) $\int x^2 e^{x^3}\,dx$ (b) $\int x^2 e^x\,dx$

(c) $\int x^3 e^{x^2}\,dx$

**8.** (a) $\int e^x \sqrt{e^x - 1}\,dx$ (b) $\int \dfrac{e^x}{\sqrt{1 - e^{2x}}}\,dx$

(c) $\int \dfrac{1}{\sqrt{e^x - 1}}\,dx$

---

**9–93** Evaluate the integral.

**9.** $\int \dfrac{\cos x}{1 - \sin x}\,dx$

**10.** $\int_0^1 (3x + 1)^{\sqrt{2}}\,dx$

**11.** $\int_1^4 \sqrt{y}\,\ln y\,dy$

**12.** $\int \dfrac{e^{\arcsin x}}{\sqrt{1 - x^2}}\,dx$

**13.** $\int \dfrac{\ln(\ln y)}{y}\,dy$

**14.** $\int_0^1 \dfrac{x}{(2x + 1)^3}\,dx$

**15.** $\int \dfrac{x}{x^4 + 9}\,dx$

**16.** $\int t \sin t\,\cos t\,dt$

**17.** $\int_2^4 \dfrac{x + 2}{x^2 + 3x - 4}\,dx$

**18.** $\int \dfrac{\cos(1/x)}{x^3}\,dx$

**19.** $\int \dfrac{1}{x^3\sqrt{x^2 - 1}}\,dx$

**20.** $\int \dfrac{2x - 3}{x^3 + 3x}\,dx$

**21.** $\int \dfrac{\cos^3 x}{\csc x}\,dx$

**22.** $\int \ln(1 + x^2)\,dx$

**23.** $\int x \sec x \tan x\,dx$

**24.** $\int_0^{\sqrt{2}/2} \dfrac{x^2}{\sqrt{1 - x^2}}\,dx$

**25.** $\int_0^{\pi} t \cos^2 t\,dt$

**26.** $\int_1^4 \dfrac{e^{\sqrt{t}}}{\sqrt{t}}\,dt$

**27.** $\int e^{x + e^x}\,dx$

**28.** $\int \dfrac{e^x}{1 + e^{2a}}\,dx$

**29.** $\int \arctan\sqrt{x}\,dx$

**30.** $\int \dfrac{\ln x}{x\sqrt{1 + (\ln x)^2}}\,dx$

**31.** $\int_0^1 (1 + \sqrt{x})^8\,dx$

**32.** $\int (1 + \tan x)^2 \sec x\,dx$

**33.** $\int_0^1 \dfrac{1 + 12t}{1 + 3t}\,dt$

**34.** $\int_0^1 \dfrac{3x^2 + 1}{x^3 + x^2 + x + 1}\,dx$

**35.** $\int \dfrac{dx}{1 + e^x}$

**36.** $\int \sin\sqrt{at}\,dt$

**37.** $\int \ln\left(x + \sqrt{x^2 - 1}\right)dx$

**38.** $\int_{-1}^{2} |e^x - 1|\,dx$

**39.** $\int \sqrt{\dfrac{1 + x}{1 - x}}\,dx$

**40.** $\int_1^3 \dfrac{e^{3/x}}{x^2}\,dx$

**41.** $\int \sqrt{3 - 2x - x^2}\,dx$

**42.** $\int_{\pi/4}^{\pi/2} \dfrac{1 + 4\cot x}{4 - \cot x}\,dx$

**43.** $\int_{-\pi/2}^{\pi/2} \dfrac{x}{1 + \cos^2 x}\,dx$

**44.** $\int \dfrac{1 + \sin x}{1 + \cos x}\,dx$

**45.** $\int_0^{\pi/4} \tan^3\theta\,\sec^2\theta\,d\theta$

**46.** $\int_{\pi/6}^{\pi/3} \dfrac{\sin\theta\,\cot\theta}{\sec\theta}\,d\theta$

**47.** $\int \dfrac{\sec\theta\,\tan\theta}{\sec^2\theta - \sec\theta}\,d\theta$

**48.** $\int_0^{\pi} \sin 6x \cos 3x\,dx$

**49.** $\int \theta \tan^2\theta\,d\theta$

**50.** $\int \dfrac{1}{x\sqrt{x - 1}}\,dx$

**51.** $\int \dfrac{\sqrt{x}}{1 + x^3}\,dx$

**52.** $\int \sqrt{1 + e^x}\,dx$

**53.** $\int \dfrac{x}{1 + \sqrt{x}}\,dx$

**54.** $\int \dfrac{(x - 1)e^x}{x^2}\,dx$

**55.** $\int x^3 (x - 1)^{-4}\,dx$

**56.** $\int_0^1 x\sqrt{2 - \sqrt{1 - x^2}}\,dx$

**57.** $\int \dfrac{1}{x\sqrt{4x + 1}}\,dx$

**58.** $\int \dfrac{1}{x^2\sqrt{4x + 1}}\,dx$

**59.** $\int \dfrac{1}{x\sqrt{4x^2 + 1}}\,dx$

**60.** $\int \dfrac{dx}{x(x^4 + 1)}$

**61.** $\int x^2 \sinh mx\,dx$

**62.** $\int (x + \sin x)^2\,dx$

**63.** $\int \dfrac{dx}{x + x\sqrt{x}}$

**64.** $\int \dfrac{dx}{\sqrt{x} + x\sqrt{x}}$

**65.** $\int x\sqrt[3]{x + c}\,dx$

**66.** $\int \dfrac{x \ln x}{\sqrt{x^2 - 1}}\,dx$

**67.** $\int \dfrac{dx}{x^4 - 16}$

**68.** $\int \dfrac{dx}{x^2\sqrt{4x^2 - 1}}$

**69.** $\int \dfrac{d\theta}{1 + \cos\theta}$

**70.** $\int \dfrac{d\theta}{1 + \cos^2\theta}$

**71.** $\int \sqrt{x}\,e^{\sqrt{x}}\,dx$

**72.** $\int \dfrac{1}{\sqrt{\sqrt{x} + 1}}\,dx$

**73.** $\displaystyle\int \frac{\sin 2x}{1 + \cos^4 x}\,dx$

**74.** $\displaystyle\int_{\pi/4}^{\pi/3} \frac{\ln(\tan x)}{\sin x \cos x}\,dx$

**75.** $\displaystyle\int \frac{1}{\sqrt{x+1} + \sqrt{x}}\,dx$

**76.** $\displaystyle\int \frac{x^2}{x^6 + 3x^3 + 2}\,dx$

**77.** $\displaystyle\int_1^{\sqrt{3}} \frac{\sqrt{1 + x^2}}{x^2}\,dx$

**78.** $\displaystyle\int \frac{1}{1 + 2e^x - e^{-x}}\,dx$

**79.** $\displaystyle\int \frac{e^{2x}}{1 + e^x}\,dx$

**80.** $\displaystyle\int \frac{\ln(x+1)}{x^2}\,dx$

**81.** $\displaystyle\int \frac{x + \arcsin x}{\sqrt{1 - x^2}}\,dx$

**82.** $\displaystyle\int \frac{4^x + 10^x}{2^x}\,dx$

**83.** $\displaystyle\int \frac{dx}{x \ln x - x}$

**84.** $\displaystyle\int \frac{x^2}{\sqrt{x^2 + 1}}\,dx$

**85.** $\displaystyle\int \frac{xe^x}{\sqrt{1 + e^x}}\,dx$

**86.** $\displaystyle\int \frac{1 + \sin x}{1 - \sin x}\,dx$

**87.** $\displaystyle\int x \sin^2 x \cos x\,dx$

**88.** $\displaystyle\int \frac{\sec x \cos 2x}{\sin x + \sec x}\,dx$

**89.** $\displaystyle\int \sqrt{1 - \sin x}\,dx$

**90.** $\displaystyle\int \frac{\sin x \cos x}{\sin^4 x + \cos^4 x}\,dx$

**91.** $\displaystyle\int_1^3 \left( \sqrt{\frac{9 - x}{x}} - \sqrt{\frac{x}{9 - x}} \right) dx$

**92.** $\displaystyle\int \frac{1}{(\sin x + \cos x)^2}\,dx$

**93.** $\displaystyle\int_0^{\pi/6} \sqrt{1 + \sin 2\theta}\,d\theta$

---

**94.** We know that $F(x) = \int_0^x e^{e^t}\,dt$ is a continuous function by FTC1, though it is not an elementary function. The functions

$$\int \frac{e^x}{x}\,dx \qquad \text{and} \qquad \int \frac{1}{\ln x}\,dx$$

are not elementary either, but they can be expressed in terms of $F$. Evaluate the following integrals in terms of $F$.

(a) $\displaystyle\int_1^2 \frac{e^x}{x}\,dx$ (b) $\displaystyle\int_2^3 \frac{1}{\ln x}\,dx$

**95.** The functions $y = e^{x^2}$ and $y = x^2 e^{x^2}$ don't have elementary antiderivatives, but $y = (2x^2 + 1)e^{x^2}$ does. Evaluate $\int (2x^2 + 1)e^{x^2}\,dx$.

## 7.6 Integration Using Tables and Technology

In this section we describe how to use tables and mathematical software to integrate functions that have elementary antiderivatives. You should bear in mind, though, that even the most powerful computer software can't find explicit formulas for the antiderivatives of functions like $e^{x^2}$ or the other functions described at the end of Section 7.5.

### Tables of Integrals

Tables of indefinite integrals are very useful when we are confronted by an integral that is difficult to evaluate by hand. In some cases, the results obtained are of a simpler form than those given by a computer. A relatively brief table of 120 integrals, categorized by form, is provided on Reference Pages 6–10 at the back of the book. More extensive tables, containing hundreds or thousands of entries, are available in separate publications or on the Internet. When using such tables, remember that integrals do not often occur in exactly the form listed. Usually we need to use the Substitution Rule or algebraic manipulation to transform a given integral into one of the forms in the table.

**EXAMPLE 1** The region bounded by the curves $y = \arctan x$, $y = 0$, and $x = 1$ is rotated about the $y$-axis. Find the volume of the resulting solid.

**SOLUTION** Using the method of cylindrical shells, we see that the volume is

$$V = \int_0^1 2\pi x \arctan x\,dx$$

The Table of Integrals appears on Reference Pages 6–10 at the back of the book.

In the section of the Table of Integrals titled *Inverse Trigonometric Forms* we locate Formula 92:

$$\int u\tan^{-1}u\,du = \frac{u^2+1}{2}\tan^{-1}u - \frac{u}{2} + C$$

So the volume is

$$\begin{aligned} V &= 2\pi\int_0^1 x\tan^{-1}x\,dx = 2\pi\left[\frac{x^2+1}{2}\tan^{-1}x - \frac{x}{2}\right]_0^1 \\ &= \pi\Big[(x^2+1)\tan^{-1}x - x\Big]_0^1 = \pi(2\tan^{-1}1 - 1) \\ &= \pi[2(\pi/4) - 1] = \tfrac{1}{2}\pi^2 - \pi \end{aligned}$$ ■

**EXAMPLE 2** Use the Table of Integrals to find $\displaystyle\int \frac{x^2}{\sqrt{5-4x^2}}\,dx$.

**SOLUTION** If we look at the section of the table titled *Forms Involving* $\sqrt{a^2-u^2}$, we see that the closest entry is Formula 34:

$$\int \frac{u^2}{\sqrt{a^2-u^2}}\,du = -\frac{u}{2}\sqrt{a^2-u^2} + \frac{a^2}{2}\sin^{-1}\left(\frac{u}{a}\right) + C$$

Remember that when we make the substitution $u = 2x$ (so $x = u/2$), we must also substitute $du = 2\,dx$ (so $dx = du/2$).

This is not exactly what we have, but we will be able to use it if we first make the substitution $u = 2x$:

$$\int \frac{x^2}{\sqrt{5-4x^2}}\,dx = \int \frac{(u/2)^2}{\sqrt{5-u^2}}\,\frac{du}{2} = \frac{1}{8}\int \frac{u^2}{\sqrt{5-u^2}}\,du$$

Then we use Formula 34 with $a^2 = 5$ (so $a = \sqrt{5}$):

$$\begin{aligned} \int \frac{x^2}{\sqrt{5-4x^2}}\,dx &= \frac{1}{8}\int \frac{u^2}{\sqrt{5-u^2}}\,du = \frac{1}{8}\left(-\frac{u}{2}\sqrt{5-u^2} + \frac{5}{2}\sin^{-1}\frac{u}{\sqrt{5}}\right) + C \\ &= -\frac{x}{8}\sqrt{5-4x^2} + \frac{5}{16}\sin^{-1}\left(\frac{2x}{\sqrt{5}}\right) + C \end{aligned}$$ ■

**EXAMPLE 3** Use the Table of Integrals to evaluate $\displaystyle\int x^3\sin x\,dx$.

**SOLUTION** If we look in the section called *Trigonometric Forms*, we see that none of the entries explicitly includes a $u^3$ factor. However, we can use the reduction formula in entry 84 with $n = 3$:

$$\int x^3\sin x\,dx = -x^3\cos x + 3\int x^2\cos x\,dx$$

**85.** $\displaystyle\int u^n\cos u\,du = u^n\sin u - n\int u^{n-1}\sin u\,du$

We now need to evaluate $\int x^2\cos x\,dx$. We can use the reduction formula in entry 85 with $n = 2$, followed by Formula 82:

$$\begin{aligned} \int x^2\cos x\,dx &= x^2\sin x - 2\int x\sin x\,dx \\ &= x^2\sin x - 2(\sin x - x\cos x) + K \end{aligned}$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

Combining these results, we get

$$\int x^3 \sin x\, dx = -x^3 \cos x + 3x^2 \sin x + 6x \cos x - 6 \sin x + C$$

where $C = 3K$. ■

**EXAMPLE 4** Use the Table of Integrals to find $\int x\sqrt{x^2 + 2x + 4}\, dx$.

**SOLUTION** Since the table gives forms involving $\sqrt{a^2 + x^2}$, $\sqrt{a^2 - x^2}$, and $\sqrt{x^2 - a^2}$, but not $\sqrt{ax^2 + bx + c}$, we first complete the square:

$$x^2 + 2x + 4 = (x + 1)^2 + 3$$

If we make the substitution $u = x + 1$ (so $x = u - 1$), the integrand will involve the pattern $\sqrt{a^2 + u^2}$:

$$\begin{aligned}\int x\sqrt{x^2 + 2x + 4}\, dx &= \int (u - 1)\sqrt{u^2 + 3}\, du \\ &= \int u\sqrt{u^2 + 3}\, du - \int \sqrt{u^2 + 3}\, du\end{aligned}$$

The first integral is evaluated using the substitution $t = u^2 + 3$:

$$\int u\sqrt{u^2 + 3}\, du = \tfrac{1}{2}\int \sqrt{t}\, dt = \tfrac{1}{2} \cdot \tfrac{2}{3} t^{3/2} = \tfrac{1}{3}(u^2 + 3)^{3/2}$$

**21.** $\displaystyle\int \sqrt{a^2 + u^2}\, du = \frac{u}{2}\sqrt{a^2 + u^2} + \frac{a^2}{2}\ln\left(u + \sqrt{a^2 + u^2}\right) + C$

For the second integral we use Formula 21 with $a = \sqrt{3}$:

$$\int \sqrt{u^2 + 3}\, du = \frac{u}{2}\sqrt{u^2 + 3} + \tfrac{3}{2}\ln\left(u + \sqrt{u^2 + 3}\right)$$

Therefore

$$\begin{aligned}&\int x\sqrt{x^2 + 2x + 4}\, dx \\ &= \tfrac{1}{3}(x^2 + 2x + 4)^{3/2} - \frac{x + 1}{2}\sqrt{x^2 + 2x + 4} - \tfrac{3}{2}\ln\left(x + 1 + \sqrt{x^2 + 2x + 4}\right) + C\end{aligned}$$

■

## Integration Using Technology

We have seen that the use of tables involves matching the form of the given integrand with the forms of the integrands in the tables. Computers are particularly good at matching patterns. And just as we used substitutions in conjunction with tables, a computer algebra system (CAS) or mathematical software with similar capabilities can perform substitutions that transform a given integral into one that occurs in its stored formulas. So it isn't surprising that we have software that excels at integration. That doesn't mean that integration by hand is an obsolete skill. We will see that a hand computation sometimes produces an indefinite integral in a form that is more convenient than a machine answer.

To begin, let's see what happens when we ask a computer to integrate the relatively simple function $y = 1/(3x - 2)$. Using the substitution $u = 3x - 2$, an easy calculation by hand gives

$$\int \frac{1}{3x - 2}\, dx = \tfrac{1}{3}\ln|3x - 2| + C$$

whereas some software packages return the answer

$$\tfrac{1}{3}\ln(3x - 2)$$

The first thing to notice is that the constant of integration is missing. In other words, we were given a *particular* antiderivative, not the most general one. Therefore, when making use of a machine integration, we might have to add a constant. Second, the absolute value signs were not included in the machine answer. That is fine if our problem is concerned only with values of $x$ greater than $\frac{2}{3}$. But if we are interested in other values of $x$, then we need to insert the absolute value symbol.

In the next example we reconsider the integral of Example 4, but this time we use technology to get an answer.

**EXAMPLE 5** Use a computer to find $\int x\sqrt{x^2 + 2x + 4}\,dx$.

**SOLUTION** Different software may respond with different forms of the answer. One computer algebra system gives

$$\tfrac{1}{3}(x^2 + 2x + 4)^{3/2} - \tfrac{1}{4}(2x + 2)\sqrt{x^2 + 2x + 4} - \frac{3}{2}\operatorname{arcsinh}\frac{\sqrt{3}}{3}(1 + x)$$

This looks different from the answer we found in Example 4, but it is equivalent because the third term can be rewritten using the identity

This is equation 6.7.3.

$$\operatorname{arcsinh} x = \ln\left(x + \sqrt{x^2 + 1}\right)$$

Thus

$$\begin{aligned}\operatorname{arcsinh}\frac{\sqrt{3}}{3}(1 + x) &= \ln\left[\frac{\sqrt{3}}{3}(1 + x) + \sqrt{\tfrac{1}{3}(1 + x)^2 + 1}\right]\\ &= \ln\frac{1}{\sqrt{3}}\left[1 + x + \sqrt{(1 + x)^2 + 3}\right]\\ &= \ln\frac{1}{\sqrt{3}} + \ln\left(x + 1 + \sqrt{x^2 + 2x + 4}\right)\end{aligned}$$

The resulting extra term $-\frac{3}{2}\ln\left(1/\sqrt{3}\right)$ can be absorbed into the constant of integration.

Another software package gives the answer

$$\left(\frac{5}{6} + \frac{x}{6} + \frac{x^2}{3}\right)\sqrt{x^2 + 2x + 4} - \frac{3}{2}\sinh^{-1}\left(\frac{1 + x}{\sqrt{3}}\right)$$

Here the first two terms of the answer to Example 4 were combined into a single term by factoring. ■

**EXAMPLE 6** Use a computer to evaluate $\int x(x^2 + 5)^8\,dx$.

**SOLUTION** A computer may give the answer

$$\tfrac{1}{18}x^{18} + \tfrac{5}{2}x^{16} + 50x^{14} + \tfrac{1750}{3}x^{12} + 4375x^{10} + 21875x^8 + \tfrac{218750}{3}x^6 + 156250x^4 + \tfrac{390625}{2}x^2$$

The software must have expanded $(x^2 + 5)^8$ using the Binomial Theorem and then integrated each term.

If we integrate by hand instead, using the substitution $u = x^2 + 5$, we get

$$\int x(x^2 + 5)^8\,dx = \tfrac{1}{18}(x^2 + 5)^9 + C$$

For most purposes, this is a more convenient form of the answer. ■

**EXAMPLE 7** Use a computer to find $\int \sin^5 x \cos^2 x\,dx$.

**SOLUTION** In Example 7.2.2 we found that

$$\boxed{1} \qquad \int \sin^5 x \cos^2 x\,dx = -\tfrac{1}{3}\cos^3 x + \tfrac{2}{5}\cos^5 x - \tfrac{1}{7}\cos^7 x + C$$

Depending on the software used, you may get the answer

$$-\tfrac{1}{7}\sin^4 x \cos^3 x - \tfrac{4}{35}\sin^2 x \cos^3 x - \tfrac{8}{105}\cos^3 x$$

or you might get

$$-\tfrac{5}{64}\cos x - \tfrac{1}{192}\cos 3x + \tfrac{3}{320}\cos 5x - \tfrac{1}{448}\cos 7x$$

We suspect that there are trigonometric identities which show that these three answers are equivalent. In fact, you may be able to use the software to simplify its initial result, using trigonometric identities, to produce the same form of the answer as in Equation 1. ■

## 7.6 Exercises

**1–6** Use the formula in the indicated entry of the Table of Integrals on Reference Pages 6–10 to evaluate the integral.

**1.** $\displaystyle\int_0^{\pi/2} \cos 5x \cos 2x\,dx$; entry 80

**2.** $\displaystyle\int_0^1 \sqrt{x - x^2}\,dx$; entry 113

**3.** $\displaystyle\int x \arcsin(x^2)\,dx$; entry 87

**4.** $\displaystyle\int \frac{\tan\theta}{\sqrt{2 + \cos\theta}}\,d\theta$; entry 57

**5.** $\displaystyle\int \frac{y^5}{\sqrt{4 + y^4}}\,dy$; entry 26

**6.** $\displaystyle\int \frac{\sqrt{t^6 - 5}}{t}\,dt$; entry 41

**7–34** Use the Table of Integrals on the Reference Pages to evaluate the integral.

**7.** $\displaystyle\int_0^{\pi/8} \arctan 2x\,dx$

**8.** $\displaystyle\int_0^2 x^2\sqrt{4 - x^2}\,dx$

**9.** $\displaystyle\int \frac{\cos x}{\sin^2 x - 9}\,dx$

**10.** $\displaystyle\int \frac{e^x}{4 - e^{2x}}\,dx$

**11.** $\displaystyle\int \frac{\sqrt{9x^2 + 4}}{x^2}\,dx$

**12.** $\displaystyle\int \frac{\sqrt{2y^2 - 3}}{y^2}\,dy$

**13.** $\displaystyle\int_0^{\pi} \cos^6\theta\,d\theta$

**14.** $\displaystyle\int x\sqrt{2 + x^4}\,dx$

**15.** $\displaystyle\int \frac{\arctan\sqrt{x}}{\sqrt{x}}\,dx$

**16.** $\displaystyle\int_0^{\pi} x^3 \sin x\,dx$

**17.** $\displaystyle\int \frac{\coth(1/y)}{y^2}\,dy$

**18.** $\displaystyle\int \frac{e^{3t}}{\sqrt{e^{2t} - 1}}\,dt$

**19.** $\displaystyle\int y\sqrt{6 + 4y - 4y^2}\,dy$

**20.** $\displaystyle\int \frac{dx}{2x^3 - 3x^2}$

**21.** $\displaystyle\int \sin^2 x \cos x \ln(\sin x)\,dx$

**22.** $\displaystyle\int \frac{\sin 2\theta}{\sqrt{5 - \sin\theta}}\,d\theta$

**23.** $\displaystyle\int \frac{\sin 2\theta}{\sqrt{\cos^4\theta + 4}}\,d\theta$

**24.** $\displaystyle\int_0^2 x^3\sqrt{4x^2 - x^4}\,dx$

**25.** $\displaystyle\int x^3 e^{2x}\,dx$

**26.** $\displaystyle\int x^3 \arcsin(x^2)\,dx$

**27.** $\int \cos^5 y \, dy$ **28.** $\int \frac{\sqrt{(\ln x)^2 - 9}}{x \ln x} \, dx$

**29.** $\int \frac{\cos^{-1}(x^{-2})}{x^3} \, dx$ **30.** $\int \frac{dx}{\sqrt{1 - e^{2x}}}$

**31.** $\int \sqrt{e^{2x} - 1} \, dx$ **32.** $\int \sin 2\theta \arctan(\sin \theta) \, d\theta$

**33.** $\int \frac{x^4}{\sqrt{x^{10} - 2}} \, dx$ **34.** $\int \frac{\sec^2\theta \tan^2\theta}{\sqrt{9 - \tan^2\theta}} \, d\theta$

**35.** The region under the curve $y = \sin^2 x$ from 0 to $\pi$ is rotated about the $x$-axis. Find the volume of the resulting solid.

**36.** Find the volume of the solid obtained when the region under the curve $y = \arcsin x$, $x \geqslant 0$, is rotated about the $y$-axis.

**37.** Verify Formula 53 in the Table of Integrals (a) by differentiation and (b) by using the substitution $t = a + bu$.

**38.** Verify Formula 31 (a) by differentiation and (b) by substituting $u = a \sin \theta$.

T **39–46** Use a computer to evaluate the integral. Compare the answer with the result of using a table of integrals. If the answers are not the same, show that they are equivalent.

**39.** $\int \sec^4 x \, dx$ **40.** $\int \csc^5 x \, dx$

**41.** $\int x^2 \sqrt{x^2 + 4} \, dx$ **42.** $\int \frac{dx}{e^x(3e^x + 2)}$

**43.** $\int \cos^4 x \, dx$ **44.** $\int x^2 \sqrt{1 - x^2} \, dx$

**45.** $\int \tan^5 x \, dx$ **46.** $\int \frac{1}{\sqrt{1 + \sqrt[3]{x}}} \, dx$

T **47.** (a) Use the table of integrals to evaluate $F(x) = \int f(x) \, dx$, where

$$f(x) = \frac{1}{x\sqrt{1 - x^2}}$$

What is the domain of $f$ and $F$?

(b) Use mathematical software to evaluate $F(x)$. What is the domain of the function $F$ that the software produces? Is there a discrepancy between this domain and the domain of the function $F$ that you found in part (a)?

T **48.** Machines sometimes need a helping hand from human beings. Try using a computer to evaluate

$$\int (1 + \ln x) \sqrt{1 + (x \ln x)^2} \, dx$$

If it doesn't return an answer, make a substitution that changes the integral into one that the machine *can* evaluate.

## DISCOVERY PROJECT T PATTERNS IN INTEGRALS

In this project mathematical software is used to investigate indefinite integrals of families of functions. By observing the patterns that occur in the integrals of several members of the family, you will first guess, and then prove, a general formula for the integral of any member of the family.

**1.** (a) Use a computer to evaluate the following integrals.

(i) $\int \frac{1}{(x + 2)(x + 3)} \, dx$ (ii) $\int \frac{1}{(x + 1)(x + 5)} \, dx$

(iii) $\int \frac{1}{(x + 2)(x - 5)} \, dx$ (iv) $\int \frac{1}{(x + 2)^2} \, dx$

(b) Based on the pattern of your responses in part (a), guess the value of the integral

$$\int \frac{1}{(x + a)(x + b)} \, dx$$

if $a \neq b$. What if $a = b$?

(c) Check your guess by using the software to evaluate the integral in part (b). Then prove it using partial fractions.

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**2.** (a) Use a computer to evaluate the following integrals.

(i) $\int \sin x \cos 2x \, dx$ (ii) $\int \sin 3x \cos 7x \, dx$ (iii) $\int \sin 8x \cos 3x \, dx$

(b) Based on the pattern of your responses in part (a), guess the value of the integral

$$\int \sin ax \cos bx \, dx$$

(c) Check your guess with the computer. Then prove it using the techniques of Section 7.2. For what values of $a$ and $b$ is it valid?

**3.** (a) Use a computer to evaluate the following integrals.

(i) $\int \ln x \, dx$ (ii) $\int x \ln x \, dx$ (iii) $\int x^2 \ln x \, dx$

(iv) $\int x^3 \ln x \, dx$ (v) $\int x^7 \ln x \, dx$

(b) Based on the pattern of your responses in part (a), guess the value of

$$\int x^n \ln x \, dx$$

(c) Use integration by parts to prove the conjecture that you made in part (b). For what values of $n$ is it valid?

**4.** (a) Use a computer to evaluate the following integrals.

(i) $\int xe^x \, dx$ (ii) $\int x^2e^x \, dx$ (iii) $\int x^3e^x \, dx$

(iv) $\int x^4e^x \, dx$ (v) $\int x^5e^x \, dx$

(b) Based on the pattern of your responses in part (a), guess the value of $\int x^6e^x \, dx$. Then use the computer to check your guess.

(c) Based on the patterns in parts (a) and (b), make a conjecture as to the value of the integral

$$\int x^ne^x \, dx$$

when $n$ is a positive integer.

(d) Use mathematical induction to prove the conjecture you made in part (c).

## 7.7 Approximate Integration

There are two situations in which it is impossible to find the exact value of a definite integral.

The first situation arises from the fact that in order to evaluate $\int_a^b f(x) \, dx$ using the Fundamental Theorem of Calculus we need to know an antiderivative of $f$. Sometimes, however, it is difficult, or even impossible, to find an antiderivative (see Section 7.5). For example, it is impossible to evaluate the following integrals exactly:

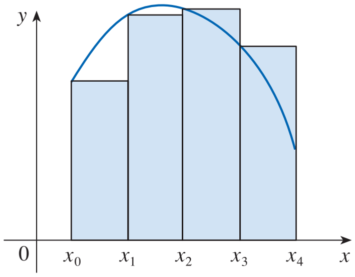
$$\int_0^1 e^{x^2} dx \qquad \int_{-1}^1 \sqrt{1 + x^3} \, dx$$

The second situation arises when the function is determined from a scientific experiment through instrument readings or collected data. There may be no formula for the function (see Example 5).

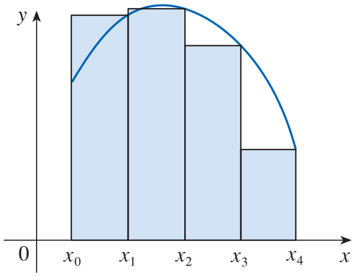
In both cases we need to find approximate values of definite integrals. We already know one such method. Recall that the definite integral is defined as a limit of Riemann sums, so any Riemann sum could be used as an approximation to the integral: if we divide $[a, b]$ into $n$ subintervals of equal length $\Delta x = (b - a)/n$, then we have

$$\int_a^b f(x)\,dx \approx \sum_{i=1}^{n} f(x_i^*)\,\Delta x$$

where $x_i^*$ is any point in the $i$th subinterval $[x_{i-1}, x_i]$. If $x_i^*$ is chosen to be the left endpoint of the interval, then $x_i^* = x_{i-1}$ and we have



(a) Left endpoint approximation



(b) Right endpoint approximation

**FIGURE 1**

$$\boxed{1} \qquad \int_a^b f(x)\,dx \approx L_n = \sum_{i=1}^{n} f(x_{i-1})\,\Delta x$$

If $f(x) \geqslant 0$, then the integral represents an area and Equation 1 represents an approximation of this area by the rectangles shown in Figure 1(a). If we choose $x_i^*$ to be the right endpoint, then $x_i^* = x_i$ and we have

$$\boxed{2} \qquad \int_a^b f(x)\,dx \approx R_n = \sum_{i=1}^{n} f(x_i)\,\Delta x$$

[See Figure 1(b).] The approximations $L_n$ and $R_n$ defined by Equations 1 and 2 are called the **left endpoint approximation** and **right endpoint approximation**, respectively.

## The Midpoint and Trapezoidal Rules

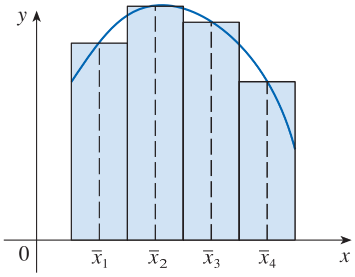


**FIGURE 2**
Midpoint approximation

In Section 4.2 we considered the case where $x_i^*$ in the Riemann sum is chosen to be the midpoint $\bar{x}_i$ of the subinterval $[x_{i-1}, x_i]$. Figure 2 shows the midpoint approximation $M_n$ for the area in Figure 1. It appears that $M_n$ is a better approximation than either $L_n$ or $R_n$.

**Midpoint Rule**

$$\int_a^b f(x)\,dx \approx M_n = \Delta x\,[f(\bar{x}_1) + f(\bar{x}_2) + \cdots + f(\bar{x}_n)]$$

where $\qquad \Delta x = \dfrac{b - a}{n}$

and $\qquad \bar{x}_i = \tfrac{1}{2}(x_{i-1} + x_i) = \text{midpoint of } [x_{i-1}, x_i]$

Another approximation, called the Trapezoidal Rule, results from averaging the approximations in Equations 1 and 2:

$$\int_a^b f(x)\,dx \approx \frac{1}{2}\left[\sum_{i=1}^{n} f(x_{i-1})\,\Delta x + \sum_{i=1}^{n} f(x_i)\,\Delta x\right] = \frac{\Delta x}{2}\left[\sum_{i=1}^{n}\bigl(f(x_{i-1}) + f(x_i)\bigr)\right]$$

$$= \frac{\Delta x}{2}\Bigl[\bigl(f(x_0) + f(x_1)\bigr) + \bigl(f(x_1) + f(x_2)\bigr) + \cdots + \bigl(f(x_{n-1}) + f(x_n)\bigr)\Bigr]$$

$$= \frac{\Delta x}{2}[f(x_0) + 2f(x_1) + 2f(x_2) + \cdots + 2f(x_{n-1}) + f(x_n)]$$

Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

**Trapezoidal Rule**

$$\int_a^b f(x)\,dx \approx T_n = \frac{\Delta x}{2}\left[f(x_0) + 2f(x_1) + 2f(x_2) + \cdots + 2f(x_{n-1}) + f(x_n)\right]$$

where $\Delta x = (b - a)/n$ and $x_i = a + i\,\Delta x$.

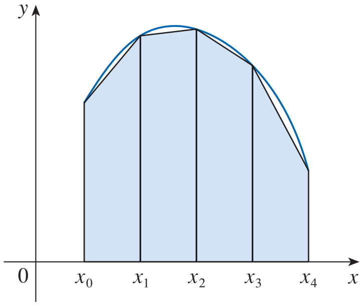

**FIGURE 3**
Trapezoidal approximation

The reason for the name Trapezoidal Rule can be seen from Figure 3, which illustrates the case with $f(x) \geqslant 0$ and $n = 4$. The area of the trapezoid that lies above the $i$th subinterval is

$$\Delta x\left(\frac{f(x_{i-1}) + f(x_i)}{2}\right) = \frac{\Delta x}{2}\left[f(x_{i-1}) + f(x_i)\right]$$

and if we add the areas of all these trapezoids, we get the right side of the Trapezoidal Rule.

**EXAMPLE 1** Use (a) the Trapezoidal Rule and (b) the Midpoint Rule with $n = 5$ to approximate the integral $\int_1^2 (1/x)\,dx$.

**SOLUTION**

(a) With $n = 5$, $a = 1$, and $b = 2$, we have $\Delta x = (2 - 1)/5 = 0.2$, and so the Trapezoidal Rule gives

$$\int_1^2 \frac{1}{x}\,dx \approx T_5 = \frac{0.2}{2}\left[f(1) + 2f(1.2) + 2f(1.4) + 2f(1.6) + 2f(1.8) + f(2)\right]$$

$$= 0.1\left(\frac{1}{1} + \frac{2}{1.2} + \frac{2}{1.4} + \frac{2}{1.6} + \frac{2}{1.8} + \frac{1}{2}\right)$$

$$\approx 0.695635$$

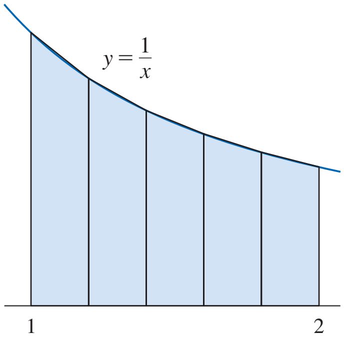

**FIGURE 4**

This approximation is illustrated in Figure 4.

(b) The midpoints of the five subintervals are 1.1, 1.3, 1.5, 1.7, and 1.9, so the Midpoint Rule gives

$$\int_1^2 \frac{1}{x}\,dx \approx \Delta x\left[f(1.1) + f(1.3) + f(1.5) + f(1.7) + f(1.9)\right]$$

$$= \frac{1}{5}\left(\frac{1}{1.1} + \frac{1}{1.3} + \frac{1}{1.5} + \frac{1}{1.7} + \frac{1}{1.9}\right)$$

$$\approx 0.691908$$

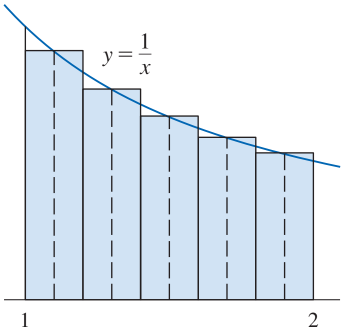

**FIGURE 5**

This approximation is illustrated in Figure 5. ■

## Error Bounds for the Midpoint and Trapezoidal Rules

In Example 1 we deliberately chose an integral whose value can be computed explicitly so that we can see how accurate the Trapezoidal and Midpoint Rules are. By the Fundamental Theorem of Calculus,

$$\int_1^2 \frac{1}{x}\,dx = \ln x\Big]_1^2 = \ln 2 = 0.693147\ldots$$

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

$\int_a^b f(x)\,dx = \text{approximation} + \text{error}$

The **error** in using an approximation is defined to be the amount that needs to be added to the approximation to make it exact. From the values in Example 1 we see that the errors in the Trapezoidal and Midpoint Rule approximations for $n = 5$ are

$$E_T \approx -0.002488 \qquad \text{and} \qquad E_M \approx 0.001239$$

In general, we have

$$E_T = \int_a^b f(x)\,dx - T_n \qquad \text{and} \qquad E_M = \int_a^b f(x)\,dx - M_n$$

The following tables show the results of calculations similar to those in Example 1, but for $n = 5$, 10, and 20 and for the left and right endpoint approximations as well as the Trapezoidal and Midpoint Rules.

Approximations to $\int_1^2 \frac{1}{x}\,dx$

| $n$ | $L_n$ | $R_n$ | $T_n$ | $M_n$ |
|---|---|---|---|---|
| 5 | 0.745635 | 0.645635 | 0.695635 | 0.691908 |
| 10 | 0.718771 | 0.668771 | 0.693771 | 0.692835 |
| 20 | 0.705803 | 0.680803 | 0.693303 | 0.693069 |

Corresponding errors

| $n$ | $E_L$ | $E_R$ | $E_T$ | $E_M$ |
|---|---|---|---|---|
| 5 | −0.052488 | 0.047512 | −0.002488 | 0.001239 |
| 10 | −0.025624 | 0.024376 | −0.000624 | 0.000312 |
| 20 | −0.012656 | 0.012344 | −0.000156 | 0.000078 |

It turns out that these observations are true in most cases.

We can make several observations from these tables:

1. In all of the methods we get more accurate approximations when we increase the value of $n$. (But very large values of $n$ result in so many arithmetic operations that we have to beware of accumulated round-off error.)
2. The errors in the left and right endpoint approximations are opposite in sign and appear to decrease by a factor of about 2 when we double the value of $n$.
3. The Trapezoidal and Midpoint Rules are much more accurate than the endpoint approximations.
4. The errors in the Trapezoidal and Midpoint Rules are opposite in sign and appear to decrease by a factor of about 4 when we double the value of $n$.
5. The size of the error in the Midpoint Rule is about half the size of the error in the Trapezoidal Rule.

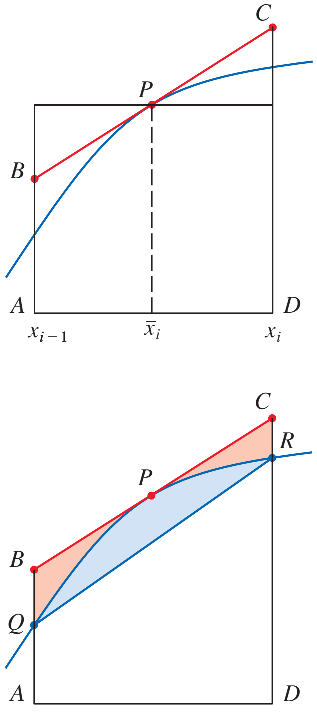

**FIGURE 6**

Figure 6 shows why we can usually expect the Midpoint Rule to be more accurate than the Trapezoidal Rule. The area of a typical rectangle in the Midpoint Rule is the same as the area of the trapezoid $ABCD$ whose upper side is tangent to the graph at $P$. The area of this trapezoid is closer to the area under the graph than is the area of the trapezoid $AQRD$ used in the Trapezoidal Rule. [The midpoint error (shaded red) is smaller than the trapezoidal error (shaded blue).]

These observations are corroborated in the following error estimates, which are proved in books on numerical analysis. Notice that Observation 4 corresponds to the $n^2$ in each denominator because $(2n)^2 = 4n^2$. The fact that the estimates depend on the size of the second derivative is not surprising if you look at Figure 6, because $f''(x)$ measures how much the graph is curved. [Recall that $f''(x)$ measures how fast the slope of $y = f(x)$ changes.]

**3** **Error Bounds** Suppose $|f''(x)| \leqslant K$ for $a \leqslant x \leqslant b$. If $E_T$ and $E_M$ are the errors in the Trapezoidal and Midpoint Rules, then

$$|E_T| \leqslant \frac{K(b-a)^3}{12n^2} \qquad \text{and} \qquad |E_M| \leqslant \frac{K(b-a)^3}{24n^2}$$

Let's apply this error estimate to the Trapezoidal Rule approximation in Example 1. If $f(x) = 1/x$, then $f'(x) = -1/x^2$ and $f''(x) = 2/x^3$. Because $1 \leqslant x \leqslant 2$, we have $1/x \leqslant 1$, so

$$|f''(x)| = \left|\frac{2}{x^3}\right| \leqslant \frac{2}{1^3} = 2$$

Therefore, taking $K = 2$, $a = 1$, $b = 2$, and $n = 5$ in the error estimate (3), we see that

$K$ can be any number larger than all the values of $|f''(x)|$, but smaller values of $K$ give better error bounds.

$$|E_T| \leqslant \frac{2(2-1)^3}{12(5)^2} = \frac{1}{150} \approx 0.006667$$

Comparing this error estimate of 0.006667 with the actual error of about 0.002488, we see that it can happen that the actual error is substantially less than the upper bound for the error given by (3).

**EXAMPLE 2** How large should we take $n$ in order to guarantee that the Trapezoidal and Midpoint Rule approximations for $\int_1^2 (1/x)\,dx$ are accurate to within 0.0001?

**SOLUTION** We saw in the preceding calculation that $|f''(x)| \leqslant 2$ for $1 \leqslant x \leqslant 2$, so we can take $K = 2$, $a = 1$, and $b = 2$ in (3). Accuracy to within 0.0001 means that the size of the error should be less than 0.0001. Therefore we choose $n$ so that

$$\frac{2(1)^3}{12n^2} < 0.0001$$

Solving the inequality for $n$, we get

$$n^2 > \frac{2}{12(0.0001)}$$

It's quite possible that a lower value for $n$ would suffice, but 41 is the smallest value for which the error bound formula can *guarantee* accuracy to within 0.0001.

and so $$n > \frac{1}{\sqrt{0.0006}} \approx 40.8$$

Thus $n = 41$ will ensure the desired accuracy.

For the same accuracy with the Midpoint Rule we choose $n$ so that

$$\frac{2(1)^3}{24n^2} < 0.0001 \qquad \text{and so} \qquad n > \frac{1}{\sqrt{0.0012}} \approx 29$$ ■

### EXAMPLE 3

(a) Use the Midpoint Rule with $n = 10$ to approximate the integral $\int_0^1 e^{x^2}\,dx$.
(b) Give an upper bound for the error involved in this approximation.

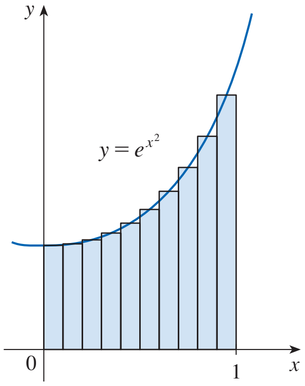

**FIGURE 7**

**SOLUTION**

(a) Since $a = 0$, $b = 1$, and $n = 10$, the Midpoint Rule gives

$$\begin{aligned}\int_0^1 e^{x^2}dx &\approx \Delta x\,[f(0.05) + f(0.15) + \cdots + f(0.85) + f(0.95)]\\ &= 0.1[e^{0.0025} + e^{0.0225} + e^{0.0625} + e^{0.1225} + e^{0.2025} + e^{0.3025}\\ &\qquad + e^{0.4225} + e^{0.5625} + e^{0.7225} + e^{0.9025}]\\ &\approx 1.460393\end{aligned}$$

Figure 7 illustrates this approximation.

(b) Since $f(x) = e^{x^2}$, we have $f'(x) = 2xe^{x^2}$ and $f''(x) = (2 + 4x^2)e^{x^2}$. Also, since $0 \leqslant x \leqslant 1$, we have $x^2 \leqslant 1$ and so

$$0 \leqslant f''(x) = (2 + 4x^2)e^{x^2} \leqslant 6e$$

Error estimates give upper bounds for the error. They are theoretical, worst-case scenarios. The actual error in this case turns out to be about 0.0023.

Taking $K = 6e$, $a = 0$, $b = 1$, and $n = 10$ in the error estimate (3), we see that an upper bound for the error is

$$\frac{6e(1)^3}{24(10)^2} = \frac{e}{400} \approx 0.007 \qquad ■$$

## ■ Simpson's Rule

Another rule for approximate integration results from using parabolas instead of straight line segments to approximate a curve. As before, we divide $[a, b]$ into $n$ subintervals of equal length $h = \Delta x = (b - a)/n$, but this time we assume that $n$ is an *even* number. Then on each consecutive pair of intervals we approximate the curve $y = f(x) \geqslant 0$ by a parabola as shown in Figure 8. If $y_i = f(x_i)$, then $P_i(x_i, y_i)$ is the point on the curve lying above $x_i$. A typical parabola passes through three consecutive points $P_i$, $P_{i+1}$, and $P_{i+2}$.

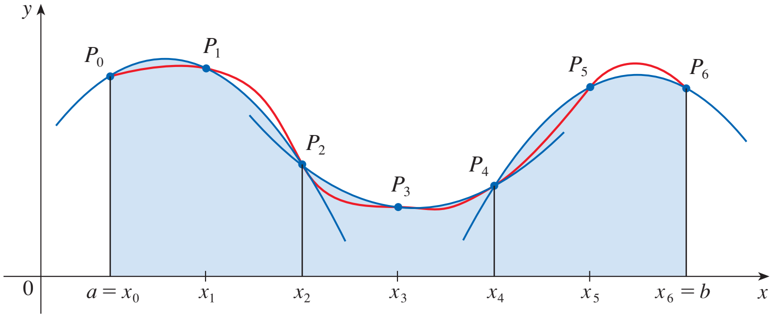

**FIGURE 8**

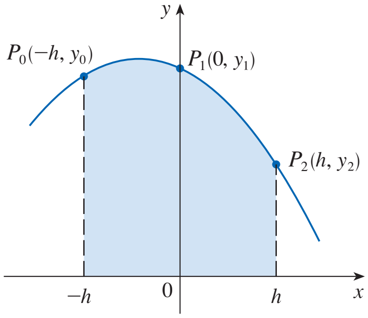

**FIGURE 9**

To simplify our calculations, we first consider the case where $x_0 = -h$, $x_1 = 0$, and $x_2 = h$. (See Figure 9.) We know that the equation of the parabola through $P_0$, $P_1$, and $P_2$

is of the form $y = Ax^2 + Bx + C$ and so the area under the parabola from $x = -h$ to $x = h$ is

Here we have used Theorem 4.5.6. Notice that $Ax^2 + C$ is an even function and $Bx$ is odd.

$$\int_{-h}^{h} (Ax^2 + Bx + C)\,dx = 2\int_0^h (Ax^2 + C)\,dx = 2\left[A\frac{x^3}{3} + Cx\right]_0^h$$

$$= 2\left(A\frac{h^3}{3} + Ch\right) = \frac{h}{3}(2Ah^2 + 6C)$$

But, since the parabola passes through $P_0(-h, y_0)$, $P_1(0, y_1)$, and $P_2(h, y_2)$, we have

$$y_0 = A(-h)^2 + B(-h) + C = Ah^2 - Bh + C$$

$$y_1 = C$$

$$y_2 = Ah^2 + Bh + C$$

and therefore $\qquad y_0 + 4y_1 + y_2 = 2Ah^2 + 6C$

Thus we can rewrite the area under the parabola as

$$\frac{h}{3}(y_0 + 4y_1 + y_2)$$

Now by shifting this parabola horizontally we do not change the area under it. This means that the area under the parabola through $P_0$, $P_1$, and $P_2$ from $x = x_0$ to $x = x_2$ in Figure 8 is still

$$\frac{h}{3}(y_0 + 4y_1 + y_2)$$

Similarly, the area under the parabola through $P_2$, $P_3$, and $P_4$ from $x = x_2$ to $x = x_4$ is

$$\frac{h}{3}(y_2 + 4y_3 + y_4)$$

If we compute the areas under all the parabolas in this manner and add the results, we get

$$\int_a^b f(x)\,dx \approx \frac{h}{3}(y_0 + 4y_1 + y_2) + \frac{h}{3}(y_2 + 4y_3 + y_4) + \cdots + \frac{h}{3}(y_{n-2} + 4y_{n-1} + y_n)$$

$$= \frac{h}{3}(y_0 + 4y_1 + 2y_2 + 4y_3 + 2y_4 + \cdots + 2y_{n-2} + 4y_{n-1} + y_n)$$

Although we have derived this approximation for the case in which $f(x) \geqslant 0$, it is a reasonable approximation for any continuous function $f$ and is called Simpson's Rule after the English mathematician Thomas Simpson (1710–1761). Note the pattern of coefficients: 1, 4, 2, 4, 2, 4, 2, . . . , 4, 2, 4, 1.

**Simpson**

Thomas Simpson was a weaver who taught himself mathematics and went on to become one of the best English mathematicians of the 18th century. What we call Simpson's Rule was actually known to Cavalieri and Gregory in the 17th century, but Simpson popularized it in his book *Mathematical Dissertations* (1743).

**Simpson's Rule**

$$\int_a^b f(x)\,dx \approx S_n = \frac{\Delta x}{3}[f(x_0) + 4f(x_1) + 2f(x_2) + 4f(x_3) + \cdots$$

$$+ 2f(x_{n-2}) + 4f(x_{n-1}) + f(x_n)]$$

where $n$ is even and $\Delta x = (b - a)/n$.

**EXAMPLE 4** Use Simpson's Rule with $n = 10$ to approximate $\int_1^2 (1/x)\,dx$.

**SOLUTION** Putting $f(x) = 1/x$, $n = 10$, and $\Delta x = 0.1$ in Simpson's Rule, we obtain

$$\int_1^2 \frac{1}{x}\,dx \approx S_{10}$$

$$= \frac{\Delta x}{3}[f(1) + 4f(1.1) + 2f(1.2) + 4f(1.3) + \cdots + 2f(1.8) + 4f(1.9) + f(2)]$$

$$= \frac{0.1}{3}\left(\frac{1}{1} + \frac{4}{1.1} + \frac{2}{1.2} + \frac{4}{1.3} + \frac{2}{1.4} + \frac{4}{1.5} + \frac{2}{1.6} + \frac{4}{1.7} + \frac{2}{1.8} + \frac{4}{1.9} + \frac{1}{2}\right)$$

$$\approx 0.693150$$ ■

Notice that, in Example 4, Simpson's Rule gives us a *much* better approximation ($S_{10} \approx 0.693150$) to the true value of the integral ($\ln 2 \approx 0.693147\ldots$) than does the Trapezoidal Rule ($T_{10} \approx 0.693771$) or the Midpoint Rule ($M_{10} \approx 0.692835$). It turns out (see Exercise 50) that the approximations in Simpson's Rule are weighted averages of those in the Trapezoidal and Midpoint Rules:

$$S_{2n} = \tfrac{1}{3}T_n + \tfrac{2}{3}M_n$$

(Recall that $E_T$ and $E_M$ usually have opposite signs and that $|E_M|$ is about half the size of $|E_T|$.)

In many applications of calculus we need to evaluate an integral even if no explicit formula is known for $y$ as a function of $x$. A function may be given graphically or as a table of values of collected data. If there is evidence that the values are not changing rapidly, then Simpson's Rule (or the Midpoint Rule or Trapezoidal Rule) can still be used to find an approximate value for $\int_a^b y\,dx$, the integral of $y$ with respect to $x$.

**EXAMPLE 5** Figure 10 shows data traffic on the link from the United States to SWITCH, the Swiss academic and research network, during one full day. $D(t)$ is the data throughput, measured in megabits per second (Mb/s). Use Simpson's Rule to estimate the total amount of data transmitted on the link from midnight to noon on that day.

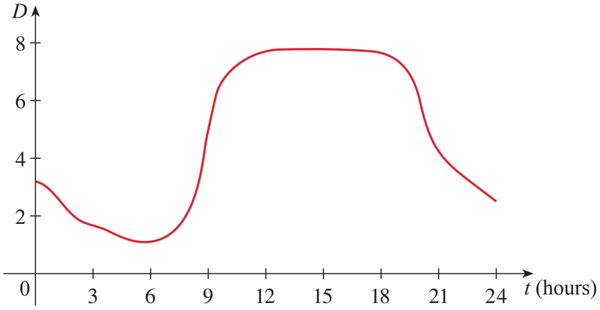

**FIGURE 10**

**SOLUTION** Because we want the units to be consistent and $D(t)$ is measured in megabits per second, we convert the units for $t$ from hours to seconds. If we let $A(t)$ be the amount of data (in megabits) transmitted by time $t$, where $t$ is measured in seconds, then $A'(t) = D(t)$. So, by the Net Change Theorem (see Section 4.4), the total amount

Copyright 2021 Cengage Learning. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part. Due to electronic rights, some third party content may be suppressed from the eBook and/or eChapter(s). Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

of data transmitted by noon (when $t = 12 \times 60^2 = 43{,}200$) is

$$A(43{,}200) = \int_0^{43{,}200} D(t)\, dt$$

We estimate the values of $D(t)$ at hourly intervals from the graph and compile them in the table.

| $t$ (hours) | $t$ (seconds) | $D(t)$ | $t$ (hours) | $t$ (seconds) | $D(t)$ |
|---|---|---|---|---|---|
| 0 | 0 | 3.2 | 7 | 25,200 | 1.3 |
| 1 | 3,600 | 2.7 | 8 | 28,800 | 2.8 |
| 2 | 7,200 | 1.9 | 9 | 32,400 | 5.7 |
| 3 | 10,800 | 1.7 | 10 | 36,000 | 7.1 |
| 4 | 14,400 | 1.3 | 11 | 39,600 | 7.7 |
| 5 | 18,000 | 1.0 | 12 | 43,200 | 7.9 |
| 6 | 21,600 | 1.1 | | | |

Then we use Simpson's Rule with $n = 12$ and $\Delta t = 3600$ to estimate the integral:

$$\begin{aligned}\int_0^{43{,}200} A(t)\, dt &\approx \frac{\Delta t}{3}[D(0) + 4D(3600) + 2D(7200) + \cdots + 4D(39{,}600) + D(43{,}200)]\\ &\approx \frac{3600}{3}[3.2 + 4(2.7) + 2(1.9) + 4(1.7) + 2(1.3) + 4(1.0)\\ &\qquad + 2(1.1) + 4(1.3) + 2(2.8) + 4(5.7) + 2(7.1) + 4(7.7) + 7.9]\\ &= 143{,}880\end{aligned}$$

Thus the total amount of data transmitted from midnight to noon is about 144,000 megabits, or 144 gigabits (18 gigabytes). ■

## Error Bound for Simpson's Rule

| $n$ | $M_n$ | $S_n$ |
|---|---|---|
| 4 | 0.69121989 | 0.69315453 |
| 8 | 0.69266055 | 0.69314765 |
| 16 | 0.69302521 | 0.69314721 |

| $n$ | $E_M$ | $E_S$ |
|---|---|---|
| 4 | 0.00192729 | −0.00000735 |
| 8 | 0.00048663 | −0.00000047 |
| 16 | 0.00012197 | −0.00000003 |

The first table in the margin shows how Simpson's Rule compares with the Midpoint Rule for the integral $\int_1^2 (1/x)\, dx$, whose value is about 0.69314718. The second table shows how the error $E_S$ in Simpson's Rule decreases by a factor of about 16 when $n$ is doubled. (In Exercises 27 and 28 you are asked to verify this for two additional integrals.) That is consistent with the appearance of $n^4$ in the denominator of the following error estimate for Simpson's Rule. It is similar to the estimates given in (3) for the Trapezoidal and Midpoint Rules, but it uses the fourth derivative of $f$.

**4** **Error Bound for Simpson's Rule** Suppose that $|f^{(4)}(x)| \leqslant K$ for $a \leqslant x \leqslant b$. If $E_S$ is the error involved in using Simpson's Rule, then

$$|E_S| \leqslant \frac{K(b-a)^5}{180n^4}$$

**EXAMPLE 6** How large should we take $n$ in order to guarantee that the Simpson's Rule approximation for $\int_1^2 (1/x)\, dx$ is accurate to within 0.0001?

**SOLUTION** If $f(x) = 1/x$, then $f^{(4)}(x) = 24/x^5$. Since $x \geqslant 1$, we have $1/x \leqslant 1$ and so

$$|f^{(4)}(x)| = \left|\frac{24}{x^5}\right| \leqslant 24$$

Many calculators and software applications have a built-in algorithm that computes an approximation of a definite integral. Some of these algorithms use Simpson's Rule; others use more sophisticated techniques such as *adaptive* numerical integration. This means that if a function fluctuates much more on a certain part of the interval than it does elsewhere, then that part gets divided into more subintervals. This strategy reduces the number of calculations required to achieve a prescribed accuracy.

Therefore we can take $K = 24$ in (4). Thus, for an error less than 0.0001, we should choose $n$ so that

$$\frac{24(1)^5}{180n^4} < 0.0001$$

This gives

$$n^4 > \frac{24}{180(0.0001)}$$

and so

$$n > \frac{1}{\sqrt[4]{0.00075}} \approx 6.04$$

Therefore $n = 8$ ($n$ must be even) gives the desired accuracy. (Compare this with Example 2, where we obtained $n = 41$ for the Trapezoidal Rule and $n = 29$ for the Midpoint Rule.) ■

## EXAMPLE 7

(a) Use Simpson's Rule with $n = 10$ to approximate the integral $\int_0^1 e^{x^2}\,dx$.
(b) Estimate the error involved in this approximation.

**SOLUTION**

(a) If $n = 10$, then $\Delta x = 0.1$ and Simpson's Rule gives

Figure 11 illustrates the calculation in Example 7. Notice that the parabolic arcs are so close to the graph of $y = e^{x^2}$ that they are practically indistinguishable from it.

$$\begin{aligned}\int_0^1 e^{x^2}\,dx &\approx \frac{\Delta x}{3}[f(0) + 4f(0.1) + 2f(0.2) + \cdots + 2f(0.8) + 4f(0.9) + f(1)]\\ &= \frac{0.1}{3}[e^0 + 4e^{0.01} + 2e^{0.04} + 4e^{0.09} + 2e^{0.16} + 4e^{0.25} + 2e^{0.36}\\ &\qquad + 4e^{0.49} + 2e^{0.64} + 4e^{0.81} + e^1]\\ &\approx 1.462681\end{aligned}$$

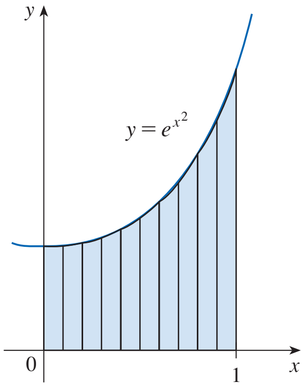

**FIGURE 11**

(b) The fourth derivative of $f(x) = e^{x^2}$ is

$$f^{(4)}(x) = (12 + 48x^2 + 16x^4)e^{x^2}$$

and so, since $0 \leqslant x \leqslant 1$, we have

$$0 \leqslant f^{(4)}(x) \leqslant (12 + 48 + 16)e^1 = 76e$$

Therefore, putting $K = 76e$, $a = 0$, $b = 1$, and $n = 10$ in (4), we see that the error is at most

$$\frac{76e(1)^5}{180(10)^4} \approx 0.000115$$

(Compare this with Example 3.) Thus, correct to three decimal places, we have

$$\int_0^1 e^{x^2}\,dx \approx 1.463$$ ■

## 7.7 Exercises

In these exercises, round your answers to six decimal places unless otherwise instructed.

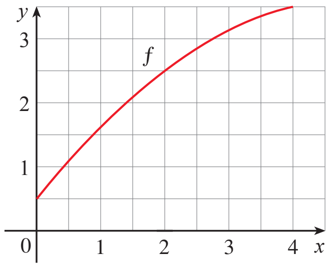
**1.** Let $I = \int_0^4 f(x)\,dx$, where $f$ is the function whose graph is shown.

(a) Use the graph to find $L_2$, $R_2$, and $M_2$.

(b) Are these underestimates or overestimates of $I$?

(c) Use the graph to find $T_2$. How does it compare with $I$?

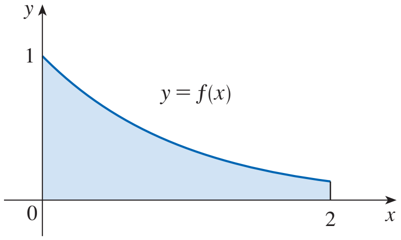
(d) For any value of $n$, list the numbers $L_n$, $R_n$, $M_n$, $T_n$, and $I$ in increasing order.



**2.** The left, right, Trapezoidal, and Midpoint Rule approximations were used to estimate $\int_0^2 f(x)\,dx$, where $f$ is the function whose graph is shown. The estimates were 0.7811, 0.8675, 0.8632, and 0.9540, and the same number of subintervals were used in each case.

(a) Which rule produced which estimate?

(b) Between which two approximations does the true value of $\int_0^2 f(x)\,dx$ lie?



**3.** Estimate $\int_0^1 \cos(x^2)\,dx$ using (a) the Trapezoidal Rule and (b) the Midpoint Rule, each with $n = 4$. From a graph of the integrand, decide whether your answers are underestimates or overestimates. What can you conclude about the true value of the integral?

**4.** Draw the graph of $f(x) = \sin\left(\frac{1}{2}x^2\right)$ in the viewing rectangle $[0, 1]$ by $[0, 0.5]$ and let $I = \int_0^1 f(x)\,dx$.

(a) Use the graph to decide whether $L_2$, $R_2$, $M_2$, and $T_2$ underestimate or overestimate $I$.

(b) For any value of $n$, list the numbers $L_n$, $R_n$, $M_n$, $T_n$, and $I$ in increasing order.

(c) Compute $L_5$, $R_5$, $M_5$, and $T_5$. From the graph, which do you think gives the best estimate of $I$?

**5–6** Use (a) the Midpoint Rule and (b) Simpson's Rule to approximate the given integral with the specified value of $n$. Compare your results to the actual value to determine the error in each approximation.

**5.** $\int_0^{\pi} x \sin x\,dx$, $\quad n = 6$

**6.** $\int_0^2 \dfrac{x}{\sqrt{1 + x^2}}\,dx$, $\quad n = 8$

**7–18** Use (a) the Trapezoidal Rule, (b) the Midpoint Rule, and (c) Simpson's Rule to approximate the given integral with the specified value of $n$.

**7.** $\int_0^1 \sqrt{1 + x^3}\,dx$, $\quad n = 4$

**8.** $\int_1^4 \sin\sqrt{x}\,dx$, $\quad n = 6$

**9.** $\int_0^1 \sqrt{e^x - 1}\,dx$, $\quad n = 10$

**10.** $\int_0^2 \sqrt[3]{1 - x^2}\,dx$, $\quad n = 10$

**11.** $\int_{-1}^2 e^{x + \cos x}\,dx$, $\quad n = 6$

**12.** $\int_1^3 e^{1/x}\,dx$, $\quad n = 8$

**13.** $\int_0^4 \sqrt{y}\cos y\,dy$, $\quad n = 8$

**14.** $\int_2^3 \dfrac{1}{\ln t}\,dt$, $\quad n = 10$

**15.** $\int_0^1 \dfrac{x^2}{1 + x^4}\,dx$, $\quad n = 10$

**16.** $\int_1^3 \dfrac{\sin t}{t}\,dt$, $\quad n = 4$

**17.** $\int_0^4 \ln(1 + e^x)\,dx$, $\quad n = 8$

**18.** $\int_0^1 \sqrt{x + x^3}\,dx$, $\quad n = 10$

**19.** (a) Find the approximations $T_8$ and $M_8$ for the integral $\int_0^1 \cos(x^2)\,dx$.

(b) Estimate the errors in the approximations of part (a).

(c) How large do we have to choose $n$ so that the approximations $T_n$ and $M_n$ to the integral in part (a) are accurate to within 0.0001?

**20.** (a) Find the approximations $T_{10}$ and $M_{10}$ for $\int_1^2 e^{1/x}\,dx$.

(b) Estimate the errors in the approximations of part (a).

(c) How large do we have to choose $n$ so that the approximations $T_n$ and $M_n$ to the integral in part (a) are accurate to within 0.0001?

**21.** (a) Find the approximations $T_{10}$, $M_{10}$, and $S_{10}$ for $\int_0^{\pi} \sin x\,dx$ and the corresponding errors $E_T$, $E_M$, and $E_S$.

(b) Compare the actual errors in part (a) with the error estimates given by (3) and (4).

(c) How large do we have to choose $n$ so that the approximations $T_n$, $M_n$, and $S_n$ to the integral in part (a) are accurate to within 0.00001?

**22.** How large should $n$ be to guarantee that the Simpson's Rule approximation to $\int_0^1 e^{x^2}\,dx$ is accurate to within 0.00001?

T **23.** The trouble with the error estimates is that it is often very difficult to compute fourth derivatives and obtain a good upper bound $K$ for $|f^{(4)}(x)|$ by hand. But mathematical software has no problem computing $f^{(4)}$ and graphing it, so we can easily find a value for $K$ from a machine graph. This exercise deals with approximations to the integral $I = \int_0^{2\pi} f(x)\,dx$, where $f(x) = e^{\cos x}$. In parts (b), (d), and (g), round your answers to 10 decimal places.

(a) Use a graph to get a good upper bound for $|f''(x)|$.
(b) Use $M_{10}$ to approximate $I$.
(c) Use part (a) to estimate the error in part (b).
(d) Use a calculator or computer to approximate $I$.
(e) How does the actual error compare with the error estimate in part (c)?
(f) Use a graph to get a good upper bound for $|f^{(4)}(x)|$.
(g) Use $S_{10}$ to approximate $I$.
(h) Use part (f) to estimate the error in part (g).
(i) How does the actual error compare with the error estimate in part (h)?
(j) How large should $n$ be to guarantee that the size of the error in using $S_n$ is less than 0.0001?

T **24.** Repeat Exercise 23 for the integral $I = \displaystyle\int_{-1}^{1} \sqrt{4 - x^3}\,dx$.

**25–26** Find the approximations $L_n$, $R_n$, $T_n$, and $M_n$ for $n = 5$, 10, and 20. Then compute the corresponding errors $E_L$, $E_R$, $E_T$, and $E_M$. (You may wish to use the sum command on a computer algebra system.) What observations can you make? In particular, what happens to the errors when $n$ is doubled?

**25.** $\displaystyle\int_0^1 xe^x\,dx$

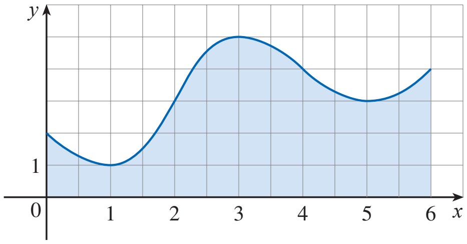
**26.** $\displaystyle\int_1^2 \frac{1}{x^2}\,dx$

**27–28** Find the approximations $T_n$, $M_n$, and $S_n$ for $n = 6$ and $n = 12$. Then compute the corresponding errors $E_T$, $E_M$, and $E_S$. (You may wish to use the sum command on a computer algebra system.) What observations can you make? In particular, what happens to the errors when $n$ is doubled?

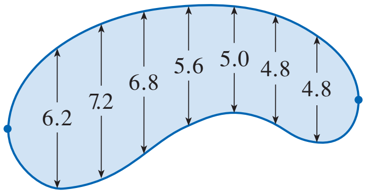
**27.** $\displaystyle\int_0^2 x^4\,dx$

**28.** $\displaystyle\int_1^4 \frac{1}{\sqrt{x}}\,dx$

**29.** Estimate the area under the graph in the figure by using (a) the Trapezoidal Rule, (b) the Midpoint Rule, and (c) Simpson's Rule, each with $n = 6$.



**30.** The widths (in meters) of a kidney-shaped swimming pool were measured at 2-meter intervals as indicated in the figure. Use Simpson's Rule with $n = 8$ to estimate the area of the pool.



**31.** (a) Use the Midpoint Rule and the given data to estimate the value of the integral $\int_1^5 f(x)\,dx$.

| $x$ | $f(x)$ | $x$ | $f(x)$ |
|---|---|---|---|
| 1.0 | 2.4 | 3.5 | 4.0 |
| 1.5 | 2.9 | 4.0 | 4.1 |
| 2.0 | 3.3 | 4.5 | 3.9 |
| 2.5 | 3.6 | 5.0 | 3.5 |
| 3.0 | 3.8 | | |

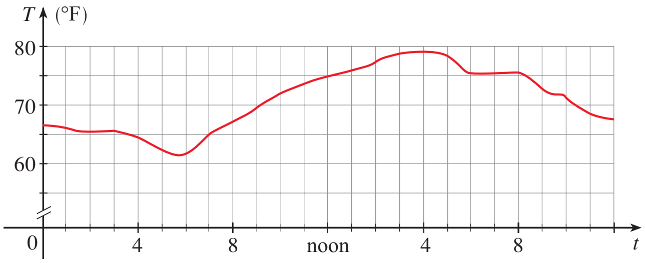
(b) If it is known that $-2 \leqslant f''(x) \leqslant 3$ for all $x$, estimate the error involved in the approximation in part (a).

**32.** (a) A table of values of a function $g$ is given. Use Simpson's Rule to estimate $\int_0^{1.6} g(x)\,dx$.

| $x$ | $g(x)$ | $x$ | $g(x)$ |
|---|---|---|---|
| 0.0 | 12.1 | 1.0 | 12.2 |
| 0.2 | 11.6 | 1.2 | 12.6 |
| 0.4 | 11.3 | 1.4 | 13.0 |
| 0.6 | 11.1 | 1.6 | 13.2 |
| 0.8 | 11.7 | | |

(b) If $-5 \leqslant g^{(4)}(x) \leqslant 2$ for $0 \leqslant x \leqslant 1.6$, estimate the error involved in the approximation in part (a).

**33.** A graph of the temperature in Boston on a summer day is shown. Use Simpson's Rule with $n = 12$ to estimate the average temperature on that day.



**34.** A radar gun was used to record the speed of a runner during the first 5 seconds of a race (see the table). Use Simpson's

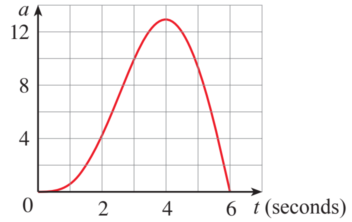
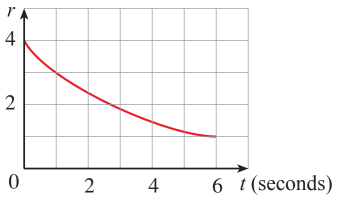
**35.** The graph of the acceleration $a(t)$ of a car, measured in ft/s$^2$, is shown. Use Simpson's Rule to estimate the increase in the velocity of the car during the 6-second time interval.



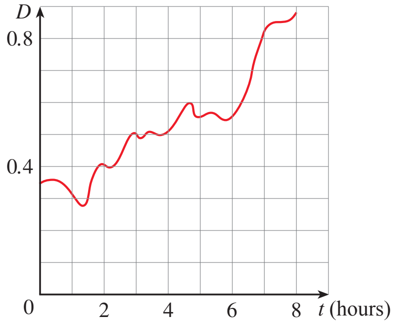
**36.** Water leaked from a tank at a rate of $r(t)$ liters per hour, where the graph of $r$ is as shown. Use Simpson's Rule to estimate the total amount of water that leaked out during the first 6 hours.



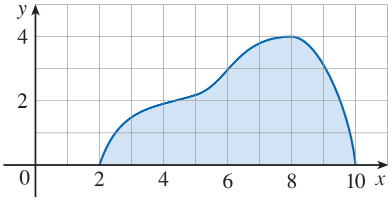
**37.** The table (provided by San Diego Gas and Electric) gives the power consumption $P$ in megawatts in San Diego County from midnight to 6:00 AM on a day in December. Use Simpson's Rule to estimate the energy used during that time period. (Use the fact that power is the derivative of energy.)

| $t$ | $P$ | $t$ | $P$ |
|---|---|---|---|
| 0:00 | 1814 | 3:30 | 1611 |
| 0:30 | 1735 | 4:00 | 1621 |
| 1:00 | 1686 | 4:30 | 1666 |
| 1:30 | 1646 | 5:00 | 1745 |
| 2:00 | 1637 | 5:30 | 1886 |
| 2:30 | 1609 | 6:00 | 2052 |
| 3:00 | 1604 | | |

**38.** Shown is the graph of traffic on an Internet service provider's T1 data line from midnight to 8:00 AM, where $D$ is the data throughput, measured in megabits per second. Use Simpson's Rule to estimate the total amount of data transmitted during that time period.



**39.** Use Simpson's Rule with $n = 8$ to estimate the volume of the solid obtained by rotating the region shown in the figure about (a) the $x$-axis and (b) the $y$-axis.



**40.** The table shows values of a force function $f(x)$, where $x$ is measured in meters and $f(x)$ in newtons. Use Simpson's Rule to estimate the work done by the force in moving an object a distance of 18 m.

| $x$ | 0 | 3 | 6 | 9 | 12 | 15 | 18 |
|---|---|---|---|---|---|---|---|
| $f(x)$ | 9.8 | 9.1 | 8.5 | 8.0 | 7.7 | 7.5 | 7.4 |

**41.** The region bounded by the curve $y = 1/(1 + e^{-x})$, the $x$- and $y$-axes, and the line $x = 10$ is rotated about the $x$-axis. Use Simpson's Rule with $n = 10$ to estimate the volume of the resulting solid.

**42.** The figure shows a pendulum with length $L$ that makes a maximum angle $\theta_0$ with the vertical. Using Newton's Second Law, it can be shown that the period $T$ (the time for one complete swing) is given by

$$T = 4\sqrt{\frac{L}{g}} \int_0^{\pi/2} \frac{dx}{\sqrt{1 - k^2 \sin^2 x}}$$

where $k = \sin\left(\frac{1}{2}\theta_0\right)$ and $g$ is the acceleration due to gravity. If $L = 1$ m and $\theta_0 = 42°$, use Simpson's Rule with $n = 10$ to find the period.

**43.** The intensity of light with wavelength $\lambda$ traveling through a diffraction grating with $N$ slits at an angle $\theta$ is given by $I(\theta) = (N^2 \sin^2 k)/k^2$, where $k = (\pi N d \sin \theta)/\lambda$ and $d$ is the distance between adjacent slits. A helium-neon laser with wavelength $\lambda = 632.8 \times 10^{-9}$ m is emitting a narrow band of light, given by $-10^{-6} < \theta < 10^{-6}$, through a grating with 10,000 slits spaced $10^{-4}$ m apart. Use the Midpoint Rule with $n = 10$ to estimate the total light intensity $\int_{-10^{-6}}^{10^{-6}} I(\theta)\, d\theta$ emerging from the grating.

**44.** Use the Trapezoidal Rule with $n = 10$ to approximate $\int_0^{20} \cos(\pi x)\, dx$. Compare your result to the actual value. Can you explain the discrepancy?

**45.** Sketch the graph of a continuous function on $[0, 2]$ for which the Trapezoidal Rule with $n = 2$ is more accurate than the Midpoint Rule.

**46.** Sketch the graph of a continuous function on $[0, 2]$ for which the right endpoint approximation with $n = 2$ is more accurate than Simpson's Rule.

**47.** If $f$ is a positive function and $f''(x) < 0$ for $a \leqslant x \leqslant b$, show that

$$T_n < \int_a^b f(x)\, dx < M_n$$

**48. When Is Simpson's Rule Exact?**

(a) Show that if $f$ is a polynomial of degree 3 or lower, then Simpson's Rule gives the exact value of $\int_a^b f(x)\, dx$.

(b) Find the approximation $S_4$ for $\int_0^8 (x^3 - 6x^2 + 4x)\, dx$ and verify that $S_4$ is the exact value of the integral.

(c) Use the error bound given in (4) to explain why the statement in part (a) must be true.

**49.** Show that $\frac{1}{2}(T_n + M_n) = T_{2n}$.

**50.** Show that $\frac{1}{3}T_n + \frac{2}{3}M_n = S_{2n}$.

## 7.8 Improper Integrals

In defining a definite integral $\int_a^b f(x)\, dx$ we dealt with a function $f$ defined on a finite interval $[a, b]$ and we assumed that $f$ does not have an infinite discontinuity (see Section 4.2). In this section we extend the concept of a definite integral to the case where the interval is infinite and also to the case where $f$ has an infinite discontinuity in $[a, b]$. In either case the integral is called an *improper integral*. One of the most important applications of this idea, probability distributions, will be studied in Section 8.5.

### Type 1: Infinite Intervals

Consider the unbounded region $S$ that lies under the curve $y = 1/x^2$, above the $x$-axis, and to the right of the line $x = 1$. You might think that, since $S$ is infinite in extent, its area must be infinite, but let's take a closer look. The area of the part of $S$ that lies to the left of the line $x = t$ (shaded in Figure 1) is

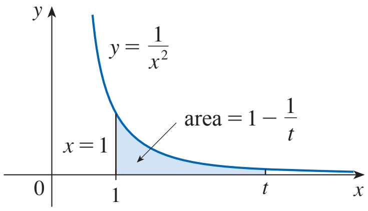

**FIGURE 1**

$$A(t) = \int_1^t \frac{1}{x^2}\, dx = -\frac{1}{x}\bigg]_1^t = 1 - \frac{1}{t}$$

Notice that $A(t) < 1$ no matter how large $t$ is chosen. We also observe that

$$\lim_{t\to\infty} A(t) = \lim_{t\to\infty}\left(1 - \frac{1}{t}\right) = 1$$

The area of the shaded region approaches 1 as $t \to \infty$ (see Figure 2), so we say that the area of the infinite region $S$ is equal to 1 and we write

$$\int_1^\infty \frac{1}{x^2}\, dx = \lim_{t\to\infty} \int_1^t \frac{1}{x^2}\, dx = 1$$

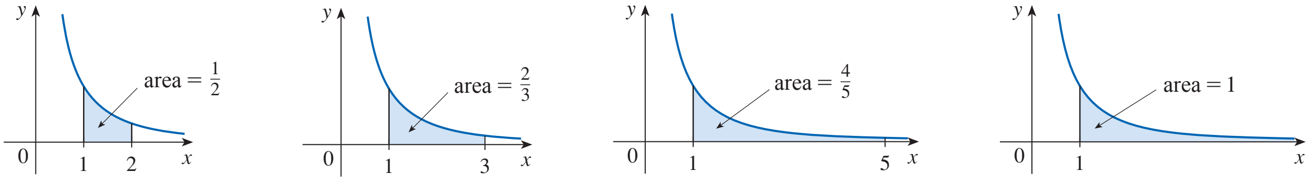

**FIGURE 2**

Using this example as a guide, we define the integral of $f$ (not necessarily a positive function) over an infinite interval as the limit of integrals over finite intervals.

### $\boxed{1}$ Definition of an Improper Integral of Type 1

(a) If $\int_a^t f(x)\,dx$ exists for every number $t \geqslant a$, then

$$\int_a^\infty f(x)\,dx = \lim_{t \to \infty} \int_a^t f(x)\,dx$$

provided this limit exists (as a finite number).

(b) If $\int_t^b f(x)\,dx$ exists for every number $t \leqslant b$, then

$$\int_{-\infty}^b f(x)\,dx = \lim_{t \to -\infty} \int_t^b f(x)\,dx$$

provided this limit exists (as a finite number).

The improper integrals $\int_a^\infty f(x)\,dx$ and $\int_{-\infty}^b f(x)\,dx$ are called **convergent** if the corresponding limit exists and **divergent** if the limit does not exist.

(c) If both $\int_a^\infty f(x)\,dx$ and $\int_{-\infty}^a f(x)\,dx$ are convergent, then we define

$$\int_{-\infty}^\infty f(x)\,dx = \int_{-\infty}^a f(x)\,dx + \int_a^\infty f(x)\,dx$$

In part (c) any real number $a$ can be used (see Exercise 88).

Any of the improper integrals in Definition 1 can be interpreted as an area provided that $f$ is a positive function. For instance, in case (a) if $f(x) \geqslant 0$ and the integral $\int_a^\infty f(x)\,dx$ is convergent, then we define the area of the region $S = \{(x, y) \mid x \geqslant a, 0 \leqslant y \leqslant f(x)\}$ in Figure 3 to be

$$A(S) = \int_a^\infty f(x)\,dx$$

This is appropriate because $\int_a^\infty f(x)\,dx$ is the limit as $t \to \infty$ of the area under the graph of $f$ from $a$ to $t$.

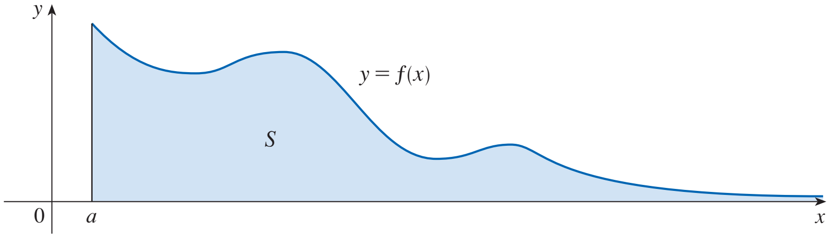

**FIGURE 3**

**EXAMPLE 1** Determine whether the integral $\int_1^\infty (1/x)\,dx$ is convergent or divergent.

**SOLUTION** According to part (a) of Definition 1, we have

$$\int_1^\infty \frac{1}{x}\,dx = \lim_{t \to \infty} \int_1^t \frac{1}{x}\,dx = \lim_{t \to \infty} \ln|x|\Big]_1^t$$

$$= \lim_{t \to \infty} (\ln t - \ln 1) = \lim_{t \to \infty} \ln t = \infty$$

Editorial review has deemed that any suppressed content does not materially affect the overall learning experience. Cengage Learning reserves the right to remove additional content at any time if subsequent rights restrictions require it.

The limit does not exist as a finite number and so the improper integral $\int_1^\infty (1/x)\,dx$ is divergent. ■

Let's compare the result of Example 1 with the example given at the beginning of this section:

$$\int_1^\infty \frac{1}{x^2}\,dx \ \text{ converges} \qquad\qquad \int_1^\infty \frac{1}{x}\,dx \ \text{ diverges}$$

Geometrically, this says that although the curves $y = 1/x^2$ and $y = 1/x$ look very similar for $x > 0$, the region under $y = 1/x^2$ to the right of $x = 1$ (the shaded region in Figure 4) has finite area whereas the corresponding region under $y = 1/x$ (in Figure 5) has infinite area. Note that both $1/x^2$ and $1/x$ approach 0 as $x \to \infty$ but $1/x^2$ approaches 0 faster than $1/x$. The values of $1/x$ don't decrease fast enough for its integral to have a finite value.

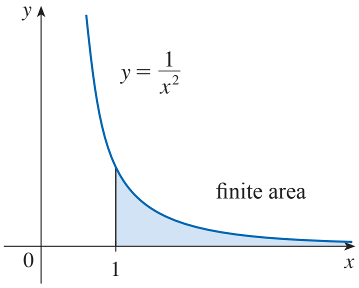

**FIGURE 4**

$\int_1^\infty (1/x^2)\,dx$ converges

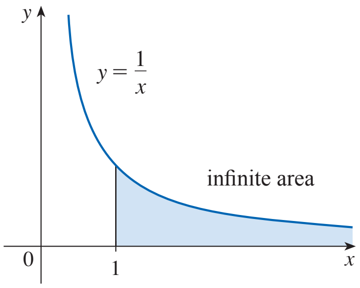

**FIGURE 5**

$\int_1^\infty (1/x)\,dx$ diverges

**EXAMPLE 2** Evaluate $\displaystyle\int_{-\infty}^0 xe^x\,dx$.

**SOLUTION** Using part (b) of Definition 1, we have

$$\int_{-\infty}^0 xe^x\,dx = \lim_{t\to-\infty}\int_t^0 xe^x\,dx$$

We integrate by parts with $u = x$, $dv = e^x\,dx$ so that $du = dx$, $v = e^x$:

$$\int_t^0 xe^x\,dx = xe^x\Big]_t^0 - \int_t^0 e^x\,dx$$

$$= -te^t - 1 + e^t$$

We know that $e^t \to 0$ as $t \to -\infty$, and by l'Hospital's Rule we have

$$\lim_{t\to-\infty} te^t = \lim_{t\to-\infty}\frac{t}{e^{-t}} = \lim_{t\to-\infty}\frac{1}{-e^{-t}}$$

$$= \lim_{t\to-\infty}(-e^t) = 0$$

Therefore

$$\int_{-\infty}^0 xe^x\,dx = \lim_{t\to-\infty}(-te^t - 1 + e^t)$$

$$= -0 - 1 + 0 = -1$$ ■

**EXAMPLE 3** Evaluate $\displaystyle\int_{-\infty}^{\infty} \frac{1}{1+x^2}\,dx$.

**SOLUTION** It's convenient to choose $a = 0$ in Definition 1(c):

$$\int_{-\infty}^{\infty} \frac{1}{1+x^2}\,dx = \int_{-\infty}^{0} \frac{1}{1+x^2}\,dx + \int_{0}^{\infty} \frac{1}{1+x^2}\,dx$$

We must now evaluate the integrals on the right side separately:

$$\begin{aligned}\int_{0}^{\infty} \frac{1}{1+x^2}\,dx &= \lim_{t\to\infty} \int_0^t \frac{dx}{1+x^2} = \lim_{t\to\infty} \tan^{-1}x\Big]_0^t \\ &= \lim_{t\to\infty} (\tan^{-1}t - \tan^{-1}0) = \lim_{t\to\infty} \tan^{-1}t = \frac{\pi}{2}\end{aligned}$$

$$\begin{aligned}\int_{-\infty}^{0} \frac{1}{1+x^2}\,dx &= \lim_{t\to-\infty} \int_t^0 \frac{dx}{1+x^2} = \lim_{t\to-\infty} \tan^{-1}x\Big]_t^0 \\ &= \lim_{t\to-\infty} (\tan^{-1}0 - \tan^{-1}t) = 0 - \left(-\frac{\pi}{2}\right) = \frac{\pi}{2}\end{aligned}$$

Since both of these integrals are convergent, the given integral is convergent and

$$\int_{-\infty}^{\infty} \frac{1}{1+x^2}\,dx = \frac{\pi}{2} + \frac{\pi}{2} = \pi$$

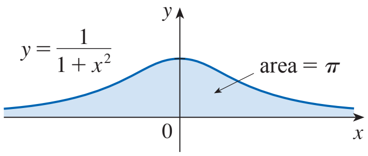

**FIGURE 6**

Since $1/(1+x^2) > 0$, the given improper integral can be interpreted as the area of the infinite region that lies under the curve $y = 1/(1+x^2)$ and above the $x$-axis (see Figure 6). ■

**EXAMPLE 4** For what values of $p$ is the integral

$$\int_1^{\infty} \frac{1}{x^p}\,dx$$

convergent?

**SOLUTION** We know from Example 1 that if $p = 1$, then the integral is divergent, so let's assume that $p \neq 1$. Then

$$\begin{aligned}\int_1^{\infty} \frac{1}{x^p}\,dx &= \lim_{t\to\infty} \int_1^t x^{-p}\,dx = \lim_{t\to\infty} \frac{x^{-p+1}}{-p+1}\Bigg]_{x=1}^{x=t} \\ &= \lim_{t\to\infty} \frac{1}{1-p}\left[\frac{1}{t^{p-1}} - 1\right]\end{aligned}$$

If $p > 1$, then $p - 1 > 0$, so as $t \to \infty$, $t^{p-1} \to \infty$ and $1/t^{p-1} \to 0$. Therefore

$$\int_1^{\infty} \frac{1}{x^p}\,dx = \frac{1}{p-1} \qquad \text{if } p > 1$$

and so the integral converges.

If $p < 1$, then $p - 1 < 0$ and so

$$\frac{1}{t^{p-1}} = t^{1-p} \to \infty \qquad \text{as } t \to \infty$$

and the integral diverges. ■

We summarize the result of Example 4 for future reference:

**2** $$\int_1^\infty \frac{1}{x^p}\,dx \quad \text{is convergent if } p > 1 \text{ and divergent if } p \leqslant 1.$$

## Type 2: Discontinuous Integrands

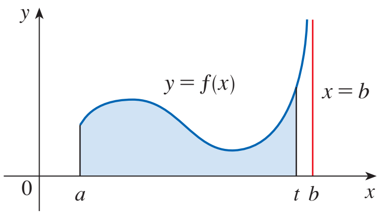

**FIGURE 7**

Suppose that $f$ is a positive continuous function defined on a finite interval $[a, b)$ but has a vertical asymptote at $b$. Let $S$ be the unbounded region under the graph of $f$ and above the $x$-axis between $a$ and $b$. (For Type 1 integrals, the regions extended indefinitely in a horizontal direction. Here the region is infinite in a vertical direction.) The area of the part of $S$ between $a$ and $t$ (the shaded region in Figure 7) is

$$A(t) = \int_a^t f(x)\,dx$$

If it happens that $A(t)$ approaches a definite number $A$ as $t \to b^-$, then we say that the area of the region $S$ is $A$ and we write

$$\int_a^b f(x)\,dx = \lim_{t \to b^-} \int_a^t f(x)\,dx$$

We use this equation to define an improper integral of Type 2 even when $f$ is not a positive function, no matter what type of discontinuity $f$ has at $b$.

Parts (b) and (c) of Definition 3 are illustrated in Figures 8 and 9 for the case where $f(x) \geqslant 0$ and $f$ has vertical asymptotes at $a$ and $c$, respectively.

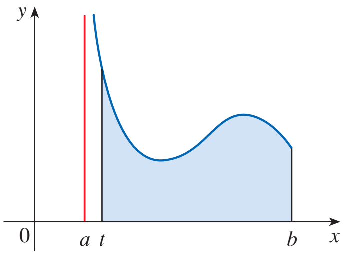

**FIGURE 8**

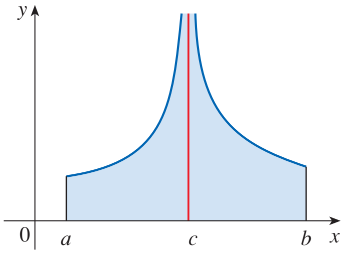

**FIGURE 9**

### 3 Definition of an Improper Integral of Type 2

(a) If $f$ is continuous on $[a, b)$ and is discontinuous at $b$, then

$$\int_a^b f(x)\,dx = \lim_{t \to b^-} \int_a^t f(x)\,dx$$

if this limit exists (as a finite number).

(b) If $f$ is continuous on $(a, b]$ and is discontinuous at $a$, then

$$\int_a^b f(x)\,dx = \lim_{t \to a^+} \int_t^b f(x)\,dx$$

if this limit exists (as a finite number).

The improper integral $\int_a^b f(x)\,dx$ is called **convergent** if the corresponding limit exists and **divergent** if the limit does not exist.

(c) If $f$ has a discontinuity at $c$, where $a < c < b$, and both $\int_a^c f(x)\,dx$ and $\int_c^b f(x)\,dx$ are convergent, then we define

$$\int_a^b f(x)\,dx = \int_a^c f(x)\,dx + \int_c^b f(x)\,dx$$

**EXAMPLE 5** Find $\displaystyle\int_2^5 \frac{1}{\sqrt{x-2}}\,dx$.

**SOLUTION** We note first that the given integral is improper because $f(x) = 1/\sqrt{x-2}$ has the vertical asymptote $x = 2$. Since the infinite discontinuity occurs at the left
